M Muqtada do, for that concretises the economic profile of cities, and generates time-series in an area where official statistics is of little help. The data show that the informal sector remains large and growing relative to urban employment in major Asian cities. However, it contains two subsectors, one is dynamic, that is, generates savings, and the other grows by absorbing under-employed. This recognition of a dualism has generated research on the sources of success within the dynamic part, i.e., small industry. Considerable product and process innovation are found to take place, usually a result of competition in the product market. A connection between innovation and educational levels can be established. But with workers, skills are acquired mainly through experience, and the use of formal training is discounted. This survey of recent research is useful in the way surveys are. But why the authors substitute the term 'micro enterprise' for 'informal sector' is a mystery. One is about as vague or as useful as the other. If 'enterprise' is a better word than 'sector', which it is, 'micro enterprise' loses on the hint of a divide in the urban economy that 'informal' connotes.

Rashid Amjad's paper addresses a certain mismatch between urban planning and labour market characteristics in the megacities of Asia, forcing informal workers and enterprises to survive on marginal infrastructure often illegally occupied. The paper outlines, in telling statistics, the 'urban inflation' in Asia, increasingly dominated by cities with populations of 10 million or more. There is a close correspondence between city growth, informal sector expansion, and growth of slums. Urban planning has for the most part consisted in land-use and physical planning bearing little contact with the socio-economic conditions of the city, "where people live, what they do, and where they work". The paper argues that measures such as provision of workspace for informal enterprises, changes in zoning laws, selective intervention in real estate market via self-financed housing schemes for example, upgradation of basic services in slums, developing labour market information systems, etc, could harmonise a better quality of life in the city with growth in employment.

It would be a mistake to expect new insight in this book. The essays summarise research on well known questions. However, the questions are important, and the quality of the surveys good. The book will interest anyone, including the non-specialist, concerned with policy reform. It is also recommended to those looking for researchable issues in labour, and to those seeking a wider perspective to ongoing work on topics like rural non-farm, urban informal, or construction.

The Yawning Vacuum

A World without Alternatives

Rajni Kothari

In assessing the current historical situation, the most fundamental change is that we may be entering, or may have already entered, a period in which there is going to be little scope for alternatives. Underlying this most unsettling discontinuity in the modern era is not just pervasive globalisation and its various concomitants, such as consumerism and commercialisation of diverse human endeavours through their marketisation, but a basic crisis of vision, a decline of engagement with Utopias, an end of 'alternatives' in the real and comprehensive sense of the term. Not just the erosion of alternative centres of power and systems of 'development' and governance (the collapse of both the socialist and the third world poles) but, though partly related to that, erosion of ideological perspectives, frameworks of knowledge and modes of consciousness.

WHEREAS there has been a large number of reactions and responses to the changes taking place over the last few years, a large majority of these have been in respect of political adjustments, both actual and contemplated, to a drastically changed global power structure. The few academic and media comments that have been there are also in respect of this change. By and large the world of ideas is yet to come to grips with the nature of transition and transformation that human society has been going through over the last few years, how these can be related to the trends which set in during the decade of the 80s (some have called it 'the lost decade', others have celebrated it as 'the end of history', signifying the triumph of one particular ideology and mode of organising human affairs), and what that decade signifies for the larger flow of human history.

Not believing in any doctrine of historical determinism, I do not think that what happened during the 80s was inevitable and inherent in the basic design of the modern world, or of modernity. But I have always had greater interest in discontinuities than in continuities. That is why, as I see it, while the human race has achieved remarkable feats of 'success' within the scientific paradigm it had set out for itself, it has undermined its own achievements through eroding the processes and institutions that it had once put in place. It is to the most recent discontinuity in the historical process and the accompanying erosion of structures and institutions that I wish to address myself in this essay. And I intend to do this by examining the implications of historical events from the point of view of the realm of ideas. From the point of view of an intellectual's perception of the changes that have, whether he likes it or not, overtaken him.

I

Thresholds of Change

The most fundamental change that strikes me in assessing the current historical situation is that we may be entering or may have already entered a period in which there is going to be little scope for alternatives. Both within the system (global and local) and from outside the system. Both within the mainstream culture and through counter-cultural assertions thereto. This entails a very sharp and probably the most unsettling discontinuity in the modern era.

What has taken place is an erosion of alternatives at different thresholds of the human enterprise. The one that is, of course, most evident is the sudden disappearance of alternative fulcrums of power and visions as against the western imperial capitalist model. It is not just the socialist alternative that has collapsed. In many ways the 'third world' as an alternative mode of thinking and organising economic and social affairs, and conceiving of themselves as such, presenting a 'third way' that was different from both the western capitalist and the state socialist ways, has collapsed too. Consequently, there has also taken place (despite assertions to the contrary) an erosion of the global structure of power and human governance, of the dialectical balance thereof, across and within societies (involving nations in one case and classes in the other).

The other major threshold, in some ways related to the erosion of alternative power centres, has to do with what is commonly known as displacement of the 'state' by the 'market'. Now there is much more to the marketisation of life and being than a mere giving up of the state as an engine of human and social change and replacing it by the market. Nor is it

just introduction of market capitalism within formerly socialist economies or third world mixed economies. (The Chinese still think they can have both a communist state and a capitalist economy, as if that was an 'alternative' to what is being proposed worldwide.) It is rather reducing the richness and complexity of civil society to a marketplace, or a variety of civil societies becoming part of one huge global supermarket. This will mean, over time, not just the march of a single commercial and consumer culture over diverse economies; it will also entail the erosion of a variety of indigenous 'markets'—from village *melas* and *hats* to various ethnic markets and bazaars—and a whole array of social exchanges that keep a large number of indigenous economies alive. The latter are still around in Africa and large parts of Asia too but they all face extinction under the impact of global homogenisation. Even the various 'ethnic' products and the versatile output of diverse handicraft and artisan communities are being threatened with getting jettisoned by cheap commercial goodies for fulfilling the lust and esoteric demands of the global consumer (including the rich urbanite within the third world countries).

Underlying these two major thresholds is a powerful economic thrust backed by a major ideological onslaught. But there is, of course, a third dimension of this, namely the erosion of counter-cultures worldwide, both in terms of indigenous civilisations and in terms of revolt of the younger generation. And of the various 'movements' from the grassroots. On this I want to dwell at some length in this essay. But before turning to it I would like to draw the macro import of what has already been said, namely, erosion of alternative centres of power and ideology and the simultaneous erosion of the state as an institution in diverse nations and

regions. What lies behind this is an unprecedented consolidation of the imperial era, of world capitalism and of technohegemony, i.e. the displacement of political management and control by a technocratic elite which represents an entirely new phenomenon. It encompasses various major shifts in the organisation of human affairs, not just the displacement of the state by the market, but also of politics by techno-rationality, of plurality of cultures by a mono-culture, of horizontal 'structures' by a vertical 'pyramid' (put differently, of multipolarity by unipolarity), of *greening* of the world which stresses diversity and spontaneity by its *whitening* which stresses integration and strait-jacketing. The 'end of history' thesis is not to be laughed out; it represents and announces the end of the era not just of the socialist challenge to the capitalist world but also of multipolarity of the world, of the system of nation states. It has called into question a plurality of the world and the dispersal of power that had taken place following the Second World War. It is the return of the capitalist-colonial framework that Fukuyama and other excited champions of western capitalism are celebrating.¹

II

Crisis of the World System

The fact is that events moved so fast after the Second World War that the imperial centres and their ideologues had no control over them. The world of Winston Churchill, that most clear thinker and defender of western imperialism, seemed to have vanished before his eyes. And the 'Nanga Fakir' and all that he symbolised proved too powerful. (I do not mean Gandhi in any specific sense but only in a symbolic sense, representing the full flow of anti-imperial, anti-colonial thrust.) But it was not just the challenge from the erstwhile colonies and the black races. There were intra-Allies contradictions too which surfaced not too long after signing the Yalta agreement. Again it is not surprising that it was Churchill who announced the arrival of the cold war from American soil. It was a 'war' that had to be waged on several 'fronts': the east of course, the south both by extension of the east but also independently of it and, with the weakening of the western imperial hold and the misadventures like Vietnam and Cuba, within the west too (from the anti-Vietnam movement to the anti-missiles peace movement in Europe). The effort of the US to recoup the lost momentum through ultra-sophisticated nuclear armaments and the star wars proved too complicated, expensive and time-consuming, apart from increasingly losing in legitimacy.

It is by now clear that the post-war diplomacy of the west could not handle

the new situation faced by it after the Second World War; there was a basic decline in political statesmanship, a relevant worldview and vision suited to the new phase of world history and the necessary mechanisms needed to deal with a more complex, global reality. This resulted in the ascendancy of a set of foreign service professionals and academic experts, small men without any sense of history. It all signalled the 'decline of the west' (and not just of British and French empires), the rise of American power being at once too arrogant and too philistine to be able to really 'lead the world' (although that has all along been the American penchant and continues to be so).² It is also clear that the key mistake on which these western (especially American) strategists worked, namely, the political dismantling of the east and of the south (hence so much stress on the military dimension) failed to 'contain' the challenges posed by the latter and instead provoked a variety of nationalist responses (to which there is no end in sight).

Where the bomb and colonial style diplomacy failed, the market is today being summoned, helped greatly by the internal collapse of the Soviet and east European states and the considerable weakening of the states of large parts of the third world. The question is: will this effort to resurrect the imperial world order succeed? Or will it prove too late and too shortsighted a response, provoking once again a new series of cultural and political backlashes including from states and regions that may just now appear to be co-opted and bought over? The future is by no means assured for the unipolar/corporate/technocratic/globalising model. But right now it is undoubtedly on the upswing and has succeeded in brainwashing the elites—both political and economic—of the erstwhile east and the remnants of the south.

Here it may be worthwhile to take cognisance of recent history in world affairs, of the growth and consolidation of the world system, and the present crisis in it, and of the most recent effort to deal with the crisis both ideologically and in terms of public policy (national and international). We need to explore the earlier correlation of forces after the Second World War that allowed an expansion of the west of a more benign type, as compared to today's expansion of a more coercive and aggrandising type. There were a number of reasons that made this possible. First, there was the tremendous success of post-Keynesian capitalism on the one hand generating enough surplus and producing an unprecedented 'boom' in the capitalist countries. And on the other hand willing (even if accepted reluctantly by some sections) to build a 'welfare state', develop a framework of industrial relations, in the bargain ensure a long era of

industrial peace, making the working class itself accept the bourgeois democratic model of the state. In the process this led to a large expansion of internal markets in these countries based precisely on the purchasing power of the working class, yet providing sufficient scope for increased profits and capital accumulation, in turn also expanding externally through a new package of neo-colonialism in which the working class (and the peasantry) in the north became willing partners in the exploitation of the south.

It was a period of considerable consolidation and expansion of western capitalism while at the same time giving it a 'human face' through the development of a globalist humanitarian ideology in the form of helping the poor of the world. There developed a series of institutional and policy initiatives—from the Truman doctrine to Eisenhower's warning to the world of the growth of a military-industrial complex that had emerged in the west (as well as the east) to the highly attractive and enticing symbols generated during the Kennedy era. It was also a period that enabled the capitalist system to respond to and at the same time contain voices of dissent at home—from civil rights to the anti-Vietnam movement to environmentalism, feminism and anti-militarism.

Second, the advocacy of liberal democracy coupled with a 'mixed economy' opened up new vistas to capitalism in parts of the third world (India being the prime example of this) in which the state itself provided major incentives and resources for capitalist expansion. Over time, as we can now see, through the growing appeal of the paradigm of technology, such an expansion paved the way for both government and industry in the third world to become part of the global framework of capitalism.

The fact is that the newly independent states of the third world which had at one time claimed that they would follow an independent path of development (some of them called it 'the third way',³ still others talked of 'delinking' from the north)⁴ failed to generate a real alternative. And ultimately accepted the dominant model of capitalist development propagated from the academic think-tanks of the west which facilitated the integrationist thrust of corporate capitalism. There is of late developing a partnership between the third world bureaucratic colonial state and transnational capital and technology, with a few highly advertised cases of 'success', especially in south-east and east Asia but also in parts of Latin America. This made others (who had opted to be both less brutal *vis-a-vis* their own people and less willing to allow multinational penetration) look like failures and, lacking confidence in their own vision and perspective and the capacity to

hold on to their own distinctive models, ultimately made them too want to 'catch up' and hence get co-opted.

That in this whole change in perspective the 'social question' was shelved or rather that the technological model overtook the social model was not sufficiently noted, even by dissident and opposition forces, and even less by the international alternatives movements, is only part of the co-optation model. The latter had in the meanwhile got sidelined by preoccupation with other issues—environment, status of women, disarmament and the like. (More on all of this later.) Unfortunately, Marxism also failed to respond adequately to this knuckling under by so many countries that were once committed to alternatives to the capitalist model. And, before it knew, came the collapse of the very citadels of socialism.

Underlying such an economic transformation has been a major shift in ideological thinking, starting in the west, then expanding globally. First in parts of the third world where the appeal of liberalisation had started growing since the mid-1970s. And then to the socialist world starting with some countries in eastern Europe where Stalinist excesses had left deep scars and the demonstration effect of western consumerism had made bigger inroads than in either the former Soviet Union or China, in Cuba or Nicaragua. And then again, with the collapse of the Soviet Union itself, both strategically and ideologically, throughout the rest of the third world, not excluding China and India, the two countries that had stood for so long for (though very differently from each other) alternative models of 'indigenous' development.

III

Right Reaction

The 'Right Reaction' first emerged in the west itself. It was a reaction against the welfare state and the modern ideas of distributive justice. It was also a reaction against the growing power of the poor, the minorities (especially the blacks in the US), the third world lobby, the United Nations itself (especially UNCTAD, UNESCO, ILO, UNICEF and the like which were seen to be partial to the third world) and generally against the so-called radical intellectuals. It was an effort to bolster the somewhat weakening military-industrial complex by co-opting a whole lot of strategic thinkers, eminent economists and technocrats (so many of them from India) and other professionals as consultants and members of advisory bodies. We have an emerging global professional elite which is indeed truly 'global' and which along with other groups (government bureaucrats and media representatives) serves the cause of transnational capitalism.

Whereas the power and reach of corporate capitalism has been on the ascendancy over time, despite challenges to it from both political and intellectual circles, what made it a vehicle of right reaction is the powerful and highly aggressive ideological twist given to it by Reaganism and Thatcherism on the one hand and the new phase of Bretton Woods institutions on the other. (There is reason to believe that president Reagan talked the World Bank officialdom out of supporting third world states and towards an ideology of 'privatisation'.) Those who talk of reduced economic power of the US do not reckon with the powerful institutional terrain that the US alone—the US state—wields. This covers a wide variety of fields. Obviously the most important is the military-strategic one. But it is also in respect of international credit and credit institutions in which financial resources of Europe and Japan are also mobilised but the main control continues to be with the Americans. Same is the case with global economic diplomacy and the international trade regime (despite the war of nerves going on at GATT), the international banking regime which is very much controlled from the US (both major commercial banks and of course the World Bank), and international lending and debt regimes, mainly through IMF and various aid-consortia. American hegemony is at once strategic and financial and commercial in which its basic clout is institutional. It is a hegemony that has so far been unaffected by the recession in the west and the US itself, the weakening dollar and all the social costs that the American citizens are paying (rising unemployment, race riots, homelessness and erosion of poverty programmes).

The liberalisation-privatisation-globalisation construct that is being offered to major countries of the third world and the socialist world (including China and Russia) is part of this spreading Right reaction. In fact, paradoxically, while it started in the hegemonic citadels of global power, it is making particular inroads in the two erstwhile alternative blocs that were at one time holding the promise of countering world hegemony by the west, namely, the east on the one hand and the south on the other. It appears as if these former bastions of alternative paradigms are more available for the new ideologies of Right reaction than the dominant centres themselves. The defeat suffered by the British prime minister, Major, on the miners' issue, the recent gentle admonition by chancellor Kohl to his partymen to be prepared to make sacrifices in living standards with a view to accommodating the interests of East Germans and other immigrants, or the whole debate in the US itself on the economic crisis arising from the deep debt in which Reagan and Bush have left the country and the growing de-

mand for the need for intervention by the federal government, are all indications of the end of the Reaganite hold. Also, as the economic crisis in the west deepens and affects more and more people, forcing them to reflect on the paradigm of liberalisation and recall their own experience of the great depression and the fact that the way out of it was built on the ideas of Keynes and not of Hayek, they are beginning to reconsider things.

Unfortunately, such rethinking has not percolated to the ruling elite of third world countries. Indeed, the real frontiers of the new economic ideology are to be found more in the south than in the north. It is here that the erosion of both our thinking as independent, post-colonial states and the alternative perspectives on development that we in our own confused way were experimenting with is taking place.

IV

Erosion of the State

Another vantage point from which to look at the process of erosion of the dominant paradigm on the one hand and the decline of credible alternatives on the other is in respect of the fact that modern history got organised around the institution of the state, both internationally and at home within diverse societies. What we find today is a growing process of disabling and disempowerment of the state at work, its integrity in decline, its legitimacy in doubt. We witness a number of efforts that seem to at once transcend and disaggregate the state and the state system based on 'nation states'—globalisation and regionalisation on the one hand and ethnicisation and demands for greater federalisation on the other. What we have is a simultaneous impact of internal democratising and external colonising thrusts both of which appear to weaken the state as we knew it.

More basic though is the growing crisis in institutionalising the civic and secular processes of history. It is not just the project of the state that is under attack. It is rather that a particular relationship that had evolved between civil society and governing structures as part of the democratic upsurge of modern history that is under strain. New forces are on the anvil—'fundamentalism', 'terrorism', the rise of 'special interests' in the structure of governance, the whole onslaught of technology and consequent depoliticisation which is marginalising both 'people' and 'communities'.

In any consideration of the decline and erosion of the nation state in the third world and multiple assaults on its capacity to manage human affairs it is crucial not to lose one's sights about the historical significance of the project of the modern state, both its philosophical and its ontological rationale at a particular phase

in the post-medieval era (in the main in the European context but in some ways more generally too). It was a project whose phenomenal unfolding gave it a certain centrality in mediating human arrangements but which faced internal contradictions arising from the opposite poles of 'state' and 'nation' (composite secularism versus domineering/decomposing nationalism). It also faced growing distortions arising out of the post-war political order based on competing structures of world hegemony, the neo-colonial political economy and the cultural onslaught of the market and the mass media, ultimately producing its more open delegitimation under the model of a 'new world order' following the collapse of the earlier world order based on multiple 'poles' and diverse ideologies. While taking cognisance of these evolving phases, each growing out of the earlier ones, it is necessary to take into account both the original promise, the essential project, of the modern state and the nature and causality of its impending destructuring pointing to its likely demise in the next few decades.

One needs to think of the modern secular state as a conceptual/theoretical artefact that emerged in the course of a quickening historical process that engulfed the whole world in one great sweep that was unparalleled by anything known in history (including the periods of the Islamic and the Christian conquests). Also, how, as a matter of basic conception and logic, the modern state had overturned the basis of human identity, turning it around from naturalist, super-natural and theistic cosmologies in the process greatly reinforcing both the homocentric and the 'knowledge' centric view of reality (man the master, the state his 'machina'). But how, also, such a powerful centralising force of history produced its dialectical responses—democracy, pluralism, ecology, ethnicity, reassertion of 'spiritualism'.

More basic than this larger dialectic of world history is the fact that even during its dominant phase, for large parts of humanity the model based on the centrality of the nation state was more an aspiration than a reality, competing as it did with other identities and loyalties. Also, it was out of the peculiar historical convergence of the cold war and the adoption of a capital-intensive development model—and the memory of conflicts that had shown up during the nationalist movements—that had provided legitimacy to centralised states, and that even then large segments of third world societies (almost the whole of Africa but also large parts of Asia) remained outside their purview.⁵ With the erosion of the state under the impact of global forces, these other identities and spaces within civil society are reasserting themselves. The point in all this is that when a major phase in both human

affairs and human consciousness is drawing to a close, there is need to take cognisance of the institutional model that had held it together so long which it is no longer able to. Hence the need, the vital need, to appreciate the crisis of the state in recent history.

Indeed, in trying to deal with the situation arising out of the collapse of alternative models to the globalising and hence homogenising model of world capitalism, we need to examine what is likely to succeed the institution of the nation state which is also under attack by the same globalising thrust. Quite new possibilities seem to be under way. Whatever be the economic direction of the capitalist thrust, it does not seem likely that some supra-national political entity will simultaneously emerge on the world scene. Instead, quite a different scenario seems to be in the offing. The vacuum created by the erosion of the modern state and the state system globally is already being filled by the rise of new ethno-nationalisms on the one hand and class encounters in the form of struggles for equity and justice on the other, both of these involving a great deal of strife and violence which seem to be inherent in any major attempt at restructuring the historical process. Perhaps growing out of this convergence of ethnicity and class, and responding to the erosion of the modern secular state, may emerge completely new pan-national formations.

The only one that seems imminent at the moment is the new composite Islamic formation within the Euro-Asian political space. But there may well be other formations too. May be from the Sinic cultural zone still struggling to preserve composite cultures in the face of both nationalist drives and globalising pressures, the re-emergence of a truly composite Hindu worldview drawing upon plural identities and diverse cultural streams or—quite the contrary of that—a fundamentalist quest for a monolithic and theistic formation such as was proposed under the banner of 'Hindutva', the new fashioning of Semitism, again the choice being between its insecure and exclusivist and its eclectic and multi-national perspectives, and of course, the still strong secular structure of European and American power. The latter too faces the challenge of correcting its materialistic, militarist and colonising legacies.

To me, of course, the real answer to the present vacuum and the turbulence is the only civilised alternative to both globalising and ethnicising trends, namely, a worldwide federal democratic movement, both political and social, which alone is capable of responding to both the demands for self-determination of regions and ethnic groups and the struggles for equity and justice. Only such a movement

can also respond to the genuine need of transcending national boundaries and experimenting with various supra-national formations that can deal with new socio-economic needs, new ideas of organising human collectivities and the growth of new identities.

V

Cult of Violence

But while all these are still in the realm of possibilities in the future, the presently emergent response to the vacuum and drift and opportunistic cynicism has been a growing turbulence that is engulfing major countries. This is taking the form of a new epidemic of violence that seems to be gaining ground everywhere, especially in the cities and among the unemployed youth but also increasingly in the interiors of various regions, tribal hinterlands and forest reserves (even national parks and sanctuaries) where ill-organised 'militants' (both 'Naxalites' and 'terrorists') find their haven.⁷ There is taking place a growing culture of violence, crime, drugs and gun-totting for the sheer 'heck' of it. This is leading to an insipid and ever escalating dissolution of social restraints, indeed of social structure itself, what may be called a loss of structure in the organisation of civil society, a loss of restraining and balancing forces. On top of this—and contributing to it in so many ways—is the macro system's growing insensitivity, callousness and indifference towards the plight of the powerless: the poor, the young, the minorities, 'the dalits' of the world, women above all. As was pointed out recently by the former chief of the Intelligence Bureau, we face 'a dramatic shift in cold, cynical and manipulated violence' arising directly out of the challenge of change for which those in charge of law and order are ill-prepared. He went on to say that "in a period of fundamental transformation and restructuring of society, the main question is: can the police afford to remain inviolate from the turbulence that is sweeping society?" And he asks whether, in the coming generation (confronted with many a serious challenge) the police will be able to draw a "subtle line of distinction" between "creative unrest" and "violent disturbance" and deal with them in the appropriate manner?⁸

In the meanwhile the spectre of unemployment is becoming worldwide (the old political and economic objective of full employment has long back been given up). As this in particular hurts certain communities and classes (blacks, dalits, Muslims), the latter also get socially humiliated, dealt with from a distance (usually by gun-totting policemen) and found dispensable, both physically and socially. For these communities the economic crisis of poverty, unemployment

and illiteracy—and for many of them ill-health—has hit the hardest. Thus, for instance, with respect to the American blacks, the *New York Times* commented: "That a significant minority of Americans face a chronic economic crisis, with 40 per cent of their children in poverty, is a national tragedy. And that a much smaller proportion—perhaps no more than 10 per cent—is trapped in a lifestyle of criminality and self-destruction, we all know and dread". Here in India too the number of people in the crime-prone age bracket (14-24) among the poor is rising, indicating a sharp increase in criminality among the young. This has happened at a time when jobs for the low and semi-skilled workers have been falling and will fall further with technological advances and labour substitution (and with the government giving in to external pressures and 'conditionalities'), putting more and more people into desperate material conditions, hence forcing them to 'escape' into both drugs and crime.

As the propagators of a new economic policy based on 'structural adjustment' are refusing to attend to the real economic crises of a chronic type facing the country—growing recession, poverty, increasing unavailability of education, health, housing, transportation and other 'living conditions' and access to natural resources at affordable costs—those suffering from it all are treated by the state too with growing lack of concern or respect. They are thought almost unworthy of protection by the political and the social order, implicitly made aliens in their own country, considered dispensable, excluded from the basic social contract. One is witness to a precipitate increase in human suffering—growing assaults on human dignity, a huge and unbelievable increase in rape and atrocities on women and children, forced evictions of tribals (several lakhs of them), a general withdrawal of minimum necessary care and compassion from those most in need of them.

Naturally, the only response that such unconcern and inhumanity generates is one of criminality and its brutal logic in which the gun becomes the only medium of communication. It provides the new and only source of power—and a sense of power—for those who are at bottom powerless. As mentioned above, wielding the gun becomes an end in itself; these young men are as willing to kill as to die. Both on the part of the agents of the state and on the part of the criminal gangs there seems to be a complete disregard for the value of life itself. Any attempt at creating a genuine democratic alternative will have to come to grips with this growing nexus of poverty, exclusion from civil society, violence and crime assuming the proportions of an epidemic which is growing worldwide but is particularly very seriously affecting us in the third world.

VI

Whither Alternatives Movement?

To sum up the analysis presented so far in this essay as well as drawing implications thereof, we seem to be up against the following:

- An erosion of 'structure' in both international relations and within nation states (alongside erosion of the state as a basis for providing order and balance as well as welfare and justice in civil society).
- End of any humanitarian vision for dealing with human suffering, poverty and unprecedented growth in disparities. Instead, a sharp rise in disparity and iniquity both internationally and within individual states. Growth of hunger and starvation caused by impoverishment created by the very model of 'development' that was supposed to eradicate poverty, growing homelessness and forced evictions of entire communities, assaults on basic dignities, and withdrawal of minimum necessary love and affection even for the near and dear ones, following a basic decline in compassion as a cultural predisposition.
- Serious environmental and cultural costs that lie in store as one looks ahead, given the worldwide acceptance of the capitalist path of industrial development. (For me this is the basic message of UNCED: a moving away from conservation of nature by the people themselves and by local communities to a technocratic management of world resources and the environment, in the process providing a major role to transnational capital and institutions like the World Bank).
- Decline in prospects for economic development, both in terms of prospects for growth and in terms of dealing with poverty and injustice. Instead, arising from an iniquitous model of development, a systematic promotion of disparities both between and within societies, the two being intimately related (two types of 'colonialism').
- An upsurge (partly arising out of economic disparities and growth in poverty and unemployment) of new ethnicities and of new nationalisms, some of these creative and responding to a basic desire for autonomy and self-determination, but many of them highly chauvinistic, including wiping out of entire communities and even nationalities through attempts at 'ethnic cleansing'.
- Meanwhile, in such a period of growing erosion and vacuum, a perceptible vacuum at the level of ideas and vision, a decline in confidence and motivation for producing credible alternatives, a weakening of various social movements challenging established structures of governance and management and the

dominant mind set on development and social change.

And yet, as one reviews the last few decades, one is struck by the considerable blossoming of alternatives movement, including movements of protest and defiance against the powers-that-be. One remembers the affluence of ideas and the human spirit that the 1968 spring gave rise to in terms of a worldwide youth movement (including an aborted attempt to develop a common front between the working class and the youth as was tried in Paris), to some extent picked up by the alternatives movement in the academia in the 70s and the Green and Peace movements in the 80s, and the diffuse human rights movements in the latter part of 70s and throughout the 80s. There has also been a women's movement that has spread almost worldwide. Yet, none of these has proved capable of defying the basic 'establishment', both the military-industrial complex globally and the corporate-bureaucratic nexus in various regions of the world. If anything, many of those who had set out to create alternative futures seem to have been induced to join these very structures.

Talking of the youth, there has taken place an amazing process of their containment and corruption, a remarkable indifference to their own fate, as if they are wholly unaware of the kind of future that lies in store for their own generation (and the generations to follow). One notices a peculiar unconcern, decline in not just insensitivity but ordinary sense too, withdrawal into some kind of a shell, perhaps of the individual self, or even of the immediate moment of self-indulgence. (Perhaps in this all-out erosion lies the real 'Decline of History'.)

It is of course a complex historical process with the younger generation at once seeking a place in the 'establishment' and feeling alienated from it, therefore turning sour and cynical, at times bored and seemingly seeking to opt out of it all but in the end proving opportunistic and getting incorporated into the 'alien' establishment. In the non-western countries this has also meant turning against their own roots (especially for the educated and the more talented and upwardly mobile), their basic social identities, their own people, or a large majority of them (in our own case the anti-Mandal outburst and violence being the apotheosis of this mood).

Meanwhile all kinds of bonds that tie human beings together are under stress. This includes both the bonds of the primary kind (family, kinship, neighbourhood, even bonds of love and sexuality) and those of secondary institutional kind (political parties, activist organisations, aesthetic and literary clubs), even in fields like industry where true business adventures based on creative entrepreneurial initiative are on the decline. The result is

an even deeper vacuum than has been brought out by a mere analysis of the erosion of the social dimensions of the state. What one finds here is a decline and erosion of community yet a craving for a 'genuine community' but not knowing where to find one. At a time when even personal relations are undergoing so much strain and tension, the search for 'community' is likely to prove increasingly problem-ridden. (This is especially so with the middle class, less so with the poorer strata of society.) Can one find it in 'nature', in the environment movement? Though this may be a good and creative 'escape' from the complexity of society and its diverse structures and moral demands, it does not sound to be enough of an answer. (More on environment later.) Is it then to be found in fleeting promiscuity, constant conferencing at home and abroad, endless use of the camera, wild-living without real roots in nature, shopping above all?

To continue the analysis, the next series of pick-ups of counter-establishment and counter-cultural thrust, both in the west and in the south⁹ came with:

- The peace movement in Europe which, because of its narrowly conceived targets, namely, the nuclear missiles in Europe, and because of the appropriation of the peace dimension by the two superpowers, soon got co-opted by politicians jostling with one another for encashing the so-called 'peace dividend'.
- The Greens movement, again European in origin, which in Europe itself got lost partly by the logic of party politics and partly as a result of the decline in middle class support for the movement. 'Environment' still continues to be a major force with a global constituency but continues to be lacking in either vision or politics. (More on this to follow.)
- The women's movement, UN-inspired and conference based to begin with, hence continuing to be largely elitist and patronising *vis-a-vis* the non-elite strata though there is some evidence of the lower classes and oppressed communities also picking up the issue and endowing it with a truly authentic culture, style and flavour. Its major weakness so far is that it is a single constituency movement although a few of the women activists are also active in other movements (e.g. environment, peace and human rights). In fact some of the most powerful women of our time are those who have been struggling for the rights of the oppressed. But few of these struggles have been waged by the women's movement proper.¹⁰
- The 'alternatives' and 'alternative futures' movement which remained largely academic and did not make it even to the mass media, not to speak of the masses.

—The human rights movement which probably will grow and acquire a broad base, given the growing repression by the state as well as the decline in welfare and development functions of the state, but which is in danger of being co-opted by the diplomatic offensive of the US establishment which has done so much to bolster militarist and dictatorial (including fascist) regimes, in the process confusing—and confounding—its appeal. How can a country supporting Pinoche and his likes on the one hand and the World Bank on the other claim to stand for human rights?

Each one of these movements has been threatened today by the new coalition of power that has emerged round the world. But more basic than that is the fact that from the point of view of the political process and of the poor, these movements have turned out to be major distractions from the basic struggles for power despite their representing big drives in the secular historical process, coming forward with new agendas, holding the promise of new mutations in human consciousness. The question is: whose history and history for whom? Are not these movements also contributing, as are the new managers of a world order based on corporate capitalism, to a process of depoliticisation, of trying to intervene in history without being armed with a politics and a vision to inform such politics?

The most fundamental challenge facing these movements is one already hinted earlier in this essay, namely, that of a wide-ranging co-optation by the system. This is of course being widely recognised by concerned individuals. (I have also written on it over many years; it is a process that has been under way for a long time.¹¹) What has made the issue of co-optation today more basic than ever before is the fact that the very 'movements' that were supposed to provide alternatives to existing paradigms are being made to serve the interests of established structures of power through clever manipulation by the latter. Leading 'activists' and 'intellectuals' who have gained influence in the thinking of many people are being 'bought up', not just in the sense of collecting hefty per diem, project grants, travel budgets and foreign trips (which too can be corrupting, even intoxicating) but in the far more basic sense of being provided with more and more avenues of recognition, praise and ego-rides. Many of these 'intellectuals' are being lionised and turned into cult figures, 'legends in their own time' as they are often referred to. They are coming under a torrent of a large and generous flow of tributes that are drowning their egos, many of them in any case being uprooted and fragile individuals, most of them suffering from deep narcissism, unable to detach themselves from the make-believe

media, the books they write, the conferences they attend, the great conventions and congresses they help organise. Some of them have of course left an impact—from de-schodding to providing the much-needed fillip to tribal medicine—and have in turn contributed to mainstream thinking, the language and slogans that are used. Also, some of them, like those providing a basic critique of western technological civilisation, are being admired for their unconventional and 'Gandhian' views.

The main reason why these intellectuals can be co-opted by the system has to do with their basic difference from Gandhi (whom they all quote tirelessly) which is that the latter led a political movement of which his critique of western civilisation and the scientific paradigm was a part. The current breed of 'fundamental dissenters', have failed to evolve a political movement out of their dissenting activities (which usually remain a set of opinions and 'voices' some of them no doubt highly relevant). But even these seem to have more of a foreign market than a domestic one. There has taken place an insipid globalisation of most of them, especially of the great dissenters against western civilisation, most of them dealing their mortal blows to the west in seminars they attend in the west: how many of them have fought the west from the real grassroots of their own societies? (In major meetings and rallies of dalits, tribals, backwards and the minorities where I have been—I never miss the chance if I can make it—I have hardly ever seen these 'movement' types, be they environmentalists, feminists, alternative technology types, anti-developmentalists, those holding out for indigenous peoples. The only exceptions have been human rights activists whose main effort is political, or so it seems, as even in their case, many of them are often running away from the heat and bustle of politics.)

In short, the biggest failure of what are known as new social movements lies in their inability to become part of a united political movement.¹² At bottom they are apolitical beings. In a way they are not really leaders of 'movements'. Intellectual movements are not really, in and by themselves, movements of history and because they are not movements of historical change they turn out to be at once anti-intellectual (though they may have started off with intellectual agendas) and anti-political. The result is that, not having really acquired roles in their respective societies through the political process, they are forced to globalise which, in reality, means westernised. In fact, if one examines their life histories, they were westernised long before they took on an anti-western trade, the latter too having been mediaised and marketised (the big-

gest co-opters being the so-called radical press and commercial publishers, and a new splash of pamphlets and journals, much the most of their products being sold in the western market.) With this and with the various 'counter-cultural' conferences and retreats for which we are told there are always 'enough funds', there has basically taken place a marketisation of dissent. Questions like how many copies sold, how many languages translated in, what kind of reviews, citations, excerpts, how was this or that person's 'Keynote Address' received, etc.

VII

Deep Co-optation

The story of co-optation, unfortunately, does not end here. If it did, it would have affected only a few marginal people (for these are in fact very marginal people from the viewpoint of historical change). The much more comprehensive co-optation that is under way reaches wide and deep. It is taking place by giving a long rope to basic tendencies of dissent and diversity. In our age this is happening through the most pernicious of all influences, namely, opening up of a whole vista of marketable channels, a whole new set of symbolic enticements (from dress to music to hair-dos, even pedicures and manicures, the traditional methods being found cumbersome and time-consuming), not to mention the large explosion of fashion boutiques (in Delhi we also have an Institute of Fashion Technology). Then there is the whole 'design' revolution (from graphics to all manner of packaging our exteriors), supposedly led by creative young talent. And the manipulation of gender revolts against conventional society, incorporating all manner of permissiveness by making it too sound 'creative', this being the most clever use by the media of the symbolism of the feminist movement. Even innocent acts like the endless parade of gifts and presents and birthday parties are being made privy to the all-encompassing market. Much of this is at bottom indeed innocent, there being nothing wrong in giving gifts or enjoying someone's birthday. What is at stake is the manner in which these things get on one's nerves and are then used commercially.

The role of the mass media in all of this has been extremely diabolic, being the most potent catalyst of co-opting all forms of dissent into the paradigm of the market. Co-optation through commercialisation of 'unconventional' documentaries and feature films, counter-cultural exhibitions, poster wars, the various expressions of environmental and anti-science fundamentalism through avant-garde journals and 'seminars' and video-cassettes, the guru-cult. And above all, signing up (through a lot of cash) of third

world economists and social and scientists, many of them Marxist and nationalistic, in the cause of a new theology of integration into both a world economy and a 'new world order'. Again at least some of the earnest expressions of the dissenting mood have a lot to commend themselves. It is their becoming so increasingly dependent on the commercial nexus which makes them prone to co-optation by a global monolith that makes them involuntary partners in its cultural onslaught.

The basic design underlying this large-scale penetration through the market is that of suppression of social and cultural diversity and the democratic strivings of diverse peoples towards a truly pluralistic consensus. The massive co-optation across nations is also being called 'consensus'. And there is 'consensus politics' within sharply polarised nations like our own where prime ministers and presidents never tire of using that term.

Perhaps the most fundamental application of the broad critique presented above is to be found in the environment movement—its big boost and deep defeat; its globalisation undercutting its real cultural roots; its creeping professionalisation and marketisation. Here is one movement whose entire rationale lies in recovering both nature and culture, which means moving deeper into community spaces, but which has ended up being more and more globalised, moving up and further up towards ethereal cerebration. This has largely happened due to the increasing commercialisation of environmental activists. Lots of money has been let loose, partly because environment is a big thing in the affluent west, partly because of its being sought after (for seeking legitimacy) by UN bodies and donor agencies, by international NGOs, many of them flush with funds which they do not know how to use, and even by governments and ministries in large parts of the third world. More and more environment-related agreements and commissions are coming up with more and more funds, the latest being the Global Environment Facility (GEF) to be handled by the World Bank. There are projects galore, some of them very good and imaginative but most of them highly routine and humdrum.

Apart from more and more people being professionally enticed, environment has also become a pastime, a leisure-time activity, in fact a commodity. There are a whole lot of young people in this so-called 'movement', landing an easy job in it, living a relatively easy life. The positive thing despite all this is the appeal of environment as a concern to the young in all societies. Otherwise, it is still largely rootless and uninspired. Hence on the one hand there still is great possibility of building on the energies and passions of the younger generation, endowing the

movement with a radical potential, while on the other hand it has been contained and rendered impotent by the commercial ethic. (To some extent this has happened to the feminist movement too.) It is an issue that takes on people, turns them on (including those without any other antennas or roots), appeals to their real inner selves, yet how much of it has been co-opted and crushed, left high and dry, led 'up the garden path'—in this lies its crucial contradiction. (The most recent major event in the environment movement was of course UNCED held at Rio de Janeiro in Brazil, popularly called the 'Global Summit', the ultimate in movement conferencing, in fact the ultimate in all conferencing. It also revealed how well movements have become increasingly dependent on not just 'foreign funding' but on big money houses,¹³ in the long run threatening to hand over the whole movement to the industrial-bureaucratic-technocratic complex.)

VIII

Conclusion

We can now return to the basic issue. Behind all the derailing of various movements is not just pervasive globalisation and its various concomitants such as consumerism and the commercialisation of diverse human endeavours through their marketisation, but underlying it all is a basic crisis of vision, a decline of engagement with Utopias, in a sense an end of 'alternatives' in the real and comprehensive sense of the term. Not just the erosion of alternative centres of power and systems of 'development' and governance (the collapse of both the socialist and the third world 'poles') but, though partly related to that, erosion of ideological perspectives, frameworks of knowledge and modes of consciousness.

We have to ask: Where do all the grassroots discussions and efforts stand? What has become of IFDA and the 'Third System', the *Alternatives* journal (of course it is still coming out, what one means is its continuing impact), the various Green movements, the Friends of the Earth, the Rainforest movement, the Gandhian *Weltanschauung* (Kumarappa and so on), the *Ecologist*, the third world network and so many such other institutional efforts? Basically these have all been part of a liberal response to the nation state on the one hand and the military-industrial complex that had undermined liberalism on the other. There are of course alternatives to the liberal alternative—socialist, third worldist ('collective self-reliance'), 'Gandhian', radical humanist, world federalist—none of which are potent any longer. Most of them still present a distant hope but the hope is getting more and more distant. (The author of

this easily has long been associated with some of these attempts. I still think that human civilisation will go under without an alternative vision and perspective, and am, despite current trends, trying hard to reconstruct one and—frankly—not finding it easy.)

For a long while this decline in the power of the counter-establishment and counter-cultural movements and actors under the steady onslaught of mainstream forces—or the latter's capacity to manipulate the former into its own grand design—had not sufficiently registered itself. Hence the continuing illusion from which activists of various types, their organisations and networks continue to suffer. There have, no doubt, been limited successes, e.g., in restoring 'democracy' in some third world and socialist countries—glasnost and all that—though this has not been mainly a result of what are called the new social movements except for the worldwide human rights struggles which have been distinctly more overtly political than the other movements. Or in successfully reducing nuclear arsenals though even here the initial success has given way to a reassertion of militarism as has been recently pointed out by Bernard Lown, the Nobel Laureate who has been part of the movement of physicians for the prevention of nuclear wars. Lown travelled to Russia 'with high expectations' of an all-round cessation of nuclear testing and discovered that, on the contrary, both Russia and the US were committed to continue 'weapons-research' and to co-operate with each other in the same. As was put to him by academician Yablokov, one of Russia's leading ecologists within the inner circle of Yeltsin's advisers, "the militaries of both countries are conspiring against the people of both countries".¹⁴

In more limited ways there have been successes through resolutions and legislation in the fields of gender rights and environment. And most certainly through raising consciousness on a wide variety of concerns. But what has been dawning on us for some time now is that, despite these gains, how things have been pretty much the same, if anything the hegemonic structures have become more powerful, major sources of challenge to them have been defeated, alternative centres of state power have been pulled down, the condition of the downtrodden has been getting worse, 'socialism' is in disarray, the G-77 and NAM are in a shambles, and so many of the NGOs are being used and even made to vie against each other. Meanwhile a lot of grassroots sectarianism is on the increase, so many individuals are becoming

competitive with each other, and the media eating them all up.

Consciousness is certainly on the increase and men and women—and children too—are willing to put up a fight against dominant structures of iniquity and exploitation. But if these structures continue to remain immune to such pressures from below and are indeed becoming more stubborn given the fact that micro struggles have no support from alternative macro structures (as these alternative centres are not around any more), increased consciousness ends up becoming a source of frustration and cynicism, and in the end a readiness to 'fall in line'.

Such a state of erosion of hope under a regime of hegemonism and homogenisation, marginalising millions of people and major centres of political power, producing growing vacuums in civil society in so many countries cannot be a matter of comfort to any thinking person or system of governance, not even to the ruling class if the latter has to pursue its task in a framework of relative stability and minimum participation of affected interests. Lacking the latter, there is going to be great uncertainty in the years and decades to come. Hegemonism *per se* is no recipe for governance or management. A world in which there is no real challenge is a world deeply adrift. Nothing really can work for long. It is indeed a fundamental condition of a yawning vacuum devouring social spaces—endemic and wholly unexpected upsurges, irrational violence on the people and by the people, from the highest to the lowest, new epidemics of poverty and disease, and general loss of control.

Notes

- 2 There has always been a large output of academic writings asking the US to play its 'leadership' role. This has got a new infusion of late following on the one hand the collapse of the Soviet Union and on the other hand signs of economic decline of the US. See, as just one sample, Zbigniew Brzezinski, 'Order, Disorder and US Leadership', *The Washington Quarterly*, Spring 1992.
- 3 See the first issue of *Alternatives*, Vol I, No 1, 1975 in particular Jimoh Omo-Fadaka, 'The Third Way', but the issue as a whole.
- 4 See the various writings of Samir Amin, in particular *Delinking* (London: Zed Books, 1990), *Maldevelopment in Africa and the Third World* (London: Zed Books, 1990)

and *Empire of Chaos* (New York: Monthly Review Press, 1992).

- 5 On this overall theme but with particular reference to the situation in Africa, see the brilliant analysis by Mahmood Mamdani, 'Africa: Democratic Theory and Democratic Struggles', *Economic and Political Weekly*, October 10, 1992.
- 6 On this whole issue, see my 'Playing the Communal Card', *Newsweek*, the International Edition, December 21, 1992; 'A Moment of Truth', *Hindustan Times*, Delhi, December 23, 1992 and 'Pluralism and Secularism: Lessons of Ayodhya' *Economic and Political Weekly*, December 19-26, 1992.
- 7 There have been many reports on this. See, for instance, 'National Parks: New Haven for Terrorists', *Indian Express*, November 13, 1992.
- 8 These views were expressed by M K Narayanan, former director of Intelligence Bureau. They were reported in *Indian Express*, October 22, 1992.
- 9 It remained largely unrelated to what was going on in the 'east', given the fact that the 'east' had withdrawn into a vast hinterland which was called socialist but which, to my mind, was the biggest let-down of peoples of the world including 'the workers of the world', this total alienation from world history of the Soviet Union and the network of communist parties around the world. Their tragedy can be traced to the process of de-Leninisation of world socialism under Stalin, the biggest culprit but not just him. All those who saw an 'alternative civilisation' in a system that was clearly counter-civilisational were fooling themselves and others. (There was nothing civilisational in Stalin's purge to kill 14,700 Poles!)
- 10 See Madhu Kishwar, 'Why I Do Not Call Myself a Feminist', *Manushi*, No 61, November-December 1990.
- 11 Rajni Kothari, 'NGOs, the State and World Capitalism', first published in *Lokayan Bulletin*, 4(5), October-December 1986, republished in *State against Democracy*, New Delhi: Ajanta Publications, 1988.
- 12 Hence the far greater relevance of organisations like Independent Initiatives, the Federal Front, Bharat Jan Andolan and the human rights bodies like PUCL and PUDR than various alternative development and alternative technology institutions though no doubt the latter do sometimes raise intellectually exciting questions.
- 13 Thus it is interesting that Maurice Strong, the highly committed global environmentalist who was director-general of UNCED had to enlist not just a leading Swiss industrialist as his advisor but also, in consequence, millions of dollars of corporate funding for the environment extravaganza at Rio.
- 14 Bernard Lown has written on this matter in many newspapers and journals; see 'Russia and US Perform a Macabre Nuclear Tango', *Pioneer*, October 13, 1992.

Value Added Tax and Fiscal Federalism

A Possible Model for VAT in a Federal Economy

§ Gurumurthi

Despite its avowed merits, introduction of VAT in a country with a federal structure is fraught with difficulties. This paper discusses this issue with a view to suggesting a possible approach to moving towards VAT in a large federal economy such as India.

The author discusses the various approaches to VAT in relation to other forms of direct and indirect taxes and describes how certain other federal economies have grappled with VAT. The issues associated with the switch-over to VAT in the Indian situation are then analysed and a possible model for VAT in India is proposed.

THE Tax Reforms Committee (TRC) headed by Raja J Chelliah, in its interim report (1991), pointed out that the basic indirect tax at the central level, which should be broadly neutral, should in course of time cover commodities as well as services and that we should move towards a value added tax (VAT) covering services and commodities. In the Committee's view it would be ideal if there were one comprehensive VAT replacing the present system of central excise, the state sales taxes and other indirect taxes except the state levy on alcoholic liquor and the state entertainment tax and the proceeds of the tax could be shared between the centre and the states.¹ With these objectives in view, the Committee has made certain recommendations, both in its interim and final reports, to simplify the excise-cum-MODVAT system, expand its base, increase its income and price elasticity and prepare the ground for a full-fledged VAT system at the central level. The Committee has recommended that the present excise tax system should be gradually transformed into a genuine VAT at the manufacturing level, particularly because the government of India has no alternative at least in the near future but to resort to an extended form of excise taxation. They have recommended extension of the reformed central excise to the wholesale stage, namely, traders who buy from manufacturers and sell to other manufacturers or traders. The Committee has recommended extension of MODVAT to textiles and petroleum products. Understandably, the reaction of trade and industry to these recommendations has been quite positive because adoption of VAT could help eliminate the cascading effects of excise and sales tax regimes. It was widely anticipated that the Central Budget for 1993-94 would incorporate the government's acceptance of these recommendations especially since significant reforms were made in personal income taxation in the 1992-93 budget based on the recommendations of the Tax Reforms Committee. While the union finance minister, as could be seen from his Budget speech for 1993-94, is inclined to accept the broad thrust of the Chelliah Committee's recommendations on both direct and indirect

taxes, his preference seems to be to move towards a value added tax system only in the long-term. This is evident from his statement that "a nationwide value added tax system cannot be introduced overnight and there has to be a broad agreement among the centre and the states on the design of such a system." In order to promote informed discussion and debate, the National Institute of Public Finance and Policy (NIPFP) has been requested to prepare the design of a possible VAT.² This kind of response is but natural: despite all its avowed merits, introduction of VAT in a country with a federal structure is fraught with several difficulties. This paper examines these issues in some detail with a view to suggest a possible approach to move towards VAT in a large federal economy like India, the US and Canada though its focus is on the Indian setting. The paper is divided into three sections. The first section discusses various approaches to VAT in relation to other forms of direct and indirect taxes like corporate income tax and excise duty respectively. The second section describes how certain other federal economies have grappled with VAT in their respective countries. The third and final section analyses issues associated with the switch-over to VAT in the Indian situation and then proceeds to propose a possible model for VAT in India which could possibly be considered for other federal economies like the US and Canada.

I

VAT in Relation to Certain Direct and Indirect Taxes

It is true that the emergence of VAT as a highly buoyant and elastic source of revenue in a period of just 30 years is something unprecedented in the history of taxation. VAT has been rightly described as the *Mata Hari* of the tax world. To quote Alan Tait, 'the history of taxation reveals no other tax that has swept the world in some 30 years, from theory to practice, and has carried along with it academics who were once dismissive and countries that once rejected it'.³ VAT has been adopted by as many as 70 countries

in the world either on their own or on the advice of the IMF and it has been universally acknowledged as a national sales tax which is evasion proof. The *Financial Times* (London) was not exaggerating the growing importance of VAT but was only stating a ground reality when, in its centennial review, it observed, 'The economic and technological changes of the second half of the century...have made VAT the quintessential modern tax'. Further it anticipated that if the trend towards higher VAT rates and fewer exemptions continued, 'the VAT would supplant the income tax as the most important single source of revenue for several governments by the end of the century'.⁴

(i) What is VAT?

VAT is a tax levied on the value added in each stage of the production and distribution process and can be aptly defined as the ultimate form of consumption taxation. In fact VAT is an alternative way of collecting a tax on consumption expenditure.⁵ VAT can be looked upon as a multi-stage tax which produces a yield equivalent to that of a single-stage retail sales tax. In other words, VAT is a tax which is levied in lieu of the cascade-type turnover sales tax. The alleged preference to VAT over sales tax arises from the fact that it could help dispense with the cascading effects of the turnover sales tax system which suffers from the snowballing incidence of tax over tax as the taxed product passes from the manufacturer to the wholesaler and from the wholesaler to the retailer. Most of the countries which have opted for VAT have only levied it in lieu of either cascading turnover sales taxes or excises. These include Argentina, Austria, Belgium, Brazil, Chile, Denmark, Federal Republic of Germany, Ireland, Israel, Italy, Korea, Luxembourg, Mexico, Netherlands, Norway, South Africa, Spain, Sweden, Taiwan and United Kingdom.

(ii) VAT as Substitute for Corporation Tax

VAT has also been viewed as a possible replacement for the corporate income tax or what we call in India the corporation tax. The arguments in favour of this

system include claims that border tax adjustments (export rebate and compensating import duties) under the General Agreement on Tariffs and Trade (GATT) are allowed for the VAT, but not for the corporate income tax, and the assumption that corporate savings and investment would witness a substantial increase if VAT were to replace the corporate income tax. However, as pointed out by McLure, there was a "glaring contrast between the neutrality of the ideal VAT and the non-neutrality of the corporate income tax which discriminates between the incorporated and unincorporated sectors of the economy, against equity financing and the use of capital in the incorporated sector, and between industries".⁶ In spite of its alleged advantages, McLure held that while the elimination of the corporate income tax might create "enormous tax haven in retained earnings",⁷ the tax haven itself might distort economic decisions in important new ways. Secondly, it is virtually certain that any tax on value added would contain exemptions for those items which are administratively difficult to tax and it might well also contain exemptions to reduce the regressivity of the value added tax. For these reasons McLure wondered whether the gain in economic efficiency resulting from the tax substitution would be great, a matter which had to be probed further. Besides, McLure was against substituting a VAT for the corporate income tax due to the regressivity of the VAT: like any general sales tax, the VAT would take a decreasing share of income as income rises and thus would impose a proportionately heavier burden on low income families than on high income families. In McLure's perception, simple substitution of a VAT for the corporate income tax without either taxation of capital gains or low income relief would be completely unacceptable on equity grounds. Around this time (1972) the Nixon administration in the US was toying with the idea of a federal tax on value added, the revenue from which would be used to relieve the burden of the then existing local property taxes used to finance public education. Considering the several faults associated with local property taxation involving several court cases, McLure felt that Nixon's proposal would be preferable to the alternative of either forgoing badly needed public services or continued reliance on the property tax. While McLure viewed imposition of a federal VAT to replace lost property tax revenues as distinctly inferior to replacing these revenues through reform of the income tax system, he felt that the question whether any future American sales tax at the national level should take the form of a VAT or a retail sales tax deserved far more explicit consideration than it had thus far received.

VAT as an alternative to the Corporation Tax has also been examined in the Indian context by Kiran Barman and Usha Bisonoi.⁹ VAT has been looked upon as one combining the advantages of being a general tax, without the disadvantages of extended input taxation. As it "does not promote vertical integration so long as there are no exemptions to important sectors in the middle of the chain of production, it is helpful for the efficient and fast growing companies". As such, the VAT is considered conducive to efficiency since a firm is not exempted from its tax liability even if it falls into a loss since it pays tax not on its profits but on the value produced, it tries to improve its performance and reduce the cost of production. Thus "it would also bring in an increase in net capital formation by releasing investable resources to the more efficient sectors of the economy". It is common knowledge that under the existing structure of corporate taxation, corporation tax is payable only by those companies which make profits and that companies which make losses are exempted from tax in spite of the fact that "they use the resources of the nation in the same way in which the profit making firms do". In the case of VAT, however, companies or corporations will try to "economise on their pay roll (wages and salaries) and also in the consumption of raw materials. Incentive to invest will increase in the case of efficient corporations because their capacity to save will increase on account of lower tax rates under the VAT." For replacing the corporation tax by VAT, the calculations made by Saravane¹⁰ for 1969-70 showed that the latter could have been at 13 per cent while the effective rate for the former was 46 per cent. "Thus tax evasion is also reduced mainly because the tax is divided into parts with the result that the incentive to reduce the tax by any one firm is reduced and it is in the interest of a firm to account for the taxes paid by the earlier firms through which the inputs have come; otherwise the firms would have to pay the tax itself. If any firm, therefore, understates its output, it would be caught by the disclosures of the firms buying inputs from this firm. This type of cross-auditing enables the authorities to plug the leakages." Saravane has emphasised that VAT in lieu of corporation tax or as a supplement to the corporate profit tax was relatively more acceptable. In substituting for the existing corporation profit tax, there would be no additional administrative cost because the number of companies registered as tax payers would remain the same: "The introduction of TVA (Tax on Value Added) as a supplement to corporate profit tax can be relatively less cumbersome, and it would turn out to be a tax with high yielding potential as a small change in the rate can

be expected to yield large revenue to the exchequer. This aspect gains in importance in view of the need for mobilisation of additional resources for financing plans."¹¹

However, adoption of VAT in place of corporation tax would pose a difficult task in a developing economy. In the first place, introduction of VAT would automatically bring within the tax-net those companies which have zero or negative pre-tax profits. A study made by the Reserve Bank of India in respect of the finances of 1,501 medium and large public limited companies showed that during 1970-71, out of 1,501 public limited companies, 365 or nearly one-fourth made negative pre-tax profits and out of these 365 companies, there were hardly a few which added no value during the course of their operations. Under VAT system, however, even these companies would be liable to pay something which could prove to be a great burden for them. According to a school of thought the policy of avoiding taxation of investment goods under the VAT could be advantageous for developed countries but would not be a good policy option for a developing economy like India where there is need for encouraging labour-intensive production techniques. Since the VAT is like a turnover tax or sales tax, it has been apprehended that it may have an adverse impact on the price level at least in the short run because the VAT would be shifted to consumers in the form of higher prices and in the process fuel inflationary pressures in the economy. Moreover VAT requires a complete change "not only in the existing structure of corporation tax but also in the approach to the Indian economic development". It has been held that if the government tries to adopt a single rate VAT, workers, shareholders and landlords will have to pay the same proportion of their wages, dividends, rent (provided there is complete forward shifting of the tax). Barman and Bisonoi finally conclude that there is no need for substituting the existing corporation tax by the VAT while there is a need to simplify the corporation tax structure and minimise *ad hoc* changes therein.¹² Besides making the VAT regressive, there are practical problems in bringing within the ambit of VAT a large number of small businessmen who maintain no proper records. The fact that the scheme of presumptive income tax introduced in the last year's budget (1992-93) for small traders and businessmen in India has been practically a non-starter confirms this position.

(iii) VAT and Excise Duties

That VAT is levied on a price which is inclusive of customs and excise duties is a fundamental principle in the theory of

the value added tax system. While VAT could be levied as well excluding customs and excise duties, it is administratively more convenient to levy the VAT on the all-inclusive base and then make adjustments for the excise duties, if necessary, inasmuch as the customs and excise duties are levied relatively early in the production process as rightly pointed out by Tait. On the other hand, levy of excise duties on a base including VAT would be administratively cumbersome. Whenever a VAT is started the excise duty rates are adjusted in such a way that the retail price of excisable commodities including VAT and excise duties does not change. Even though India introduced a modified version of VAT called MODVAT in 1985-86, it needs to be mentioned that MODVAT is not a VAT in the true sense of its term. To quote Tait, "India has introduced a MODVAT which is not a VAT but a federal excise to get around the powerful interests of the states and their state sales taxes."¹¹ Despite the established position that a value added tax is levied in replacement of the cascading turnover sales tax which is administered by states, VAT has been generally prescribed as a federally levied tax, presumably with a view to ensure uniformity in commodity taxation throughout the country. According to this school, introduction of VAT in a federal economy would invariably require the states to surrender their powers of sales taxation to the federal government. Later in this paper we have questioned the logic behind this popular international approach to VAT. As sales tax is the single largest source of revenue to almost all the states in India, any move to replace it by a central VAT could have serious political repercussions. The Tax Reforms Committee, fully seized of this predicament, has made a guarded recommendation that administratively it would be more convenient if VAT at the wholesale stage is collected by the sales tax department of the states concerned in close co-operation with the officers of the central excise department and the amount of VAT collected could be allowed to be retained by the state where it is collected.

The committee has further recommended that the central VAT can be levied with the co-operation of the states which can be persuaded to accept this levy, because their own right to levy the sales tax on goods will in no way be circumscribed and at the same time they will get the entire revenue from VAT at the wholesale stage. As regards sales tax, the committee is of the view that this tax could be converted into a form of state VAT within the manufacturing sector and there would be no need for levying sales tax at more than two rates, since the distributional and other non-revenue objective could be left to be performed by the central taxes which

would apply uniformly throughout the country. With these recommendations, the committee has tried to protect the interests of the states. These measures alone, in our view, would not be sufficient for a satisfactory switch-over to a VAT in the context of fiscal federalism in India. Before we take up this question for a detailed analysis, it would be useful if we look at the experience of other federations in this respect.

II

Approach towards VAT in Other Federal Economies

(i) Federal Republic of Germany

In the Federal Republic of Germany, VAT is handled by the states who collect the tax at uniform rates fixed by the federal government and the total VAT revenue is shared between the federal government and the states roughly in the ratio of 70:30 with some special provisions for a larger share for economically weaker states. The sharing between the federal government and the states is reviewed periodically and refixed through prolonged and fairly difficult negotiations. Hailing this system as 'the simplest practical approach', Tait has recommended this as the 'preferred option' for VAT in a federal structure.¹² We shall have an occasion to examine this view in the final section of this paper.

(ii) Brazil

Prior to 1988, the Brazilian VAT system was similar to the German system in the sense that the federal government determined the base and rates. However, the VAT base in Brazil was much smaller as items like agricultural inputs, minerals, fuels, fresh food and several services had been excluded. Brazil levies 11 per cent tax on inter-state sales and 17 per cent on intra-state sales. Further, while the federal government levies the VAT on manufacturers' inter-state trade, the states themselves levy the intra-state VAT up to the retail sales. The lower rate of tax for out-of-state sales, fixed mainly to satisfy the consumer states, leads to certain administrative complications and consequently to tax evasion. This system, however, is not administratively feasible since the end-user is generally tempted to buy out of state due to the lower tax rate of 11 per cent rather than within the state at a tax rate of 17 per cent.¹³ Moreover, a firm purchasing any of the several tax-exempt inputs will have less credit to offset against its VAT liability on sales than it should and the VAT on its value added will be much higher. While this could be justified to some extent, there is a constant conflict between producer and consumer states. Modifications to the Brazilian con-

stitution introduced in 1988 have empowered the states to set the state VAT rates themselves and graduate them according to their individual assessment of the importance of goods and services. Under the new system, the states are to get 75 per cent of the revenue from the state VAT and the balance 25 per cent would go to the municipalities. We shall have an opportunity to refer to the Brazilian model in the third section of this paper.

(iii) Mexico

There are 31 states and a federal district in Mexico and it is the states who are in charge of collection and administration of VAT in Mexico and remit the entire revenue to the federal government and get in return 19 per cent of the collections. Even though the model is similar to that of the Federal Republic of Germany, disproportionately lower share in VAT revenue to the states is a dampening factor for the efficiency in collection. The Mexican revenue-sharing formula is based on economic conditions in different states. The redistribution formula does carry a weight for the VAT collection efforts of the states, effort being defined as the ratio of change in the particular state to the total change in collection. In practice, the reward hardly works out to one per cent of the collections. Introduction of VAT in Mexico has also left the states rather unenthusiastic about sales tax collections purely for the benefit of the federal government. Further the federal district, despite accounting for 50 per cent of the taxpayers, collects only 20 per cent of the revenue. The collection efficiency also varies substantially from state to state but these problems are more institutional in character and not in any way attributable to the structure or administration of VAT.

(iv) Argentina

Argentina has chosen a federal VAT administered by the federal government under which the tax-revenue is shared with the states, using a revenue sharing formula. The Argentine VAT system suffers from a major flaw in that the powers enjoyed by the states to grant exemptions under the federal VAT lead to erosion of the federal tax base.

(v) Australia

The Australian wholesale tax system is considered to be 'complex, inequitable and inefficient'.¹⁴ While Australia for sometime toyed with introduction of either a retail sales tax or a VAT in order to mobilise more revenue and reduce personal marginal income tax rates, it finally gave up both options and decided to extend the existing wholesale tax and levy a separate tax on services. The alleged

high administrative and compliance costs associated with VAT, relatively larger scope for tax evasion compared to retail sales tax, overstated claims for tax credit as a potential loophole and concerns expressed by trade unions regarding regressivity of VAT have been cited as some of the reasons for Australia deciding against VAT. However, according to some others, the real reason against introduction of VAT was the far greater lead time required, of the order of additional 12 months, for getting approval of parliament as compared to retail sales tax as it would be practically difficult to get any law passed through parliament which has a term of only three years in Australia.¹⁷

(vi) Canada

Canada, like Australia, relies on an unsatisfactory manufacturers' tax which is generally believed to involve distorting cascaded tax elements in exports. Again fiscal federalism has been the main stumbling block in switch over to a VAT in Canada: all except one among the 11 provinces in Canada have substantial independent retail sales tax which they are reluctant to give up. In 1987, the Canadian authorities published a proposal for sales tax reform suggesting three possible sales taxes. The first and most preferred option was a 'national sales tax' which represents a direct subtractive accounts based VAT (the business transfer tax) based on company accounts because its effects on prices would not be explicit and a retail sales tax could still be levied in addition to it. Under this system, while the tax would be at a single federal rate uniform throughout the country, the provinces would have some flexibility to levy their own local variants on the rate. Thus if the federal rate is 8 per cent, Newfoundland could supplement this with a provincial rate of 2 per cent while British Columbia could levy 3 per cent. Provinces which decide to have no truck with the sales tax would be taxed at a zero rate. The tax would be federally administered based on accounts by the Income Tax department. The Canadian authorities claim that the national sales tax system would be revenue neutral: the final tax collected on a product would be the same as it would be under a combined retail sales tax in the province in which the goods are consumed. Taxpayers, however, as Tait points out, would face a tax return with 11 columns, 10 for other provinces and 1 for exports for both inputs and outputs which would make the system administratively quite cumbersome. If only the co-operation of provinces could be secured, the federal authorities are confident of making a success of the system by going ahead with either a federally administered direct-subtractive VAT or a straightforward VAT.¹⁸ The major difference between the

two alternatives is that the direct-accounts-based tax would necessarily imply a uniform base and a single rate VAT, whereas the second option could involve exemptions and multiple rates. The national sales tax involves both federal and provincial agreement on the base but allows different rates, while the federal-only goods and services VAT is simple to operate, but cannot accommodate exemptions and multiple rates. The difficulty of reaching a satisfactory agreement with the provinces, apart from the usual apprehensions regarding regressivity and price effects, has probably been the major factor inhibiting Canada from adoption of the VAT.¹⁹

(vii) United States

United States, with a federal structure, provides an important case study for consideration of VAT for a federal economy in general and India in particular. Even though the US has been interested in VAT for the last 30 years, introduction of VAT in the US does not seem to be anywhere near the horizon. The main reason for this phenomenon is that the US does not merely appear to be satisfied with its existing states' retail sales taxes but the possibility of the federal government usurping the powers of the states' powers of sales taxation has been keeping the US away from VAT at a respectable distance—a factor which should not escape attention while contemplating a design for VAT system in India. In the late 70s, Congressman Ullman came up with a proposal for VAT to replace part of the payroll tax, personal income tax and corporate income tax for \$52 billion, \$50 billion and \$28 billion respectively. This proposal was subject to a great deal of public debate even after 1980 when Ullman lost his election. In 1981, Charles McLure proposed that if there were to be a division in favour of a federal sales tax, it might be preferable to go in for a federal retail sales tax rather than to experiment with "a new and unfamiliar form of sales tax, the VAT".²⁰ Charles Galvin made a fruitless attempt in 1983 to convince the public that a 10 per cent VAT on all purchases would not only finance the defence budget but help to balance the budget as well.²¹ In 1984 Richard Lindholm proposed that the corporate and personal income taxes as well as the estate taxes could be replaced by a VAT at 15 per cent and a net worth tax at 2 per cent under which the VAT would become the major source of current revenues while the role of the net worth tax would be to inject better equity into the tax structure than the present direct taxes.²² In 1985, Senator Roth opted for a Business Transfer Tax (BTT) using the direct-subtractive method under which all traders with a turnover exceeding \$10 million, except retailers, were to sub-

tract inputs from outputs leaving value added, namely, wages and profits, to be taxed.²³ This VAT would be available not only for being rebated on exports but also would be eligible for a credit against the social security tax. However, this proposal suffered from a serious flaw in the sense that it would metamorphose an indirect tax into a direct tax, leading to violation of export rebate regulations under the GATT.

We would now like to look at various possible options proposed for a US VAT. One such option would be to continue the existing state retail sales taxes parallel to a federal retail sales tax. The rates of sales tax levied by states in the US are around 5 to 7 per cent. For a federal retail sales tax system to be viable, the federal rate has to be a minimum of 5 per cent without which it may not be possible to cover the costs of establishment and the collection machinery. In that event the combined federal and state retail sales taxes would be 10 per cent or more which would prove unduly excessive. Besides traders would face increased handling costs "unless exemptions, tax periods, returns, audits and penalties are made identical".²⁴ If they were to be made uniform then one could question the need for two separate taxes. The second option is to continue the existing state retail sales tax in combination with a federal VAT. This would again involve traders having to file two separate returns "taxing different goods and services with differing exemptions".²⁵ Some goods may be subject to state retail sales taxes and some subject to federal tax and some both. Further in the US, by a court ruling, mail order traders are exempt from any obligation to collect taxes from out of state purchases unless the trader has a business presence in that state, which gives the mail order trading houses a competitive advantage over others.²⁶ The combination of state retail sales tax and a federal VAT may not only be pragmatic as it would in all likelihood be opposed by commercial interests but could also lead to certain amount of cascading. The third option is to combine state VATs with a federal retail sales tax. This possibility too has been considered impractical on two grounds, viz, the states in the US would loath to migrate from their present state retail sales tax towards a VAT system and different states' VATs with different bases and different rates could invariably lead to several administrative bottlenecks in the inter state sale transactions. The fourth option is a combination of federal and state VATs. It has been alleged that this option could also run into difficulties if different states decide to levy different rates of VAT. The VAT content of the commodities subject to inter-state and intra-state sales could be different depending on the state in which the goods originated, viz, tax credit on each invoice

could be quite different for identical goods if they had originated in different states. As observed by Tait, it may not be possible for traders to apply the joint federal and state VAT rate to inputs for getting credit against VAT liability on sales, as their state VAT rate could differ from the VAT rate of the exporting state: "there is no way out of this dilemma unless full harmonisation of rates and coverage is obtained".²⁷

After examining the pros and cons of various such alternatives, Tait concludes that in a federal structure the preferred option to implement a VAT system would be to adopt a form of revenue-sharing on the lines of the one prevailing in the Federal Republic of Germany.²⁸ This would involve the states surrendering their sales tax powers to the federal government and in return settle for a share in the VAT revenue. While this system might work smoothly in the Federal Republic of Germany, it is doubtful if the same could work in a large federal system like the US, Canada or India with states giving up their sovereign powers of sales taxation not to speak of difficulties associated with working out a mutually acceptable revenue-sharing formula. Even in Federal Republic of Germany, the negotiations between the federal government and the states (Länder) in the matter of revenue-sharing have proved prolonged, difficult and sometimes even painful. Further the states would have no latitude to use different rates or different bases. McLure felt that this method did not appear to be "an appropriate or politically viable solution to the issues of inter-governmental relations".²⁹ The second-best solution, according to Tait, is to use federal and state VATs on the same base, with the same definition and treatment of goods and services where the traders would register only once, complete the same forms, and make a single return.³⁰ This again would require surrendering the powers of sales tax by the states to the federal government and therefore may not be practical. If different rates were allowed, it would result in states with low tax rates finding their merchants importing inputs from high-tax states offsetting their input liability and effectively reducing their VAT liability and the state revenue. Tait has suggested switch-over to a direct subtractive method of calculating VAT as a possible solution to this problem. Under this system, "each trader in each state would calculate his actual value added for his accounts, and the federal and state VATs could be levied at whatever rates were wanted".³¹ For this method to work, it is necessary that the VAT should be calculated by the income tax authorities from the same accounts as the corporate income tax. This procedure, however, will change the character of VAT from a sales tax (indirect tax) to a direct

tax on business and would amount to contravening the GATT regulations. Further, as McLure observes "Imports would be diverted through the states with the lowest TVA (tax on value added) rates and exports through the states with the highest rates".³²

Nevertheless VAT continues to engage the attention in the US as a means of generating an increase in net revenue and reduce government borrowing:

Interest in the... VAT... will increase as the Gramm-Rudman-Hollings targets for deficit reduction become increasingly difficult to achieve through budget cuts.³³

Alan Tait sums up opposition to a US VAT as follows:

(i) Liberals oppose VAT on grounds of regressivity.

(ii) Conservatives fear the VAT as a 'money machine'.

(iii) Both liberals and conservatives worry that a VAT would be inflationary.

(iv) State and local officials are concerned about a VAT's intrusion into their traditional preserve for raising revenue.

(v) Both federal and state officials fear that the VAT would be an administrative nightmare.³⁴

The interest in VAT has gathered more momentum in the recent years in the US mainly due to the fact that it does hold out potential for augmenting the federal revenue. Introduction of VAT in the US could possibly help financing social security, encourage savings and pave the way for restructuring of the direct taxes. It has been estimated that a general 5 per cent VAT could yield US \$70 billion in 1988 and a VAT exempting food, housing and medical care could yield US \$40 billion. Nevertheless, introduction of VAT in US is strewn with hurdles mainly impinging on fiscal federalism as the states would not like to give up their sovereign powers of sales taxation. President Clinton is reported to have recently stated that he has not been convinced that a nationwide VAT would be necessary: "I have never been convinced that we've had to go to a VAT tax; we have some significant reservations about it". Let us now proceed to examine the possibility of introducing a VAT in India which could also provide a suitable model for a US or Canadian VAT.

III

VAT in the Context of Indian Federalism

The above discussion was mainly in the context of a possible VAT for the US but several difficulties associated with the various options broadly hold good for a country like India or even Canada with a federal structure and similar powers of taxation enjoyed by the states. In fact the

problem of introducing VAT in India would become far more difficult since sales tax happens to be the only elastic source of revenue available to the states.

As mentioned earlier, the Tax Reforms Committee (TRC) has observed that it would be ideal if one comprehensive VAT could replace the present system of central excise, states' sales taxes and other indirect taxes except the state levy on alcoholic liquor and the state entertainment tax. However, it is the translation of this theory into practice in the context of fiscal federalism as it operates in India which is an extremely difficult and delicate task. In the field of commodity taxation, the Constitution of India has assigned the powers of customs and excise taxation to the central government with the exception of excise on alcoholic liquor while the states have been given the powers of sales taxation. Before examining the question of introducing a VAT in India, it is not merely useful but quite necessary to understand and appreciate the nature and import of these two levies. There is no essential difference between the two from the angle of incidence on the consumer but it has to be recognised that the two taxes are not identical or interchangeable and there are some basic differences between the two levies. In the first place, an excise is a levy at the production point whereas a sales tax is levied on a commodity at one or more points of sale or purchase between the stages of production and final consumption. On the other hand, there could be only one stage at which any particular commodity completes its production process and therefore the incidence of an excise duty should theoretically be only at one point. Since, however, the component parts of the commodity could have themselves been the subject to excise duty, an excise duty on the final product could in practice involve a multiple duty on the components unless the duty is based on the value added components only. It was with a view to eliminate cascading in the incidence of excise duty that government of India introduced MODVAT—a subject to which we referred to briefly earlier. We have dealt with MODVAT in detail later in this section. In the case of sales, the same commodity might pass through various stages of sales, making itself susceptible to sales tax at more than one point, depending upon the system of the sales tax levy. While an excise levy ends at the production point and does not take into account, even indirectly, elements of cost that are incurred after the production stage, e.g., freight, insurance, distribution charges and the like, a sales tax is on a much more comprehensive concept of cost and touches not merely the cost at the production point, but also subsequent elements including profits and the excise duty itself.

This aspect was also touched upon in the earlier section on VAT and excise duties. It should also be recognised that the excise duty in India, being a union levy, does not differentiate between one region and another and is uniform throughout the country while the sales tax system and the rates of sales tax differ from state to state. Again, while most of the excise duties are specific, sales taxes are *ad valorem* levies with the result that during a period of high inflation, the sales tax yield automatically goes up, other things remaining the same. In certain countries where excise duties are exclusively reserved for the centre, the levy of sales tax by states has been held to be unconstitutional on the ground that they are substantially the same as excise duties. Similarly the question has also been raised whether the *ad valorem* excise duties are not really sales taxes. As pointed out by the Fourth Finance Commission, the point that needs to be noted is that despite all these similarities both taxes have "distinguishing features" and both have "a positive place in a comprehensive system of taxation and are expressly mentioned in our Constitution".³⁵

During the last 45 years, union excise duties and state sales taxes have expanded substantially exhibiting phenomenal growth and buoyancy. In 1950-51, the aggregate yield from the two levies was roughly Rs 128 crore, representing 1.3 per cent of the national income during that year. By 1963-64, this level went up to Rs 998 crore, accounting for 5.8 per cent of the national income. By 1989-90, it rose to Rs 37,466 crore accounting for 10.57 per cent of national income. Among the tax receipts of union government, the excise receipts occupy the most dominant position and account for 43 per cent of the total tax receipts of the centre as compared to 16.3 per cent during 1950-51. Taking all the states together, the yield from state sales taxes in 1950-51 was around Rs 60 crore, accounting for 27.5 per cent of the aggregate state taxes. During 1991-92, the sales tax revenue represented around 54 per cent of the total yield from state taxes. In the structure of the state finances, the position of sales taxes is broadly similar to union excise duties in the case of the union finances, though the relative importance of the sales tax differs from state to state. Sales tax is the single largest source of revenue to almost every state government accounting for about 60 to 70 per cent of the states' own tax revenue in the case of several states as could be seen from the table. That the share of sales taxes in the total tax-revenue of the centre and the states has increased from 12 per cent in 1960-61 to about 21 per cent at present bears eloquent testimony to the growing importance of this tax in India. As a percentage

of the total tax-revenue of the states including their share in central taxes, the share of sales tax has increased from 26 per cent in 1960-61 to around 38.5 per cent in 1989-90. Most of the states levy tax on raw materials as well as other inputs. Sequel to the amendment to the Constitution in 1982, sales tax has become leviable on work-contracts, hire-purchases and leases though this has been challenged in the courts of law.³⁶ Among the various incentives offered by state governments to encourage growth of industries, sales tax concessions either as deferrals or concessional rates are quite significant. Such concessional rates of sales tax or exemptions are available for small scale and tiny industries in nine states and medium and large industries in twelve states. In addition to the general sales tax, central sales tax is collected on all inter-state transactions.

The Fourth Finance Commission, which was called upon to measure the combined incidence of these two taxes and the effect of the incidence on production, consumption or export of the commodities taxed, examined the possibility of determining the proportion that the combined money burden of union excise duties and sales taxes bore to the sale price of each taxed commodity.³⁷ The commission found that even this limited study bristled with several difficulties: while excise duties were mostly in terms of specific rates, sales taxes, being *ad valorem* levies, created the problem of converting the excise rates to *ad valorem* rates. "For the same commodity, excise rates differed for different categories, whereas in the case of sales tax there was no such differentiation in general." Further there was so

much diversity in the system of sales tax-levy from one state to another that the question of bringing them to a uniform scale was a job in itself.

The commission noted that wherever the sales tax rates were on the basis of a single-point levy, the problem was simple while where these rates were in terms of multi-point, double-point or a combination of various systems, the conversion of these levies into single-point rates created several problems. The commission also observed that the total incidence of the excise duty and sales taxes on manufactured commodities might also have to include the incidence of excise duty and sales tax on their components: the determination of this multiple incidence was not always easy. The commission found that the states were not in a position to furnish data regarding the total value of sales and total sales tax collections under each item. Had this data been made available the problem of converting other levies into single-point levies might have been far easier, the commission felt. In view of these reasons the commission found it difficult to pursue even the limited study of the proportion that the money burden bore to the price in each excisable commodity.

Even if the commission were able to determine the proportion that the money burden of the two taxes bore to the total price of a commodity, it might not have taken them far in relation to the main task before them since the commission had to assess the effect that money burden had on production, consumption or export of a commodity while the factor of taxation had a bearing on the price of a commodity and in the commission's view, this was

TABLE

(Rupees in crore)

States	States' Own Tax Revenue	Sales Tax	Col (3) as a Percentage of Col (2)
(1)	(2)	(3)	(4)
1 Andhra Pradesh	2986	1628	54.5
2 Bihar	1336	940	70.4
3 Goa	93	64	68.8
4 Gujarat	2687	1642	61.1
5 Haryana	1278	554	43.3
6 Karnataka	2880	1605	55.7
7 Kerala	1642	995	60.6
8 Madhya Pradesh	2050	943	46.0
9 Maharashtra	5491	3039	55.3
10 Orissa	1306	470	36.0
11 Punjab	1524	645	42.3
12 Rajasthan	1384	750	54.2
13 Tamil Nadu	3340	2286	68.4
14 Uttar Pradesh	3209	1582	49.3
15 West Bengal	2679	1320	49.3
15 States (A)	33885	18463	54.5
25 States (B)	34920	18907	54.14

no more than "one out of a host of important factors". According to the commission, unless they were in a position to undertake for each excisable item detailed cost-analysis studies of the type that were usually undertaken by the Tariff Commission, they would not be able to determine whether its production, consumption or export was being hampered on account of the excessive burden of either these two taxes or some other factors. In order to recommend any ceilings on sales taxes the commission had not only to determine the combined incidence of the two taxes but also the separate incidence of each. The commission observed that even if data were available it would be "analytically impossible to be precise about the effect of one or two variables when the number of variables was so large" with the result the commission found themselves unable to undertake these detailed studies.

Certain states had represented before the commission that in judging the reasonableness of the restraint that a tax imposed on production and consumption, one had to keep several factors in mind: in the case of certain commodities it might well be the objective of the government policy to limit the growth of consumption and production and in the case of such commodities no corrective action was called for. If the combined incidence of the two levies went to inhibit consumption of essential consumer items to the detriment of the living standards, corrective action had to be taken. Similarly, if taxation had an inhibiting effect on the production of intermediate and capital goods, it was definitely a matter for concern. Apart from the quantum of the tax there was also the manner of imposition and collection. If the taxes were levied or collected in a manner which would stand in the way of the efficient organisation and development of industry—if it would prevent the diversification or location of industry on rational lines or the organisation of procurement of raw materials or distribution of products in the most economic manner—there was a case for overhaul of the taxation scheme. In the then prevailing situation this question was also important from the point of view of promotion of exports. Most states had assured the commission that so far as this aspect was concerned, they themselves were very conscious of the need for exports and were devising suitable adjustments in sales tax levies with a view to reducing any disincentive effect that the sales taxes might have on exports.

With these observations, the Fourth Finance Commission proceeded to examine the manner in which better co-ordination between union excise duties and sales taxes levied by the states could be brought about. All the states had conceded the point that "unrestricted and un-coordi-

nated taxation might affect production as well as exports and that there was need for co-ordination between the tax policies of the union and the states". As to whether this co-ordination could be achieved through a system of ceilings on sales tax rates on certain commodities, combined with a financial sanction in the form of the possibility of a cut in the state's share out of union excise duties in case a state exceeded the ceilings, was a matter on which the states had expressed strong views.

The states drew the pointed attention of the commission to the fact that "sales tax was the only elastic source of revenue left with them and any attempt to place restrictions on their freedom in this field of taxation would affect their capacity to raise resources and would thus handicap them in relation to the requirements of the Fourth Five-year Plan. Sales tax was essentially of regional application and was almost the only major instrument left with them for shaping their economic and industrial policy". The commission noted that the states had been using sales tax along with power tariffs for giving incentive to industry and trade and any dilution of their power in this respect would mean setback to their efforts for encouraging the growth of industry and trade within their respective areas. It was felt that any ceiling on sales tax rates determined by the Finance Commission for a period of five years would remove the element of flexibility from the taxation system of the states and would "cut at the very root of the principle of states' autonomy, thereby, weakening the federal structure". It had also been contended that the "mechanism of adjustments in the share out of an item of devolution, depending on the observance of specified conditions by the states, might well be inconsistent with the constitutional provisions regarding sharing of taxes".

While union excise duties were not compulsorily divisible, it was argued that once a tax was made divisible according to a certain formula, it had acquired all the elements of a devolution item and any conditions imposed on the sharing scheme might not be legally valid. It had also been pointed out that the "linking of the shares of excise duties with the rates of sales taxes might run counter to the principles that a Finance Commission might decide for distributing excise duties". Certain states had expressed the view that between sales taxes and union excise duties it was the latter category of levies which in the case of the most of the commodities imposed a higher money burden. According to them, if at all any restrictions were necessary, the proper course would be to put ceilings on excise duties. The Finance Commission noted that out of the 68 items which were then figuring on the ex-

cise list, the problem of co-ordination between excises and sales taxes did not arise in 19 items, accounting for 45 per cent of the aggregate excise revenue. Eight of these items, namely, cotton fabrics, silk fabrics, rayon or artificial silk fabrics, woollen fabrics, sugar, tobacco (un-manufactured), cigars and cigarettes had been exempt from the levy of sales tax under the scheme of additional excise duties in lieu of sales tax. In respect of four other items common to excise and sales tax lists, namely, cotton yarn, jute, steel ingots and pig iron, there was already a ceiling of 2 per cent on sales tax rates under the Central Sales Tax Act, 1956. Then there were certain other items known as 'special goods' in respect of which all the states were then uniformly levying a sales tax at the rate of 10 per cent. In fact the suggestion for this uniform levy had been given by the union government and the states had accepted it. There were in all 15 items in this category out of which seven items, namely, motor vehicles, tyres and tubes, cycles and parts thereof, refrigerators and air-conditioners, wireless receiving sets, gramophones and certain iron and steel products were then in the excise list. In the case of these items, no upward revision had been envisaged in the near future; at any rate, since the current rates had been fixed after consultation with the centre, in future also the revision would be after mutual consultation. Thus out of 68 commodities it was in the case of 49 commodities that the question of co-ordination between excise and sales tax arose. The states' view generally was that if on a proper study of the facts, it was found that in the case of a few selected items out of these 49, a co-ordinated tax policy was called for that could certainly be effected. According to them, however, the proper course, for such co-ordination was 'not the mechanism of a financial sanction in the form of reduction in the share out of a devolution item but a periodic exchange of views between the union and the state governments on problems of taxation and related subjects with a view to evolving co-ordinated lines of action.

It had been pointed out to the commission that there was no need to resort to a scheme of linking the share out of union excise duties with sales tax rates as the then existing powers with the union government under Article 286(3) of the Constitution together with Section 14 of the Central Sales Tax Act, 1956 were adequate for controlling the upper limit of sales taxes in the case of such items as might be deemed to be of special importance. If such action was necessary and the states agreed, the union government could further enlarge the existing list, after providing for compensation to the states for loss of revenue rather than resort to

a financial sanction of the type contemplated in the term of reference. Certain states had argued that a scheme of ceilings on sales tax rates would be inequitable as between industrially and commercially advanced states with a fairly large urban sector and the states which were predominantly agricultural. In the case of the former, the sales tax yield occupied a much more pivotal position in their finances than in the latter: if ceilings were imposed their finances would be more adversely affected than the finances of agricultural states. As against this argument, the commercially backward states had argued that the sales tax revenue on inter-states sales accruing to the advanced states was largely paid by consumers in other states and that in the distribution of Central Sales Tax—a source of revenue which the central government should have distributed on some equitable basis, the backward states had been discriminated against under the then existing arrangements according to which each state kept what it collected on behalf of the central government.

In view of the fact that adequate data for determining the combined incidence of the two taxes and their economic effects were not available, the commission could not proceed to the next stage, namely, that of fixing the ceiling and devising a formula for adjustment in the share out of the excises did not arise. The procedure for framing a scheme of ceilings on sales tax rates and for its implementation should be the same as in the case of additional duties of excise in lieu of sales tax. Both could be evolved by mutual agreement; their successful functioning again depended on mutual understanding. In view of what has been explained above, the commission did not recommend any scheme of ceilings on the sales tax rates of any of the excisable commodities and the question of suggesting a formula for adjustments in the share of the states out of union excise duties did not therefore arise. It is important that the above observations and recommendations of the Fourth Finance Commission are kept in view while making any move to replace states' sales taxes by a "centrally sponsored value added tax". Further the exchange of views between the states and the Finance Commission summarised in the above paragraphs gives a flavour of the reaction of the states to such issues affecting centre-state financial relations.

VAT AND MODVAT

One of the merits of the VAT system is that it helps to dispense with the cascading effects of commodity taxation both under either form of commodity taxation—be it excise duty or sales tax. This is the main reason why industries and trade in India

have been urging the government to an early switch to VAT. It was with a view to minimise the cascading effects of excise taxation of inputs that in 1985 the government of India introduced a modified form of excise duty called MODVAT. In the following two or three years, MODVAT was extended to cover practically all chapters of the central excise tariff except petroleum products, textile products, tobacco, cinematographic films and matches. The fact, however, remains that MODVAT is not a value added tax in the real sense of the term: "The so-called Indian MODVAT is not a VAT at all, but rather a form of modified excise duty. MODVAT is essentially a manufacturing excise tax with credit allowed for excise duty and customs in a limited number of industries, introduced mainly with a view to eliminate the cascading effect of multi-point excise levies."³⁸ It is also necessary for the purpose of our study to know the background in which the MODVAT scheme was formulated. Chakraborty noted three measures attempted earlier for containing the inflationary impact on account of the excise taxation system:³⁹

(i) In the production of an excised commodity, inputs belonging to Tariff Item 68 were rendered eligible for set-off.

(ii) Within each tariff item the duty paid on inputs within the same item was made available as proforma credit.

(iii) For several excised commodities provision was made for duty relief for specified inputs.

It was, however, found that this approach of selective concessions coupled with exemptions granted through more than 500 notifications had only led to several complications in tax administration. Due to the predominance of sales tax as the single most important source of revenue for most of the states, any assessment of the distribution of the tax burden among different sections of society had become extremely difficult. It was in this context that the MODVAT was formulated "as a theoretically appealing way of providing set-offs for taxation of inputs".⁴⁰ The L K Jha Committee on Indirect Taxes (1978) had also recommended the levy of such a tax on manufactured goods. However, it has to be recognised that "as long as credit is given only for excise duty and additional duty of customs paid for inputs and not for general customs duty, relief in MODVAT would not be available to certain category of producers like automobile manufacturers who depend largely on imported goods". Inasmuch as the MODVAT has not been followed up by a similar system at the state level in sales taxation, MODVAT could at best be viewed only as a step towards adoption of a full-fledged VAT in India and not a VAT in itself, while introduction of a full-fledged VAT in India would seem to pre-

sent "numerous administrative and constitutional difficulties, including the vexed question of union-state relations".⁴¹

The Tax Reforms Committee (TRC) has strongly underlined the need to switch over to a VAT system in India. It is the popular perception that introduction of VAT will invariably require determination of VAT rates by the centre and that a centrally determined VAT should replace the cascading turnover sales tax levied by states. Let us assume for a moment that this theory is correct. It would then follow that introduction of VAT in India is a difficult proposition as the states would not be willing to give up even part of their sovereign powers of sales taxation. Further it would be a Herculean task to convince the states about the superiority of VAT over first-point sales taxes because whatever experience the states so far have in such related matters cannot be considered satisfactory to lure them into a value added tax system. For example, in pursuance of an agreement reached between the centre and the states at a meeting of the National Development Council in December 1956, it was decided that the centre would levy additional excise duties on cotton fabrics, woollen fabrics, rayon or artificial silk fabrics, sugar and tobacco including manufactured tobacco in lieu of sales tax on these commodities earlier levied by the states, with the states agreeing to abolish sales tax on these commodities. Under this tax-rental arrangement, the entire net proceeds from the additional excise duties in lieu of sales tax are to be distributed to the states on the basis of recommendations of the Finance Commission every five years. States have expressed their unhappiness with this arrangement both with regard to the method of its implementation by the centre and the scheme of redistribution recommended by the Finance Commissions.

While the Ninth Finance Commission was given a term of reference to examine the possibility of merging additional excise duties in lieu of sales tax with basic excise duties, not only were the states unanimous in vehemently opposing the proposal but the Finance Commission also strongly recommended against any such move. The commission found that much of the opposition against the proposed merger could be traced to the manner in which the tax-rental arrangement was being implemented by the centre. For example, it had been decided at the meeting of the National Development Council as early as in December 1970 that within a period of two to three years the proceeds from additional duties of excise in lieu of sales tax should achieve a level of 10.8 per cent of the value of clearances and the ratio between the yields from basic duties of excise and additional excise duties on these commodities was intended to be

brought up to 2:1. The commission noted that while the latter commitment was fulfilled in recent years, the former one which was required to be done within three years of the meeting of the National Development Council in 1970, still remained to be realised. Apart from the fact that government of India did not fulfil its promises in regard to realisation from this levy, it had unduly expanded the coverage of the goods by resorting to definitional changes precluding thereby more items from the levy of sales tax and many commodities were also subjected to 'nil' rate of duty. These commodities, therefore, were free not merely from the levy of additional duties of excise but also escaped the liability to sales tax which the states were prevented from imposing for fear of forfeiting their share in the proceeds from additional duties of excise. The Ninth Finance Commission not only did not recommend the merger of additional duties of excise with basic duties of excise, but also proposed that the revenue loss suffered by the states on account of the exemptions of additional duties of excise in lieu of sales tax allowed by the central government should be estimated.⁴² The National Institute of Public Finance and Policy (NIPFP) which was entrusted with this responsibility found that states were losing revenue on account of exemptions in the case of khandasari sugar, certain items of textiles like rubberised textiles, knitted or crocheted fabrics and fabrics of man-made materials coated or filamented with preparation of LDPE etc.⁴³ The NIPFP study has established that the centre has increasingly mobilised revenue from yarn and the raw materials of yarn, empirical evidence provided by the decline in yield from the basic excise duties on fabrics and increase in the yield from yarn. The NIPFP study has strongly recommended that the divisible pool of the additional excise duties in lieu of sales tax should take into account the central tax base of raw materials, yarn and fabrics lest the centre should derive exclusive benefit from the base.⁴⁴ Several states have also expressed their reservations regarding the economic criteria adopted by the Finance Commissions for horizontal redistribution of the proceeds from the additional excise duties in lieu of sales tax among the states. While many states have favoured sales tax collections as the basis of distribution, the adoption of criteria like net state domestic product, adoption of 1981 population figures by the Ninth Finance Commission as against the 1971 population figures stipulated in the term of reference have left several states dissatisfied with the scheme of redistribution too. Going by such experience, it should not be surprising if states view any move to introduce VAT not merely as an attempt to encroach upon their sovereign powers of sales taxation

but could even question the alleged superiority of the VAT over the sales tax system. Earlier in this paper it was stated that VAT could also be looked upon as a multistage tax which produces a burden equivalent to that of a single stage retail sales tax. That it is the first point turnover sales tax which causes the maximum amount of cascading in the absence of any provision to give set-off for the tax paid at production point in the form of either excise or MODVAT both of which are central levies is fundamental to any attempt at a design for an Indian VAT. In most of the states, sales tax is levied mainly at the first point known as the single point sales tax. The tax is thus collected from the importers, manufacturers or the wholesalers. The only states still having multipoint tax on a few commodities are Karnataka and Kerala. However, since several states also apply lower rates of taxation on sale of items going into manufacturing, like inputs, they may claim that the cascading effects have already been minimised by such measures and that VAT would be redundant in the Indian context.

As mentioned earlier, the possibility of introducing VAT in India has been considered earlier by the L. K. Jha Committee on Indirect Taxation in 1978 and more recently by TRC headed by Raja J. Chelliah. Both the Jha Committee and the Tax Reforms Committee have been in favour of a complete change-over to the VAT system. This would involve redistribution of tax powers between the centre and the states with a view to vest all powers of commodity taxation, namely, excise and sales taxes in the central government, with the states settling for a share of revenue on the basis of formulae recommended by Finance Commissions every five years. As already explained this will be very difficult to achieve since the states would not be willing to part with their sovereign powers of sales taxation. The TRC in its final report has recommended an admixture of VAT, viz, MODVAT at the central level extending to most commodities and rationalising sales tax system at the state level. The Tax Reforms Committee has also recommended extension of MODVAT to the wholesale stage mainly to discourage under-valuation of the manufactured goods since the procedures for MODVAT administration require the levy of tax at the stage of clearance and not at the time of sale. While under-valuation of the manufactured goods at the wholesale stage is an issue which needs to be addressed, extension of MODVAT to the wholesale stage, in our view, is not the solution to the problem. Extending MODVAT to the wholesale stage which involves no manufacturing process would not only be unjustified but would amount to an infringement of the states powers of sales

taxation. The transaction between the manufacturer and the wholesaler is in the nature of sale and not an extension of production and should be subject to sales tax and not MODVAT which is a form of excise. We have dealt with this aspect in more detail later in this section. In any event, VAT in replacement of the sales tax through the wholesale stage should be considered as an interim measure preparing the ground for extending the VAT fully to the retail stage. Mahesh Purohit, in a recent paper on the adoption of a state VAT in India, has suggested that the union government could limit their powers to levy excise duty on certain select important revenue-yielding commodities in the nature of special excises which would not be set off against the VAT and the rest of the excise duties could be converted into a system of VAT and the states could be empowered to levy a full-fledged state VAT in the country.⁴⁵ Under this system the tax would be levied on all sales beginning with production or manufacture, the tax levied at the stage of manufacture (the existing MODVAT) could be given set-off at the time of levy of sales tax (now VAT) and that the tax at the second stage, i.e., at the time of sale, would be levied only on the value added. For reasons of administrative efficiency, however, Purohit has recommended that the centre should continue to levy VAT at the manufacturing level and the revenue so collected by the centre could be distributed to the states on the basis of collection. Purohit believes that "inclusion of MODVAT commodities under the state VAT would eliminate the cascading completely while at the same time allow the centre to retain a fixed proportion of MODVAT revenue as their cost of collection and its own share". Purohit's model envisages division of VAT operations into VAT at the level of centre and also at the level of states both giving set-off for the tax already paid on earlier transactions. Under this system, the inter-state transactions should be treated on destination principle and each state would tax the inter-state sales but the importing state would give set-off for the tax already paid in the exporting state. Under this approach, the existing central sales tax would no longer be necessary.

In our view, any model proposed for a value added tax system in the Indian fiscal federation should be formulated not merely with a view to eliminate the evils of cascading in the system of commodity taxation, be it union excise duty, state or central sales taxes but should be designed in a manner which is politically acceptable to the centre and the states particularly keeping in view the delicate and sensitive nature of centre-state financial relations prevailing in the country. In other words the design of a VAT for India or any other federal economy for that matter cannot

be done in a political vacuum: an economically 'ideal' model could turn out to be politically unacceptable. Any design which ignores this aspect is bound to remain a text book theory which could never see the light of the day. Viewed from this angle, both Tax Reforms Committee's recommendations and Purohit's model suffer from shortcomings though both proposals have definite positive features which have been incorporated in our model. The attempt in this paper is to present a model which, while preserving the economic objectives of a VAT, is also feasible from the point of implementation in the Indian political economy. The reaction of the states to the issue of putting a ceiling on sales tax rates discussed earlier is a clear pointer to the likely reaction to a central VAT.

At the outset, for the reasons explained above, our model tries to preserve the existing division of responsibility between the centre and the states in the area of commodity taxation in India, namely, excise duty at the production point to be levied by the centre in the form of union excise duty and sales tax at the consumption point to be levied by the states. In our view it is the cascading turnover sales tax which has to be transformed into a genuine value added tax. In other words, our model is founded on the fundamental principle that if a value added tax in replacement of states' sales taxes were to be introduced in India that value added tax has to be purely a state VAT, while the central VAT, if any, has to be confined to the extension of MODVAT system for the union excise duties up to the production point only. Even though MODVAT is not a VAT and the value added tax is levied on a price inclusive of excise duties, we recommend continuation of the MODVAT system for union excise duties insofar as it helps eliminate the ill-effects of cascading in the system of excise duty. We do not agree with the popular notion that value added tax has to be necessarily a federal tax. In our view, this is a misconception: as long as uniformity and harmonisation could be achieved among the rates, there is no need to transform states' sales tax to a federal VAT. In fact we would even go to the extent of suggesting that the choice to opt for a VAT in replacement of the sales tax should be left to the states and that it is the states which should exercise full powers with regard to the existing rates, exemptions, administration and collection in the case of VAT just as in the case of the present sales tax system.

The above approach could be supported by the experience with the VAT system in the European community where the member countries run their own independent country VATs. It may be recalled that the VAT was the choice of the

member countries of the EC as the best way to promote neutrality and uniformity of the tax burden and to provide incentives for increased productivity and industrialisation. VAT was first introduced in France in 1954 when it became the first European country to implement VAT on a very large scale: "The latest innovation is the VAT. Its emergence in France illustrates the process by which a sort of continuing ferment of improvisation now and then gives rise to an innovation of the first order".⁴⁶ The recommendation of the EC Fiscal and Financial Committee that all the member-countries could shift to the VAT form was formulated as early as 1962. In fact members who joined the EC later had to introduce a VAT: Ireland in 1972, United Kingdom in 1973, Portugal and Spain in 1986 and Greece in 1987. Italy was the last country to introduce VAT as late as 1988. It may thus be seen that VAT system in the European community was not introduced overnight in all the member countries at the same time but was introduced by them at different points of time. In our view replacement of states' sales taxes by a value added tax system in a federal economy like not only India but the US and Canada should draw inspiration from the EC model by looking at the European community as a federation of states or vice versa for the limited purpose of our study.

We, however, endorse the following recommendations made by the Tax Reforms Committee for implementation in a phased manner as part of the tax reforms measures to introduce a value added tax system in India.

(a) Extension of excises to cover most manufactured goods at present exempt and some select services mentioned in the interim report;

(b) Reduction in the level of rates on some commodities which are unduly high,

(c) Gradual reduction in the number of rates moving them towards three rates between 10 and 20 per cent for all goods that would be covered by the VAT system;

(d) Extension of Modvat credit to all inputs that are used in the production of, or incorporated in, taxable commodities except for office equipment, accessories and furniture, building material and a few others,

(e) Extension of Modvat credit to machinery not fully at the time of purchase, but in instalments during a subsequent period of years which could be laid down in the law; and

(f) Extension of VAT to the more important services used by productive enterprises.⁴⁷

We also fully agree with the observations of the TRC that the existing excise duty regime for the textile sector should be transformed into a value added tax system by introducing the MODVAT scheme till

the yarn stage in all sectors and applying the MODVAT principle in cotton textiles without subjecting grey fabrics to tax at the present time. We also agree with the views of the TRC that extension of MODVAT to the cotton textile sector in order to stimulate export potentials of cotton fabrics and garments.

We have, however, difficulty with the recommendation of the TRC on the extension of VAT to the wholesale stage.⁴⁸ The TRC has recommended that a value added tax, namely, the reformed central excise system, should be extended to the wholesale stage, wholesale stage being defined as traders who buy from manufacturers and sell to other manufacturers or traders. The TRC has observed that they should be subject to VAT in addition to excises payable by the manufacturer and that only the value added at their hands should be subject to tax and the manufacturers who buy from these wholesalers should also be able to obtain credit for tax paid earlier. According to the committee this would provide adequate safeguard against the attempts at undervaluation by the manufacturer to reduce excise liability which is the cause of many disputes in excise besides capturing the value added at the hands of the wholesalers. The Tax Reforms Committee has recommended that the VAT at the wholesale stage could be collected by the states' sales tax department concerned in close co-operation with the officers of the central excise department and the amount of VAT collected could be allowed to be retained by the state where it is collected: "This central VAT can be levied with the co-operation of the states who can be persuaded to accept this levy, because their own right to levy the sales tax on goods will in no way be circumscribed, and at the same time, they will get the entire revenue from VAT at the wholesale stage".

The above recommendations have been made keeping in view the existing demarcation of responsibilities in the area of commodity taxation between the centre and the states. In our view, the moment any product leaves the production point after completion of the production process in all respects, all subsequent transactions should be only deemed to be sales and they should be only subject to sales tax and not to any further form of excise duty in the form of a central VAT even though this may be collected and retained by the states as per the recommendations of the Tax Reforms Committee. It is true that sales tax at the first-point of sale is of a cascading type and no credit is currently available to the wholesaler for the excise or MODVAT already paid. Keeping this point in view the TRC has recommended that the VAT at the wholesale stage should be a central VAT which would be levied only on the value added

and could be subject to tax while no such credit would be available if this were to be a sales tax. In our view, this could be solved in a different fashion. We have already recommended that state sales taxes could be replaced by a state VAT. The state VAT at the first-point of sale, namely, from the manufacturer to the wholesale stage could be on the value added at the hands of the manufacturer and the necessary credit could be allowed under the state VAT. We are conscious that this procedure is fraught with very serious problems since a state giving set-off credit to a tax paid at the central level is bound to lead to loss of revenue for the state. In our view, this could be solved by linking the issue with the system of redistribution of the net proceeds of union excise duties among the states. Presently the net proceeds of union excise duties are distributed among the states based on the formula recommended by Finance Commissions which take into account several economic indicators like population, poverty index, distance of per capita income from the state with the highest per capita income, composite index of backwardness measured in terms of the number of agricultural labourers and SC/ST population in the state, etc. Further, part of the divisible pool also stands earmarked for filling the non-plan deficit gaps of the states with post-devolution deficits in their revenue account. In our view, if the VAT at the wholesale stage were to replace the cascading first-point sales tax which would involve giving credit for the tax already paid at the manufacturing level in the form of excise duty or MODVAT, then the scheme of redistribution of the proceeds of union excise duty among the states would have to carry a suitable weight for the collection of union excise duties in the state so that the states are assured of getting back some part of union excise duty collected in their states. It would also be necessary to dispense with setting apart any portion of the divisible pool of union excise duties to fill non-plan deficit gaps which have to be taken care of only by grants under Article 275. Since only 45 per cent of the union excise duty currently forms part of the divisible pool with the balance going to the central government, this measure alone would not be adequate to compensate the states fully for the credit allowed by them at the first-point sale against MODVAT or union excise duty as the case may be. In this connection the author in a recent paper has suggested that the tax-sharing between the centre and the states should be in terms of a fixed percentage of the total gross tax-revenue of the centre without restricting tax-sharing to some selective taxes and that this percentage should be 33.33 of the centre's gross tax-revenue.⁴⁹ If this system were to be adopted, the horizontal redistribution

among the states will have to be on the basis of a single formula which would be recommended by the Finance Commissions for the entire gross tax-revenue of the centre comprised of income tax, corporation tax, customs duty, surcharge on income tax, taxes and duties under Articles 268 and 269 of the Constitution in addition to union excise duties and additional excise duties in lieu of sales tax. Assigning some weight to the amount of union excise duties collected in the state in the formula for redistribution of the entire gross tax-revenue may not be appropriate. In order to take care of this problem, we recommend that the powers to levy surcharge on income tax could be delegated to the states and the states could fix this percentage individually subject to a ceiling of 12 per cent depending on their commitment towards allowing credits at the wholesale stage for manufacturers' MODVAT. Supplementing a federal income tax by a state income tax is prevalent in other federal economies like the US for quite some time. In India states have also been pleading with the centre for about the last 30 years for adding the net proceeds from surcharge on income tax to the divisible pool. We would recommend that such delegation of powers to the states will not only be an important step in the direction of improving the centre-state financial relations but could pave the way for a smooth transition to introduction of a value added tax system in India.

It should be mentioned that our model differs from the EC model in one major respect. In the case of the European community, the member countries have, in addition to their own VATs, a federal European community VAT. This federal VAT is levied at a maximum of 1.4 per cent. This federal VAT, however, is not strictly a VAT but is assessed on a theoretical base. In order to ensure that all the European community members are treated equally the commission defines precisely how the theoretical tax-base should be calculated from national income figures, the base equivalent to that defined in the various EC VAT directives: all the various exemptions and deviations that can be used are ignored and it is on the broadest base that the 'federal' EC Commission VAT is levied. While the advantage in the system is that traders are not at all involved in tax collection, the states can keep their own tax-bases and rates but have to simply meet this federal charge calculated on the basis of the estimated value added. The practical problem in this method is that it requires computation of household consumption under various headings of goods and services consumed for each state. In the Indian conditions when the retailers maintain no proper records, computation of any such theoretical base will almost be an impossible task. Moreover

the federal charge involving all such complicated computation might be justified in the case of EC as the EC VAT is primarily meant to finance the Commission's expenses and programmes and such a federal VAT would not be necessary in the Indian context as the states form part and parcel of one country unlike the countries in Europe.

Despite the fact that a federal VAT on the lines of EC VAT may not be necessary in the Indian context, it is not only possible but also preferable to transform the current central sales tax into a federal VAT in the event of India going in for a VAT system in place of the state sales taxes. Despite the fact that sales tax is a state subject, the Indian Constitution has placed certain restrictions under which the states are prevented from imposing sales tax on sale or purchase of goods where such sale or purchase takes place outside the state or in the course of import of goods into or export of goods out of the territory of India. Further, there is a ceiling rate of 4 per cent under Essential Goods (Declaration and Regulation of Tax on Sale or Purchase) Act 1952 on goods declared essential for the life of the community. This covers a large number of items like cereals, pulses, fresh and dried fruits, fresh milk, meat, fish, eggs, edible oil and oil seeds, gur, salt, all cloth woven on handlooms, raw cotton, cotton yarn, hides and skin and so on.

In 1956, the Central Sales Tax (CST) was enacted following an amendment to the Constitution which authorised the parliament to levy tax on sale or purchase of goods (other than newspapers) in the course of inter-state trade, revenue from which was assigned to the states fully by amending Article 269 of the Constitution. This central sales tax act has also placed the following restrictions on the power of the states with regard to levy of local sales tax on goods declared as of special importance within their respective states.

(a) The rate of sales tax cannot exceed 4 per cent;

(b) The tax cannot be levied at more than one stage; if the tax on the local sales has been levied and if such goods are later sold in inter-state trade the local tax is refundable.

Obviously the above restrictions were incorporated mainly with a view to eliminate cascading which is the ultimate objective of the value added tax system.

Purohit has pointed out that even though central sales tax is levied to avoid unnecessary movement of goods among the states it does cause the phenomenon of cascading.⁵⁰ He is correct in his observation that the objective of the CST Act is to regulate the inter-state movement of goods and not to raise revenue for the exporting states. The progressive increase in the rate from 1 per cent in 1956 to 2 per

cent in 1963, to 3 per cent in 1966 and 4 per cent in 1975 has been done without due consideration to the consequences. The central sales tax, at present, is levied on inter-state sales only and consignments are exempt. With the current proposal to levy CST on all these exempted transactions which comprise three-fourths of the base, Purohit feels that taxation of all the transactions including consignments would be "inflationary, inequitable and distortionary".⁵¹ Purohit's model for VAT also dispenses with the existing central sales tax altogether with each state taxing the inter-state sales with the importing state giving set-off for the tax already paid in the exporting state to make the system revenue neutral.

Once it is decided to switch over to VAT in place of cascading turnover sales tax, the consequent tax reform measures should cover all aspects of the existing taxation system including central sales tax. Further there are several loopholes under the present central sales tax system like the 'high-sea sales' which are exempt from CST under the act: in actual practice, imported products are kept in customs-bonded warehouse for considerable length of time and mere paper transfer takes place several times depending on market conditions, all these sales being claimed as exempt. Therefore in the event of India opting for VAT system it would be preferable to bring out comprehensive amendments to the Constitution embracing all aspects of sales taxation within the ambit of VAT including provisions of the existing central sales tax. In the process it should be possible to replace the central sales tax by a federal VAT removing some of the elements which have contributed to cascading. However, the yield from the central sales tax thus transformed into a federal VAT should be shared between the centre and the states. As mentioned earlier, the author has suggested that the share of the states in the central taxes should be one-third of the centre's gross tax-revenue, two-thirds being the centre's share and the same should be fixed in the Constitution for a period of 15-20 years. While the yield from the state VAT in place of turnover sales tax will be available fully to the respective states, the yield from the federal VAT in place of the central sales tax should form part of the gross tax-revenue of the centre which would be subject to sharing between the states and the centre on the lines suggested above.

If the states in India were to be given full powers of VAT in the place of the sales tax, one could argue that it would lead to different rates in different states and there would be no uniformity. This can be solved by achieving a certain degree of harmonisation as in the case of EC countries, with the central government playing the role of the EC in co-ordinating the efforts

of the states in this direction. In this connection the experience of the EC in the matter of VAT has some valuable lessons for India. The VAT can be applied either on the basis of origin or on the basis of destination—which then allows replacement of the destination principle by the origin principle when a significant degree of harmonisation has been achieved. The EC has firmly adopted the destination principle as the approach of the origin principle of VAT has been considered not feasible in the EC context.

We feel that with the above structural changes in tax reforms, it should be possible to introduce a VAT successfully in India on the lines of the EC model. Uniformity in tax burden and full harmonisation could be achieved over a period of time with the central government playing the role of the European Commission without any need for a federal VAT. Fiscal federalism will stand in the way of VAT only if there is an attempt to replace the state sales tax by a central sales tax or a central VAT. The model recommended in this paper does not suffer from these problems. It could, however, be argued that a similar system in Brazil where under the new Constitution enacted in 1988, the states are to set the state VAT rates themselves on the basis of their assessment of 'essentiality' of the goods and services has been criticised on the ground that "while in other countries there seems to be a general movement toward reducing divergencies in tax rates between sectors and between countries to reduce distortions, Brazil seems to be moving in the opposite direction".⁵² But it is possible to solve these problems by the states organising themselves into a regional grouping or a community on the lines of EC or a customs union with a view to bring about harmonisation and uniformity in VAT rates. In fact Brazil has used the state VAT to stimulate exports and promote certain projects of 'natural interest'. Since 1975, such projects, including telecommunications, power, and steel have not had to pay VAT on their inputs. During 1971-77, the usual VAT exemption for exports was supplemented by a subsidy which was an extra VAT credit expressed as a percentage of the firm's export value. The state VATs in Brazil have a wider base including services such as communications, consumer credit charges, electricity, and transport and also include fuels and minerals. But the problem in Brazil is the constant battle between the producer and consumer states on account of the vast difference between inter-state and intra-state VAT rates and exclusions and exemptions granted by the federal authorities justified on grounds of the need to stimulate economic expansion. In one sense the difference between inter-state and intra-state VAT rates in Brazil

is not different from the inability of the US government to bring the mail order firms within the ambit of retail sales tax liability. We would suggest that the National Institute of Public Finance and Policy which has been entrusted with the task of evolving a suitable design for an Indian VAT should, among other things, study both the EC model and the Brazilian experience, and see to what extent it could be adapted to suit the Indian conditions. It would be necessary for the NIPFP to associate persons with vast experience in sales tax administration in some of the major states in India with this study of national importance. We would also suggest that the NIPFP should be requested to complete the proposed study in a period of three to six months. In view of the fact that introduction of VAT in a federal economy like India would invariably require the co-operation of the states the government of India could refer the design recommended by the NIPFP as well as other models like the one suggested in this article to the 10th Finance Commission with a view to give their recommendations on their feasibility by ascertaining the views of the state governments on the same lines as the issue of the combined incidence of Union excise duties and sales tax was made a term of reference to the Fourth Finance Commission in 1964.

There could be no two opinions on either the growing importance or the advantages of value added tax system as could be seen from the phenomenal increase in the number of countries opting for the VAT system year after year, even though, at least one country, namely, Norway, which after having opted for VAT in place of retail sales tax has seriously considered the possibility of reverting to retail sales tax system. While the protagonists of sales tax could argue that a single-point sales tax largely takes care of the problems which are supposed to be solved by VAT, it has been the general experience that the single-point sales tax proves efficient at relatively low rates but it becomes increasingly difficult to administer the same with the progressive increase in rates. Apart from the advantages of eliminating cascading associated with sales tax regime, VAT also holds out great potentials of raising additional resources by bringing within its purview the services sector like medical, computer, consultancy and automobile repairs services and even a sector like housing. Therefore a country like India which experiences the phenomenon of a large fiscal deficit might stand to gain by opting for VAT in the not-too distant future. In this paper we have tried to dispel the impression that VAT and fiscal federalism always "constitute an uneasy compromise" (Tait). This would, no doubt, require legislative changes. Federalism may have its shortcomings but

the European community is a shining example of how politically independent countries, by coming together to derive great benefits in the matter of international trade, have moved far ahead in this direction by enlarging and refining the concept to embrace monetary and fiscal policies. Even in the case of the erstwhile Soviet Union, a strong case was made out to opt for a system where the republics could be politically independent but could continue to remain economically united in the matter of monetary and fiscal policies. Fiscal federalism in India, despite some of its shortcomings, can be rightly described as a highly successful model for other federal economies to emulate in several respects; for instance the institution of an independent Finance Commission is a unique feature of the Indian Constitution, which has no parallel anywhere in the world. India could seriously consider the EC model in the event of opting for a value added tax system in replacement of the cascading type turnover sales tax and may in the process prove to be a good model which could possibly be followed by other large federal economies including Canada and the US.

DOCUMENTARY FILMS

Videocassettes of the following documentary films by Anand Parwardhan are now available for Rs 400/- each (inclusive of postage) Discount rates for bulk order are available on enquiry Please send cheques or demand drafts in the name of Anand Patwardhan, C/o Centre for Education and Documentation, 3, Suleiman Chambers, 4, Battery Street (Behind Regal Cinema), Bombay - 400 039 Tel 202 00 19

The films are

- 1) *Bombay Our City (1985)* On the daily battle for survival of the slum dwellers of Bombay (Awards: Special Jury Prize, Cinema du Reel, France, 1986, Best Documentary India 1986, Filmfare Award, Bombay, India, 1986)
- 2) *In Memory of Friends (1990)* On the legacy of Bhagat Singh and his relevance in the Punjab today (Awards: Jury Prize Mannheim, Germany, 1990, Silver Conch, Bombay, India, 1990; Best Investigative Documentary, India, 1990)
- 3) *In the Name of God (Ram Ke Naam) (1992)* On the growth of Hindu fundamentalism as exemplified in the Ayodhya Conflict. (Awards: Filmfare, Best Documentary 1992; Ecumencial Jury Prize, Nyon 1992; Critics Prize, Fribourg 1992, National Awards Best Investigative Documentary 1993) * Available in Hindi or English subtitled versions (Please specify).

Macroeconomic Impact of Public Sector Enterprises

Comment

S Mohanan Pillai

THE operational inefficiencies of Public Sector Enterprises (PSEs) and their impact on government finances have been much debated issues in the policy circles. Though rhetoric very often gains currency, hardly any concerted effort has so far been made to empirically quantify the implication of public sector units on the fiscal crisis. R Nagaraj ('Macroeconomic Impact of Public Sector Enterprises: Some Further Evidence', *EPW*, January 16-23) has raised a few issues, viz, whether the deficit of the PSEs has increased over the years, whether the financial burden of the PSEs on the government budget increased over the period, whether the internal resource generation of PSEs has been lower than that of private corporate sector and whether there is any observed improvement in resource generation by PSEs in the 80s, and if so, whether it is on account of increase in administered prices.

Nagaraj's study attempted to discuss the above issues by comparing the growth and trend in fiscal deficit *vis-a-vis* public sector enterprises' deficit during the period 1960-61 to 1989-90. In the estimation of fiscal deficit, the author has used the consolidated accounts of centre, states and union territories governments. Regarding public sector enterprises, the study considered all non departmental non financial enterprises (NDNFEs) which, according to the author, are not only the majority in terms of number but are also analytically comprehensive. The study concludes that the deteriorating fiscal deficit is mainly on account of decline in the savings of administrative departments (ADs) which has turned negative since mid 80s rather than due to decline in surplus generation of the public sector.

This note examines the methodological appropriateness of Nagaraj's study and the inferences drawn from it. The following are some of the methodological shortcomings in the estimation of PSE deficit and findings thereon attempted by the study. Firstly, the public sector enterprises' deficit estimated in the study may not truly be comparable with the fiscal deficit. The gross fiscal deficit, in the strict sense, refers to the aggregate public sector borrowing requirement (PSBR). In other words, fiscal deficit refers to the overall debt financing of the budget. The study, however, has not specified the methodology of estimating the fiscal deficit. Moreover, the overall PSE deficit estimated seems to be rather a conventional deficit

gauging by the method adopted. It may be noted, the fiscal deficit by definition is a wider concept and conventional deficit is a narrow concept. Hence, there is a methodological limitation in comparing two sets of

estimates based on differing conceptual frameworks. Instead, what the study should have attempted was to estimate the overall public sector deficit (central, states, UTs and public sector enterprises put together) and then to relate the contribution of PSEs to the total deficit.

Secondly, the study has pictured a widening gap between PSE deficit and fiscal deficit over the period. Such a trend observed may again largely be attributed to the differences in the definitions of the two concepts. As alluded to earlier, fiscal deficit is a wider concept and loans and advances as a source to bridge the resource gap consti-

Net incurrence of liabilities	9266	19224	36374

Source: National Accounts Statistics (various issues)

tutes a major component. A significant portion of the loans and advances raised by the government, however, goes to public sector units in the form of equity of the PSEs as well as loans. It may be noted that over the years while the government's liabilities have gone abnormally high in the form of interest burden, the returns from PSEs by way of dividend have been paltry. In this context, the study should have made a comparison of PSEs' deficit with fiscal deficit net of interest liabilities since PSEs also elicit a portion of the loans and advances raised by the government. In other words, instead of the fiscal deficit, Nagaraj should have used the primary deficit to study the pattern and trend in fiscal versus PSE deficit.

Thirdly, the study has confirmed that the budgetary allocations to PSEs have shown a downward trend during the 80s. Statistical evidence is quite supportive of this argument. Nevertheless, one could also notice that the debt financing of those units also showed tremendous strides in the 80s (see table). National accounts statistics (NAS), which form the basic source of statistics on PSEs used by the study, indicate that net incurrence of liabilities (paid-up capital and loans including from government) has surged over time from Rs 9,266 crore in 1980-81 to as much as Rs 36,374 crore in 1989-90.

Finally, the inference of the study that the fiscal crisis is basically on account of the growing expenditure of the administrative departments rather than the poor financial performance of the PSEs is also not flawless. It is a fact that the emergence of the fiscal crisis has largely been on account of the growing expenditure of administrative departments. At the same time, one should note that the poor working results of the PSEs have a larger bearing on the upsurge in the expenditure of administrative departments. Government very often resorts to jacking up administered prices basically to meet the growing resource crunch of the public sector enterprises. This, in turn, balloons the expenditure of the administrative departments through the inflationary process, the government sector being a captive market for most of goods and services of the PSEs. Another channel through which PSEs' operations burgeon the administrative departments' expenditure is subsidy. NAS data show that the subsidy received by NDNFEs has shown a steady increase from Rs 2,145 crore in 1980-81 to Rs 6,983 crore in 1989-90. The subsidy element also provides protection to the PSEs against competition from the private corporate sector. To capture this influence, the subsidy should be treated as a component on the expenditure side although the study has netted it out from the revenue side.

The study under reference is nevertheless an earnest attempt to capture the magnitude and implications of public sector enterprises' deficit in the budgetary operation. The findings of the study, however, have limited validity owing to the aforesaid methodo-

logical problems. In other words, discussion of the issues relating to the estimation of the overall public sector deficit in general or the deficit of public sector enterprises in particular still remains inconclusive. In this connection, it may be noted that the estimation of a comprehensive public sector deficit is limited by, *inter alia*, the difficulties in the compilation of requisite data as well as consolidation of statistics for activities that are of different nature. The only available estimate on public sector resource gap, albeit partial, is that published in the *Economic Survey of the government of India*.

To sum up, since the estimates of public

sector enterprises' deficit arrived at by the study cannot be used for working out the overall public sector deficit (PSER) due to conceptual flaws, the methodology adopted by the study has got only limited practical applicability. The study, however, provides some insight into the nexus between the financial performance of public enterprises and the fiscal crisis.

Note

- * This is based on the fact that the weight of administered items forms almost 20.2 per cent in total weight in the WPI Index.

Reply

R Nagaraj

S MOHANAN PILLAI (SMP hereafter) has faulted our methodology for assessing the macroeconomic impact of public sector enterprises (PSEs) in India [Nagaraj 1993]. Defending the method followed, this note offers some more evidence to strengthen our findings. As the concepts and definitions used here are same as earlier, no explanations are provided for them.

SMP says that "The study... has not specified the methodology of estimating fiscal deficit." Perhaps, he has overlooked footnote 5 of the paper (p 108), which provides the necessary details.

Overall deficit of PSEs, as explained, is a ratio of the difference between their revenue and expenditure—combined for capital and current accounts—and current GDP at market prices. As R P Short, who outlined this concept, stated: "The principal summary indicator of the macroeconomic impact of public enterprises is their overall deficits of financing requirement. It provides a measure of the effect of public enterprise operations on the balance between demand and supply in the economy..." [Short 1984, 144]. This indicator of PSEs' deficit is a comprehensive measure which includes,

FIGURE 1: PUBLIC ENTERPRISE SECTOR DEFICIT AND PRIMARY DEFICIT OF PUBLIC SECTOR AS PERCENTAGE OF GDPMP

Source: NAS and Public Finance, (various issues)

among others, repayments of loans, dividends and (explicit) subsidies. Moreover, since the concept captures all the major financial flows between the government and PSEs in the economy, as recorded in the *National Accounts Statistics*, we considered it appropriate to compare the overall deficit of PSEs with gross fiscal deficit of the government, combined for central, state and union territories.

However, to examine SMP's suggestion, the overall deficit of PSEs is compared with the primary deficit instead of the gross fiscal deficit as done earlier (Figure 1). The widening gap between the two curves clearly suggests that the overall deficit of PSEs does not seem to be the reason for the deteriorating primary deficit. Since the movements of the primary and fiscal deficits [Nagaraj 1993: Figure 1] are quite similar, our finding is not altered by change in the measure of deficit used to capture the fiscal imbalance. In other words, the growing fiscal (or primary) deficit is perhaps not attributable to the overall deficit of PSEs.

SMP says that, "A significant portion of the loans and advances raised by the government... goes to public sector units in the form of equity of the PSEs as well as loans." To examine this proposition, we estimate the share of PSEs (sum of equity, loans and capital grants) in the government's net (domestic plus external) borrowing. Figure 2 suggests that this ratio has come down sharply from around 90 per cent in 1976-77 to about 20 per cent in 1989-90, lowest over the three decades. Hence SMP's argument is evidently not sustainable. This result together with our earlier finding of the declining burden of PSEs' (current and capital) expenditure on the budget [Nagaraj 1993: Figures 2.1 and 2.2] clearly demonstrates that not only has the dependence of PSEs on the budget reduced over the years, the share of government's resources flowing into PSEs has also come down very sharply. Therefore, there seems to be little basis to argue that contributions to PSEs form the principal reason for the government's growing debt burden.

Providing some evidence on the absolute increase in PSEs' 'net incurrence of liabilities' in the 80s, SMP further contends that "...over the years, while the government's liabilities have gone abnormally high in the form of interest burden, the returns from PSEs by way of dividend have been very paltry". It is widely known that the concept of 'return on equity' for PSEs—as is conventionally used to assess private corporate firms—is inadequate to capture their financial performance due to (i) historically evolved capital structures, and (ii) the variations in accounting practices of PSEs. Until recently, the significance of capital structure on PSEs' financial performance was inadequately appreciated. Therefore return on equity is perhaps not a very meaningful measure of PSEs' financial performance.

FIGURE 2: SHARE OF PSEs IN GOVERNMENT'S NET (DOMESTIC PLUS EXTERNAL) BORROWING

Note : Observation for 1973-74 is omitted due to discrepancy in the data.

Source: *National Accounts Statistics*.

FIGURE 3: RATIO OF NET PROPERTY INCOME PAID BY PSEs AND NET INCURRENCE OF LIABILITY BY PSEs

Note: Net property income includes interest, dividend, rents and royalties. Liabilities include equity and loans.

Moreover, since *National Accounts Statistics* does not provide adequate break up to arrive at such a measure, we have computed the ratio of 'net property income' paid by PSEs (to government and all other creditors) and the 'net incurrence of liabilities' (that is, equity capital and loans from all sources) by PSEs. This ratio rose from about 3 per cent in 1960-61 to about 46 per cent and went down to 26 per cent in 1989-90 (Figure 3). Ignoring the sharp peaks, for which we have no explanation for the moment, an overall increasing trend in the ratio, especially since the mid-80s, is clearly discernible.¹ Although the measure is rudimentary, it nevertheless suggests PSEs' increasing repayments of their financial dues to the rest of the economy. This, together with the evidence (reported earlier) on the increase in (i) self-financing ratio of PSEs and (ii) their gross profit as a proportion of capital employed over the period 1973-74 and 1989-90, even excluding the contribution of petroleum firms, clearly suggest noticeable improvement in the financial performance, which would perhaps do not get adequately reflected in a single measure of return on equity.²

While admitting that "fiscal crisis is basically on account of the growing expenditure of the administrative departments rather than the poor financial performance of the PSEs", SMP argues that "the poor working results of the PSEs have a larger bearing on the upsurge in the expenditure of administrative departments". This according to him is on account of (i) administrative departments (or simply, government) being captive market for PSEs' products, and (ii) the subsidies provided by government to PSEs.

While the captive sales to government and its subsidies could, undoubtedly, be an important source of revenue for PSEs—and a corresponding loss for the government—one cannot perhaps ignore the substantial costs incurred by PSEs in fulfilling various public policy objectives for which they usually do not receive (explicit) budgetary support. Therefore, unless one has quantitative information on all these transactions, they are not amenable to empirical analysis at a macro economic level.

Quite contrary to SMP's impression, explicit subsidies, as seen above—and also as stated in 4 of the paper—are included in computing the overall deficit of PSEs. Admittedly, implicit subsidies could not be captured in our exercise. However, since the share of government's subsidies received by PSEs are estimated to form only 16 per cent of the total in 1987-88 [Mundle and Rao 1991], they perhaps cannot account for the growing expenditure and dissaving of the government.³

Thus, on a close scrutiny, much of SMP's criticisms of our methodology seem invalid. Although our attempt does not fully cap-

ture the complex interrelationship between PSEs and the government in its totality—as, in fact, is admitted in the study—it nevertheless seems to take into account the principal financial flows. Notwithstanding its shortcomings, our effort seems to indicate discernible changes in the macro-economic impact of PSEs over the period of three decades, especially in the 80s, which perhaps warrant a closer examination.

Notes

- 1 However, it needs to be stated that unless the ratio is greater than one, the debt on account of PSEs will continue to rise. I am grateful to Kirti Parikh for pointing this out for me.
- 2 The evidence does not constitute an uncritical support of the present state of PSEs in India. There is an urgent need and substantial scope for improving their financial performance, a discussion of which, we believe, is outside the scope of this exercise.

3 We are in fact aware of this possibility and have taken care to qualify our assertion [Nagara] 1991: 2882, note 19].

ACTIONAID

We are an international non-government organisation supporting development initiatives in some of the poorest parts of Asia, Africa and Latin America. In India, our mission is to facilitate the empowerment of the poor in the process of social development. Currently, we offer financial, managerial and technical assistance to over 100 local voluntary agencies in the planning, implementation, monitoring and evaluation of poverty eradication and community based rehabilitation programmes. We are also increasingly getting involved in influencing public policy, emergency relief and urban poverty. Our team consists of development professionals in general management, land and water resources, health, education, community organisation and disability. We are now seeking to strengthen our human resource base to manage our fast expanding operations in different parts of the country.

Director, Development Support

The Development Support Division exists to enhance the quality of ACTIONAID India's work by a series of interlinked functions including providing technical support services to community-level projects, research and documentation, training, and influencing other key development institutions. We are now looking for a person to lead this division which comprises about twenty specialists in Health, Education, Livelihood Systems, Policy and Training. This is a senior management position and the incumbent should have at least ten years' relevant experience with outstanding credentials in the Indian development sector. A thorough grasp of development theory and practice, excellent written and oral communication skills in English and doctoral/postgraduate qualification in a related discipline are essential. Knowledge of the voluntary sector, international exposure, and specialisation in a thematic area/gender issues are desirable.

Co-ordinator, Livelihood Systems

The Livelihood Systems Unit is responsible for shaping ACTIONAID India's economic development initiatives – both natural resource management and non-farm. We are now seeking a Co-ordinator to head this unit. The incumbent should have a postgraduate qualification in a related discipline and at least five years of relevant experience. Familiarity with sustainable agriculture systems and income generation programmes, and good written communication skills in English are essential.

Training Officer

The job entails meeting the training and development needs of ACTIONAID India's human resources at all levels. The incumbent should have professional qualifications in Human Resources Development/Training, at least five years of relevant experience, excellent interpersonal skills, and good written and oral communication skills in English. Knowledge of the Indian voluntary sector is desirable.

Research Associate

We are looking for a person with experience in the design and execution of action research projects to join the Policy Unit which is responsible for research documentation and advocacy. The incumbent should have a postgraduate degree in statistics or a related discipline with five years relevant experience and sound knowledge of qualitative and quantitative aspects of social science research and familiarity with use of computerised statistical packages.

All positions are Bangalore-based but involve extensive travel. Remuneration will not be a constraint for the right candidate. We welcome applications from women candidates. Please respond within ten days to The Administrative Officer, P B 5406, Bangalore 560 001.

IOL RECEIVES ISO 9001

Ceaseless Quest for Quality, Safety and Team Work brings IOL international recognition. Commitment to Quality Improvement Programme (QIP) has made it possible for our Plant Manufacturing Works (PMW) to receive the prestigious ISO 9001 accreditation, certified by the TUV, Germany. PMW makes world class process plants and cryogenic vessels.

To us at IOL, QIP goes much beyond product quality. Leadership through relentless technology upgradation, continuous improvement of systems and manufacturing processes, adherence to stringent safety standards and competent manpower has opened up for IOL new vistas of international market.

A torch bearer in all areas of its operations, IOL is poised to set new standards — directed towards complete satisfaction of customers both in India and overseas.

Surely, the international recognition will inspire all of us at IOL to reach newer heights of excellence in technology and quality standards. On this momentous occasion, IOL rededicates itself to make India technologically self-reliant and internationally respected.

IOL. Where Quest for Quality is a continuous process.

FAMINE MORTALITY

We help Nature keep her true colours.

As reputed manufacturers of vital chemical products we've been in the forefront of promoting safety and environment protection.

Our commitment to preserve the environment, improve safety and enhance the health and welfare of our employees and the surrounding community manifests itself in every facet of our operations, right from our choice of technology to process selection and engineering design.

Effluent treatment plants at both our factories render liquid wastes harmless. Sophisticated pollution abatement equipment keep emissions within tolerance limits.

Our R&D wing develops products that are environment friendly.

searches for ways to recycle waste and constantly evaluates the effectiveness of our own pollution prevention and control efforts.

We've designed education programmes to inform, train and encourage our employees to actively participate in achieving safety and environmental protection goals, safety inspections and safety audits to assure continuous control, and, onsite and offsite disaster control plans to aid effective response to a wide range of emergencies.

It's all part of our integrated effort to keep our operations safe and harmless.

And to ensure that we help Nature keep her true colours.

Famine Mortality

Reconstruction of famine history in the later 19th century calls into question the assumptions on which the government's famine policy was based. Relief measures, therefore, could not but come into operation piecemeal. Moreover, mortality on the colossal scale recorded in the famine years was not simply the direct result of starvation, but the outcome of a far more complex set of conditions than official policy allowed for. What these conditions were and how patterns of famine mortality were determined by them can be demonstrated by the history of Madras, 1877-78, compared with Punjab, 1896-97 and 1900-01.

1169

Rose-tinted Prism

Emanating from linguistic/literary theory and rapidly colonising the social sciences, postmodernism has encompassed much of the discourse that permeates, among others, the subaltern studies project, new social movements, resistance theory and popular culture. Postmodernism, popular culture and resistance theory have all combined to subvert the famous dictum of Gramsci about the nature of political action: instead of pessimism of the spirit and optimism of the will, they now license optimism of the spirit and pessimism of the will.

1162

Flawed

While the Janakiraman committee has laid bare the different aspects of the banking and stock market scam, its perception of the political-economic environment which facilitated the gigantic

fraud is fundamentally flawed

1137

In Crisis

The crisis in sociological research in India has to be located in three institutional structures—the universities, the UGC and the professional bodies such as the Indian Sociological Society. The overarching framework within which the role of each of these bodies may be understood, however, is provided by the practices of politics.

1159

The Aged

With the changing demographic profile of the population, the living conditions of the aged, their economic, social and psychological status and society's response to their problems call for greater attention than in the past. A survey of the aged in Maharashtra.

1188

In Debt

With aggregate external debt of almost \$ 87 billion at the end of September 1992, India is on the verge of slipping into the category of severely-indebted low-income countries. First of a new Special Statistics series.

1151

Money and Prices

The monetary authority in India would be wrongly advised that it can be certain of containing inflation solely by effecting a pre-announced reduction in money growth rate, leave alone being able to do so costlessly.

1185

Against Communalism

The strategy of combining an anti-communal appeal with a, as for evolving an alternative pattern of development has led to successful mass mobilisation in southern Maharashtra

1142

Tried and Tested

In Bihar the new reservation policy has further consolidated backward class support for the chief minister

1145

Broken Reed

The Narasimha Rao government, its credibility thoroughly eroded, cannot provide an effective riposte to the pressures on the developing countries to open up their economies to the goods, services and capital of the developed countries even as the latter feverishly raise protectionist walls for themselves and set up restrictive trading blocks.

1140

New Morality

The fervid debate in the Lok Sabha on the motion of impeachment of justice Ramaswamy laid bare the swift sea change that notions of corruption and moral turpitude are undergoing.

1135

Legacy of Apartheid

In South Africa, for generations of black Africans hatred and violence have become part of daily existence. Not surprisingly, then, township violence and the restructuring of post-apartheid society in the face of ethnic violence are today among the major issues facing the country.

1148

LETTERS TO EDITOR

SSP and World Bank

IF Anil Patel (May 22) has to worry about "what will happen to the SSP oustees, if after the withdrawal of the World Bank, the government of India fails to keep up its promise and to force the states to implement R and R in a fair manner?", with what face and logic does he criticise the EDs of the Bank and ridicule the Morse-Berger report which have serious doubts and express concern about the willingness and capacity of our governments to resettle and rehabilitate all project-affected people of SSP from the three states, even as per the agreed R and R policy?

The discontinuance of the aid for the SSP is not the decision of the government of India, but the decision of the World Bank consequent upon our government's failure to meet by March 31, 1993 the time bound R and R and environment (benchmark) targets set by the Bank last October for continued assistance. The announcement by the GOI is only a face-saving device jointly agreed upon to save both of them from further embarrassments. If it is true that Bank's continued involvement and monitoring of the R and R has contributed to the improvement of the R and R policy it is more true that the Bank's decision to jump into the project without full pre appraisal of all aspects of the SSP before 1985 and without waiting for the GOI's clearance and its incremental policy have led to the present crisis which it could not manage. Even after the Morse Berger report, the Bank never wanted to withdraw. Instead it made all attempts to salvage and help the governments to fulfil its targets. Ultimately that proved to be impossible and the Bank had no option but to withdraw.

All those who are familiar with the Tribunal's failure to know the full dimensions of the total displacement of the SSP, the early ruthless evictions of people of Vadgam in 1980-81-82, the report of the Supreme Court's commission in Arch Vahini's petition, the reluctance of the Gujarat government to improve its policy, Scudder's reports in 1985 and 1989, the internal correspondence of the Bank about R and R and environment from 1989 onwards, the governments' attempts to flatter and influence the Morse Committee, the massive misinformation campaign, the loyalty of our governments to the World Bank, but not to our own people, and the latest attempts to forcibly remove people are not surprised by the withdrawal of the Bank. Only the governments try to fool the people and only the government's NGOs suffering from megalomania of their own achievements, are out to support the governments. When the people in the valley have succeeded in asserting their independence and saving national honour by compelling the Bank to withdraw from the destructive development, we can only pity those NGOs who have accepted SSP as a 'reality' right from

the beginning and who have tried to drive the poor 'victims of development' to the path of self-eviction and self-destruction. When an outside agency like the World Bank has shown genuine concern for the human rights of the oustees and for environmental protection, our own governments consider this concern as interference in and hindering India's path of development and as humiliation and indignities imposed upon us. It is ironic that NGOs committed to 'total revolution' have become champions of false national dignity and honour, instead of being defenders of our people's rights.

Neither the Morse-Berger report nor "the violent intellectual attack" on the SSP has failed. Rather the legitimacy and credibility sought to be derived for the project from the World Bank's support has been now knocked out. All the tall claims of the governments have been exposed. When the governments' own confidence is shaken, it is strange that some NGOs assert that "SSP cannot be stopped". Instead of maligning the Narmada Bachao Andolan, let Arch Vahini do some introspection to find out how it has been caught in its own trap!

GIRISH PATEL

Lok Adhikar Sangh,
Ahmedabad

Rural Poverty

THE Eighth Five Year Plan document has mentioned that "in 1987-88 the rural poverty line in term of per capita monthly expenditure was Rs 131.80" (p 27). The Fourth Quinquennial Survey of Consumer Expenditure 43rd Round, 1987-88 has shown the following pattern of monthly per capita consumer expenditure (MPCE) in rural India. The table shows that the bottom 46.6 per cent of the rural population had an MPCE of Rs 117.45 and was clearly below the poverty line. Another 9.7 per cent of the population in the MPCE range of Rs 125-140 had MPCE of Rs 132.58 which was higher

than the cut-off point of poverty line of Rs 131.80. Assuming that rural 3.4 per cent of the population in the MPCE class of Rs 125-140 had an MPCE of less than Rs 131.80 it can be seen that 50 per cent of the rural population was below poverty line.

Minhas, Jain and Tendulkar (EPW, July 6-13, 1991) had questioned the methodology adopted by the Planning Commission which shows a massive reduction of poverty ratio in the rural India to 32.7 in 1987-88. They

MPCE Class (Rs)	Percentage of Persons	MPCE (Rs)
Less than 65	5.1	53.71
65-80	7.3	73.25
80-95	10.2	87.74
95-110	12.5	102.56
110-125	11.5	117.45
125-140	9.7	132.58
140-160	10.6	149.30
160-180	7.7	169.67
180-215	9.2	196.36
215-280	8.3	212.77
280-385	4.8	321.32
385 and above	3.1	628.52
All	100.0	100.00

Source: Sarvekshana July-September 1991 p S 65

calculated the rural poverty ratio at 48.69 in 1987-88. The Planning Commission compared the National Sample Survey (NSS) consumer expenditure survey with the National Accounts estimate of aggregate consumption for the nearest financial year and when it found that the NSS estimate was lower than the NAS estimate, it jacked up *pro rata* the NSS size distribution of consumer expenditure and estimated the rural poverty ratio at 32.7.

The Fourth Quinquennial Survey of Consumer Expenditure 43rd Round, 1987-88 has vindicated Minhas, Jain and Tendulkar.

The Capitulation

IT is not even that times are a-changing; times have changed. In earlier seasons, official decisions on basic issues of policy would be announced, preferably in parliament, by ministers who were politically sufficiently weighty. Such conventions have obviously been given the go-by. Or it could be that the ministers are much too ashamed to disgorge unpleasant tidings. A civil servant, holding charge in the union ministry of commerce, due to retire by the end of this month, was chosen to inform the nation about the government's intention to accept the norms and standards laid down by the Dunkel draft on trade-related intellectual property rights. The government, according to this spokesman, has also decided to bow down to the Dunkel demand to extend patent rights up to 20 years. The transnational cartels could now breathe freely: the New Delhi decision to embrace the Draft all the way would not make an exception of the drugs and pharmaceutical industry either. It is a question of faith; as the commerce secretary took pains to explain, the government simply does not believe that drug prices in the country would rise by 500 or 1,000 per cent as a result of the transnational invasion following the acceptance of the Dunkel regime. There is, in his view, a lot of 'exaggeration' indulged in by the campaigners who claim that acceptance of the GATT secretary-general's proposals would compulsorily subject plant seeds and genes to the tyranny of foreign patenting; India should be able to evolve a *sui generis* system of protection in this area and conserve the rights of indigenous farmers, research workers and scientists. The civil servant expatiated at great length on one particular point, this country will have a grace period of 12 years to sort things out; after all, the implementation of the GATT proposals could be held back till 2005. The hint was dropped that confidential talks have already been initiated with representatives of the US trade department; since we have effected total surrender on major issues, minor concessions hopefully were bound to come India's way. One of the concessions the government is evidently aiming for is some relaxations in the patent provisions for seeds and plants. The commerce secretary used up several hundred words to emphasise the government's eagerness to lobby intensely with the lords and masters in Washington, DC, and other western capitals so that a crucial footnote could be added to the Draft Final Act of the Dunkel text; it would suggest that the act be read in conjunction with Article 5 of the Paris Convention which in certain instances allows compulsory licensing of patents. The civil servant sounded jubilant in advance: if only such a footnote would be added, foreign parties would not be able to mulct our consumers and farmers at will.

As of now, this is of course pious hope. But the government has its own compulsions. The decision to give in on Dunkel, the commerce secretary was candid enough to admit, is primarily based on the assumption that it would stimulate the flow of foreign investment to the country. Implicit too is the hope that, once we have signed the deed of surrender on TRIPS, the venerable Americans would withdraw the Damocles' sword hanging in the form of threats under Super and Special 301 of their Trade Act. What the secretary has left unsaid for the sake of

politeness is that the Indian Patents Act of 1970 would now need to be given a comprehensive burial and that coda of trade imperialism, the Paris Convention, which for decades on end Indian patriots had kept at bay, would henceforth command total obedience. The patents act this country put in the statute book almost a quarter of a century ago was hailed around the world as a piece of model legislation for all poor countries aspiring for self-sustained economic and technological development. That legislation would now be officially certified as dead. Perhaps the government is not unfeeling; it perhaps would quote, *sotto voce*, some Tudor poetry: true, we loved her once; but that was in another country; besides, the wench is dead.

Yes, a quarter of a century ago, India was a different country, and the lady in the imagery, the national goal of self-reliance, is now safely dead. The authorities therefore feel secure enough to leak the news of its capitulation through the lips of an about-to-retire bureaucrat. The earlier promise to have the whole range of issues concerning the Dunkel draft debated in parliament before a final decision was taken has, to all indications, been scrapped. The government, there is no question, wants to be consistent. The finance minister has, in the course of the past two years, accepted each and every provision with respect to trade-related investment measures (TRIMS) in the Dunkel draft. Why should we therefore cavil at TRIPS? We should rather first sign the deal of surrender and then throw ourselves at the feet of the Americans, begging them to grant us morsels of mercy, such as on the issues of compulsory licensing and exemption of plant patenting.

Anything to propitiate the strong and mighty western nations. Our delegation to the human rights conference organised by the United Nations is to be led by the finance minister. Does he not have the reputation of being Their Man in New Delhi? His presence in Vienna is intended as a signal for the Americans: we will agree to whatever you say on human rights, including—maybe with some dissembling necessary for home consumption—on Kashmir; but you must keep your part of the bargain, you must not cut us off funds. The unambiguous statement, on the acceptance of the Dunkel draft is another signal in the same direction: India will be loyal and order-abiding, please, sirs, the rich powers must not choke off the flow of funds to its shores.

For those who have been fighting strenuously and for long years for technological self-reliance, is the battle all over? Not quite. There is still one weapon left in the armoury of the political parties that have gone on record opposing Dunkel and there is little doubt that they continue to represent the sentiments of a considerable proportion of the electorate. These parties could sign a joint declaration to the effect that they do not endorse the official decision to suspend resistance to the Dunkel proposals; once a change in regime takes place in New Delhi following democratic elections, they propose to look into the issues *de novo*, reserving the right for themselves to re-negotiate aspects of the proposals the present government might have already agreed to. That might not exactly set the cat among the pigeons, but at least prevent our going naked into the council chamber.

PRIORITY SECTOR CREDIT Lip Service

ADDRESSING the ninth regional consultative committee meeting of nationalised banks for the southern region—held after a gap of seven years!—the union finance minister has been reported as having expressed grave concern over the reduced flow of bank credit to the priority sectors in the last three years and exhorted bankers to provide more credit to these sectors. Lest bankers should misunderstand him, the finance minister was quick to clarify that he was seeking this performance on a voluntary basis, that instead of lending under compulsion from the government, the banking sector should take advantage of the government's new liberalisation policy and extend more credit to agriculture and the small-scale sector to boost productivity in these segments of the economy. However, it passes comprehension why, in the liberalised set-up, bankers should soil their hands with more lending to the disadvantaged sectors. It is not merely a question of the bankers' anxiety about their bottom line; it is more a question of the sections and classes which bankers and government functionaries wish to serve. In the initial period of bank nationalisation there was a strong impetus for significant structural changes in banking because there was a political thrust, but this was not sustained and the class biases of banking personnel and the government bureaucracy began to assert themselves, particularly after the mid-1980s when the liberalisation theology gained rapid currency. The achievements of bank nationalisation have been put in reverse gear since then. This is also the period when the presence of foreign banks on the domestic banking scene has expanded noticeably; this is not a mere coincidence.

Priority sector advances are a good example. Banks were expected to achieve a 40 per cent target for priority sector lending by the end of March 1985, which the public sector banks not only achieved but surpassed. Priority sector advances as a percentage of net bank credit reached a peak of 45.7 in June 1988. Many small-sized public sector banks had a tradition of priority sector lending and in their case the ratio even crossed 50 per cent. But the climate underwent a change in the second half of the 1980s when, under the influence of economic liberalisation, banks vied with one another in scouting for the bigger accounts. And if the bigger accounts were not forthcoming, banks did not hesitate to concentrate on treasury operations. As a result there occurred a steady decline in the share of priority sector advances in net bank credit to 42.3 per cent in June 1990 and 40.9 per cent in June 1991. In 1991-92, the year of a radical turn-around in economic policies, priority sector ratio fell below the target of 40 per cent, to 39.3 per cent at the end of March 1992. The extent of the decline is better appreciated in

incremental terms. During 1990-91, expansion of priority sector advances at Rs 2,532 crore constituted 20.5 per cent of incremental total non-food credit and in 1991-92 the expansion of a similar amount of Rs 2,554 crore constituted 28 per cent. Partial data for 1992-93 (April-July) suggest that the expansion of Rs 1,189 crore in priority sector credit worked out to a mere 14.6 per cent of the expansion in non-food gross bank credit. The decline in priority sector advances is sometimes attributed to the Janata Dal government's discredited loan waiver scheme of 1990-91, but this is only partly true. The erosion of the priority sector's share had begun much before the loan waiver scheme and it has continued unabated thereafter. The foreign banks, which were not affected by the loan waiver scheme, have also reduced their priority sector ratio from 9.8 per cent at the end of March 1990 to 9.5 per cent at the end of March 1991 and 7 per cent at the end of September 1991. This decline should be considered sharp even after taking into account seasonal factors, especially when compared with the target of 12 per cent for the end of March 1990 and 15 per cent for the end of March 1992 set for the foreign banks.

The above data do not tell the entire story of the neglect of the credit requirements for the bulk of the disadvantaged production units in agriculture, small-scale industry and small businesses. The rural credit structure is in total disarray which calls for a significant attitudinal change on the part of the government. The urban orientation of commercial banks is now increasingly becoming blatant. The relaxation of credit norms for large-sized industrial advances, permission for bank lending in favour of share brokers and against the security of gold and company shares, etc, and the government's constant refrain of financial sector reform on the basis of the Narasimham committee's command performance with the focus almost exclusively on the banks' profitability have gone to reinforce the urban and large industry orientation of commercial bank managements. Why, the finance minister has only to find out the proportion of man-hours spent in his own ministry and its departments on external liberalisation, gold imports and other gold policies and such other aspects of stabilisation and structural adjustment compared to that spent on the rural credit structure and bank credit for agriculture, small-scale industry and small

borrowers, the sectors which constitute a dominant but neglected component of this poor society.

GOVERNMENT SECURITIES Callous Lack of Concern

HOW the structural adjustment and stabilisation programme is leading to contradictory economic policies is evident from the government's stance on coupon rates on its securities. On the one hand, the government is under pressure to reduce the fiscal deficit and, on the other, the goal of financial sector liberalisation demands, among other things, the progressive introduction of market-related rates of interest. The result is an increase in coupon rates which makes no sense, looked at from whatever angle.

The government and the Reserve Bank have fixed the coupon rate at 13 per cent on five-year government of India securities. As recently as in the initial two phases of 1991-92, the coupon rate for five-year securities was 10.5 per cent and those for 10-year, 15-year and 20-year securities were 10.75 per cent, 11.25 per cent and 12 per cent, respectively. For floatations done on an auction basis in 1991-92 the maturity periods were slashed to five years and 10 years and the coupon rates on the basis of cut-off yields fixed at 12 per cent and 12.75 per cent, respectively. In the current year the government has resorted to a novel method of converting over Rs 7,000 crore 364-day treasury bills into three-year dated securities at a coupon rate of 12.75 per cent to facilitate roll-over of debt. The government has also issued securities on auction basis with a variety of maturities—five, six, seven, eight and now nine years. Hitherto the coupon rates on these securities ranged from 12 per cent to 12.70 per cent (except for the nine-year securities which are yet to be concluded). Against this background, the drastic enhancement in the coupon rate to 13 per cent for the second tranche of five-year securities raises many questions. First, within a short period of three months or so a chaotic range of coupon rates have been prescribed—12.75 per cent for three-year, 12 per cent for five-year, 12.3 per cent for six-year, 12.6 per cent for seven-year, 12.7 per cent for eight-year and now 13 per cent for five-year securities. It is possible that the market prices of the securities may bring

Assistant Editors

EPW is looking for one or two Assistant Editors with academic background in the social sciences and with writing and editing skills. Those interested in knowing more details may please write to the editor.

about a semblance of rationality in their yield rates, but it will have unequal repercussions on asset values in the balance sheets of banks and other institutions holding these securities.

One is not sure if the RBI and the government realise that they have been taken for a ride by the banks when the latter placed their bids for Rs 1,000 crore issue at the cut-off yield of 13 per cent. This has happened despite the fact that the banking industry currently possesses easy liquidity. The bankers are aware that the government is in a tight position. Apart from the repayment obligations of Rs 8,777 crore in 364-day treasury bills (of which a significant part has been converted into three-year securities), the government has a target of Rs 9,700 crore to fulfil for market borrowings and borrowings through 364-day treasury bills. Earlier attempts at market borrowings have not been successful. It is very likely that the 13 per cent coupon rate has been manipulated by a few banks using their oligopolistic clout and knowing that the government and the RBI do not seem to be overly concerned about the interest burden put on the budget so long as the impression of ongoing financial sector liberalisation can be kept up. If the government were really concerned, there was ample scope, in the existing money market conditions, for attracting subscriptions at lower coupon rates. Apart from the fact that banks are relatively flush with funds due to the reduction in the cash reserve ratio (CRR), government securities are zero-weighted assets for capital adequacy norms and banks with excess export refinance limits with the RBI at 11 per cent interest would obviously take advantage of investment opportunities in government securities at rates higher than 11 per cent. Instead of giving in and thereby generating exaggerated market expectations the government and the RBI should have stuck to lower coupon rates.

That the government and the RBI are unconcerned about the consequences of such irrationally high rates on government securities is confirmed if we consider that, with the likelihood of a further slashing of the CRR, the banks will continue to be flush with funds. Due to the recessionary conditions in industry, the prospects for commercial sector credit are not particularly buoyant. The finance minister has himself admitted that the macro-economic situation calls really for a reduction in interest rates. The current account deficit in the balance of payments has come down; crop prospects are bright; and the inflation rate is claimed to have reached a low level of 6 per cent. According to Manmohan Singh, 'full convertibility' of the rupee has not eaten into foreign exchange reserves and the economy is generally looking up. Against such a background, how do the government and the RBI justify their pushing up coupon rates on government securities to such high levels? With such attractive yields on government

securities, banks have little incentive for undertaking lending operations.

The Sukhamoy Chakravarty committee had recommended that the (91-day) treasury bill rate be fixed at the expected short-term inflation rate plus a marginally positive return and the coupon rate on 15-year government securities at the expected long-term inflation rate plus a positive real rate of return of 3 per cent per annum. The discount rate offered on 91-day treasury bills today is about 9.75 per cent and the coupon rate on five-year securities has been fixed at 13 per cent. This would imply an expected short-term inflation rate of 8 to 9 per cent and a long-term inflation rate close to 10 per cent. In fact, with the norm suggested by the Chakravarty committee, the coupon rate on five-year securities should not in any case exceed 11 per cent in 1993-94. There is a strong case for fixing an even lower norm for coupon rates on securities as (a) they are extremely safe and riskless investments; (b) the operational cost for the banks of such bulk investments are negligible; and (c) the average earnings on such investments should be lower than the average earnings on bank advances. (This is particularly important as long-term securities contribute the bulk of the banks' investment holdings.) With the benefits derived by banks from holding government securities in matters relating to capital adequacy, etc, banks would be clearly reluctant to expand their lending operations. Also, considering the opportunity cost involved in parting with government resources in the form of increased interest cost when a large number of socio-economic programmes are crying out for additional funds, increases in coupon rates on government securities should be effected in small doses of 0.25 percentage point. The current practice of allowing increases ranging from 0.50 percentage point to 2 percentage points shows utter insensitivity to sacrificing government resources to enhance rentier incomes in the economy. It is because of this insensitivity that the centre's interest payments have galloped from Rs 32,500 crore in 1992-93 (revised estimate) to Rs 38,000 crore in 1993-94 (budget estimate)—an increase of Rs 5,500 crore in contrast to an increase of Rs 3,607 crore in the centre's budgetary support to the central plan outlay for 1993-94.

ASSAM

Electoral Cleansing

Kamaroopi writes:

YET another controversy is building up in Assam over the 'special revised instructions' (these are no more described as 'guidelines') for revision of electoral rolls recently issued by the Election Commission, directing an intensive revision of electoral rolls in the state with reference to January 1, 1993 as the

'qualifying date' for inclusion. These instructions, issued on May 18, have caused considerable misgivings among many sections of the people, not all of whom can be described 'illegal infiltrants' or even as 'suspected illegal infiltrants', even while being welcomed by those sections passionately committed to ensuring an electoral roll 'cleansed' of all illegal aliens.

In this, the latest phase of the ongoing ding-dong battle between the Election Commission and the state government that began on August 21 last year, when the initial guidelines were issued, the state government appears to have secured the unexpected support of several tribal organisations. The All-Tiwa Students' Union and the Autonomous Lalung District Demand Committee, which are agitating for the constitution of an autonomous district comprising areas claimed to be predominantly inhabited by the Tiwas (formerly Lalungs); several organisations of the Mising people including the All-Mising Students' Union and the All-Rabha Sahitya Sabha have opposed those features of the instructions which, in their view, seek to exclude encroachers in grazing reserves and forest and 'khas' lands from inclusion in the electoral rolls. The United Minorities Front (UMF) too has opposed these directives.

The point of dispute is para 7.4 of the 'special revised instructions' which directs the electoral registration officer to ensure that "the names of encroachers on VGR [village grazing reserve] / PGR [professional grazing reserve] forest lands/ khas lands or any other government lands are not included in the draft rolls".

Almost as soon as the 'special revised instructions' were received, the state government pointed out the almost insuperable difficulties that would arise if these instructions were to be followed, given the fact that for years (if not generations) a very large number of people belonging to every class and community—indigenous tribal and non-tribal people as well as refugees and legal and illegal migrants from erstwhile East Bengal and East Pakistan and, later, Bangladesh (and Nepal)—have settled down in such lands. That the state government has been unable or unwilling to regularise these 'illegal' occupations or evict the 'encroachers' is, for the purposes of enumeration of potential voters, not strictly relevant.

As is the case with almost every official provision, the ban on encroachment into these grazing reserves, forest and khas lands, etc, has several in-built loopholes, though even without these loopholes, such encroachments, always made under political encouragement, could not have been avoided. Two types of grazing reserves came into existence in Assam in the 1920s. According to a state government publication (*Revenue Administration in Assam*, Government of Assam, 1990), "The VGRs are constituted near villages for facility of common farmers

having few cattle heads, while most of the PGRs are located in riverine areas or char areas for bigger herds. . . encroachments on VGRs and PGRs, if any, will be removed. Henceforth, land under VGRs and PGRs will not be further decreased by way of dereservation and allotment, etc, except for public purposes under special circumstances." These (in principle) admirable provisions have in practice been regularly violated at least to the extent that every kind of encroachment into these reserves has been tolerated (if not selectively encouraged on all sides) for decades.

What is surprising is that this, an essentially political and social issue has now got enmeshed in the regulations that are to govern the inclusion of a person's name in the electoral rolls. The lessons of the Assam Accord and, especially, the contretemps that accompanied the very first moves of the AGP government to implement some of its provisions appear to have been lost on all sides.

Clause 10 of the Assam Accord had also said (the choice of tense is deliberate for the Accord has been overtaken by other developments) that the Accord would ensure "all relevant laws for prevention of encroachment of government lands and lands in tribal belts and blocks are strictly enforced and unauthorised encroachers evicted as laid down under such laws". Interestingly, the AGP government whose leaders had ridden to power on the plank of evicting illegal aliens and who, in popular perception, were the biggest encroachers on government lands, began its moves against such illegal encroachments into forest lands where most of the encroachments have been by the state's own indigenous tribal and non-tribal people.

The measures taken by the AGP government to evict encroachments in forest lands led to the alienation of the tribal people—who by definition do not view themselves as encroachers in any part of the state—and the intensification of the then still incipient movements of various tribal organisations for greater autonomy within or total separation from Assam. Indeed, the shift in the strategic objective of the leaders of the 'anti-foreigner' agitation from eviction/deportation of such illegal aliens to securing the deletion of the names of the majority of such illegal aliens from the electoral rolls, and that too for a limited period of 10 years, shows that the leadership fully appreciated the political and demographic compulsions that it would have to face, and the allies it would have to work with, when once it assumed office.

Those parts of the 'special instructions' of the Election Commission which in essence constitute an intervention in such sensitive matters are likely to further exacerbate passions and create more divisions. But then, it is precisely such issues that continue to provoke the strongest passions also among

the advocates of a cleansed electoral rolls, however impossible such an objective appears to be in practical terms—something that the leadership of the Assam agitation was shrewd enough to realise when it signed the Assam Accord.

HUMAN RIGHTS

Not in Kashmir Alone

THE UN-sponsored World Human Rights Conference in Vienna seems to have sent South Block and North Block into a tizzy. The usually tongue-tied officials of the ministries of home and external affairs (who in normal circumstances would not part with any information, however innocuous it might be, on the sanctimonious plea of protecting the 'national interest'), have all of a sudden discovered the gift of the gab. In a whirlwind of briefings, they have been busy advising journalists as well as official and non-official delegates to the conference on how to behave as 'patriotic' Indians once they reach Vienna. They are expected to assure the western delegates how good a job India is doing in leading its citizens to the fairyland of 'human rights', and how the fierce demon of Pakistan is getting in the way of this wonderful journey!

A large number of NGO (non-government organisation) representatives from India are attending the Vienna conference, and the government is naturally keen on making them toe the official line on Kashmir and other issues. In one such briefing by the home ministry, the NGOs were warned against falling into the trap of Pakistani propaganda about the atrocities by Indian security forces in Kashmir. The NGOs were asked to counter allegations of atrocities by reiterating that it was Pakistan which had created the Kashmir problem by supplying arms to the secessionist militants there. In his attempt to substantiate this counter charge, the joint secretary in the home ministry who is in charge of Jammu and Kashmir (and 'human rights' to boot) was reported to have told the NGO representatives attending the briefing that Pakistani arms and ammunition seized by Indian security forces from captured militants since

1989 have been so vast as to equip three divisions of the Indian army. If this is true, there are legitimate reasons for cutting down on our arms expenditure. Let Pakistan take care of our arms needs by pumping into Kashmir all the sophisticated weaponry which then falls ready prey to our ever-vigilant security forces. One hopes that the delegates to the Vienna conference do not repeat such official claims, and further jeopardise India's tottering image abroad by making New Delhi a butt of ridicule.

But to turn to more serious matters, the bureaucrats in New Delhi are solely obsessed with the fear of Pakistani allegations about Kashmir in the Vienna conference. They are completely oblivious of other misdeeds of their government which are likely to draw criticism at the international forum. The forcible eviction of villagers from the site of the Sardar Sarovar dam and other dam-building projects (which has been documented by the ILO in a report accusing India of discriminating against tribals, which is to be presented at the Vienna conference), the connivance of the Indian administration and police in the killing of members of the minority communities in the recent communal riots, the abetment of the government in the continuation of social evils like untouchability, child marriage, child labour and discrimination against women, the heinous practice of police torture and killing of suspects in custody—all these issues will be raised by the NGOs, both Indian and foreign, at the conference. Can New Delhi hope to absolve itself of the responsibility of violating the human rights of these citizens by blaming Pakistan?

What needs to be emphasised—and exposed—both at world conferences and public platforms in India, is that the atrocities by the security forces in Kashmir are not isolated responses in an exceptional situation (of a 'proxy war' as made out to be by New Delhi), but a general manifestation of the brutalisation of the state machinery which violates the human rights of ordinary Indian citizens in every part of the country—whether in the Narmada valley, or in police custody, or in the tribal villages of the north-east, or in the slums and homes of the poor in Bombay, Delhi, Bhopal.

Special Statistics

Beginning this week (see pp 1151-1158) *EPW* will carry from time to time a Special Statistics series prepared by the EPW Research Foundation. The series will seek to present, in analytically meaningful form, up-to-date data on different aspects of Indian economy and society and on important international themes.

Monnet Ispat

MONNET ISPAT, promoted by Sandeep Jajodia and Jindal group's flagship company, Jindal Strips, is setting up a project for the manufacture of non-coking coal-based sponge iron with a capacity of one lakh TPA in district Raipur, Madhya Pradesh. The project is sited in a centrally notified backward area in village Kurud, eight kilometres from Raipur, with the advantage of being located in the iron ore and coal producing area and well connected by air, road and rail. Jindal Strips is an existing, listed and highly profitable company and is amongst the leaders in the steel industry in India. Its product range comprises stainless steel, ferro chrome, cold rolled steel, sponge iron, etc. Jajodia, with experience of over six years in manufacturing, international marketing, leasing and finance, etc, has promoted Monnet Ferro Alloys, manufacturing high carbon ferro chrome. Jindal Strips, under the chairmanship of O P Jindal, has developed indigenously the technology to manufacture sponge iron using the non-coking coal route at a substantially lower project cost as compared to other similar projects. It has already set up, using its technology, two modules of one lakh TPA each at Raigarh, Madhya Pradesh, to manufacture sponge iron which are running successfully. It is now setting up further manufacturing facilities to increase the capacity to six lakh TPA. O P Jindal is chairman of Monnet Ispat and Sandeep Jajodia the managing director of the company. Two important features of Monnet Ispat's project are its low project cost, which at Rs 36 crore is amongst the lowest in the industry, and the other is the 100 per cent buyback of its entire production by Jindal Strips for the first five years from 1992. As such the company does not envisage any marketing problem. In this light, leading financial institutions such as the ICICI, the UTI and Credit Capital Venture Fund have participated in the company's equity and NCDs to the extent of Rs 8.20 crore. The project is slated to commence production by August. The company expects to achieve 50 per cent capacity utilisation in the first year of operation and peak capacity of 80 per cent (output of 80,000 tonnes of sponge iron) from the third year. It is to earn cash profit amounting to Rs 3.56 crore and net profit of Rs 0.89 crore during the first year of operations. The company's financial projections, as appraised by the ICICI, are quite impressive. During 1993-94 (nine months), 1994-95 and 1995-96 its turnover is expected to be Rs 17.94 crore, Rs 31.10 crore and

Rs 38.28 crore, respectively, and is expected to earn a net profit of Rs 1.14 crore, Rs 4.91 crore and Rs 6.09 crore in that order. However, since commercial production is now slated to commence in August instead of in June as was proposed, the profitability figure for the year will be for a seven-month period. In order to part finance the project, the company is entering the capital market on June 21 with a public issue of 46,00,000 equity shares of Rs 10 each at par aggregating Rs 460 lakh. The company proposes to list its equity shares at Delhi, Bombay, Calcutta and Jaipur stock exchanges.

Ponni Sugars and Chemicals

Ponni Sugars and Chemicals is making a rights-cum-public issue of 14.70 lakh partly convertible debentures of Rs 150 each of which 4.04 lakh debentures are to comprise offer of rights to the shareholders in the proportion of one PCD for every 10 equity shares held and 9.60 lakh debentures public issue. A quantity of 1.07 lakh debentures is reserved for allotment to banks' mutual funds. The public issue opens on June 21 under ICICI and SBI Caps as lead managers. The debentures are being issued in two parts—part A of Rs 60 for conversion into two equity shares of Rs 10 each at a premium of Rs 20 per share six months after allotment, and part B of Rs 90 to be redeemed in the sixth, seventh and eighth years from the date of allotment. The debentures carry 16 per cent interest. The issue follows a proposal by the company to set up a new sugar unit with an installed capacity of 2,500 tonnes cane crushed per day at Bolangir, Orissa. The company, promoted by S Vishwanathan, took over in August 1991, a sick co-operative sugar mill at Bargarh, Orissa, having a capacity of 1,250 tonnes of cane crushed per day, on a contract of management to run a period of 16 years against receipt of royalty fees on a yearly basis. The capacity of the company until 1991-92 also was 1,250 tonnes of cane crushed per day with which it commenced operations in 1984 after it was incorporated in 1982. It was increased, however, to 2,500 tonnes of cane in 1991-92, with a turnover posted of Rs 39.52 crore for the year and a net profit of Rs 1.86 crore. The turnover with 1,250 tonnes capacity for 1989-90 was Rs 35.81 crore and net profit Rs 2.89 crore. The new sugar unit of 2,500 tonnes capacity is appraised by the ICICI to cost Rs 45.50 crore, which amount is being provided with share capital funds of Rs 8.13 crore, PCD issue of Rs 22.05

crore, rupee term loans of Rs 12.50 crore and internal accruals of Rs 2.82 crore. SPB Projects and Consultancy has been appointed the project consultants on payment of Rs 55 lakh fees. Operations are to commence from January next. ICICI has projected for the company a turnover of Rs 50.33 crore for 1993-94, Rs 55.65 crore for 1994-95 and Rs 78.62 crore for 1995-96, with net profit respectively of Rs 1.36 crore, Rs 2.34 crore and Rs 1.85 crore and EPS of Rs 3.37, Rs 2.31 and Rs 1.82. The management of the company expects it to be exceeding these projections. Vishwanathan, the promoter, has two other listed companies to his name—Seshasayee Paper and Boards and High Energy Batteries (India) with their turnover for 1992 amounting respectively to Rs 84 crore and Rs 10.52 crore and net profit to Rs 4.62 crore and Rs 25.90 lakh.

Ravileela Granites

Ravileela Granites proposes to expand the processing capacity of its existing unit at Sampannabolu village, 40 kms from Hyderabad, from 43,158 square metres of granite tiles to 81,600 square metres per annum at a capital outlay of Rs 980 lakh. The company is buying all the major machinery from Breton spa, Italy, for the manufacture of tiles of larger format and slabs with five feet width. It has already obtained quarries on lease from the department of mines and geology, government of Andhra Pradesh, with a total area of 14 acres of rich black and multicolour granite. Besides, it has made an application for quarrying lease in respect of three quarries of multicolour granite. It has entered into an MOU with Northeast Granites, USA, to sell its entire production for the next five years. It has already exported granite tiles and slabs worth \$ 2,17,750 to Northeast Granites and to the other US buyers to the tune of \$ 92,118. Orders worth \$ 6 million are awaiting execution. The company has implemented the first phase of the project covering the complete tile line and trial runs have been successfully completed, while the second phase is expected to be completed by September 1993. To part finance its expansion programme, the company is entering the capital market with a public issue of 63,70,000 equity shares of Rs 10 each for cash at par aggregating Rs 6,37,00,000, out of which 6,40,000 equity shares are earmarked for NRIs. The issue opens on June 21. Nagarjuna Finance, Hyderabad, and Prudential Capital Markets, Calcutta, are the lead managers to the issue.

—JK

Gains of Liberalisation

Jalraj Kapadia

OUTSTANDING performance 'has become customary for high profile Hindustan Lever, holding its sway in personal products and soaps and detergents and having diversified into chemicals (fluid cracking catalysts and functionalised biopolymers) and agriproducts (fertilisers and seeds). Its directors simply put the results for 1992 as 'satisfactory'. However, these illustrate the meeting of growth and profit targets by all sections of the company's business. Between them, in net sales, processed triglycerides accounted

for Rs 121,927 lakh (Rs 105,407 lakh in 1991), chemicals and agriproducts for Rs 23,567 lakh (Rs 21,230 lakh) and exports, personal products and others for Rs 30,209 lakh (Rs 24,124 lakh) in the aggregate figure of Rs 175,703 lakh (Rs 150,761 lakh).

As big turnover and big finance make the company's business, profit as return on sales and as return on investment have shown increases only in decimal points. But as return on equity there is an improvement of two percentage points to

29.55 per cent, while earnings per share has shown a fair increase from 5.73 to 7.03. This is commendable, considering that the exchequer claimed 57 per cent of the year's earnings, over two times the figure of operating expenses of 25 per cent. With a 19 per cent final dividend, the gross dividend is raised again to 42 per cent, after it was reduced in 1991 to 38.50 per cent following a 1:2 bonus issue.

The number one company in soaps and detergents, Hindustan Lever is taking over the one next to it, namely, the Tata Oil Mills. Its absorption will place Hindustan Lever in a better position in the soaps market by offering varied products in a varied price range. Meanwhile, the company is going global, having acquired 80 per cent of the equity of Nepal Lever which is setting up a modern soap, detergent and scourer plant at Hitauda in Nepal. The first stage of the project is expected to be commissioned by the end of 1993. A project is under way at home at Khamgaon in Maharashtra for manufacture of 'Pears' soap for world markets. With loss of opportunities in the erstwhile Soviet Union, the directors observe that the domestic policy framework also turned out to be "unusually export-unfriendly" during 1992. Apart from strong inflationary trend in the country, the directors also complain of the rupee's significant appreciation vis-à-vis European currencies and the replacement of the Exim scrip within a short time with the dual exchange rate mechanism. Nevertheless, the company's exports, including those made by 100 per cent subsidiary, Indexport, recorded an increase from Rs 202 crore in 1991 to Rs 224 crore in 1992 and generated surplus foreign exchange of Rs 82.20 crore, after meeting the requirements of imports, dividends and other expenses incurred in foreign exchange.

Research and development has continued to provide valuable support to the company's business. R and D work in chemicals is concentrated on developing new functional products for industrial use. A natural sunscreen agent has been developed and is undergoing product tests in India and abroad. An FCC additive for increasing LPG and gasoline yield in petroleum cracking has also been developed. A project in collaboration with Unilever for enzymatic modification of guar gum has progressed towards commercialisation. In addition, speciality chemicals are being developed for functional uses by a cross-section of industry comprising soaps, detergents, personal products, food, paper and textiles. With R and D the company is thus broadening

* Includes preference dividend Rs 4,14,071 1991-92, Rs 1,50,000 **Includes preference share capital Rs 50 lakh. 1991-92; Rs 25 lakh.

Figures in Indian Sewing taken from Abridged Report published. Thus, under Raw Materials consumed the figure covers manufacturing expenses of which Rs 3,995 lakh (Rs 3,493 lakh in the previous year) towards purchases made; under loans it covers aggregate of loan funds, under Gross Fixed Assets it refers actually to net block (cost less accumulated depreciation which is not shown separately) plus capital work-in-progress, and likewise in Net Sales the figure covers gross sales turnover, including services.

the base of its operations. At the same time, it is diversifying. A leather garments factory has commenced production at Madras while a project to process 'wool-on-leather', in collaboration with Sawyer of Napa, California, is at an advanced stage of implementation near Neyveli in Tamil Nadu. A fish paste ('Surimi') project to upgrade hitherto wasted fishery resources is under way at a cost of Rs 15 crore at Veraval, Gujarat, in collaboration with Shinto Corporation, a subsidiary of Toya Suisan, Japan, with 100 per cent buy-back of the product by the collaborators. The plant is expected to be commissioned in 1994.

Following the success of the pilot project to produce channel catfish in India, the company is now setting up a large-scale aquaculture centre at Thanjavur in Tamil Nadu for farming and processing catfish for the US markets in technical collaboration with FFDA, Florida, which has also provided a full buy-back arrangement. A 30,000 tonnes soaps packing plant by way of revival of the sick company, Sivalik Cellulose has been completed and is expected to reach targeted levels of capacity utilisation in 1993. The 10,000 tonnes per annum cosmetics and toiletries plant at Yavatmal, Maharashtra, has gone into commercial production.

POLAR INDUSTRIES Rise in Exports

With Polar Industries was merged Polar Electrotech with effect from April 1, 1991. The financial results of Polar Industries for the year ended March 31, 1992 present the combined position of the two companies. That the merger was welcome is seen in Polar Industries raising equity dividend for the year 1991-92 to 16 per cent from 10 per cent for the previous year, notwithstanding the increased equity from Rs 223 lakh to Rs 300 lakh as a result of the issue of 7,70,143 equity shares of Rs 10 each to shareholders of the erstwhile Polar Electrotech.

The company also increased the preference share capital to Rs 50 lakh with the issue of 25,000 additional shares of Rs 100 each to be redeemed from January 24, 1999 to January 24, 2002. The rate of interest on the preference shares is 14 per cent per annum. The preference dividend also has amounted more in the aggregate. The total provision for dividend has almost doubled from Rs 27 lakh to Rs 52 lakh, with the pay-out of equity dividend increasing from Rs 19.05 lakh to Rs 47.97 lakh.

Profit after tax has recorded over cent per cent rise from Rs 74 lakh to Rs 155

lakh as exports, at the same time, have improved from the previous year's figure of Rs 48.51 lakh to Rs 120.71 lakh. A further improvement is foreseen in exports as Polar fans have found wide acceptance in Gulf and European countries. To exploit these markets the company is adding a new range of fans with attractive colours, designs and styles.

Meanwhile, production has been stabilised at the pressing (called lamination earlier) division while the operations are being expanded to cover pressing of sheet metal in order to meet the requirements of the company. A new project for manufacture of die casting and sheet metal components is under way at a cost of Rs 5 crore to meet which a rights issue of equity shares in the proportion of one-for-one at a premium of Rs 8 per share is proposed by the company.

INDIAN SEWING Record Growth in Sales

The Singer company, Indian Sewing Machine, has achieved during the year to March 1992, a 17 per cent growth in sales and a 23 per cent improvement in profit before tax, while it has maintained dividend at 25 per cent. Sales growth reflects the advantages of zig zag sewing machines compared to straight stitch sewing machines as well as the growth of the market for home appliances. Between them, zig zag range of sewing machines and home appliances recorded growth of 41 per cent and 69 per cent, while the market for straight sewing machines showed a decline. With added features introduced, zig zag machines contributed 22 per cent to the total turnover, while in the appliances segment the company successfully added steam irons and rice cookers to the existing range. Exports through a wholly owned subsidiary, Himec India, amounted to Rs 129.35 lakh earning a profit of Rs 23.67 lakh.

Hire purchase business, an important activity for the company, is done by another subsidiary, Ismaco Engineering and Finance, which during the year disbursed Rs 547 lakh to finance individual hire purchase transactions of sewing machines and domestic appliances as compared to Rs 451 lakh in the previous year. As the dealer financing scheme was discontinued, the total of hire purchase disbursements declined from Rs 1,102 lakh in 1990-91 to Rs 641 lakh in 1991-92. The company has absorbed Mahavir Founders and Engineers having invested Rs 7 lakh in 50,000 equity shares of it. The company owns a foundry at Jammu which is the captive source of castings used by India sewing's Jammu factory.

The company augmented working capital resources with an issue of 14 per cent non-convertible debentures amounting to Rs 100 lakh which it privately placed with PNB Mutual Fund. The debentures will be redeemed seven years later at 5 per cent premium. The company is actively formulating a strategy for expansion under the liberalised government policies, feeling assured of the future outlook. Meanwhile, it is expanding the zig zag range of its sewing machines and even considering setting up a new project with Singer's technological support. It expects also to be making further progress in consumer products.

COLOUR-CHEM Higher Earnings

Gross sales of Colour-Chem for the year ended March 31, 1993, have shown improvement to Rs 181.31 crore compared to Rs 155.58 crore for 1991-92. So also have net sales to Rs 157.20 crore from Rs 133.72 crore and gross profit to Rs 16.94 crore from Rs 11.88 crore. After provision of Rs 4.69 crore (Rs 3.56 crore for the previous year) for depreciation and of Rs 12.25 crore (Rs 8.32 crore) for taxation, net profit has improved to Rs 8.60 crore from Rs 5.32 crore in the previous year. The unaudited financial results for the six months ended March 31, 1993 show an increase over the previous corresponding period in net sales from Rs 69.20 crore to Rs 82.58 crore, in gross profit from Rs 6.98 crore to Rs 9.60 crore and in net profit from Rs 3.26 crore to Rs 4.66 crore. Earnings per share (annualised) on paid-up equity share capital of Rs 9.63 crore (Rs 7.94 crore) has amounted to Rs 102 compared to Rs 67 previously.

VANAVIL DYES AND CHEMICALS Larger Trading Sales

Vanavil Dyes and Chemicals has reported for the year ended March 31, 1993 net sales of Rs 2,205.21 lakh against Rs 1,964.78 lakh for the previous year, gross profit of Rs 131.97 lakh (Rs 147.12 lakh) and net profit of Rs 70.87 lakh (Rs 81.47 lakh). The company's manufacturing operations and profits suffered a setback due to a prolonged strike extending to 107 days. However, an increase in the trading sales contributed to higher turnover. The directors have recommended a dividend of 15 per cent, the same as in the previous year. The board has also transferred a sum of Rs 25 lakh to the general reserve (previous year Rs 25 lakh) and a sum of Rs 20 lakh to the reserve for environmental upgradation (Rs 30 lakh).

Calcutta Diary

AM

These are obviously revolutionary times. Connotations of corruption and moral turpitude are undergoing a swift sea-change. The fervid debate in the Lok Sabha on the motion of impeachment of the judge adorning the nation's highest judiciary, who has given a new interpretation to the concept of carpet-bagging, bears this out.

THE income tax payable by its ministers, the Punjab government has decided, will henceforth be borne by the state. Taxation laws being what they are, this extra bit added to a minister's income, for the purpose of saving him from the pain and rigour of paying tax, will raise the gross income on which tax is payable, and is likely to entail payment of extra tax. The state authorities may however very well issue a further notification to the effect that the additional tax liability arising out of the official decision will also be covered by the government. The gross taxable income will consequently increase once more, perhaps inducing the government to make a yet further announcement fully compensating the ministers for the additional tax burden at the second stage. This could start off an infinite series of accretions to ministerial earnings, with each compensatory gesture on the part of the government attracting additional tax liability, immediately followed by further upward adjustment in the gross income of ministers, followed by further rise in tax liability, and the cows will never come home. Zero as well as infinity were the particular forte of Indian mathematicians of yore, who would churn out formulae involving the behaviour of such numbers. This passion for the theory of numbers had appeared to be dying out, until in the opening decades of the twentieth century, that weird genius from Kumbhakonam, Ramanujan, chose to make fresh contributions of a most enriching order. Punjab consists of doers, and the government of that state, through its treatment of ministerial taxes, has ventured into a significant practical demonstration of mathematical truths involving an infinite series. It has, in the process, also revolutionised a fiscal principle. According to conventional notion, a tax on income reduces the take-home pay; the authorities in Punjab have challenged that arcane doctrine; a tax on income, it has ordained, must enhance a minister's gross income and at the same time ensure the immutability of his take-home pay; the higher the burden of taxation, the larger

will be the gross income even while it keeps unchanged the take-home pay.

These are obviously revolutionary times. The revolution proceeds apace in other spheres as well. Connotations of corruption and moral turpitude are, for instance, undergoing a swift sea-change. The fervid debate in the Lok Sabha on the motion of impeachment of the judge adorning the nation's highest judiciary, who has given a new interpretation to the concept of carpet-bagging, bears this out. His peers might have found him guilty of the charges of financial waywardness posted against him, parliament however occupies a superior judgmental level. Crime, the Lok Sabha has decided by its vote, is not-crime. A is not-A, which is, in ordinary circumstances, absurd, but not in a revolutionary situation such as we are currently in. Already PhD theses are being hurriedly assembled on the social philosophy of the crooks who wheedled money out of the banks on the security of false bankers' receipts and, Bukharinites all, used that money to enrich themselves in the stock exchanges. Nothing could be more exciting or more revolutionary. The natives of this land have not only a way with the mathematics of numbers, they have a way with words too. They have, with more than a straight face, described the worst manifestations of capitalist aggrandisement as pristine socialism. That too is a revolutionary idea. Journalists not quite out of their teens have satisfied themselves that the former member of the Planning Commission, who used his official position to plan the acceptance of commissions from foreign parties for favours rendered and deposited such commissions in numbered Swiss accounts, is actually a saint and a visionary of the first water; at the same time, that abominable nineteenth century pest, Karl Marx, was an imposter deserving of retrospective beheading one hundred and seventy-five years after his birth and one hundred ten years after his death.

These revolutionary developments have little to do with the collapse of the Soviet system in eastern Europe or the gradual

flowering of liberalisation in this subcontinental country. There is of course an indirect nexus, since either phenomenon illustrates the triumph, in the domain of international relations, of the moral mindset attaching to the concept of the free market. The Americans have been unduly modest in not claiming their due share of credit for this great victory, and have been chastised on this score by such savants as John La Carre. A spin-off of the coming of age of the ethos of the free market, embodying the message that scruples be hanged and profit-making by hook or crook is the only consideration, is the emergence of a new philosophical perception: the policy of non-principle is the best policy. In the Indian ambience, we are at present witnessing interesting applications of this magnificent maxim. For example, the fundamentalists who went on the rampage at Ayodhya are arguing with telling effect that they could hardly be held responsible for the demolition of the Babri mosque; the reasons: (a) since the mosque was a non-mosque, its demolition too was an act of non-demolition, that was that; and (b) even assuming, for argument's sake, that the mosque was not a non-mosque, it was the business of the government in New Delhi to prevent them, the Decemberists, from demolishing it; because the authorities did no such thing, and on that famous December afternoon the prime minister preferred to have his usual siesta instead, that was, once again, that.

Or consider the case of the gentleman, a restless soul if ever there was one, who, four years ago, was determined to be the nation's prime minister, never mind the logic of numbers or the encumbrance of the political philosophy he was, till that time, wont to flaunt. He had barely thirty followers in the Lok Sabha in a house of five hundred and forty-two; he was however prepared to sup with the devil if that would lead to the fulfilment of his dream. It did; the policy of the non-principle was adjudged to be the best policy, and he became prime minister for four months. He paid a what-might-appear-to-others a heavy price for the transient enjoyment of the most coveted prize this nation can offer. His shenanigans can in a sense be held responsible for the transition of the polity to a milieu which rendered possible the ushering in of the World Bank-IMF epoch in Indian history. Even were one to brush that aside—on the plea that accidents of history are accidents of history—the supposedly minor gifts he was compelled to offer to the party which shored him up for those four months are worth writing home about. He, for instance, concurred

in the dismissal of the Dravida Munnetra Kazhagam government in Tamil Nadu on the flimsiest pretext. He gave in to pressures mounted on him in regard to appointments to three key posts: those of the Governor of the Reserve Bank of India, the Attorney-General of India, and, glory of glories, the Election Commissioner of India. The persons respectively named by him as RBI Governor and Attorney-General in no time found themselves sucked into the maelstrom of The Scam. The individual named as Election Commissioner, even a child knows by now, has discovered in himself the attributes of divinity; he was, he continues to assume, present at the creation of India's parliamentary democracy, he is equally determined to be present at its destruction. The prime-minister-for-four-months who was persuaded—if it pleases you, cajoled—into appointing this individual now regrets his decision. That does not necessarily mean that the gentleman who was the nation's most important person for four months is in a contrite mood. Nothing of the sort. He has not reined in his ambitions, nor would he contemptuously spurn offers to make him prime minister again for another stint of four months, or four weeks, or four days. His following in the Lok Sabha has meanwhile dwindled to just one, meaning that of himself alone. This minor aspect of reality does not cramp his style. He is back to spouting moral principles. It is India, circa the miserable final decade of the withering twentieth century.

Another of the past prime ministers, who unfortunately met a gory end, could hog one hundred per cent credit for the economic quagmire the country is currently in. A is nonetheless not-A. The economic debacle, through the courtesy of the media and testimonials from every foreign Tom, Dick or Harry, has been re-discovered as the miracle. It is an inspiring spectacle of collective auto-suggestion: prices are rising, but the housewife must agree that prices are falling; industry is in doldrums, but captains of industry must reconcile themselves to the illusion that they never had it so good; workers are being retrenched in their thousands, but they must feel proud and admit that the exit policy is really a policy for national renewal. And one must be careful not to raise unpatriotic questions on the state of agriculture, which has reverted to the state of being the unilinear, exclusive function of the weather. Here too, revolutionary forces are at work. At great cost to the nation, including the shelling out of precious foreign exchange, state-of-the-art hardware was imported for raising the level of precision in weather forecasting techni-

ques so that our farmers could be its major beneficiaries. It has however now been decided that, for reasons of state, the contents of such forecasts should be withheld from the people, including, it goes without saying, the farming community. Knowledge is harmful to the security of the nation, including such knowledge that A is not-A.

We can usefully get back to the Lok Sabha debate which decided on the non-impeachability of the judge whom his peers had adjudged to be a purloiner of public property and a defalcator of public funds. He could not be impeached because the ruling party found the whole idea disgusting beyond words. The decision not to support the resolution proposing impeachment was reached by the party on impeccable moral grounds. Was not the judge named to the Supreme Court by the great prime minister instrumental for initiating the process which has ensured the nation's arrival to the present state of economic arcadia? Was not the very same great prime minister against this impeachment proposal when it was first mooted, would it not therefore be equivalent to committing lese-majeste of his memory to support it now? Besides the judge being pilloried hailed from Tamil Nadu; will it be ethical to impeach a judge from Tamil Nadu while not impeaching judges hailing from other states? Will that not infringe Article 14 of the Constitution, and moreover give a handle to the forces of national disintegration? A minister—one presiding over the ministry of legal affairs, no less—raised the debate to an even higher moral level: if the honourable judge was guilty of moral turpitude, why they, the ministers themselves, were no less guilty, for they too, each one of them, used public resources for private purposes. After such confession, what non-forgiveness? Since he and his colleagues were not being called to account for their malfeasance, what moral right had parliament to impeach the judge? Finally there was that innocent-eyed honourable member belonging to the ruling party who failed to see what the brouhaha was about; the judge stole money from a state government, not from the till of the union government, so why should they bother in the nation's capital? It was left to the official spokesman of the party to make the clincher of an authoritative pronouncement. Members of the ruling party were asked not to vote in support of the resolution for impeachment because, according to the party, the judge was guilty of a relatively unimportant misconduct like fiddling of accounts; in other words, it would have been a different matter if he had murdered an advocate or a brother

judge or raped an advocate's or a brother judge's wife; he had done no such thing; since he had only pocketed money he had no business to pocket, he remains very much an honourable man. The party, after all, had to take a moral stand: what will happen to this great nation if a judge were to be hanged merely because he was a thief; India is a country where the rule of law is firmly established; medieval excesses are not permissible here.

Moral principles were married with shrewdness in the ruling party's decision to turn the motion for impeachment down by abstaining from voting. There was here some truly fast thinking on the part of the party leadership. On the eve of the debate, it was announced with much fanfare that, on this grave issue involving moral stakes, it would be hardly proper for the party to issue any whip, members of the Lok Sabha belonging to the party could vote according to the dictates of their conscience. The trend of the debate made it obvious though that the overwhelming majority of the MPs, given their firmly held belief in the moral principle of A being not-A, would vote against the motion of impeachment. The party leaders, including the prime minister, had hurried second thoughts. No doubt the party and its leaders are confirmed votaries of turpitude, whether financial or moral. But the social awareness of the electorate lags behind; it might fail to appreciate the lofty ethical reasons on the basis of which the party approved of the judge's thievery. A misunderstanding of this nature deserved to be avoided. The courage of conviction was accordingly a non-starter, and the ruling party just stopped short of endorsing, in toto, the doctrine that the more crooked you are, the higher is the social and political status you could claim for yourself in this revolutionary society.

Such occasional mishaps do occur in revolutionary times. Where thought and ideology are concerned, the leaders are often ahead of their followers. Which is why they are known as the vanguards of the revolution. A revolution is not a cocktail party; it involves occasional switching and re-switching of decisions and measures, otherwise known as the two-steps-forward-one-step-backward drill. The abstention on the motion for the judge's impeachment was the unfortunate one-step-backward part. But we shall overcome one day.

Janakiraman Reports on Banking Scam

By a Special Correspondent

The six reports of the Janakiraman committee have painstakingly unravelled the details of the banking-stock market scam involving banks and other financial institutions, stock brokers and public sector undertakings. What they have failed to do is to shed light on the contribution of the overall policies and attitudes of the government and the country's central bank to the perpetration of fraud on such a massive scale.

THE committee constituted by the Reserve Bank of India (RBI) under the chairmanship of R Janakiraman to enquire into the massive financial scandal in banks and financial institutions has rung the curtain down on its labours after releasing two further reports simultaneously. The fifth report has presented the committee's findings in respect of 10 more banks and financial institutions which had not been covered in the earlier four reports, as also fresh findings in respect of some already covered. Apart from giving an overview of the irregularities, the sixth and final report goes beyond the micro details and presents an assessment of the key elements in the perpetration of the fraud, the nature of the nexus between banks and brokers and amongst banks, an explanation of why the irregularities were not detected earlier, an assessment of what the committee itself had been able to achieve and what it could not and a set of recommendations, some of which had been put forth in the first report but also some fresh ones.

Overall, it can be said that the six reports of the Janakiraman committee represent a fairly thorough professional piece of work. The vast number of banks and institutions covered and the massive number of transactions probed into, in the short span of about a year, indeed called for painstaking work, meticulously establishing the links between different legs of the transactions involving banks and brokers. The reports provide useful insights into how a fossilised system can be exploited by crooks with impunity and also interesting lessons for all concerned—the RBI's proposed supervisory set-up, the accountancy profession, the internal auditors of banks and financial institutions and, above all, the managements of banks and financial institutions. The

reports may have disappointed those who expected earth-shaking revelations regarding the funds siphoned off abroad, individual culpability among banks and institutions and the nexus between them and politicians. Objectively speaking, the committee as it was constituted was not capable of probing these broader aspects of the fraud. Instead it has done what was expected of it, which was to dissect the *modus operandi* of the transactions, the various nexuses involved in them, and the motivations behind them. Obviously, it is the Joint Parliamentary Committee (JPC) which has to probe the banker-broker-politician connections. Similarly, it is for the investigative agencies, who have the power to summon and question individuals, to go into the question of individual culpability. The detection of individual guilt in fraudulent practices which have gone on for so long and on such a massive scale in such a large number of institutions is a very complex task. To quote the Janakiraman committee report, it "is an endless task". Unless a thorough investigation of specific transactions is undertaken and responsibility is fixed in regard to the execution of a given piece of malfeasance, it would be improper to pass judgment on any individual's involvement. Every dealing in every bank will have to be examined separately and responsibility apportioned at every level of the hierarchy. Again, the nature and extent of involvement would be different at different levels of the hierarchy in a bank or financial institution. More often than not, the role of the top executives who mastermind the shoddy dealings may not show up on the surface and hence the Janakiraman committee has rightly recommended that the managements of individual banks (and the RBI, in the case of the banks' top managements) handle the question of individual

culpability. If the government itself does not show sincerity in punishing the guilty, the RBI, the managements of individual banks and even the intelligence agencies, who wield enormous powers of enquiry and prosecution, can do very little. The JPC should demand periodic reports on the progress of enquiries into individual culpability and on punishment of those found guilty, including those within the top managements of banks.

THE RING-LEADERS

No doubt, 34 out of the 180 banks and financial institutions have been involved in the irregularities, but it should be emphasised that, both in regard to the initial motivating force in the mid-1980s and the subsequent momentum acquired during 1991-92 due to the so-called economic liberalisation the guilt is concentrated in a few banks and institutions. The whole process was led by four foreign banks under Citibank's leadership (the other three being Stanchart, Bank of America and ANZ Grindlays). This was followed by Canara Bank and its subsidiaries. Anyone familiar with the banking scene will recall how the foreign banks led by Citibank and the then chairman of Canara Bank, the late B Ratnakar, had during the mid-1980s, when the first phase of liberalisation was foisted on the country by Rajiv Gandhi, created the impression that they were close to the powers-that-be and that they were the trend-setters in the process of financial innovation which had the blessings of the government, even if it meant breaking the rules of the game. As the Janakiraman committee has emphasised, the irregularities have largely arisen out of attempts to circumvent RBI guidelines. The above-mentioned few banks and institutions pushed ahead with their irregular activities in two forms, namely, the portfolio management scheme (PMS) with assured rates of return and for durations of less than one year, contrary to RBI guidelines, and the financing of brokers through illegal ready-forward and double ready-forward deals, through money market operations, and discounting of fictitious bills. Such activities became so blatant and widespread that they almost emerged as 'market practices' and hence some other institutions also joined the fray. But a few continued to dominate the fraud scene. Canfin and the three foreign banks (Stanchart, Hongkong and Citibank) accounted for Rs 32,255 crore (or 83.4 per cent) of the

total funds under PMS and similar schemes (Rs 38,675 crore) during the period of a year and a half from January 1991 to June 1992. Likewise, in the various transactions relating to government securities, PSU bonds, Units of UTI and others primarily used to finance brokers or those booked through brokers which aggregated a mind-boggling amount of Rs 1,285,549 crore during the 14-month period (April 1991 to May 23, 1992), the top four banks involved were foreign banks (Citibank, Stanchart, Bank of America, and ANZ) which accounted for 51.1 per cent of the total transactions. The fifth position was occupied by Canbank Financial Services (accounting for 7 per cent) and the sixth position again was held by a foreign bank (American Express). Yet another important institution involved in PMS transactions was Andhra Bank Financial Services. It is interesting that the key personnel in this institution as also in some of the foreign banks had been drawn from the Canara Bank family.

It is significant that the main source of funds for the irregular transactions were PSU bonds. It is reported that the aggregate acquisition cost of PSU bonds held by the banks as part of their own portfolios and in PMS and other schemes was Rs 10,681 crore, 56.4 per cent of a total outstanding amount of Rs 20,550 crore as on March 31, 1992.

A statistical analysis of the transactions in securities in banks brings out the extent to which the system had degenerated. Of the astronomical figure of transactions of a face value of Rs 1,285,549 crore (two times the country's GDP, and 5.5 times the size of bank deposits), only Rs 69,192 crore (or 5.4 per cent) was for outright or such other similar sales or purchases; the others were ready-forward or double ready-forward or other transactions. Secondly, of the total amount, government securities constituted Rs 607,627 crore (47.3 per cent), while PSU bonds Rs 494,415 crore (38.5 per cent). With 35,352 transactions in PSU bonds, the amount of Rs 10,681 crore held by banks has been roughly turned over 46 times in the short period of a year and a half. Thirdly, the large indulgences have not been entirely due to the PMS clients. Own-account transactions aggregated Rs 865,449 crore (67.3 per cent) while transactions relating to PMS clients worked out to Rs 340,303 crore (26.5 per cent) with another Rs 79,797 crore (6.2 per cent) attributed to transactions on behalf of others including brokers. Fourthly, broker-wise analysis of the transactions reveals that the bulk of what are shown as direct transactions also pertain to transactions with 'routing' banks where the counter-

parties were in fact brokers. The transactions essentially involved brokers. Assuming that transactions for Rs 1,000,000 crore out of Rs 1,285,549 crore were undertaken through brokers and if brokers earned a net profit of just 0.5 per cent out of the total amount of these transactions, an amount of Rs 5,000 crore would have been generated as profits for the broker community during less than 14 months between April 1, 1991 and May 23, 1992. The committee has identified as many as 24 major brokers who have shared this booty. Three top brokers, namely, Hiten Dalal, Harshad Mehta and Bhupen Champaklal Devidas have accounted for 31.3 per cent of the transactions booked through brokers.

BANKER-BROKER NEXUS

The Janakiraman committee has identified seven types of irregularities committed by banks in the operation of the PMS system: indicating assured rates of return; providing of the funds collected under the PMS and other schemes to brokers under ready-forward transactions; failure to ensure that the PMS funds were in fact invested in areas in which the clients were legally permitted to invest; attempts to siphon off the excess earnings on PMS funds through artificial rates shown on books so that the actual earnings remained close to the indicated rates; the crediting of lower yield rates on PMS accounts than those credited to banks' own accounts whenever composite sales were made; failure to provide full details of PMS accounts to banks' clients; and finally, fictitious transactions of loaning customers' Unit holdings to the bank concerned and siphoning off the income in the PMS account to the credit of the bank. The total amount of funds so generated on PMS account on Units by Citibank was Rs 411.21 crore. Interestingly, in all these irregularities the Citibank has been singled out for mention by the Janakiraman committee.

The banks and institutions involved in the PMS irregularities are five foreign banks (Stanchart, Citi, ANZ and Bank of America), Canfina, Andhra Bank Financial Services, Syndicate Bank and Vijaya Bank. The beneficiaries were all brokers. The PMS funds as also large amounts of their own funds were lent to brokers in the form of ready-forward transactions. As ready-forward transactions could be entered into only with banks and only in respect of government securities, transactions were recorded as though made with certain counter-party banks, but their actual beneficiaries were brokers. To accomplish this, certain banks acted as 'routing' banks for brokers. The 'routing' banks in turn purchased and sold securi-

ties in their own names without indicating that they were acting on behalf of brokers. When securities did not exist, they even created fictitious BRs. Many fictitious entries were made debiting the cost of purchases to the brokers' accounts and crediting the sale proceeds also to the brokers' accounts. As many as nine major banks functioned as 'routing' banks in favour of 14 brokers. Brokers liberally used banks as counter-parties, sometimes even without their knowledge. Many purchasing banks were unaware of the fact that they were dealing with brokers and not with counter-party banks. When delivery was not effected of securities for which payments had been made, the liability was denied by the banks whose names were shown as counter-party banks.

A significant part of the problem has arisen on this account. The Janakiraman committee has now updated and worked out the gross problem exposure of banks at Rs 4,024.45 crore—a significant increase from the first report's estimate of Rs 3,078.63 crore—comprising (a) total value of investments made by banks for which they do not hold any securities, SGL forms or valid BRs (Rs 2,262.57 crore); (b) total exposure against BRs/SGL transfers issued by Bank of Karad and the Metropolitan Co-operative Bank for which there appears to be no security backing (Rs 1,473.47 crore), and (c) other items (Rs 288.41 crore). This gross problem exposure does not include the depreciation or losses suffered by several

JUST OUT

Access to Justice: A Case for Basic Change *Justice V.R. Krishna Iyer*

1993, xiv, 164, Demy 8vo.
ISBN 81-7018-755-9 • Rs. 150

The book is a critical study and suggests curative strategies which deserve the attention of all those who are deeply concerned with the fulfilment of the constitution's *first promise* to the Indian people, viz, justice—social, economic, and political.

banks as ready-forward transactions could not be reversed and the banks were left holding securities which had depreciated in value. Only a small amount of Rs 600 crore or so is in sight as having been recovered by banks.

The most revealing aspect of the Janakiraman committee's final report relates to the close nexus between brokers and certain banks which enabled the brokers to have unlimited access to funds: Harshad Mehta with SBI and its subsidiary, State Bank of Saurashtra, and also with its merchant banking subsidiary, SBI Capital Markets; Harshad Mehta with the National Housing Bank, ANZ Grindlays Bank and UCO Bank; Hiten P Dalal with Stanchart and Citibank and, through another broker A D Narotram, with Bank of Karad and the Metropolitan Co-operative Bank; Stewart and Company and C Mackertick with Citibank; Hiten P Dalal and C Mackertick with Canfina. There are many more such examples and also examples of the nexus among banks whereby one bank could be used as a source of funds and another as a disburser of funds.

The key element in the perpetration of the irregularities was the BRs which were used to generate transactions that had no security backing. BRs were used almost as negotiable instruments and transferred from one bank to another and also third party BRs were accepted by banks. As the Janakiraman committee report argues, "the indiscriminate use of BRs without security backing created a kind of paper money which circulated from bank to bank like a stage army of soldiers and provided an opportunity to brokers to avail of funds of increasingly larger amounts". All these irregularities were possible because of the complete breakdown of the system of internal control in a number of banks.

PREMATURE LIBERALISATION TO BLAME

While the Janakiraman committee has thus unearthed various dimensions of the irregularities with commendable insight and thoroughness, it is on a weak wicket on two counts, namely, in its perception of the environment which facilitated the perpetration of these irregularities and, second, in its analysis of the reasons why the irregularities were not detected earlier. In explaining the environment, the committee has fallen for arguments similar to what the protagonists of liberalisation have been advancing, namely, that the rigid regulatory environment created arbitrage opportunities for banks whereby funds could be borrowed cheap and re-lent dear. The committee's arguments runs along these lines. First, with the withdrawal of budgetary support, the PSUs

had to raise funds massively in the market. With the short-term money market closed to them, they needed an investment avenue yielding more than the coupon rate on their bonds. Therefore, the PSUs raised huge funds from the banks and re-lent them through the PMS. Secondly, the stock market was booming and the 'bulls' needed to finance their over-bought positions, never mind the high badla rates. Thirdly, bankers who faced rigid controls on interest rates and cash reserve and liquidity requirements, and who accepted high cost funds from PSUs, saw that the only avenue which yielded high enough returns was financing of stock brokers in a booming market. The committee seems to overlook that given the free play of opportunities, such arbitrage possibilities between speculative brokers operating in the stock market and banks flush with funds always exists and that is the reason why lending by banks in favour of brokers and against corporate equity is rigidly controlled the world over. In the present instance, it is unnecessary to credit the system with such learned responses based on regulated or non-regulated environments. Essentially the predatory instincts of the foreign banks (and one or two Indian bankers) overtook the system. In the first place, PSUs did not require the funds for investment and yet they were allowed to borrow massive funds through PSU bonds. Such funds were deposited with banks under the PMS, so that the banks could lend them to brokers. It was a system of fraud perpetrated with the connivance of banks, brokers and PSUs. It is now revealed how Harshad Mehta had been enjoying the benefits of over Rs 5,000 crore worth of PSU bonds for over five years. It could not be that any of the broader considerations of rigidity of banking regulations played any role in this largesse which the PSUs conferred on the big broker through the commercial banks. Secondly, it is a moot point if the share prices would have boomed but for the availability of these scam-generated funds for the brokers. Thirdly, no where in the banking world can yield rates in the short-term money market ensure regular returns higher than yield rates on long-term bonds. This is a myth created by the liberalisers to condemn the erstwhile regulatory system. Fourthly, the irregularities, with the foreign banks in the lead, were not restricted to PSU funds. Fictitious and artificial funds were generated out of thin air through BRs and SGLs just to finance the brokers illegally. If anything, it was premature liberalisation which gave freedom to banks to create parabanking subsidiaries and which totally freed the money market from interest rate regulation that facilitated the so-

called arbitrage operations. If the supervisory system remains weak, frauds will occur in any environment, controlled or liberal. The fact that banks have incurred losses on a massive scale, including of about Rs 800 crore through depreciation in the value of PSU bonds, suggests that there was hardly any trace of professional ingenuity, competence and calculation on the part of the banking personnel who indulged in arbitrage operations; it was a crude method of financing brokers who enticed the bankers with the prospect of book margins and profits.

As for the reasons why the irregularities were not detected earlier, the Janakiraman committee appears to be soft on all the three major parties, namely, the bank managements, the supervisory authority (i.e., the RBI) and the banks' internal auditors, who should have detected the irregularities. There is no doubt that the failures everywhere have been at the top for want of professional commitment and competence. In the banking industry, over the years, the quality of personnel in the higher echelons has been deteriorating. Likewise, in the case of the Reserve Bank, the Janakiraman committee argues that in emphasising the quality of banks' assets, provisions for doubtful debts, etc., the central bank did not perhaps give sufficient importance to the banks' treasury functions. It also points out that the RBI had nevertheless detected some of the irregularities earlier. This may be true and may redound to the credit of lower-level functionaries in the RBI. Even so, irregularities on such a massive scale for so long a period since the mid-80s could not have occurred but for lack of vision and foresight in the higher echelons of the Reserve Bank. The Janakiraman committee report is silent on this aspect of the RBI's failure.

Lame-Duck Government and MNCs' Challenge

BM

The siren song of multilateralism in world trade and economic exchanges is being used to persuade the developing countries to open up their economies to the goods, services and capital of the developed countries even as the latter feverishly raise protectionist walls for themselves, set up restrictive trading blocks and mount bilateral pressures. However, the minority Narasimha Rao government, its credibility thoroughly eroded, is in no position to provide an effective riposte to these challenges.

THE result of the by elections to the Lok Sabha and state assemblies in May have further eroded the credibility of the government headed by Narasimha Rao. The Congress (I), running a minority government, has suffered a severe setback in the elections. Coming in the wake of a series of other embarrassing developments, among them its discomfiture over the impeachment motion against justice Ramaswami and the MP high court verdict against the dismissal of the BJP government in MP, the question of revival of popular rule in the states placed under president's administration after the demolition of the Babri masjid, has been placed squarely on the agenda. Thereafter a mid-term poll for the Lok Sabha is bound to become unavoidable. Any attempt to circumvent the demand for a fresh poll at the centre will be impossible in the event of the Congress suffering a major debacle which is very much on the cards in the assembly elections in UP, MP, HP and Karnataka. The fact that the minority Congress (I) government still perpetuates its ill by manipulating votes in Lok Sabha is likely to have serious consequences for the already shaky democratic base of the government and its organs.

The failure to respond positively to the imperative of a fresh mandate for any arrangement for governance at the centre will mean that those who occupy positions of power without popular sanctions at different points in the polity will resort increasingly to intrigues, manipulations and authoritarian methods to exercise power. The trend in this direction have already become so normal that the normal life of ordinary citizens is being affected and civic order and public norms are being disregarded in the name of the state by many individuals as well as groups in

a position to do so. Lumpen behaviour in political and civic life is growing. Violence is tending to be pervasive. Felt grievances, problems and disputes are leading to defiance of lawful authority. Political chaos in the wake of what led up to the December 6 events and the subsequent widespread rioting and violence culminating in the Bombay bomb blasts is visibly leading to chaos in civil society and its day-to-day functioning. Political leaders, those in office or in the opposition, must not take an ambivalent view of the prevailing conditions and mood of the people. The government might have survived the budget session of parliament by taking advantage of the disunity among the opposition parties. But this has not improved its political viability. It is not surprising either that factional squabbles in the ruling party have further intensified. The crude efforts of the dominant faction to assert its supremacy in the party have not proved to be very effective. The recent conflict with and the consequent discipline in the party have turned out to be farcical. The stand taken by the Congress (I) leadership on the motion to impeach justice Ramaswami, which has sullied its image as a party which is willing to condone corruption in high places, testifies to the vulnerable position of the so-called party high command.

COMPETING WITH PJP

The high command is seen to be concerned only with personal and sectional interests. It is resorting to tactics for survival which are dangerous. The prime minister has had no hesitation in entering into questionable deals with reactionary and obscurantist elements in India. He has also been active in promoting deals with foreign business interests about

which there are questions galore. There is total disregard for the principles of accountability and transparency in the functioning of the government. For instance, the prime minister declaimed not long ago that puja in the temporary 'Ram temple' put up by VHP at Ayodhya had been allowed by the district authorities without reference to the centre. Now it being asserted that the 'som yagna' organised by Chandraswami, the notorious godman close to the prime minister, at Ayodhya has nothing to do with the government. But the district administration is known to have been overhauled to suit the convenience of the godman after the newly appointed governor of UP openly declared his support for the 'yagna'. The much-advertised fight against communal forces has turned out to be a competition between Congress (I) and BJP in building the Ram temple at Ayodhya and in mobilisation of 'sants' and 'mahants' behind their respective camps. This competition is being organised within the framework of a possible Congress (I)-BJP coalition, an idea which is being discreetly projected as a possible political resolution of the problems facing Congress (I). The deceptive postures of Narasimha Rao of consensus politics and of strict action against anti-secular forces are turning pathetic. The BJP-RSS combine is treating them with derision. The NF Left alliance can only be sceptical about them. All this has created an environment, political and social, which can have tragic consequences for Indian democracy and the needs and aspirations of its variegated society.

Questions of economic revival and of appropriate policies to that end have been pushed far into the background. This has been found to be very convenient by the government in respect particularly of the talks GATT round of negotiations. The shady manner of functioning of the Rao government attracts special interest in this context. These negotiations are now entering their final stage. The round was stalled for quite some time by differences among the developed countries, but these differences are now being ironed out. The developed countries, while they have contradictions among themselves over some aspects of the world trading arrangements, are working in concert to pressurise the developing countries to submit to their collective concerns. Pranab Mukherjee, after he took over charge of the commerce portfolio in the cabinet, has become very active in favour of accepting the G7 diktat for a GATT treaty which will so manage world trade as to promote the unhindered operations of multinational corporations and transnationalise

global economic exchanges for their advantage. The notion that what is at issue is just some adjustments in the intellectual property rights regime, capital flows and trade in services is wrong. The GATT round actually seeks to create conditions which come into conflict with the development aspirations of the people in the entire third world.

MOUNTING PRESSURES

In the case of India, they conflict with not only existing Indian laws but India's fundamental law, the Indian Constitution itself, on several counts. The agitation of large sections of peasantry against the proposed globalisation of even the farm sector should have jolted the government. But this has not happened. On the contrary, attempts are being made to put a gloss on the GATT round and to fall in line with the G7 proposals for the management of world trade in goods and services and of world capital and technology flows. This will totally nullify the strivings of the developing countries after gaining political independence for a world economic order which would make it possible to sustain and accelerate their development. The siren song of multilateralism in world trade and economic exchanges is being used to persuade the developing countries to open up their economies to goods, services and capital of the developed countries even as the developed countries feverishly raise protectionist walls for themselves, set up restrictive trading blocks and mount bilateral pressures on individual developing countries.

The new US administration has queered the pitch for India by again naming India under clause 301 of its trade law. It had earlier withdrawn preferential tariffs for some of Indian goods, especially drugs, exported to the US. When confronted with this issue, commerce minister Pranab Mukherjee bravely stated that the government would not engage in bilateral negotiations with the US on GATT issues under the threat of special 301, but would negotiate the issue of intellectual property rights and other matters in the GATT round. In fact senior officials in the commerce ministry have been sent to Washington to assure the US that what the US desires under special 301 would be given to it under the GATT round. This is the reason for the US decision to keep sanctions against India under 301 in abeyance.

It is not at all fortuitous that the disbursement of foreign credits even after they have been sanctioned is being held up and foreign investment is not being made even after they have been approved.

More and more stringent conditions and terms are being attached to these credits and investments. In this process, the government has become more and more vulnerable to foreign pressures.

The position of the government and the IMF management on exceptional financing facilities for India is an interesting case study in this context. Before India's finance minister, Manmohan Singh, went to the recent meetings of the IMF and World Bank at Washington, there was talk in some quarters, evidently inspired by finance ministry officials, that with India's foreign exchange reserves position becoming strong after the introduction of the unified exchange rate regime for the rupee, it may no longer be necessary to go in for the medium-term extended financing facility with all its stiff conditionalities. The idea obviously was to create the impression that the government had regained its initiative to bargain with foreign creditors and international financial institutions. The truth, however, is that the request for the IMF facility has been pending before the IMF management for quite some time, in fact as an extension of the standby credit negotiated in 1991. One of Manmohan Singh's tasks in Washington actually was to try to explain the government's need for this credit line and clear the way for formal negotiations for securing it. There is a great sense of satisfaction in the finance ministry that the managing director of the IMF responded favourably to this position. The negotiations on the EEF are now due to start in July after the annual Aid India Consortium meeting at Paris. What happens at Paris too will, therefore, be interesting to watch as it will have a bearing on the EEF negotiations.

MNCs ON OFFENSIVE

Side by side, MNCs are playing their own well-rehearsed games in India. They are taking measures to establish for themselves a commanding position in the Indian market. After the amendment of FERA, so that foreign holding in a company in India is no longer limited to 40 per cent of the equity, the field has been cleared for transnational corporations to upgrade their holdings to 51 per cent and more or directly set up subsidiaries in India. The MNCs have taken big strides in this direction. A significant part of their moves is the removal of any Indian touch in the brand names of products and services of ventures in which they hold equity. The idea that joint ventures in India will provide an opening to Indian business enterprise to associate with globally well-established brand names was fanciful to begin with. The question of developing

Indian brand names in the global market with the help of MNCs is a pipe-dream. It is not surprising either that direct foreign investment by transnational corporations in their ventures in India is still kept at a low level. After the initial minimal investment is made, expansion of their business in India is made contingent on profits generated in India, only a part which are reinvested here. Take, for instance, the funding of the expansion scheme of the most shining example of Japanese investment in India. Suzuki is insisting on large dividend repatriation on its investment. But it does not propose to make large additional direct foreign investment and will prefer to use internal reserves and funds raised from the Indian market to finance the expansion programme of Suzuki-Maruti.

This is not something novel. The transnational corporations which have for long engaged in business in the Indian market have followed this policy with great success. Unilever is a striking example in this context. Its Indian subsidiary, Hindustan Levers, has grown into a giant enterprise in India despite the erstwhile restrictions on foreign shareholding. With FERA restrictions gone now the business ambitions of Levers have grown enormously. It is now engaged in the takeover of several Indian companies. The most spectacular catch in its bag is Tomco, a company belonging till recently to the biggest Indian business house, the Tatas.

The spate of joint ventures established as part of the economic liberalisation drive in the second half of the 80s, according to C K Prahalad of the University of Michigan, provided transnational corporations the opportunity to participate in and get to know the Indian market at low cost. The initial investment was low. The MNCs could establish their brand names: first as "hyphenated brands such as Maruti-Suzuki, Hero-Honda and Modi-Xerox. MNCs did not have the burden of exports. The joint ventures were not foreign exchange neutral to India". Further, "as these MNC brand names take hold and come to signify a level of quality, the value of the Indian part of the hyphenated brand name is likely to become less and less ... Indian firms will then have a difficult time penetrating the world markets". The process envisaged by Prahalad is already unfolding and its acceleration is logical as part of the liberalisation-globalisation process. Indian big business interests which have developed comprador relations with multinational corporations through joint ventures are ready to provide a social base for MNCs and function as their commission agents with far-reaching implications for India's socio-economic development.

Mobilisation against Communalism in South Maharashtra

Anant Phadke

The strategy of combining an anti-communal appeal with a plea for evolving an alternative path of development has led to mass mobilisation in southern Maharashtra.

A 30,000-strong 'parishad' was organised in a small village, Kini, in Kolhapur district in southern Maharashtra against communalism, against the Congress-BJP axis and pleaded for a new direction in a new agricultural development. Against the background of a low-key, weak response of the left in Maharashtra to the onslaught of aggressive Hindu-chauvinism and the new economic policy, this parishad stands out as a bold, welcome initiative. Baba Adhav, the noted socialist reformer, had taken the initiative in Pune to organise a rally of all democratic, secularist, leftist forces in Pune, on Republic Day this year. This national 'Integration March' in Pune of over 5,000 people showed that given determined efforts, people can be rallied for a secular stand.

The Kini parishad has not only demonstrated this again but has gone beyond the Pune rally. It was bigger and had a wider appeal and agenda and was a rural mobilisation. Inaugurated by the famous progressive film artist, Nilu Phule, this parishad was organised jointly by a combine of a handful of left activist leaders from south-west Maharashtra. Nagnath 'Anna' Naikwadi, the revolutionary freedom-fighter (a member of the revolutionary 'Prati-Sarkar' group in 1942) turned leftist took the initiative. He has a charismatic image which was an important factor for the success of the parishad. This 70-year-old independent leftist leader has been the moving spirit behind and is at the helm of the famous Hutatma Ahir Sugar Co-operative factory. This is the best run co-operative sugar factory in Maharashtra and its functioning has been quite democratic, egalitarian and free of corruption, mal-utilisation of funds, indifferent management, nepotism, etc. It has therefore been consistently paying a higher price for cane-sugar than any other sugar factory. In addition a good amount of money is spent on pollution prevention measures. Anna is, therefore, looked upon by many farmers as an alternative to the sugar kings and as somebody who can deliver the goods. At the instance of 'Anna' Naikwadi, the 5,000-strong general body meeting of the factory decided to launch a big campaign against communalism and sanctioned Rs one lakh towards expenses. (More and more money was subsequently sanctioned.) As a first step, on February 15, the death anniversary of Hutatma Ahir, a human-chain of 88 km was formed symbolising national integration. Enthused by the response of the people, it

was decided to carry out a sustained campaign against communalism. 'Anna' was joined by a few activists of Shramik Mukti Dal; a few from the Lal Nishan Party, (the Maharashtra-based left party parallel to SUCI in West Bengal). Bharat Patankar and his colleagues of Shramik Mukti Dal had proposed that all progressive organisations in Maharashtra organise a Maharashtra-level rally against communalism and the new economic policy on the Shahid Bhagat Singh Day. But the response to this was weak, one reason being a general sense of helplessness amongst the progressive forces. But the fact that some activists, intellectuals have reservations about Bharat Patankar's attempt to drive a wedge between brahminical Hinduism and 'people's culture' also played its part in the uneven response to this proposal. Shramik Mukti Dal had given a call for rallying around the slogan of 'Ida Pida Tala, Baliche Rajya Yevo' ('let the evil forces go, let Baliraja's Kingdom arrive'). Baliraja is a popular legendary king of the toiling peasants and was much glorified by Mahatma Phule. But according to some leftists intellectuals Baliraja is not a very appropriate counter-focus to the BJP's dream of 'Ram-rajya'. In practice, however, this distinction between brahminical Hinduism and people's religion seem to be making a lot of sense to the people in rural areas.

For common rural people, even today, the talk of keeping religion a strictly private matter is not a very appealing proposal—religious festivals and social interactions are so intermingled. Some leftists are, therefore, now arguing that instead of neglecting this socio-cultural role of Hinduism, it is necessary to incorporate it into our strategy. It is necessary to make people aware that BJP's Hinduism is brahminical; that peasants and other toiling people have their own healthy cultural traditions and that there is a need to revive them rather than fall a prey to the brahminical encroachment—of revival of Rama or Ganesh, etc. Such an approach seems to be finding a response among rural people. It is being pointed out that many of the rural festivals ('Pola', 'Hadga', Navaratra, 'Kojagiri-Poonima', 'Chaitri-Padwa', Diwali, 'Makar-Sankranti', etc) are more related to natural and agricultural cycles than abstract mythological superstitious stories from the Puranas. Though there are some theoretical and practical problems in reviving socio-religious peasant-traditions, there seems to be no better way today to

counter the BJP-strategy of rallying common people around Ram mandir issue, and of misusing people's religious feelings for narrow political ends.

Learning from the people's positive response to the critique of brahminical Hinduism, activists-leaders from different shades of progressive organisations in Maharashtra are veering towards this strategy. There is a growing realisation that an appeal to adhere to the constitution, to secularism, etc, is insufficient to fight the Hindutva onslaught. That this modern republicanism is to be coupled with a revival of non-brahminical, peasant cultural traditions in order to sink roots into the rural psyche. Bharat Patankar's booklet on critique of brahminical Hinduism is becoming popular and thousands of copies have been sold. A second popular booklet is by Govind Pansare of the CPI. This two-rupee Marathi booklet, *Are Muslims being Pampered?* is selling very well along with a larger booklet published by the Brahme Granthalaya, an independent left institution. In the hundreds of mass meetings that have taken place in the villages in south-west Maharashtra—eight meetings per day from March 10 to May 25—the facts and figures packed in these booklets have been extensively used and have reached lakhs of people. These village meetings are well-attended and the speeches very well received.

The second plank of the current campaign in south-west Maharashtra is the critique of not only the new economic policy but the whole strategy of green revolution. Shramik Mukti Dal/Mukti Sangharsh has been arguing that the green revolution has resulted in an all-round degradation of agriculture. There has been a fall in the primary productivity of agriculture; a complete dependence of farmers on the petroleum-based (a dwindling resource) fertilisers and pesticides and on hybrid-seeds marketed by profit-hungry companies; and on banks which have linked loans to the acceptance of the green revolution strategy. Traditional methods, modified by some aspects by modern technology, can reverse this process of technological and other dependence of farmers and of agricultural degradation. Peasants have begun to experiment with 'sustainable agriculture' either on their own or at the behest of activists. The talk of 'new self-reliant, sustainable agriculture' of new agro-based industries for decentralised model of development now finds many eager listeners amongst farmers in irrigated areas, since even in this area peasants are now acutely facing problems created by the green revolution. In the meetings in the drought-prone areas, this perspective of alternative agriculture was combined with that of equitable distribution of water. This demand is now being accepted by ordinary farmers in irrigated areas also because degradation of agricultural land due to excess use of water and increased dependence of small, medium farmers on the bosses who control water-

distribution is forcing these small-medium farmers to seek alternatives.

The strategy of combining an anti-communal appeal with the appeal for an alternative path of development was largely responsible for the large turnout at this parishad. The charisma of 'Anna' Naikwadi was of course an important factor. Anna's charisma along with the fact that Anna and a band of committed activists from different backgrounds are coming together to build something new has created hopes in south-west Maharashtra. The arguments of this team were also somewhat new and closer to the experience of the farmers. The 15 detailed resolutions passed in the parishad ranged from the demand for democratic and proper functioning of the sugar co-operative factories, to the issue of degraded agriculture, to communal issues, along with issues of abolishing capitation fees and problems of deserted women. It was a broad progressive manifesto of a sustainable, egalitarian agro-industrial path of development based on secular, democratic culture built by incorporating healthy people's traditions. Though many of the demands of this parishad are to be taken up as principal demands for different agitations, the parishad itself did not give any concrete single plan of action. In this sense it was essentially a gathering to express allegiance to a new path, independent of the Congress and the Shiv Sena/BJP combine; against communalism and for a new agricultural strategy of development. (The newly form-

ed 'Bahujan Samaj Party' has also taken a stand against 'brahminical Hinduism' and for equitable distribution of water. It has also received a good response, though some of its leaders are known for their opportunism.) Given the fact that the campaign was limited to only three districts, Satara, Sangli, Kolhapur, a gathering of 30,000 (a police estimate), is according to senior activists, the largest political mobilisation from this area organised by the opposition (excluding mobilisation during elections) since the days of Samyukta Maharashtra movement some 25 years ago.

An agricultural labourers-toiling peasants organisation has been formed. Follow-up meetings and the process of electing office-bearers has begun. The task of mobilising people around the perspective of this parishad is an immense one. Only the coming months will tell us whether this united initiative towards a new left path in rural Maharashtra will continue to progress.

The problems of urban and peri-urban areas, its youth, its communalism are somewhat different. Secondly, encroachment of vulgar, pop-culture through videos and through the market forces especially amongst the youth even in rural areas will require additional consideration and perhaps a separate counter-strategy. But the May 26 parishad and the campaign for its preparation has shown that at least among the toiling peasants, a break from the current stagnant left politics in rural Maharashtra can be achieved.

superficial attempts. This time too it was a farce, a show put up only for public consumption, with the rivals trying to undermine each other's position behind the scene.

In fact, former chief minister S C Shukla came to attend the meeting with great reluctance. He simply did not want to share any public platform with Singh. His reading of the situation was that prime minister P V Narasimha Rao would not be too pleased with any effort to accord legitimacy to Singh's campaigns. However, he turned up for the meeting at the last moment after being informed that Rao had approved the idea of a unity rally.

Although a single meeting cannot be construed as a campaign, even an appearance of unity would help the Congress(I) in the state at this juncture. As it is, the Congress(I) is a badly divided party right now, with the three main groups lead by Singh, the Shuklas and Scindia pulling in different directions. The Dabra meet, as former chief minister Morilal Vora put it, "has energised the party workers". In fact, Scindia wants other leaders of the party to carry on the good work done by him.

The Dabra meet had a different message, which was missed by most of the people. It was a formalisation of the uneasy alliance that Singh and Scindia have entered into during the past few weeks. Advertisements published in local newspapers by the supporters of the two leaders underlined the fact that now 'Arjun' and Madhav', the mythological friends in the Mahabharat, would prove a formidable combination for the BJP in real life. In fact, at the Dabra meet Singh was given more importance than the Shukla brothers, confirming the worst suspicions of S C Shukla.

The alliance between Singh and Scindia is also not new. The two have a love-hate relationship. Scindia has played a key role in Arjun Singh's ascent to power for the first time in 1980. Since then Scindia has been participating in the frequent anti-Singh campaigns off and on. He was himself denied the chief minister's post in 1989 when Singh's men preferred Vora to him. The thing is that Scindia also needs Singh's support. Singh is the only leader who can stand up to Rao and at the moment Scindia's relationship with Rao is not altogether a happy one. Ever since his resignation from the union cabinet, he is feeling neglected by the party high command. The final blow came when his name was not even considered for the high-power consultative committee constituted for Madhya Pradesh.

But the main beneficiary of the unity move will be Singh. He has been under tremendous pressure in his home state at a time when he wants to spread his wings. The unity will mean a let-up in the attack against him and provide him with breathing space. No wonder, he is the most enthusiastic supporter of the move. But as Sitaram Kesri, the welfare minister, told the rally, with an open jibe at Singh, the unity is needed not only in Madhya Pradesh. Said he: "Unity is required at the national level too."

MADHYA PRADESH

Smoking Peace Pipes

The unity moves of Congress leaders in the state, although superficial, has served to boost workers' morale.

THE change could not have been more marked. Three months back Madhavrao Scindia, the former civil aviation minister, had publicly insulted Arjun Singh, the union human resources minister, at a Congress(I) rally in Madhya Pradesh. Both of them had gone to Rajnandgaon to address the rally. However, Singh reached late for the meeting. Instead of waiting for him, Scindia finished his speech and left the venue as soon as Singh's helicopter was sighted. Last week it was a different story when Singh went to Gwalior to attend a party rally organised in Scindia constituency and was received at the railway station by Scindia.

The Congress(I) leaders of Madhya Pradesh have now again assembled to smoke peace pipes. The warring chieftains met last week at Dabra, a small tehsil town near Gwalior in an effort to solve their disputes at Scindia's behest. The result was an uneasy truce among various rival factions of the party.

The meeting had been planned by Scindia. He had invited not only Singh but also the

two Shukla brothers, union minister V C Shukla and his elder brother S C Shukla, the main adversaries in state politics. Braving a hailstorm, which delayed the meeting by more than two hours, a large number of Congress(I) workers and a host of junior and middle-ranking party leaders, who had been fighting each other on the ground level, assembled at Dabra. The rally had an obvious effect on the mood of the Congressmen, boosting their morale. After all the warring group leaders had put aside their differences and decided to share the same public platform and put up at least a facade of unity for public consumption. Addressing the rally, Scindia declared: "This is the power of Madhya Pradesh Congress. We are ready to face any crisis." But this was not the first time that the Congress(I) leaders in Madhya Pradesh had tried to achieve unity. They have been making periodic attempts at times of crisis. The last time they had done it was during the 1991 parliamentary elections.

Most of the time such moves have been

P N Mathur

D Ghosh

To economists in India and abroad, P N Mathur's name was synonymous with input-output analysis, but for Mathur input-output analysis was only a tool in his quest for understanding how economic systems work. In this quest his focus was on the interrelationships among prices, wages, interest rates and technology.

FOR an economist, Purushottam Narayan Mathur had very good pedigree. His grandfather, Brij Behari Mathur stopped cultivation of indigo when he realised that cultivation of cash crops was one of the causes of the famine of 1890. He then followed it up by introducing an informal system of rationing as well as mango tree plantation work in the village. Mathur had excellent pedigree in his chosen field of hobby as well. We will come to that later.

Mathur was born in Manipuri, near Agra on July 5, 1925, youngest son of Vinod Behari Lal Mathur. He had two brothers and two sisters. He did his MA in Economics at Agra University (1948) and Diploma in Statistics at Indian Agricultural Research Institute, New Delhi (1952) where he was awarded the Randhawa gold medal for the best thesis. The award, incidentally, was presented to him by Pandit Nehru and he took great care to hide the photograph of this ceremony from public eyes. It only became public knowledge towards his retirement days, under pressure from his nearest and dearest. This we mention since it tells us one aspect of Mathur's personality. He did not believe in reflected glory.

Mathur started his academic career as a lecturer at Indian Council of Agricultural Research at New Delhi and from there started his long journey of understanding, studying and analysing of economic processes. What makes an economy tick, to use a somewhat informal expression. This early part of his career was devoted to a number of major research projects and teaching. During the mid-50s he joined the Gokhale Institute of Politics and Economics at Pune as a senior lecturer. He rose to become a professor and then director within about 10 years. In between his tenure at the Gokhale Institute, he joined Harvard Economic Research Project at Harvard University as a senior research associate for about two years. This is the period when his long personal association with Wassily Leontief began. However, in the field of input-output analysis, by now, Mathur was already on the way to building

up an international reputation. At Gokhale Institute he founded, along with a few like-minded friends and colleagues, the Indian Research Association for input-output studies and for Income and Wealth. It is no exaggeration to state that Mathur was instrumental in introducing India's name in contributions to input-output analysis.

Mathur left India in 1970 to join the University College of Wales in Aberystwyth as Professor of Economics. He is the first ever Indian to be appointed as professor in a British University and attracted quite a lot of media interest. Readers of *EPW* are probably aware of the fact that a number of Indian economists, working abroad, live a somewhat dual life. They tend to become a bit more neoclassical while working abroad than when at home. Mathur was the exception. He taught, supervised and carried out his own research in what were to him the true economic issues. He was not an 'anti' anything. It is just that he felt genuinely confused in the uselessness of certain approaches in economics. His many students from different parts of the world, a majority of whom, perhaps not surprisingly, are teaching or involved in research, have been brought up to measure and analyse interdependences within an economic structure and their changes. The economic and political climate in the western world during the late 70s demanded a price from the academic who, to use Mathur's own expression, "was not prepared to cut the t's and dot the i's". Mathur was one such. He retired from University College of Wales, Aberystwyth in the mid-80s. He was more confused than angry. He genuinely did not understand the rationale behind the new orthodoxy. He did not give in. He planned to write a number of books spelling out what he passionately believed to be the real issues in economics. These include *Why Developing Countries Fail to Develop* (1991) and *Interest Rate: Its Impact on Price Movement* (1986) as well as a number of nearly completed manuscripts. In all Mathur has published more than 90 articles on economics and supervised at

least 55 doctoral dissertations. Economics to him was not merely a tool for personal promotion, getting invited to conferences, publishing another paper. His joy was in seeing the truth explored. It did not matter to him who got the credit. He was generous with his ideas and practical help and encouragement to his students and colleagues. He wanted everybody to benefit from the insights he worked so hard to achieve into the working of the economic system.

What is Mathur's economics? To answer this question in full one has to go through, in addition to his major publications, the nearly completed manuscripts he was working on. For the time being we can only try to have a glimpse of what is his major contribution in to understanding of economics. Though to economists both in India and abroad Mathur's name is almost synonymous with input-output analysis, going through the major work of his one perhaps cannot avoid the feeling that input-output analysis was only a tool to him in understanding the working of an economy. His main quest was how an economic system works. The interrelationships among price, wage and interest rates, technology—the building blocks. In his world, current price structure is determined by current wage and interest rates as well as technology as reflected in the input-output coefficient. However, unlike in Sraffa, this input-output coefficient is related to the *least efficient technique and not to the average or the best practice technique*. What is the reason behind this? At the risk of over-simplification, let us try to provide a flavour of Mathur's analysis. In a growing economy, layers of techniques with differing productive efficiency exist and are employed simultaneously. This is what he called a *state of flux*. A successful innovation lowers the variable cost per unit of output and an entrepreneur's decision on whether to continue in production or not is dependent on variable cost per unit of output. The introduction of a new, most efficient, technology can cause variable cost per unit of output for the existing technologies to increase, forcing the least efficient one(s) to become obsolete. The *marginal* techniques, the techniques which are on the verge of obsolescence, will determine the price. In a state of flux, the firm using the most up-to-date technology will earn the highest returns. The amount of returns over and above the recurring cost of production (including interest on working capital), Mathur called technological surplus of a firm. A firm will continue to operate so long as it earns a non-negative technological surplus. An establishment with the oldest technology in use will be earning zero technological surplus while a firm with the most modern technology will, naturally, earn the highest surplus. This technological

surplus is slightly more comprehensive than Schumpeterian profit. While Schumpeter's definition of profit excludes interest, depreciation, etc, on fixed capital these are included in Mathur's technological surplus. This surplus is almost like Ricardian rent. It is, like rent, based on differential efficiency of different units. However, the similarity ends there. As in the long run, as more and more firms enter the industry with most recent technique firms which were earning zero 'rent' before, the marginal firms, are forced out of the industry. Though this technological surplus may look like Marshallian quasi rent, in the latter case a new firm has no particular advantage over its predecessors whereas this is not the case in technological surplus. We thus see that at any given moment in time a spectrum of technology exists in an economy working simultaneously and having different productivities and profits. Out of these, the least efficient technique is the one determining the price structure. The marginal technique is in operation because demand at the price structure associated with that technique exceeds the total capacities of all the more efficient techniques.

When any new investment is made it uses the best practice technique at the time. But if demand ceases to increase to accommodate the newly created capacity the firm has to poach on someone else's market. A competitive firm (or a fix-price firm in the sense of Hicks) will either reduce the price of its product to such an extent that the marginal firm is compelled to leave the market or it may increase the wages of its employees thereby increasing the variable cost of the marginal firms, again forcing them out of the market. In sum if new investment is undertaken under the scenario of stagnant demand (this can happen to, say, replace old capital and/or to reap high profit made possible by technological advances) it will cause some firms to close down. Under these circumstances, there will be an increase in unemployment. Thus we can see that a situation may exist under which increase in wage (for those labourers associated with the new technology) may exist with a high level of unemployment. We have the Phillips curve story without the militant trade unions. Or a somewhat Marxian conclusion without universal exploitation of labourers.

Mathur used this relationships among wage, price and technique of production to analyse the prospects for developing countries in the international trading system. This prompted him to build an international trade theory without Say's law. For his analysis of developing countries his starting point was the studies undertaken by Dadabhai Naoroji. This is not from a sense of nationalistic feelings. He built part of his model on Naoroji's Drain

Theory because he found it relevant. Mathur would happily refer to research findings even if these were by a humble PhD student. He was searching for truth and could not be bothered with 'public relations'.

This brief look at Mathur's economics does not do justice to the wealth of wisdom he has left behind. Anybody searching for an alternative to the neoclassical general equilibrium economics or getting frustrated with the standard literature on growth, technological progress and macro-economic instability will find Mathur's work a profitable investment. Similarly, for development economists and practitioners brought up on a diet of models of dual economy his work will lead to a new rewarding direction.

The areas of economics in which Mathur worked in and contributed to include price system, theory and empirical study of consumer behaviour, growth and technological change, development planning, north-south relationship, international trade and inter-regional co-operation, agricultural economics and price behaviour, national income accounting and, of course, input-output analysis. The areas of application extended from analysing strikes in the Bombay cotton textile industry to construction and application of input-output tables from

countries like Sudan, Iraq, Sri Lanka and Nigeria to name but a few. Add to this his enormous volume of research, publication and supervision on aspects of Indian and the UK economy and you will only be beginning to get a hint of this man's intellectual capacity.

What Mathur did for a hobby many people would consider themselves lucky to do as their full-time occupation. His hobby was ancient Indian astronomy, anthropology and Indology. He was a Sanskrit scholar and also produced scholarly articles on *Ramayan* and *Mahabharat*. His pedigree in these areas derived from his father who, though an advocate by profession, wrote a book on Vishishtha Advaita Sidhanta. He was also one of the trustees of the Shri Rangi Temple in Vrindavan.

Mathur had an impish, almost child-like, sense of humour and a tremendous urge to discover. He never could stop working. His economics grew from his early days of going round villages collecting data on rural consumption. In his conversations he would recall incidents from those days to explain some point or other, and then suddenly one would realise what had prompted this man to devote his life to writing on and teaching economic growth and distributive justice.

P N Mathur passed away on Sunday, March 21, 1993 at Carmarthen in Wales.

BIHAR

New Reservation Policy

Kameshwar Choudhary

The new reservation policy has further consolidated backward class support for the chief minister. However, the withdrawal of reservation benefits for upper caste women has generated intense criticism.

THE Supreme Court's verdict on the Mandal Commission report has given an unexpected but important opportunity to Laloo Prasad Yadav, the chief minister of Bihar, to further consolidated his base among the OBCs and strike at the hegemony of upper castes in the state.

For the last 15 years Bihar has had a policy of reservation for OBCs, was implemented by the government led by Karpoori Thakur. The Karpoori Thakur scheme of reservation was formulated under the constitutional provision of reservation for socially and educationally backwards (Article 16). As per the scheme, there was provision of 12 per cent and 8 per cent reservation in jobs for the most backwards and backwards respectively. In addition, the ratio of reservation for the economically poor among the upper castes and women belonging to all caste groups had been 3

per cent each in government jobs at the state level. The scheme also excluded the economically well-off among the backward classes from availing the benefits of reservation through putting an income tax ceiling. Agitations were held by the upper castes against this reservation policy, but gradually petered away partly because the scheme had an in-built strategy of dividing the upper castes on the issue through making provisions of reservation for those among the upper castes who were backward in terms of economic position and gender.

But the government led by Laloo Prasad has very recently replaced the Karpoori Thakur scheme with a new formula. The ordinance to this effect was approved by the state cabinet on February 16 and got the assent of the governor Mohammed Shafi Qureshi the following day and thus

became effective. Under the new scheme, the ratio of reservation in government jobs has been raised by 2 per cent each for the two sections of the OBCs, i.e., from 12 per cent to 14 per cent for the most backwards and from 8 per cent to 10 per cent for the backwards. The earlier provision of 3 per cent reservation for the economically backward upper caste people has been struck down. The ordinance ensures 2 per cent job reservation for women belonging to the SCs, STs and OBCs. Now the upper caste women cannot enjoy the benefits of reservation. Gender is thus not considered to be a common denominator of socio-educational backwardness as was the case under the previous scheme. In addition, the ordinance has also abolished the income tax ceiling which had been imposed under the Karpoori Thakur formula of reservation to prevent the economically prosperous section among the OBCs from taking advantage of reservations. There is a provision for constituting a five-member permanent commission to look into the claims of beneficiaries of job quota scheme in the light of the judgment delivered by the apex court on the Mandal Commission report. The proposed commission is to comprise a chairperson, a social scientist, two experts and an officer of the joint secretary rank.

The chief minister has strongly defended the new schemes. He argues that the apex court in its judgment on the Mandal Commission report had declared the job reservation scheme on the basis of economic backwardness and gender 'unconstitutional'. The court has upheld reservation in jobs only on the "basis of social and educational backwardness" as per the provisions of the Constitution. Hence, he reasons continuing job reservation on the basis of economic backwardness, in the state was tantamount to violation of the judgment given by the highest court of the land on the Mandal report. However, he suggests that the central government should bring about an amendment in the Constitution if it was willing to extend the job reservation facilities for the poor among the upper castes.

In fact, the dynamics of the changes introduced in the reservation policy by Yadav are a result of his political calculations and compulsions as well as his politico-social objectives. The BJP has made concerted moves to counter Yadav and penetrate his solid social base of the backwards, especially the yadavas. Recently, as a part of its strategy the BJP drafted the former MP and senior party leader, Jagdambī Prasad Yadav, as the president of its newly-founded body, the Shriram Lok Sangharsh Samiti and projected another party leader belonging to the

yadav camp, Ramdas Rai, as an 'important functionary' of the party. In addition, it is trying hard to make inroads into the SC and ST vote banks. During his recent visit to Bihar, L. K. Advani repeatedly emphasised that his party had got Kameshwar Choupal, a BJP MLA, belonging to the SC community to perform shilanyas of the Ram Mandir at Ayodhya. The Hindutva juggernaut is gradually gathering momentum even drawing some sections of the backward castes. In February, the convenor of Kranti Morcha, Birendra Nath Sharan, and the Kurskanta block Congress leader, Ganesh Prasad Yadav, along with hundreds of their followers joined the BJP.

Obviously, Laloo Prasad has to be on guard against communal onslaughts of the BJP. He knows that the support extended by a section of the leaders of the BJP and the Congress(I) to the fierce anti-reservation movement in the wake of the implementation of the Mandal Commission report had yielded dividends to the Janata Dal, particularly in the last Lok Sabha elections in Bihar. The movement has widened the gulf between the upper castes and backwards. This polarisation has enabled the JD and its allies to win 49 seats out of 54 in the last Lok Sabha elections.

Besides the legal justifications extended by Yadav, the current changes made in the reservation policy are latently guided by his strategy to encourage the political (electoral) polarisation between the upper castes and the backwards and solidify his base among the latter. He thinks that the new ordinance on reservation, which removed the provisions giving some benefits to the upper caste men and women, would generate a reaction among the upper castes and force them into the fold of the BJP which is gaining strength in the wake of the demolition of the Babri mosque. Such a reaction, he calculates, may create a counter-reaction among the backwards and prevent them from falling prey to the designs of the BJP. In this process, only the Congress(I) would lose its upper caste supporters to the BJP and the backward vote-bank of Yadav would get further cemented. Further, due to his unrelentless aggressive stance and moves against communal propaganda and activities of the BJP, he has become immensely popular among the Muslims who speak of supporting him even if his own castemen, the yadavas, desert him.

Another significant factor leading Yadav to adopt the new reservation formula is the ongoing internal struggle within the Janata Dal. Currently, a section of the party opposed to Yadav is led by the engineer-turned-politician and MP, Nitish Kumar who was previously a close

confidant and friend of the former. Nitish Kumar was conspicuous by his absence at the grand 'sadbhavana' rally organised under the stewardship of Yadav at Patna's Gandhi Maidan on January 20. The rally was attended by a galaxy of leaders including former prime minister and BJP leader Chandrashekhar and the West Bengal chief minister, Jyoti Basu.

This opposition from a section within the party grew as Yadav declared that the Karpoori Thakur scheme of reservation would be changed as per the Mandal Commission report. Only a few days after the massive rally several prominent leaders and ministers of the party led by Nitish Kumar paid glorious tributes to the former chief minister Karpoori Thakur. The function was jointly organised by the Karpoori Rachna Chakra and the Jan Nayak Karpoori Thakur Vichar Kendra. Participants demanded that the state government should not reverse the Karpoori formula. It was held that if the formula was replaced the most backward classes and backward class) would be clubbed together and, as a consequence the most backward class (MBC) stands to lose. The gathering comprised several ministers belonging to the most backward class. The wrath of these leaders was targeted at the initial announcement of Yadav that a commission would be set up to prepare the list of beneficiaries as required by the decision of the Supreme Court on the Mandal report. Further, delegate session of the Most Backward Caste Co-ordination Committee was held at Patna on February 15. About 200 delegates participated to launch a direct agitation demanding, among other things, a higher percentage of reservation for MBCs in government jobs. The participants at the session unanimously favoured a revision in the Karpoori Thakur scheme in such a manner that the MBCs would not lose. They demanded 16.5 per cent reservation to the MBCs in government jobs and criticised the 15 per cent reservation of government jobs for MBCs. There was a scuffle between supporters of the warring groups in the ruling JD, one led by Yadav and the other headed by Nitish Kumar on February 16 at Patna College seminar hall where Kumar had gone to address a meeting. Supporters of the chief minister held the field shouting the slogans 'Nitish hai hai', 'Nitish go back', 'Mandal virodhi vapas jao' and 'Laloo Yadav zindabad'. They were agitated over Kumar's campaign to unite the MBCs under one umbrella to protest against the violation of much publicised slogan of social justice which is alleged to have benefited yadavas only so far. Kumar had addressed at Patna the conference of MBCs like dhanuks earlier.

Political observers believe that though Nitish Kumar appears to be in the forefront, the real man behind the scene is another JD stalwart, Sharad Yadav. It was through the efforts of Sharad Yadav that a truce was hammered out between the chief minister and Kumar and a co-ordination committee constituted. However, rumblings in the party continue.

Laloo Prasad Yadav was however able to successfully tackle the opposition of a section of the party members when he, finally, came out with the new formula largely allaying the fears of the MBC leaders. Kumar himself clarified that the new formula enhancing the percentage of reservation for the Annexure I and Annexure II categories was almost similar to what he wanted. He further said that there was no dispute over Mandal Commission and Karpooi Thakur formula.

POLITICAL REACTIONS

Many political parties and organisations have expressed their views on the introduction of the new reservation formula. Most of them are opposed to it. But there is no mobilisation of people yet on the issue. The protest is verbal and ritualistic in character. Some political parties have deliberately ignored it and some others have maintained a studious silence. Initially, sources in the Congress(I) and the BJP said that they would not 'repeat their past mistakes'. They knew that if they started agitations against the new scheme, the polarisation of upper castes and the OBCs would get further accentuated, as in case of the anti Mandal agitations, and the Yadav base would get further solidified.

But the leader of opposition in the state assembly, Congress(I) stalwart Jagannath Mishra, could not hold back his opposition to the new scheme. He criticised the hasty approval of the ordinance by the state cabinet on the ground that the verdict of the Supreme Court regarding the Mandal report had not been widely debated yet. He held that the amendment to the Karpooi Thakur formula on reservation was "untimely, irrational and against the verdict of the Supreme Court". He disparaged the chief minister for playing games with the MBCs and women on the issue of reservation. The new formula he held was against the views of Ram Manohar Lohia who stood for special treatment for women of all castes. In addition, he argued that the Mandal Commission recommendations were for the central services and, hence, the verdict of the apex court on this question would, in no way, affect the reservation policy in the states. The chief minister had, in his opinion, been playing into the hands of

'haves' among the backward castes and had done nothing for the depressed and most backward castes. Moreover, the Bihar Pradesh Congress(I) Committee (BPCC-I) vehemently criticised the state government for 'discriminating' against the women and resolved to oppose the striking down of 3 per cent reservation in government jobs for the women belonging to all castes.

The BJP has really turned a blind eye to the recent ordinance. Party sources maintain that they will carry forward their Ram Mandir programme and will not fall prey to the trap laid by Yadav, by opposing the ordinance.

According to the senior Janata Dal (Ajit group) leader Ram Sunder Das, the Karpooi Thakur scheme was "more scientific and justifiable" in comparison with the Mandal Commission report in the present situation as it had job quotas for the poor among the upper castes and also for women. He clarified that neither he nor his party was against the Mandal report, however, the state government had no right to implement the Mandal Commission report without constituting a commission to categorise the backward castes and identify, as per the directive of the Supreme Court, for the purpose of exclusion, the 'creamy layer' among the backwards (*Hindustan Times*, (HT) February 1, 1993).

The leader of the Bihar Rajva Atyant Picchada Varg Evam Upekshit Samaj, Ramdhari Bind asserted that the manner in which the state government aimed at implementing the reservation norms was against the formula of social justice championed by the Janata Dal.

The Most Backward Castes Students' Association of Bihar criticised the decision of the Laloo Prasad Yadav government to reserve 2 per cent of jobs for backward class women as a whole. The association held that it would be proper not to disturb the job quota of MBCs and provide 2 per cent reservation for women of reserved class in each category (MBCs and BCs) separately. Speakers at a seminar on 'Fight for Social Justice and the MBCs' organised by the association held that the MBCs were entitled to 16 per cent reservation in consonance with their ratio in the population of the state, but the new reservation scheme had restricted their quota to only 14 per cent. They considered this 'unfair' (HT, Patna, February 18). Speakers included Vinay Kanth, Ram Bali Singh, Navin Kumar Arva, U N Sinha, Kisor Das and Anil Kumar Das.

The Indian Peoples Front (IPF) and the Pragatisheel Mahila Manch denounced the state government for taking away 3 per cent of reservations for women in govern-

ment jobs granted under the old formula. The cancellation of 3 per cent reservation for women drew strong protest from most women's organisations, particularly the Bihar Mahila Samaj (BMS). The general secretary of Patna district branch of BMS, Sushila Sahay regarded it a gross violation of the Supreme Court decision. She argued that Bihar's women formed more than 49 per cent of the state's total population and were socially, economically and educationally backward with none or few incentives or avenues for advancement and warned that if the government did not retract this step, there would be massive agitations. She made an appeal to women's organisations to unite and fight against the injustice done to Bihar's women (HT, Patna, February 2).

It was only the leaders of Samajvadi Janata Party who fully approved of the new reservation formula implemented by the Laloo Prasad Yadav government. The state president, the secretary and the general secretary of the party, Ajit Kumar Mehta, Harendranath Prasad and Ramsakal Singh reiterated their total commitment to the Mandal Commission report. They asserted that the Karpooi formula was tilted in favour of the upper castes. Other signatories to the press release to this effect included Hasan Manzoor Hasmi Azmat Ali Khan and Nripendra Gupta (HT Patna, February 27).

Further, it is important to note that the Left parties like the CPI, the CPI(M) and the IPF have maintained a silence over the new reservation scheme. (The IPF has aired its opposition only to the changes made regarding reservations for women.) During the debates on the Mandal Commission report in the past, the CPI(M) had been insistent on exclusion of the relatively better off section of the OBCs from drawing the benefits of reservation. But its silence is ironical in the wake of the Laloo Yadav government removing the old provision of debarring, through a rough economic criterion, those people paying income tax from availing the benefits of reservation.

The nature of opposition to the new reservation scheme by the political parties and organisations has thus been very cautious. No effort has been made to mobilise affected people and launch a movement. It is obvious that the affected people, i.e., the upper castes and also the political parties championing their interests have, on this score, conceded a defeat to the calculated and aggressive backward caste politics of the chief minister.

However, all is not well with the legal justification of the step taken by Yadav who asserts that the new scheme of reser-

vation has been necessitated and introduced in line with the verdict of the Supreme Court on the Mandal report. His measure is right to the extent that OBC reservation is constitutionally meant only for those who are socially and educationally backward and not for those who are backward on economic or gender lines. Hence, exclusion of the poorer (economic) upper castes from enjoying the benefits of reservation would be correct under the given constitutional provision. But the new scheme of reservation is constitutionally not valid in retaining reservation for SC, ST and OBC women. The verdict of the apex court nullifies reservation on the basis of sex. And Yadav is very much aware of it as is evident from his statements on the issue. But he has made reservation for backward class women.

Secondly, he has removed the income tax (economic) criterion which formed a part of the old scheme debaring income tax payers from the benefits of reservation. This goes against the decision of the apex court regarding exclusion of the 'creamy layer' of the OBCs from the advantages of reservation. The Yadav government should have first identified the 'creamy layer' of the OBCs and then implemented the new scheme. Or if he was in such haste, he should have retained the

income tax criterion which could have prevented at least a part of the 'creamy layer' of the OBCs in Bihar from cornering the benefits of reservation. Apart from these important loopholes Yadav is not opposed to making a constitutional amendment providing reservation for the economically poorer upper castes. He needs to take a similar stance concerning reservation for women so that if he is not to be portrayed anti-(upper caste) women.

Lastly, Yadav has further consolidated his base among the OBCs by introducing the new scheme expanding reservation for them, allaying OBCs fears and completely excluding the upper castes from drawing any benefits of reservation. However, there would have been greater polarisation on caste lines benefiting Yadav, had there been agitations against his scheme by the upper castes. Obviously, Yadav has to think of other moves in his crusade against the age-old hegemony and domination of upper castes in Bihar. After all, he has to realise his ambition which he frequently reiterates at public meetings by using a picturesque Hindi proverb: 'Bees saal tak mai moong dalunga dushmano ke chhaati par' (translated literally, it means that he will continue to sit like a grinding stone on the chest of his enemies for 20 long years).

1990 the 'dirty tricks' operation mounted by Military Intelligence went on from May through December 1991. The Bisho massacre and earlier to that the Boipotong massacres revealed the connivance of the South African regime in perpetuating violence which was conveniently seen as Black against Black violence. The two major issues that confront South Africa today are township violence and the restructuring of post-apartheid South Africa in the face of the 'ethnic conflicts'.

Concern with violence today cannot blur the past where lies the roots of the present. Colonisation of Africa has been anything but peaceful and colonialism in South Africa has the dubious distinction of having created a regime founded on racial segregation. Such a regime could survive by sheer force alone and not by democratic consent. Suppression and legal banning of all political opposition often gave rise to only one language—that of violence. The regime had no acoustics for any other. For generations of Black Africans, hatred and violence have become part of daily existence.

One cannot help going back to Fanon. "The native town is a crouching village, a town on its knees, a town wallowing in the mire. It is a town of niggers and dirty arabs. The look that the native turns on the settlers town is a look of lust, a look of envy; it expresses his dreams of possession—all manner of possession: to sit at the settlers table, to sleep in the settlers bed, with his wife if possible. The colonised man is an envious man. And this the settler knows very well; when their glances meet he ascertains bitterly, always on the defensive, 'they want to take our place'. It is true, for there is no native who does not dream at least once a day of setting himself up in the settlers place" [2].

Even a decade earlier the apartheid regime was unwilling to come to terms with majority rule. Its response to people's demands was repression and the imposition of emergency in 1985. Despite the banning of all political opposition in 1960s, by the end of the decade African nationalism erupted in the form of Black consciousness movement. Influenced by Black politics in the US and encouraged by National Party's policies of 'tribal colleges' and 'Bantu' education, the movement represented a restructured racial consciousness of Africanism. It was among students that it emerged when Steve Biko led Black students in the break with the multi-racial, but predominantly white and English-speaking National Union of South African Students (NUSAS). He formed the South African Students Organisation (SASO) among university

'Blacks against Blacks' Violence in South Africa

Rama S Melkote

A regime founded on racial segregation could only have survived by the use of force and not by democratic consent. For generations of Black Africans, hatred and violence have become part of daily existence. Not surprisingly, today, the two major issues in South Africa are township violence and the restructuring of a post-apartheid society in the face of ethnic violence.

JEAN PAUL SARTRE in his preface to Fanon's *Wretched of the Earth* wrote "Fanon hides nothing, in order to fight against us the former colony must fight against itself—or, rather, the two struggles form part of a whole" [1]. He continues "when they are taught what shame and hunger and pain are, all that is stirred up in them is a volcanic fury whose force is equal to that of the pressure put upon them. You said they understand nothing but violence? Of course, first, the only violence is the 'settlers', but soon they will make it their own, that is to say, the same violence is thrown back upon us as when our reflection comes forward to meet us

when we go towards a mirror. As violence continues in South Africa (post-apartheid?), it is seen as a manifestation of 'Blacks against Blacks' phenomena the connotation of which should be obvious. 'the incapacity of Blacks to govern themselves'

Recently it was revealed by the government appointed investigative panel that the South African Defence Forces (SADF) had hired a convicted murderer last year to lead a covert operation aimed at compromising members of the military wing of the ANC by using prostitutes, drug dealers and homosexuals. Even after the lifting of the ban on the ANC in February

SASO found its counterpart in the high schools in the South African Students Movement (SASM). SASO embraced all non-white university students and preached black unity, black self-reliance and psychological liberation. The inchoate philosophy of Black consciousness was the tentative framework for organising black youth under the leadership of Steve Biko and others [2]. A different style of politics to the non-racial inclusive of axioms that were characteristic of campaigns of the ANC and its 'congress alliance' in the 1950s emerged. Politics of public protest was reintroduced and a whole new generation began to grow in the 1970s that was imbued with a sense of rebellion, self-assertion, and believed in itself, its rights and its ability to fight for a better future. The process culminated in the Soweto uprising of June 16, 1976. This was in a way, the take-off of the youth factor in liberation movement of South Africa.

A conscientised youth outstripped the older generation in their militancy and began to act independently of them. The immediate cause for June 16 was the protest march of some 10,000 youth in Soweto against the introduction of instruction in Afrikaans as well as English in urban black schools. The response of the regime was violent, following exchanges between pupils and security forces killing between 600 and 1,000 Black people—many of them children in different parts of South Africa. The regime had to reckon with the political potential of the vast poor of angry young Blacks, but not by conceding to their demands or entering into a dialogue but by seeking to root out student and pupil leaders and ensure that there was no repetition of the rebellion—leaders were arrested and even sent to Robben Island, Biko died in detention and SASO and SASM were banned. By then the youth had moved on from purely educational grievances to broader resistance to apartheid and proved that direct mass resistance was possible. The Azanian Peoples Organisation (AZAPO) was formed in 1978 as a successor to the proscribed Black consciousness structure and the mass organisation to embrace the Freedom Charter of 1955 Congress of South African Students (COSAS) was formed in 1979. The COSAS aggressively promoted the nationwide 'Free Mandela' campaign. Youth were now involved in consumer boycotts, rent strikes, and solidarity action with Trade Unions and COSAS paved the way for a new phase of resistance politics. The year 1980 witnessed intensified political activity and the youth involved manifested a deeper grasp of and concern with political ideology and strategies. Youth and com-

munity organisations mushroomed everywhere. In 1983 these structures came together in the broad-based umbrella resistance movement of the United Democratic Front which consisted of several hundred affiliate groups. The structure of UDF lent itself to decentralisation and encouraged localised initiatives. Black consciousness and left-wing groups opposed to the Front coalesced in the National Forum, with a socialist element added to its ideology. The adherents styled themselves as 'anti-racist' as opposed to non-racial and excluded whites. By 1984 an unprecedented popular rebellion against the South African state was mounted and took a variety of forms. The militancy of the youth was such that even five-year old were engaged in the struggle. "It is shocking the extent to which children turned into daredevils. Soldiers meant only teargas to them, policemen only enemy target. There was such a great contrast with the young whites, still playing with toys and pestering their mothers for popcorn and ice-cream" [2]. The days of insurrectionary politics had begun.

As the regime's only response was blatant repression—mass detentions, killings and forcing members underground—student organisations were deprived of their leadership and ties that linked political groups in a loose but coherent organisational network. Democratic procedures and debates which had become an article of faith for the majority of youth organisations eroded and seen as 'unaffordable luxury' in the face of blatant repression. When emergency was declared in 1985 a large number of angry youth activists were dislocated from a necessary process of political education and development. While the youth were in the forefront of the struggle, they were the first to be detained and first to be shot. Increasingly the more daring ones regarded themselves as leaders of the struggle and took upon themselves to enforce compliance by brutal means—the most gruesome of them 'the necklace'—placing of a rubber tyre, filled with petrol, around a victim's neck before setting it alight. In March 1985 a community councillor was assassinated in this fashion. The phenomenon of power of youth in township life raised many issues for the adults of black communities. While they supported the youth in their struggle for freedom, many were disappointed of their brutal methods. The belief that freedom was round the corner and the willingness to die for it created various levels of activity which were not always well debated and blurred their creativity at times. Detained leaders were replaced by younger, more radical and militant activists often lack-

ing in political maturity. Raw power of youth became an irreplaceable factor in South African political life. It is this generation of Africans that the older leaders particularly those who have returned from exile or from prison have to work with.

The attempts of parents and elders to bring the youth back to schools succeeded only partially. Rivalry between resistance groups and bloody feuds between youth organisation on the one hand and township gangs or 'vigilants' on the other, 'revenge' killings became the order of the day. While the elders acknowledged with pride that their children refused to live under apartheid they also sadly recognised that they had 'the knowledge of how to die, and how to kill'. The response of the state was once again to reimpose law and order by declaring national emergency on June 12, 1986 giving the police and security forces *carte blanche* in dealing with the troublesome youth. Forty per cent of the detained (of about 22,000) immediately following emergency were under the age group of 18. The one interesting spin-off of unprecedented repression was the tactical alliance between warring comrades—the Soweto Students Congress (supporters of Freedom Charter) and the Azanian Students Movement of Black consciousness. The realisation that the struggle was a protracted one and that they need to organise themselves and in relation to other sectors of resistance particularly workers led to the underground launching of South African Youth Congress (SAYCO), the country's largest ever youth grouping. SAYCO pledged to be a part of "class alliance of workers, community, women and student organisations with principles similar to ours".

The students and youth movement in South Africa has accelerated the liberation movement and put the apartheid regime in a state of alert. Yet liberation itself was not to come by easily. The psychological brutalisation, 'vigilanteism' and the use of 'hit squads' demand a bloody price from black youth.

ETHNIC VIOLENCE

'Ethnicity' 'ethnic conflicts' in South Africa today are as much a legacy of the apartheid system as poverty, population relocation, death and illiteracy. "However, the depth of ethnic identification and its manipulation for political ends will be less easy to wipe away. Political manipulation of ethnicity has permeated the very transmission of ideas, ethnicity has informed the actions of South Africans over many years because it seemed to make sense of the every day world" [3].

However, ethnicity is not an African

communal', 'national' identities are unfolding in various ways, often violently, ethnic conflicts called 'tribalism' in Africa are no exception. The present conjuncture in South Africa is ripe for political mobilisation of ethnic identities as the country limps painfully towards freedom—a post-apartheid state. Ethnicity has been used by the apartheid regime to divide the African population, to keep them segregated resulting in Federal and Bantustan policies. Bantustan politician such as Ntsamwisi and Buthelezi use it to mobilise opposition to a unitary South Africa. Within the national liberation movement, there are divergent opinions and attitudes—one wing calling for the denial and suppression of ethnic differences in the cause of national unity and the other wing recognises the power of ethnicity as an instrument for political mobilisation at the regional level. The Freedom Charter of the ANC holds that while they denounce tribal pride, they are not indifferent to traditions, languages and cultures of individual ethnic groups [4].

Whether ethnic identities are 'imagined', or 'historically constructed', it is important to ask why identities become important at one particular juncture and not at another. Faced with the demand for liberation, the apartheid regime is fighting its last battle by once more using ethnic divisions for political mobilisation to create a federal South Africa with a central government economically and politically weak. The 'homelands' were reproducers of cheap labour for the apartheid regime. But once it lost control of homelands, it gave up homeland policy. In April 1990 six homeland leaders pulled out of important talks with president de Klerk at the behest of ANC and by 1991 National Party abandoned the homeland policy. Having abandoned the policy, the regime supports opposition to ANC-led liberation struggle brazenly as is evident from the revelations in November that South African military intelligence has been channelling weapons to Inkatha from Mozambique's right-wing guerrillas of Renamo, is a part of the overall strategy of the South Africa regime designed to stop the ANC from coming to power.

In 1959 the policy of ethnic fragmentation of National Party was given legislative form in the promotion of Bantu Self-government Act. The Zulu identity which existed in looser form in the 1950s was later carefully nurtured by Buthelezi who claimed to be destined to lead a 'Zulu Nation' that pre-existed apartheid and colonialism. Buthelezi refused to follow the politically suicidal route of 'independence' for the Kwazulu 'homeland'. In 1972 the Zulu land Territorial Authority became

the Inkatha Freedom Party and in 1975 Inkatha Freedom Party was formed. The balancing act between a regional Zulu mobilisation, and an African nationalist mobilisation tilted in favour of the former by the end of 1970s. In 1986 the Indaba Constitution was drawn up and made provision for chiefs to play an important role, provided for 'a council of chiefs' for 'tribal authority' to remain as a form of local government and for the existence of tribal police. The process of politicisation of Zulu ethnic identity took several forms—invocation of Zulu 'history', Zulu nation, and the ideology of Zuluness, that became the core of Inkatha Syllabus in schools. It "sanctioned superiority based on sex, age and social position and reproduced the whole set of authoritarian and hierarchical relations found in Zulu society". With the unbanning of the ANC and other political parties and release of Nelson Mandela, ethnic mobilisation within Inkatha Strategy has not only increased but takes the form of violent confrontation with those who oppose it and co-operation with the apartheid state in defending privileges inextricably tied to the Bantustans.

"Ethnic social identities and ethnic group consciousness have now been tied inextricably to violence in South Africa. The racism of colonial conquest and slavery and the years of segregation in the Union of South Africa; the sacred history of the Afrikaner volk with its claims to a God-given mission in Africa; and the vicious consequences of the implementation of apartheid—a policy based on separation—all these repressively enforced 'group politics' have involved violence [3].

Six homeland chiefs pulled out of important talks with president de Klerk in April 1990 at the behest of the ANC. Of them, General Bantu Holomisa of Transkei is seen as the strongest supporter of ANC [5]. Transkei, the first 'independent' Bantustan in 1976, was ruled dictatorially by Mantanzima until 1987 when Holomisa took over. The change of policy of the apartheid regime towards Transkei was evidently to punish Holomisa for his support to ANC. The government of Pretoria stopped paying its R200 million share of Southern African customs union unless Transkei withdrew its ban on South African Sorghum Beer. Threats from apartheid government continued and by August 1990 hundreds of Transkeians were killed by Inkatha and South African police. In Ciskei Brigadier Oupa Gqoza captured power from Lennox L. Seba in 1990 after the release of Mandela. P. Botha manoeuvred to restructure the government and change the Constitution to reincorporate Ciskei into South Africa in February 1991. South Africa ruled

Ciskei with an 'iron' hand since the emergency of November 1991. People of course did not figure anywhere in these transactions.

While 'Zuluness', 'Zulu identity' may not be seen purely in terms of the outcome of articulations of peripheral economies with the centre, it can hardly be doubted that the manipulations of the apartheid have contributed more than any other factor to the creation of separatism of the Inkatha Freedom Party and its confrontationalist attitude to the ANC and CODESA talks. Federalism that it supports is precisely what the white minority would like. In the attempt to build a post-apartheid state that would not shed white capitalist market economy and yet maintain the facade of Black majority government politically free, the Inkatha Freedom Party, those African chiefs who have been carefully nourished by Pretoria are important allies. Violence in Black townships mainly between the warring Inkatha Freedom Party and the ANC, the increase in crime rate not only by Blacks, but by Whites as well marks the South African scene today. But there is a difference. Violence of Black Africans is seen as 'tribalism'. Violence by state security agents, of SADF is justified for 'reasons of state'. What worries the regime is the increase in White crime not only by the neo-Nazi AWB but by White youth, thieves, women shop-lifters, etc. Economic factors may be blamed for the explosion of White crime, but what is appalling for the White policemen and detectives is the dilemma of investigating these crimes, particularly when a White youth gets caught or killed by Black security personnel. As the sense of powerlessness, disempowerment of the White male increases, with no apartheid laws to protect them, their anger is directed against the most vulnerable—women, children, old people and blacks. It is said that "at the police dog training centre in Pretoria, the Alsations are no longer trained to bite just Blacks".

India's External Debt

EPW Research Foundation

THE quality of official statistics on India's external debt has shown a noticeable improvement recently, thanks to the assistance of the IMF and the World Bank in being provided comprehensive and up-to-date information on different aspects of the Indian economy as part of the stabilisation and structural adjustment programmes. Compared to the earlier attempts at obfuscation and concealment, the government is now having to come out with data on different dimensions of external debt—multilateral and bilateral aid, commercial borrowings of different types, export credits, IMF borrowings, NRI deposits, rupee debt, loans for defence purchases and short-term debt.

Hitherto there used to be significant differences in debt statistics published by the Reserve Bank of India (RBI) and the government of India (GoI). There were also differences between the estimates released by the Indian authorities and those of international agencies, namely, the World Bank, the IMF, the Institute of International Finance (IIF), the Organisation for Economic Co-operation and Development (OECD), and the Bank for International Settlements (BIS). Though there was no formal definition of external debt until 1988 when an International Working Group on Debt Statistics provided an exhaustive definition, there was general agreement that all outstanding liabilities owed to non-residents repayable with or without interest constituted external debt and that, within it, liabilities with an original or extended maturity of above one year represented medium- and long-term debt and those with a maturity of one year or less short-term debt. It was the World Bank's Debt Reporting System which was one of the early initiators of debt data and gave currency to such a definition with the emphasis on repayment of liabilities in either foreign currency or goods or services.

Until now the debt figures released by the Indian authorities (RBI and GoI) have invariably been significantly lower than those published by the international agencies. First, the Indian authorities were reluctant to include NRI deposit liabilities in debt. It was presumed that the NRIs, with strong local links, would renew the bulk of their deposits from time to time and eventually utilise the proceeds, including interest income, locally. Apart from the conceptual problems with this

approach, the massive withdrawal of NRI deposits after the 1990 Gulf crisis exposed how unreal was the presumption on which it rested. Second, on supposed security considerations, data on defence debt were kept a secret by the government. Third, the official agencies did not have, until 1991, the details of short-term debt, including bank exposures and suppliers' credits. Finally, differences in valuation have also given rise to non-comparability of official debt statistics with those of international agencies. While the official agencies follow the foreign currency to rupee to US dollar route for conversion, the World Bank's Debt Reporting System, for instance, uses the IMF cross rates for directly converting original currency values into US dollar equivalents.

The differences between debt data put out by the RBI and those published by the government have been essentially due to differences in data sources. The variations in the estimates of the different international agencies have been due to differences in sources of data, coverage and valuation of debt. While the World Bank, IMF and IIF get country reports, BIS and OECD use a mixture of creditor and debtor reporting systems. OECD includes non-civilian or defence debt whereas the World Bank includes it only to the extent reported by the debtor country. OECD includes debt denominated in the domestic currency and use of IMF credits. While the World Bank includes accrued interest on NRI deposits, OECD and IIF do not do so.

The Reserve Bank's Policy Group and Task Force on External Debt Statistics of India (1992) tried to reconcile these differences and suggested that while it was not possible to always accept the procedures of the international agencies nor hope to change them, the aim should be to ensure that the data put out by the RBI and the GoI are generally consistent and uniform and that debt statistics are presented in such a detailed and transparent manner that users are able to identify the sources of divergence of data from different agencies. The Task Force has suggested that India's external debt should cover (i) all government and non-government loans from abroad, bonds raised from international capital markets, some revalued balances under IBRD pooled loans and exchange adjustments in respect of pre-1971 IDA credits, convertible debentures

until they are converted into equity, use of IMF credits, and export credits including those extended by foreign official export credit agencies; (ii) non-resident deposits with an original maturity of over one year including accrued interest on FCNR deposits; and (iii) short-term credits consisting of bank exposures, suppliers' credits and NRI deposits up to one year maturity. The Policy Group and the Task Force have suggested that where there are grey areas, the data could be presented as memorandum items. An example was the bilateral rouble and rupee credits owed to the erstwhile USSR and the east European countries, respectively. The Policy Group Report argued that though they constituted debt and had the same macro-economic implications requiring transfer of goods and services out of the country to service the debt, they had no direct impact on foreign currency reserves. Hence they could be shown as memo items in all debt statistics. The report suggested transparency and similar treatment for defence debt considering (a) the actual payments for defence debt are shown in the government budget documents, (b) international institutions anyway gain access to these data following globalisation of financial transactions, though their figures are a combination of some conjecture and some hard facts, and (c) debt discharge obligations and macro-economic management require full knowledge of aggregate debt, their maturity and terms. Also, with the exception of NRI deposits all short-term credits up to six months' maturity had to be excluded from even short-term debt as these transactions were basically trade-related.

• DEBT ESTIMATED AT \$87 BILLION

The revised statistics put out by the government show the country's external debt to be significantly larger than indicated by earlier estimates. Excluding defence debt and civilian rupee/rouble debt as also short-term debt of less than six months' duration, India's external indebtedness has risen from US \$53.9 billion (Rs 85,500 crore) at the end of March 1989 to \$67.58 billion (Rs 199,000 crore) at the end of March 1992, i.e. at the rate of about \$4.5 billion a year. Quick estimates up to September 1992 show a further rise to \$71.11 billion. As a proportion of GDP, the country's foreign debt rose from 19.8

per cent in 1988-89 to 30.1 per cent in 1991-92.¹ But, as indicated above, this does not include the memorandum items, namely, short-term debt of less than six months' maturity, civilian rouble debt and defence debt from both the general currency area (GCA) and the rupee payment area (RPA). The special arguments adduced for their exclusion from debt cannot stand theoretical or operational scrutiny. The outstanding amount of all contractual liabilities to non-residents to be repaid with or without interest or, as the World Bank has emphasised, any debt repayable in either foreign currency or goods or services, constitutes debt at any point in time. Debt may have different components—concessional or on normal terms, short-term or long-term, against marketable or non-marketable instruments—but they all constitute debt. Even debt denominated in rupees involves transfer of goods and services to service it. The all-inclusive estimate of India's aggregate external debt would touch \$82 billion as at the end of March 1992 and nearly \$87 billion as at the end of September 1992. As percentage of GDP in 1991-92, the aggregate external debt as at the end of March 1992 was 38.8 per cent. As percentage of exports total debt has shot up to 312 per cent in 1991-92 from 274 per cent four years earlier. Inclusive of the memorandum items mentioned above, the proportion of aggregate debt to exports would rise to 371 per cent for 1991-92 (Table 1).

NO MORE MODERATELY INDEBTED

External debt statistics published by the government on a comparable and consistent basis are available only for a relatively short period, from the end of March 1989 (Table 2). Amongst the multilateral agencies, the World Bank has been publishing, based on official returns as well as creditor sources, fairly comprehensive external debt data—except for the limited coverage of non-civilian debt.² Unlike the Indian official agencies in the past, the World Bank has been including both short-term debt and NRI deposits along with accrued interest on such deposits in debt outstanding and in debt service. As per these statistics, India's external debt as a percentage of GNP has more than doubled from 12.6 per cent in 1981-82 to 29.2 per cent in 1991-92 and as percentage of exports of goods and services from 137 per cent to 294 per cent (Table 3). Taking government of India's revised data for total debt for 1991-92, the ratio of debt to GDP was 32.6 per cent and of debt to exports 312 per cent. The differences are explained by (i) use of GNP by the World Bank and of GDP in the Indian official statistics; (ii) inclusion of official grants as part of the exports of goods and services by the

World Bank and their exclusion by the official agencies; and (iii) non-inclusion of debt service on account of IMF credits by the World Bank. Another source of difference lies in the valuation of debt denominated in different currencies, though the exact direction of this difference is difficult to discern due to the varied nature of fluctuations in exchange rates. Incidentally, as flow data are converted at period average exchange rates and stock data at period-end exchange rates, over-the-period variations in debt outstanding may not equal net flows (disbursements less amortisation) or net transfers on debt (net flows minus interest payments).

Be that as it may, India's external debt has assumed alarming proportions. The World Bank continues to classify India as a moderately indebted low-income country, but this is on the consideration that India has a large share of concessional debt. The World Bank's estimate of the present value of India's debt (defined as the discounted value of future debt service, taking as discount rates the normally accepted interest rates such as the OECD export credit rates, the World Bank's normal lending rates and the currency-specific market rates) works out to \$56.456 billion as against the actual debt of \$71.557 billion in 1991-92—a downward adjustment of about 21 per cent. This favourable situation is unlikely to last for long as the proportion of concessional debt in the country's total debt has steadily declined from about 75 per cent in 1980-81 and 60 per cent in 1982-83 to 41.6 per cent in 1991-92 (Table 3). The share of private creditors, NRI deposits, and World Bank loans at market-related rates of interest has risen. The share of private creditors in total debt has gone up from about 10 per cent in 1981-82 to 40 per cent in 1991-92. Above all, in India's case, the acceptable threshold level of 220 per cent for the present value of debt to exports ratio has been crossed, though the present value of debt to GNP ratio of 80 per cent specified as critical is yet to be reached. Interestingly, in its latest *World Debt Tables: 1992-93*, the World Bank has clarified that "lowering the critical values by 5 per cent would add [along with a few other countries] India to the severely indebted group..." (p 129). But it is a moot point whether for a large-sized economy such as India's with the external sector having a relatively low share in GDP, the latter norm is at all relevant.

NEGATIVE NET FLOWS

As a result of the growing debt service burden, there has occurred a steady decline in net flows and net transfers through debt (Table 3). But for the \$1.6 billion

inflow under the India Development Bonds in 1991-92, net transfers would have been negative in that year, as was close to happening in 1990-91. Negative net flows already mark external commercial borrowings (Table 4) and net transfers on account of external assistance have begun to taper off (Table 5).

A significant aspect of net flows turning negative is its impact on the central government's budget (Table 6). Considering that future debt service payments will have to be at current exchange rates, the implications for net receipts in the government's budget will be serious in the very near future. At the end of March 1992, the outstanding external public debt valued at the current exchange rate (Rs 1,09,608 crore) was three times the value of debt measured at historical exchange rates (Rs 36,948 crore).

The projection of debt service payments (Table 7) brings out the implications of growing debt service for BoP. Debt service payments are likely to be about \$8 to 9 billion in each of the next five years and when the India Development Bonds mature in 1996-97 there will be a sizeable additional burden. Besides, a part of the debt incurred in 1991-92 which is not included in the above data will also mature in 1995-96 or thereabout.

COMPARISON WITH CHINA

A striking success story in managing external finances is that of the People's Republic of China. Despite a low level of concessional debt (ranging from 15 to 18 per cent as against India's over 70 per cent in the 1980s and over 40 per cent even now) and of multilateral aid (10 to 12 per cent compared to over 30 per cent for India), China's external debt as a proportion of exports has remained, remarkably low at 90 per cent compared to 312 per cent for India. Also, despite such limited dependence on external debt, China has achieved an export level of \$70 billion in 1991 compared with India's \$24 billion in 1991-92.

Notes

- 1 The government of India's *Economic Survey, 1992-93* has grossly under-estimated this proportion at 27.3 per cent in 1991-92 (p 118). The corresponding figure put out by the RBI, apparently based on the old method, is 31.7 per cent for medium- and long-term debt plus all NRI deposits or 33.1 per cent for total debt including all short-term debt (see RBI, *Report on Currency and Finance, 1991-92*, p 412).
- 2 The data now released by the government, as tabulated and presented in Table 1, are the most comprehensive of all the available estimates.

* Actuals

Note: Principal repayments and repurchases are projected based on repayment/repurchase schedule. Interest payment on external assistance and commercial borrowings (those at fixed interest rates) are estimated based on the interest indicated in loan agreements. Interest on commercial borrowings (those at floating rates), FCNR/NR(F)A deposits and charges payable to IMF are estimated on the basis of the latest rates. Principal repayments under NRI deposits are based on a quick survey of selected banks.

Sociological Research in India

The State of Crisis

Veena Das

The crisis in sociological research in India has to be located in three institutional structures—the universities, the UGC and the professional bodies such as the Indian Sociological Society. The overarching framework within which the role of each of these bodies may be understood, however, is provided by the practices of politics.

RESEARCH in any field is sustained over a period of time not by the brilliance of a few outstanding scholars but by the patient building up of competence in the average researcher. What Thomas Kuhn called 'normal science' provides the backbone of research in any subject. While students cannot be trained to do brilliant research they can and must be trained to do competent research. One cannot plan for paradigmatic shifts in a discipline. When these occur they are, by definition, unpredictable. A result of the imaginative flights taken by unfettered minds these paradigmatic shifts are to be celebrated but they cannot be methodically replicated. What is a cause for dismay in the field of sociological research in India is not so much the lack of brilliance as the lack of competence.

I base my comments on my experience as a teacher in the University of Delhi for the last 25 years when I have had the opportunity to interview students from several universities and for the past few years to act as an expert member in selection committees for the positions of lecturers and research associates, both in universities and the UGC.

The number of students registered in the doctoral programmes in sociology has increased phenomenally in the last decade. For a position of Lecturer or Research Associate anything up to 100 applications may be received of which 40 may be of candidates who have obtained their doctoral degrees from any of the Central or State Universities. Another 40 may have an M Phil degree. It is on the basis of my experience of interviews with these candidates that I have found the following characteristics among several candidates who possess the highest research degree in sociology.

(1) In most universities students are not

expected to read any books systematically. To the question whether the candidate has ever read a book in the social sciences from cover to cover, the answer is usually in the negative. The level of competence in sociology is so poor that candidates with doctoral degrees have assured me that Malinowski conducted his fieldwork in India; that Max Weber's thesis on the Protestant ethic was based on his study of American society; that Calvin was the name of a place in Europe; that there was not a single ethnographic study of any tribe in India; and that they had temporarily forgotten the name of the theory associated with Darwin.

(2) The ignorance of elementary facts is matched by an eloquence on generalities. For example, the same candidates who could speak for 15 minutes on the importance of class conflict in Marxian Theory and the urgency of social justice for the downtrodden, was unable to distinguish between use value and exchange value or to tell me the meaning of the word Brumaire in *The Eighteenth Brumaire of Louis Bonaparte*.

(3) Every dissertation has a long list of references. However, candidates are unable to remember the argument of a research paper or a book although they have themselves referred to it in the body of the text. Some candidates make a candid admission that they did not feel the need to actually read the books and papers cited in the text or included in the list of references. Others state that they have forgotten what they have read. I want to emphasise that this ignorance or forgetfulness is with regard to books and papers that they have themselves quoted, not with regard to sociological works that I may consider important.

(4) The standard format of PhD dissertations in many universities now is for the candidate to prepare a questionnaire on

such topics as "Attitude of working women to marriage", or "Prevalence of drug addiction among youth". The questionnaire is administered to 100 or 150 respondents selected according to the convenience of the researcher. Each chapter is then organised around the specific responses received around a cluster of questions presented in the format of tables. This is followed by a description of these responses. The students are not required to learn how to use primary or secondary sources; they have no experience of library research; they conduct neither intensive fieldwork nor well-designed survey research; and despite the appearance of tables they do not learn the elements of statistical reasoning.

(5) Some of this research is published. Normally it is published in departmental journals or magazines in which there are no procedures for referring a paper. Some of the research also gets published in the form of a book usually by small publishers on the grant of a subsidy. In some cases, as for instance in the case of UGC Research Scientists, there is an individual contingency grant of the magnitude of Rs 2 lakh available to each incumbent. I have come across cases in which a subsidy of about Rs 80,000 has been given to a publisher. In one case, I found that the book published on the basis of a subsidy consisted entirely of materials copied from District Gazetteers. The reason why such publications escape all academic scrutiny is that a vicious cycle is built through availability of research funds leading to subsidy for publications and publications leading to more grants for research. Many publishers have now come into being who survive solely because there are bodies like the UGC and various Research Councils which provide financial support for substandard publications. Clearly, it is not my claim that all research published through these schemes is substandard but it is noticeable that very little of such research is published in national or international journals of repute and very little receives any critical attention in the book review sections of good journals.

(6) One consequence of this configuration of factors is that books are published which are plagiarised, bringing disrepute to Indian universities. About a year ago *Anthropology Today* carried a letter by Gustaff Houtman of the University of Manchester which stated that he had come across an astonishing volume called *Monastic Buddhism among the Khamtis of Arunachal* by one Dr Kondinya,

published by the National Publishing House of Delhi in 1986 "of which", to put it politely, "a substantial part seems to duplicate Melford E. Spiro's *Buddhism and Society*". The letter went on to state, that, "There is no bibliography and no reference to Professor Spiro but a considerable number of paragraphs would appear to differ from Spiro's text only in the most minor particulars such as the substitution of 'Khamti' for 'Burmese'. Yet the author apparently has a doctorate from Delhi, has worked as a post-doctoral Fellow for the Ministry of Home Affairs of Indian Government" (See *Anthropology Today*, Vol 8, No 3, June 1992)

Unfortunately, this is not an isolated case and only a systematic survey of books published in recent years can reveal the extent of the malpractice. This tendency to plagiarism can be directly traced to the proliferation of publishers, subsidies for substandard research, and the refusal to apply academic judgment with honesty on the part of those who recommend these for subsidies. Before I discuss the factors responsible for the crisis, let me also add that a small number of students, located in different universities and research institutes continue to produce professionally competent research. The evidence for this is available in the fact that while in the 60s, reputed publishers were able to find only a few senior scholars whose monographs were considered worthy of publication, now there are young scholars whose monographs find a place in the list of books of the most reputed national and international publishers. What the cumulative work of these young scholars has done is to provide a plurality of perspectives on the understanding of Indian society. Clearly traditions of sound research need to be built up with care. Where certain departments and institutes have nourished sound research through their efforts at regular teaching, departmental seminars and involvement of senior faculty with the building of library resources, the institutional framework must be protected. Where talented young persons are located in institutions where such facilities are not available they must be provided the means to participate in the research programmes of such centres of advanced studies. However, the trend in policy-making is to treat all institutions equally without any regard to their academic record leading to the situation in which the profession is swamped with substandard research. I do not use the word crisis easily to apply to any kind of situation. In this case, however, I do believe that we are in a state of crisis requiring the immediate application

of sound judgment. Borrowing an analogy from medicine, the patient is in a critical state and there is every reason to believe that if critical interventions are not made, we will face the death of social science in India.

What are the factors responsible for this crisis? One would have to locate the crisis in three institutional structures—the universities, the UGC and the professional bodies such as the Indian Sociological Society. The overarching framework within which these may be understood, however, is provided by the practices of politics.

At the level of the universities, the proliferation of the subject has simply not been matched by the will to ensure competence in teaching and research. In several universities, textbooks such as that of Melver and Page, written almost 50 years ago, continue to be taught. These textbooks are available in translations in several regional languages. The combination of commercial interests and academic apathy leads to the dismal situation in which students are completely unaware of what has happened in the subject in the last 50 years.

Second, where teaching and research is conducted in regional languages, students do not acquire proficiency even in reading in the English language. I am afraid that rhetorical statements about national self-respect notwithstanding, neither the translations of competent sociological works in the regional languages nor original contributions add up to a sufficient body of literature that may be available in these languages. Thus a student fails to acquire competence in her subject on the basis of this literature. I may add that proficiency in reading in the English language for graduate students is considered necessary in most universities in the world now, even in countries which were known for their linguistic chauvinism a decade ago, such as Germany, France and Japan.

Third, the policies for recruitment and promotion of teachers increasingly sacrifice academic competence for political expediency. Even in the best of cases, universities find themselves caught in a double bind. Due to the fact that recruitment and promotion of teachers is increasingly subjected to political pressures, those who come to be in positions of responsibility are rarely men and women of towering intellectual stature. Unable to receive academic legitimacy through either their teaching or research, they seek self-confidence and legitimacy through either political patronage or through a mechanical routinisation of academic procedures.

The fear of populist pressures which represent the other side of mechanised bureaucracies has increased in the university campuses to such an extent that decision-makers internalise the imagined responses of populist, trade union bodies and direct their own actions accordingly. Most scholars of repute either withdraw in the face of this combination of bureaucratic and populist assault on their dignity, or they simply succumb. Even vice-chancellors and pro-vice-chancellors whose own academic stature and reputation for integrity are unquestioned find that in their efforts to tame the power of unscrupulous heads of institutions or departments they end up by discarding the idea of academic judgment itself.

Fourth, the examination of PhD dissertations is managed within a small coterie of scholars. There is real dearth of competent examiners within the country but a search for examiners from the international field is regarded with suspicion as a sign of a colonial subjugation of the mind. We are now in a situation when dissertations are approved on the basis of reciprocity rather than the application of academic standards. While differences in academic judgment can happen and even the best of universities once in a while produces a doctoral student whose dissertation does not meet high professional standards, it is the frequency with which this is happening in our universities that is a cause of concern. Where dissertations are written in regional languages, the availability of examiners is further limited.

If the universities are to take a share of the blame for the falling standards for research, the UGC cannot escape its major responsibility either. The decision-making bodies in the UGC seem to have completely misguided notions about the state of social science research in the country. Among the reasons for the proliferation of substandard doctoral degrees is the premium attached to a PhD for teaching posts at the level of Lecturer and Research Associate, regardless of the quality of research. The pressure to obtain a PhD on the part of the student is matched by the pressure on supervisors to accumulate credits for producing large number of students with doctorates obtained under his or her supervision. Such 'objective' (read mechanical) factors as the number of doctoral students enhance the prestige of the supervisor. This has led to the paradoxical situation in which the efforts to improve the quality of teachers has led to a further deterioration in standards of teaching and research.

The plain fact is that no amount of introduction of national testing schemes will

solve the problem. Every objective type of test introduced at the national level, produces its own corresponding tutorial schools and *kunji* type texts. Unless the UGC squarely faces up to the fact that with the exception of five or six departments in the country, others are simply not competent or equipped to provide facilities for advanced research and withdraws any accreditation from these departments, the problem will assume alarming dimensions. The need is to consolidate resources and see that good students are provided opportunities to study and conduct research under the guidance of competent scholars. Hence while undergraduate and postgraduate teaching should be strengthened across the country, facilities for research supervision must be limited to a small number of places with proven competence and reasonable resources provided for these departments to maintain a national character.

The UGC seems to work with a vision of a floating population of brilliant young scholars who are to be directly recruited by experts appointed by the UGC. As conceived, the schemes of the UGC seek to give support to young scholars who are seen as crushed by the faction-ridden politics of university departments. While it is true that many departments are ridden with factionalism and also that not all deserving young scholars get opportunities for research, it is equally true that in the overall context of deteriorating standards, the UGC ends up by recruiting scholars with rather poor skills in research. Once money is available for a scheme, such as that of Research Associateships, on Research Scientists, the UGC seems hesitant to discontinue it. In this, it receives the support of senior scholars who are aware that resources for social scientists are shrinking and who do not want to contribute further to this decline.

I do not wish to suggest that the problem of declining resources does not pose a serious threat to the survival of young scholars. However, there can be no quick fix solution for the kind of problems I have described here. While it is very important to nourish talented young scholars, the search for such talent cannot be through the mechanised procedures evolved by the UGC and the universities. It may be necessary to appoint search committees which would seek professional opinions on the sample of the research work of a young scholar and to draw up a list of accredited journals to which such scholars are encouraged to submit their work. All of this can be accomplished

much better if the UGC takes a supportive role towards the well recognised departments and charges them with the task of fulfilling national responsibilities rather than taking the indifferent or even adversarial approach that it has been taking *vis-a-vis* established universities in recent years.

Finally, the professional bodies have done little to salvage the situation. The interests of the profession lie not only in producing greater number of jobs for sociologists but in ensuring that ethical practices in the discipline are maintained. The Indian Sociological Society should take upon itself the task of preparing a serious report on the state of sociological research in the country so that we can face the situation squarely. A discipline that has been nourished by such eminent scholars as Radhakamal Mukherjee, G S Ghurye, N K Bose, D N Mazumdar and M N Srinivas now stands in a position where there may not be a next generation.

In the general clamour of voices that are calling for universities to act more responsibly, I want to state as strongly as I can that this can only be done if practices of politics become more responsible. It cuts little ice to speak of financial responsibility on the part of universities when the government itself sets rather high standards of financial irresponsibility. New universities are announced in a game of political one-upmanship committing major resources towards infrastructure while existing universities are kept on tenterhooks even about availability of salaries. Universities are urged to raise their own resources but the minimal changes in budgetary practices and bureaucratic control that would enable universities to retain these resources are not permitted. A case in point is the insistence of the UGC that all extra resources raised by a university would be deducted from the overall budgetary allocations, despite the fact that detailed evidence of the impossibility of retaining the minimum infrastructural facilities for teaching and research under present allocations has been provided to all decision-making bodies.

Once we consider the practices of political parties that are not transparent, the situation appears even more alarming. Every political party aspires to control and use the university as its experimental ground. There is not only the effort to use the university as a recruiting ground for political parties (which may be legitimate) but also to recruit students who can help in the conduct of the night life of political

parties. One has to only consider the phenomenal amounts of money poured into students' and teachers' elections to realise that university politics provides a far quicker route to social and economic mobility for many students than the laborious task of attending lectures and tutorials and reading books. It would only be fair to add that there are several teachers who also find it easier to build a reputation through participation in university politics rather than their teaching and research. When we further consider the money poured into sponsored agitations, crowd management, and instigation of violence in the campuses, we get to understand the night battles for control of universities waged by political parties all over India.

How can universities stand up to such moral corruption? It seems to me that the first thing to realise is that the so-called representatives of students and teachers are the ones who in the name of representation are devouring those they claim to represent. Research can only flourish in an academic environment in which academic honesty is not discounted. But academic honesty first requires that we face up to our predicament, to curtail the rhetoric of academic brilliance and restore a dignity to dull, honest, plodding research. It also requires that we recognise the enormity of our responsibility in saving what little is left of critical reflection in our society.

One may question my whole argument that in order to save critical reflection we need to save the tradition of professionally competent research despite its incapacity to suggest paradigm shifts. I shall conclude with two observations on the relevance of such work within the accepted paradigms of a discipline. First, it is important to build up a critical mass of empirical data on the society on the basis of which alone does it become possible to pursue arguments within a rational discourse. Second, as I stated at the beginning, paradigmatic shifts cannot be methodologically replicated. Most of us are intensely aware of the mediocrity of our own efforts. Speaking on a personal note, if I find it necessary to continue at my efforts with writing despite my disappointment with myself, it is because I am aware that I am simply doing a holding operation till someone comes along one day and transforms the understanding of those sociological problems that I find so intractable. Meanwhile I can only transmit certain skills to my students so that when that person arrives, she does not find a complete vacuum of thought.

A-Way with Their Wor(l)d

Rural Labourers through the Postmodern Prism

Tom Brass

WHAT originally started out as a review of two recently published collections about south Asian history and society [Haynes and Prakash 1991 and Prakash 1992] offers a timely opportunity to comment on the impact and implications of what purports to be an entirely new approach to the study of agrarian change, and the role in this of peasants and workers in general and unfree rural labour in particular.¹ At times during the immediate past it has seemed as though development theory about agricultural labour has imploded, a consequence of on the one hand economists [for example, Srinivasan 1989] who reduce it to an epiphenomenon of mathematics, and on the other non-economists who question the very existence/possibility of development itself.² Into the latter category falls postmodernism, which propounds something akin to a form of 'cultural individualism', or the politico-ideological equivalent of bourgeois economic individualism, and which—when combined with concepts such as 'resistance' and 'popular culture'—dilutes/downgrades/diminishes unfreedom and creates a space for reactionary politics. In considering the impact/implications of postmodernism, therefore, this review will focus largely on texts by Prakash, since these provide agenda-setting introductions to both collections and also constitute a symptomatically postmodern approach to the agrarian issues under consideration.³

ROSE-TINTED POSTMODERN PRISM

Emanating from linguistic/literary theory and rapidly colonising the social sciences, postmodernism encompasses much of the discourse which permeates (among others) the subaltern studies project, new social movements, resistance theory and popular culture. The influence of its methodological and theoretical impact on political practice cannot be underestimated. As elsewhere, the 1980s has witnessed in India a confluence between academic discourse, as projected by the subaltern studies series, and the political practice of what are termed new social movements.⁴ The latter consist of environmental movements, composed of tribals and forest-dwellers, peasants and new farmers' movements, and more gene-

rally the women's movement, which has played a prominent role in both the ecological and the new farmers' movements. It is frequently argued, both in academic discourse about these movements, and by the spokespersons of the latter, that what is on offer here is nothing other than a radical new agenda, or a complete break with a socialist/nationalist/colonial/male past and thus the shape of an entirely new future.⁵

A form of radical conservatism which denies the fixity of meaning (or the theory of the floating signifier), postmodernism licenses an anti-universalistic, indeterminate, decentering and thus a relativistic interpretation of social existence, in which no particular identity or political view is—or can ever be—privileged.⁶ From within a postmodern epistemology, therefore, it is possible not merely to deny the necessity and/or desirability of changing an existing or traditional political order but also to espouse/endorse fascism with a clear conscience.⁷

In rejecting totalising/Eurocentric metanarratives, postmodernism also denies thereby the possibility of a universal process of socio-economic development embodied in the notion of history-as-progress (regardless of whether or not this is actually realised). Such a view necessarily signals the abolition of the Enlightenment project, or emancipation as the object and attainable end of historical transformation, and along with it socialism and communism. The collective is replaced by the autonomous/fragmented individual subject, action is guided not by class structure/formation/struggle but by subaltern/elite identities and/or those based on ethnicity/gender/religion/region, revolution is replaced by resistance, and in term of the desirable/(possible) outcome of such action socialism is displaced by bourgeois democracy—or worse.

In true postmodern fashion, Prakash claims that in India the concept 'agricultural labour' was constituted by colonial discourse, the implication being that outside the latter it had no material existence (1992a: 2, 3-4, 9).⁸ The main target of his postmodern critique is Marxism in general, and in particular its privileging of 'the economic' (1992a: 2, 3, 11, 12, 13,

14, 15-16, 21), dismissed by him as 'foundational' (1992a: 3, 15).⁹ Unsurprisingly, therefore, Prakash regards the Eurocentric/enlightenment/emancipatory economically-based notion of class differentiation as inapplicable to Indian countryside (1992a: 21), and rejects this in favour of an approach which emphasises the 'cultural' formation of labour (1992a: 3, 11, 34, 35-36). For example, the *jajmani* relationship should in his opinion be regarded as a form of 'patronage', or a specifically 'cultural form of power relations' (1992: 37). For Prakash, therefore, "the use...of indigenous categories such as *jajman* and *kamin* allow an empirical access to real life that categories such as landlords and labourers do not provide easily" (1992a: 38), thereby (re-)privileging 'indigenous' categories over the discourse of political economy ('indigenous' = real, political economy = unreal), a procedure which he himself criticises with regard to colonial/nationalist/Marxist views on the free/unfree labour distinction (1992a: 1, 6). It also confirms the idealist nature of his approach; that is, the denial of an objective reality independent of and beyond the immediate perception of the individual subject—no false consciousness, in other words [for example, see Prakash 1992a: 3].

Part of the difficulty here is that the concept 'false' consciousness is itself epistemologically impermissible within a postmodern framework. Since Prakash not merely accepts but celebrates the plurality of the ideological, by definition no form of consciousness can be categorised as 'false'. Generally speaking, postmodernism rejects consciousness of class as an Eurocentric concept that involves an 'outsider' unacceptably imputing a politically appropriate, logically consistent and historically necessary set of universalistic beliefs to particular socio-economic agents. However, without a concept of consciousness that discriminates between notions of 'true' and 'false' (which in turn entails the theorisation of a politics that transcends the randomness of non-specific/amorphous conflictive practices), it becomes possible to identify each and every single component of behaviour/activity (or existence) as yet another form of 'resistance'.¹⁰

Once the postmodern framework of Prakash has conceptually decoupled agrarian relations from their material (= 'foundational') base, it becomes possible not merely to deny the existence/efficacy of power-exercised-from-above (= class rule) but actually to invert this: social relations of production thus recast become instead evidence of power-exercised-from-below (resistance = popular culture = carnival). Accordingly, for Prakash (see below) and Haynes and Prakash (1991: 2, 17) the fragility of power-exercised-from-above licenses the inference that agricultural workers and bonded labourers could have rendered it inoperable had they chosen to do so: that they did not is then taken as evidence both for its non-coercive/non-exploitative nature and for the claim that, where it operates, ruling class power is exercised with the consent of the labourer him/herself and not against the wishes of the latter. When combined with non-class-specific concepts such as 'everyday forms of resistance' and 'popular culture', therefore, the actions/beliefs imputed to agricultural workers and unfree labour can be (re-)presented by postmodernism as proof not just of the fractured/tenuous or even non-existent character of ruling class power but also of a corresponding process of worker self-empowerment.

RESISTANCE THROUGH POPULAR CULTURE

It is impossible to understand the political impact of postmodern discourse on issues to do with agrarian change and development generally without reference to the way in which postmodernism fuses with and is simultaneously reinforced by the concepts 'resistance' and 'popular culture', both of which structure the collection edited by Haynes and Prakash (1991). The endorsement by the latter of 'resistance' and 'popular culture' is due in part to the way in which such concepts challenge the notion of passivity by recognising the voice and action of those historical categories (women, agricultural labourers, tribals, peasants) usually perceived as mute and/or dominated [Haynes and Prakash 1991:13, 16ff; Adas 1991:291, 292; Prakash 1992a:42]. On the face of it, therefore, such a process can be viewed as politically progressive.

Within a postmodern framework that links 'resistance' to the ideological plurality of the subject, 'popular culture' becomes identified with the 'voice from below', and action based on this accordingly constitutes an authentic expression of the democratic will. Consequently, anything and everything associated with its grassroots manifestation, now increasingly celebrated in that most fashionable form

of power-exercised-from-below, the 'primordial' rituals (crowning/decrowning) associated with 'carnival' [Bakhtin 1984:122ff], automatically becomes the embodiment of democratic expression.¹¹ The difficulty with this is that once the 'popular' is accepted as an unmediated construct (or the 'natural' voice of the people), it follows that what is desirable becomes whatever the 'popular' says is so; in short, a procedure that fails to ask precisely how such views are constructed, by whom, and for what political ends.

In this connection it is perhaps salutary to recall two interrelated points. First, 'popular culture' is associated historically with the emergence of 19th century European nationalist movements [Burke 1981]. Hence the importance to the latter of 'reinventing' traditional folkloric concepts linking an ethnically-specific homogeneous 'people' to a particular territory, thereby establishing a politico-ideological claim to its own rightful place/space and simultaneously denying any rival claims to this made by a 'foreign' occupying power. And second, that in its attempt to undermine the exceptionalist image of German fascism, "the right has rethought its analysis of National Socialism in part by borrowing, altering, and often gravely distorting the concepts, methods and conclusions of social history. The right's discourse is filled with pleas to normalise the study of Nazism, to empathise with the little man and to recognise that many aspects of the Third Reich, including its most horrendous acts, were not unique. . . It was history from below which first sought to reconstruct non-elite groups' perceptions of fascism" [Nolan 1988:52; on this point, see also Habermas 1989:209ff].

The metamorphosis of 'popular culture' from a passive to an active historical role is in turn linked to its being the source of self-empowerment mediating the 'everyday forms of resistance' associated with the work of Scott (1985; 1986; 1990; 1992). This 'resistance' framework has now been extended to include not only individual actions undertaken by subordinates with the object of obstructing/denying the process of material appropriation (for example, poaching, foot-dragging, pilfering, arson, dissimulation, flight) but also those multiple forms/contexts which in his view similarly obstruct/deny the process of ideological subordination (linguistic disguises, ritual codes/aggression, taverns, fairs, rumours, folktales, songs, gestures, jokes). The implication is that opposition to the existing social order derives from a hitherto undiscovered authentic grassroots voice (= 'popular culture', 'carnival'), which can be re-presented by postmodernism as a depoliticised discourse untainted by discredited overar-

ching metanarratives.¹² Like the 'moral economy' position of E P Thompson (1991:184ff), primacy is allocated to customs, traditions, culture, and practices as these already exist within the peasantry and the working class, a view which contrasts with that of Marxists who have tended to emphasise the backward-looking, politically reactionary and historically transcendent role of much of what passes for resistance based on an already existing 'popular culture' (racism, nationalism, religion). Lenin (1961:349ff), for example, warned against the opportunistic espousal/endorsement of spontaneous conflict 'from below' simply because this happened to be taking place, and emphasised instead the importance of party organisation structured by a specifically political input into the formation of what would eventually become a consciousness of class.

The politically conservative nature of the 'resistance' framework is clear from its epistemological lineage, both outside and within texts by Scott himself. To begin with, that aspect of Scott's framework which is most frequently invoked and/or celebrated for its novelty—everyday forms of resistance—is not in fact new. An almost identical concept of non-confrontation with the state, a form of indirect political action known as the 'theory of small deeds', was actually pioneered by Russian populists during the late 19th century [Utechin 1964]. More importantly, much of the theory which prefigures the 'resistance' framework is already present in an earlier text by Scott (1968:94ff, 119ff), where he endorses both the 'limited good' argument of George Foster (1965) and the 'culture of poverty' thesis advanced by Oscar Lewis (1962).

Together with Foster and Lewis, Scott attributes rural impoverishment and the lack of economic development to cultural factors operating within the peasantry itself. Peasant societies everywhere are traditional and thus closed economic systems, governed by the politics of scarcity, or what Scott (following Foster's 'limited good' argument) terms a 'constant-pie' orientation: that is, a zero-sum situation which assumes rigidly fixed or 'natural' shortages. Accordingly, rural society remains largely outside of and impervious to the capitalist system, both the process and effects of socio-economic differentiation are contained, and traditional culture survives intact. Such a framework casts all petty commodity producers in the role of a pan-historical, stereotypical non-accumulating peasant proprietor (the Chayanovian peasant family farm, in other words), the basic 'other' of development theory and planning strategy.¹³ For Scott, Foster and Lewis, therefore,

peasants are economically backward largely because they want to be (choice), because of non-economic reasons (culture), and because of reasons to be found within rural society itself.

In many ways, Scott has not departed substantially from the theoretical analysis which structured his original 'constant-ple/'limited good'/culture of poverty' approach. Hence the myth of a stereotypically undifferentiated/non-accumulating, subsistence-oriented, resistance-engaging peasantry which pervades his current work, is prefigured in earlier views; on the one hand regarding a pre-given situation of 'natural' material scarcity (a view he shares with neoclassical economic theory), and on the other concerning the presence/role of levelling mechanisms (wealth traded for prestige) whereby actual/potential rich peasants are made to disgorge their surpluses by the village poor through carnivalesque redistributive rituals (fiesta, potlatch), a process which can be perceived as evidence of successful resistance-from-below mediated in the form of popular culture.¹⁴

In one important respect, however, the most recent work of Scott breaks with that of Foster and Lewis: unlike the latter, for whom traditional culture was perceived in negative terms because it constituted an obstacle to economic development, for Scott—as for new social movements theory and postmodernism—the meaning of traditional culture has now been recast in positive terms.¹⁵ In keeping with his postmodern predilection, Scott inverts the argument of Foster and Lewis regarding the relationship between economic development and culture: precisely because it is an obstacle to development, therefore, 'traditional' (= popular) culture can now be celebrated by means of the 'resistance' theory framework.

By retaining much of the Foster/Lewis framework, yet reversing its negative theorisation of culture, Scott represents in an even more politically conservative form their central argument about the relationship between culture and economic development. Much the same is true of Prakash's (1992a:18) essentialist argument that colonialism made very little impact on India, and that there remained underneath a 'real' India largely undisturbed by its coming/going. This, of course, permits him not only to reify and celebrate an indigenous discourse as an authentic 'other', resisting economic development successfully, but also to reclassify agrarian institutions such as debt bondage as part of this indigenous discourse; in short, not as unfreedom (= an economic relation) but rather as part of this underlying 'otherness' (= a natural occurrence).

ARBEIT MACHT FREI

A political economy of unfree labour begins by focusing on the labour-power of the subject as private property, and hence as an actual/potential commodity over which its owner has disposition. Unlike a free labourer, who is able to enter or withdraw from the labour market at will, due to the operation of ideological constraints or extra-economic coercion an unfree worker is unable personally to commodify his/her own labour-power. Like chattel slavery, therefore, production relationships such as debt bondage or peonage, contract and indentured labour, all of which may entail a period-specific loss on the part of a debtor and/or his kinsfolk of the capacity to sell their labour-power at prevailing free market rates, cannot be regarded as free wage labour. Unlike chattel slavery, however, where the *person* of the slave is itself the subject of an economic transaction, in the case of a bonded, contract or indentured labourer it is the latter's *labour-power* which is bought, sold, and controlled without the consent of its owner.¹⁶ Just as Scott postmodernises and thus inverts the meaning of culture found in the work of Foster and Lewis, so Prakash and other postmodernists invert the meaning of unfreedom.

In the postmodern framework of Taussig (1984; 1987), for example, the debt peonage relation encountered in the Putumayo region of Peru during the Upper Amazon rubber boom of the early 1900s merges into and becomes nothing more than a specifically cultural manifestation of irreducible 'otherness'/difference; accordingly, unfreedom possesses only a discursive existence, linked to the construction by colonists of a mythological/folkloric image of indigenous horror/terror (based on savagery/rebelliousness/cannibalism), and projected by them onto the tribal workforce they recruited/employed. Rather than connecting the existence of terror/unfreedom in such a context to struggles over the commodification of labour-power, and identifying thereby a specifically economic role for terror in the enforcement of unfreedom which in turn licenses the process of capital accumulation, he deprivileges/banishes economics and reifies ideology.¹⁷

Unsurprisingly, Taussig (1984:491, 495; 1987:27, 69, 442-43) opts instead for the non-economic/innateness of Foucault's postmodern concept of power, whereby the exercise of terror becomes an irrational end in itself; in short, a Nietzschean view of terror/unfreedom as chaotic, purposeless, and hence unchanging/unchangeable. The resulting analysis oscillates uneasily between two competing dis-

courses about debt peonage in the Upper Amazon region: one by Roger Casement condemning the use of unfree labour for rubber production, the other by employers supporting its use, and (because of 'epistemic murk') neither of which according to Taussig (1984:470, 494; 1987:27-28, 29) it is possible to categorise as true or false.¹⁸ Like other revisionists, Taussig comes near not just to endorsing the 'lazy native' myth, but also to questioning both the actuality of terror—as distinct from the efficacy of discourse about this (= uncorroborated 'stories' which are believed, and thus possess a materiality regardless of whether or not they are accurate)—and ultimately the reasons for together with the existence of debt peonage itself.¹⁹

The more recent postmodern (re-)interpretations of unfreedom by Prakash (1990a; 1990b; 1992a; 1992b; and McCreery 1990) not only attempt to give voice to the mute indigenous subject of Taussig's analysis, but in so doing push the problematic theorisation of unfreedom structuring his postmodern framework to its logical conclusion. Since Taussig does not address the issue of how unfreedom was perceived 'from below' by the tribal worker, for him the question of a negative/positive perception of such a relation by the subject of labour does not arise, and consequently remains open. In seeking to answer precisely this question, and attempting to supply this missing voice-from-below, texts by both Prakash and McCreery illustrate how a postmodern and revisionist concept of unfreedom is compatible with the concept 'popular culture' and 'resistance' theory.

Like Taussig, Prakash (1990b: 197-98) maintains that because it lacked a discursive form in the precolonial era, debt bondage in the Indian state of Bihar automatically had no relational existence. As with his revision/dematerialisation of the world/(words) of agricultural labour generally, therefore, Prakash also revises the meaning of its unfree component; the materiality of the latter is similarly dismissed as part of economic discourse, and the relation itself consequently recast in more benign terms. He concludes that unfreedom is the significant and invented other of 'colonial discourse', and consequently that freedom is the correspondingly unacceptable embodiment of totalising Eurocentric notions of human destiny. Accordingly, the anti-universalising/decentered postmodern analysis of Prakash objects to (and thus denies the efficacy/existence of) unfreedom for two symptomatic reasons (1992a:4, 16-17). First, because it operated with a universal and enlightenment notion of slavery, the abolition of which was used by the

British to equate colonialism with liberation. And second, that in the overarching metanarratives of colonial and capitalist discourse, free labour is privileged as the totalising agent of universal progress. Like neoclassical economic theory, which precludes a connection between capitalism and unfreedom by redefining the latter as free wage labour, postmodernism dismisses bondage as a figment of western discourse, thereby banishing it from indigenous accumulation and simultaneously reifying unfreedom as a cultural 'other'.

Against this it is possible to make a number of points. To begin with, not the least of the many difficulties which confront the postmodern framework of Prakash is its refusal to countenance any alternative to a specifically bourgeois/individualist concept of freedom, thereby ignoring completely the socialist approach in which unfreedom is negated by collective freedom based on class. As with Taussig, moreover, this symptomatically postmodern outside-of-discourse/language there is nothing new is a palpably idealist position. And again like Taussig, Prakash fails accordingly to distinguish between an *ideology* of unfreedom (which may indeed have been absent, although precisely what constitutes proof of this remains problematic) and *de facto* unfreedom, which had a material existence that predated colonialism (regardless of whether or not it was identified by its subject as such).

Similarly, the difficulties into which Prakash gets as a result of his rejection of a specifically economic concept of free/unfree labour are illustrated by his inability to theorise the connection between unfreedom and the market. Hence the resort to moralising when confronted by their co-existence, as evidenced by his view (1992a 31) that 'the market, it turns out, was nothing but a sanitised name given to certain sordid events' and his reference to the market as a 'euphemism' for coercion (1992a 29), whereas in economic terms the concept 'market' is actually an antithesis of coercion. His inability to understand why the segmentation of the labour market frequently occurs along ethnic or gender lines (1992a 31ff) derives from a similar cause: since on the one hand it involves the demoralisation of workers' struggles by transforming/deflecting consciousness of class into (false) ethnic/national consciousness and conflict, yet on the other to probe the surface appearance of ethnic/national/gender identity is forbidden to postmodernism, the underlying ('foundational') reasons for segmenting the labour market is not a question that can be posed within such a framework.²¹

This problem keeps coming back to haunt Prakash. Notwithstanding the claim that hierarchical inversion in oral

tradition was a form of 'resistance' practised by unfree labour in the southern part of Bihar in eastern India, therefore, he finally concedes that, after all, it might just be the case that 'the resistance contained in oral traditions was not particularly significant, they may have made the burden of bondage a little easier to shoulder, moderated the impact of hierarchy, but did little to change the 'real' condition of the Bhuinyas: one may say that the oral traditions deluded the Bhuinyas into thinking that they were reconstituting hierarchy and labour relations when, in fact, they did nothing of the sort' [Prakash 1991 170].²² In other words, what is idealised as a form of 'resistance' may amount to no more than a contextually/historically specific form of false consciousness.

Another symptomatic text in this regard is that by McCreery, where the culturally based 'resistance' theory of Scott is similarly deployed in order to invert the meaning of unfreedom on coffee plantations in Guatemala during the late 19th century. Despite noting that "force, the coffee planters reasoned, was what the Indian understood, force would do, and force was what the Indians got", that "labour recruiters and state agents in villages jailed workers, beat and defrauded them, kidnapped their wives and children, and burned their houses", that from the 1870s "the state had the ability to deliver effective and immediate violence to the countryside", and that "life on the run and cut off from the community,

was precarious [Labour contractors and village authorities], pressed to deliver labour, increasingly took their search for [workers] into every corner of the municipality, making evasion more difficult", McCreery (1990 161, 164, 166, 168) nevertheless claims that the state was powerless to enforce unfreedom on the indigenous population.²³ For this reason, he theorises the debt bondage relation in a positive fashion, as a mechanism that enabled rural workers "to force from their employers as much money as possible", accordingly, bonded labour is subsumed by McCreery (1990 167, 169, 172) under the rubric of 'culture' which—along with folk tales, dances, religious ceremony and ritual—becomes yet another form of unproblematically successful 'resistance' on the part of indigenous communities.

This revisionist position, in which unfreedom is regarded by McCreery as evidence of the enhanced bargaining power of agricultural labour (= worker 'self empowerment'), is itself a variant of the postmodern view of Prakash—a view to which Scott (1976 231) also subscribes—whereby unfree workers symbolically 'win' (carnavalesque) battles in the ideological domain which in economic terms they

either lose or do not fight. In many ways, the attempt by postmodernism to revise the meaning of unfreedom constitutes a new variety of functionalism. The old functionalism maintained that the survival of a particular institutional form (such as religion) was linked to its capacity to satisfy basic societal needs, thereby contributing to what was perceived as social stability, as critiques pointed out, however, this amounted to a framework in which institutions were functional-for-those-who-rule. By contrast, the new functionalism of postmodern theory argues that the continued existence of institutional forms such as indenture and debt bondage is similarly linked to their ability to meet basic social needs, but this time not of the subjects but rather of the objects of rule, that is, unfreedom as a relationship that is perceived as being functional for-those-who-ruled. This, it will be recalled, is precisely the claim made by Fogel and Engerman (1974) in what amounted to a defence of plantation slavery in the antebellum American south.

CONCLUSION

The real importance of postmodernism lies in its theoretical impact on political practice: it forbids socialism, encourages bourgeois democracy, and allows fascism. Where agricultural labour is concerned, the consequences of such an approach are clear. In admitting that 'the complexity of drawing such a [postmodern] portrait makes it difficult to measure the changing fortunes—or rather the immiserisation—of agricultural labourers in India over the last two centuries', therefore, Prakash (1992a 46) finally recognises the conservative political effect of his idealist framework: the impossibility of analysing the material basis of exploitation, and thus formulating political solutions based on the identity of the subject as worker. Ironically, postmodernism, popular culture and resistance theory have all combined to invert/(subvert) the famous dictum of Gramsci (1971 175) about the nature of political action: instead of pessimism of the spirit and optimism of the will, they now license optimism of the spirit and pessimism of the will.

This point applies with particular force to the problem of unfree labour. Given a postmodern teleology, whereby freedom is not merely linked to the bourgeois/individual discourse of British colonialism, but also wrongly finds its closure in such a discourse, two things follow: first, a critique of freedom is incorrectly equated with a self-empowering critique of colonialism and capitalism, and second, a defence of freedom is misleadingly conflated with a defence of colonialism and capitalism. Such a framework overlooks

the presence of an alternative political trajectory—also springing from the Enlightenment—which regards unfreedom as a negation not of bourgeois individualism but rather of the collective freedom of the working class in a socialist context. But the latter is of course a future that postmodernism denies, and consequently its form of freedom is not one that is recognised.

Notes

- 1 The text which follows pursues in greater detail some issues arising out of earlier articles [Brass 1991; Brass and Bernstein 1992]. An additional consideration here is that one of the books [Prakash 1992] is a contribution to a new series of edited key texts on a particular issue, preceded in each case by lengthy introduction. The object of the latter is "to critically assess the state of the art on its theme, chart the historiographical shifts that have occurred since the theme emerged, rethink old problems, open up questions which were considered closed, locate the theme within wider historiographical debates, and pose new issues of inquiry by which further work may be made possible" [Prakash 1992:vii]. Other similar collections in this series include Hardiman (1992), Ray (1992) and Stein (1992).
- 2 For a recent attempt to postmodernise development theory, see Pieterse (1992). Symptomatically, rather than engaging with politics/theory to which it is opposed, much postmodern discourse simply dismisses-by-chronologising; hence the frequent recourse to the prefix 'post-' (e.g. 'post-Marxism', 'post-industrial'), which—like post—modernism itself—constitutes an attempt to delineate a closure of a particular debate without having to confront it theoretically and politically ('this argument/position is of the past and need not detain us here'). The only legitimate application of the term 'post' is to activity connected with the delivery of letters.
- 3 It must be emphasised that both collections under review contain useful texts, the contents/argument of which on occasion implicitly challenge the revisionist editorial view of Prakash. For example, Bates and Carter (1992) present a rather less optimistic version of unfreedom as this applies to the recruitment of tribals as indentured migrant labour for Assam and Mauritius, but unfortunately have little to say about its important role in the capitalist restructuring of the plantation (on this point, compare Behal and Mohapatra (1992)). Similarly, the text by Adas (1991:300, 301) voices a welcome caveat to counter overenthusiastic endorsements of the 'resistance' theory of Scott.
- 4 The subaltern studies project is presented in—but by no means confined to the collection of texts edited by Ranajit Guha (1982-89); a strong endorsement of the latter is contained in Haynes and Prakash (1991:7-8) and Adas (1991:296). For discussions from different perspectives of new social movements as global phenomena, see Slater (1985), Fuentes and Frank (1989), Fekstein (1989), Foweraker and Craig

(1990), Escobar and Alvarez (1992), Calman (1992), and the contributions by Melucci, Laclau, and Vargas to Pieterse (1992). Although Fuentes and Frank (1989:184, 187-89) are correct to observe that 'new' social movements are neither new nor comprehensible without reference to class composition, they mistakenly believe that "in the third world social movements are predominantly popular/working class", and thus overestimate the socialist content and potential of such mobilisation. For a discussion of the divergence between Marxism and the egocentric resource mobilisation theory of collective action that structures much new social movements analysis, see Melucci (1989:184-92).

- 5 As has been argued elsewhere [Brass, forthcoming], this denial by the postmodern discourse of new social movements (eco-feminists, tribals, peasants, farmers, women) of history/modernity/socialism/class on the one hand, and on the other its reaffirmation of peasant/ethnic/gender essentialisms, is in the Indian context particularly supportive of the neopopulist/communal/nationalist discourse of the BJP/VHP/RSS.
- 6 Unless it is to be regarded as innate, immutable, and therefore part of 'nature', any concept of 'difference' has—and can only ever have—its origin in a class structure which first assembles and then ideologically consecrates it. By conferring a 'natural' fixity on 'difference', postmodernists who reify/essentialise it simultaneously naturalise the (bourgeois) socio-economic order which constructs this (historically-specific notion of) 'difference' in the first place.
- 7 On the connection between postmodernism, linguistic deconstruction, decentering/deprivileging and fascism, see Kermode

(1991:102-18) and Lehman (1991).

- 8 It should be noted that, on this point, as on so many others, Prakash adopts a contradictory position. Accordingly, he observes that discourse analysis does in fact "permit the recognition of certain categories and concepts as true or false" (1992a:1), which would seem to accept the possibility of objective evaluation that he subsequently denies. Similarly, having dismissed unfreedom as an invention of colonial discourse, Prakash concedes that the latter was merely invoking rules about slavery contained in the earlier discourse of the indigenous 'other' (1992a:5). And despite conceding that "even relatively privileged groups can participate in resistance", Haynes and Prakash (1991:4) immediately contradict this by observing that "obviously we rule out as resistance those actions of dominant groups that only further their domination".
- 9 Notwithstanding his coded rejection of Marxism in terms of an 'economistic' and 'West European model' (1992a:21, 35, 46), Prakash nevertheless utilises a number of Marxist categories, such as the formal/real subsumption of labour, rich peasant and proletarians, surplus appropriation, and class (1992a:24, 26, 27, 29; 1990a:2). The most obvious of the many difficulties posed by this eclectic approach is the existence of a contradiction between on the one hand the way in which postmodernism accepts only the surface appearance of identities such as ethnicity and nationalism, and on the other the Marxist theorisation of these same identities as the false consciousness of ('foundational') coercive/exploitative class relationships which license the extraction by landholders of surplus-labour or surplus-value from their labourers. Insofar as he attempts to combine a postmodern

IMPERIAL AFFINITIES

Nineteenth Century Analogies and Exchanges between India and Ireland

S B COOK

Imperial Affinities is an important contribution to British imperial history which challenges the school of thought that believes that there was actually no such thing as an Empire displaying one flag, governed from one throne and operating according to one set of laws by suggesting how the Empire actually had a substantial degree of cohesion. To demonstrate this, Dr Cook investigates the various ways by which the British borrowed from their experience of Ireland in formulating policies and deepening their hold on India.

framework with selected components of a Marxist analysis, therefore, Prakash juggles uneasily with these mutually incompatible (positive/negative) theorisations of the same relational form.

10 That 'existence' is frequently confused with 'resistance' is acknowledged by Prakash (1992a:43) when he notes that "reading dissonance in the cultural forms which landholders and labourers lived their social lives is...difficult because, as anthropological studies of village India amply demonstrate, transactions imbued with such institutions as caste hierarchy and patriarchy appear to have the status of unquestioned habits, as matters of everyday routine."

11 Unsurprisingly, Scott (1990:175) identifies the carnival as resistance incarnate, "the ritual location of uninhibited speech...the only place where *undominated discourse* prevailed, where there was no servility, false pretences [*sic*], obsequiousness, or etiquettes of circumlocution" (original emphasis). In keeping with this view of carnival, Dirks (1991) maintains that religious festivals in south India were examples of power-exercised-from-below. Such a view overlooks the extent to which carnival not merely does not challenge but actually reinforces and justifies the existing social structure, and is therefore more accurately categorised as a form of social control (or power-exercised-from-above). For the way in which the carnivalesque in India has on occasion served to reinforce communalism, see Cashman (1975) and Freitag (1989).

12 More recently, Scott (1990:x) has admitted that his analysis "shares with postmodernism...the conviction that there is no social location or analytical position from which the truth value of a text or discourse may be judged".

13 The description of peasant economy as 'non-productive', together with the view that 'limited good' not only results in 'extreme individualism' but is also structured by a perception of all resources available to the rural community as finite (= 'natural'), suggests that Foster (1962:52; 1967:297, 301) subscribes to Chayanovian neopopulism: accordingly, the observation that "wealth, like land, is something that is inherent in nature" [Foster 1967: 296, 298] naturalises and thus legitimises the inequalities which occur in the agrarian class structure. Elsewhere [Brass 1991] it has been argued that the neo-populist concepts which structure Chayanovian theory of peasant economy also structure a common epistemological lineage that can now be traced from the moral economy argument and the 'middle peasant' thesis to the new social movements and subaltern studies project.

14 That Scott continues to subscribe to a constant-pie approach is implied in his more recent view (1990:x) that for "subordinate groups in these forms of domination...status is fixed by birth. Social mobility, in principle, if not in practice, is precluded". His view about growth-inhibiting cultural levelling mechanisms [Scott 1990:27] is similar to that of Foster (1967:302), who noted that 'self-correcting [cultural] mechanisms' serve to prevent individuals or families from accumulating.

15 Foster's negative perception of traditional culture is evident from his comment (1965:296) that "such peoples will be seen as constituting a drag...on a nation's development, and will be cutting themselves off from the opportunity to participate in the benefits that economic progress can bring".

16 Because for Prakash (1992a:6,16; 1990a:185) the postmodernised concept of unfreedom is theorised in Foucaultian terms of a 'corporeal' relationship, whereby power takes the form of physical control by a landholder over the body and not the labour-power of the worker, it is easy for the absence of actual violence to be interpreted as evidence of either the benign nature of bondage (= the 'economy of gentleness') or even the non-existence of unfreedom.

17 At some points Taussig maintains that in the Upper Amazon region a market for labour-power was absent, and is therefore correspondingly dismissive of Casement's attribution of terror/unfreedom to a scarcity of workers; elsewhere, however, he appears to accept not merely the existence of labour shortages but also the economic irrationality of destroying scarce workers and that the object of terror was in fact to increase rubber production [Taussig 1984:475-77, 488; 1987:52ff]. For Casement's account of Putumayo, see Singleton-Gates and Girodias (1959:201-315). In other words, terror combined with unfreedom possessed a two-fold economic object: to intensify output on the one hand, and on the other to warn potential absconders of the consequences of flight/disobedience. As in the case of the tobacco plantations in the Dutch colony of Sumatra, therefore, executions and floggings of tribal workers in the Putumayo region took place in the labour process itself [Breman 1989; Taussig 1984:475-77].

18 This equivocation on the part of Taussig is prefigured in the similarly postmodern ambiguity of de Man (1979:293), who notes: "It is always possible to face up to any experience (to excuse any guilt), because the experience always exists simultaneously as fictional discourse and as empirical event and it is never possible to decide which one of the two possibilities is the right one. The indecision makes it possible to excuse the bleakest of crimes because, as a fiction, it escapes from the constraints of guilt and innocence". The outcome of this framework, in which language is decoupled from material reality, is ethical relativism, which in turn naturalises horror/terror/(unfreedom). That such a position licenses complicity with fascism is confirmed by the cases not only of de Man himself but also of Heidegger and Blanchot.

19 See Taussig (1984:490, 494; 1987:60, 65-66) for his views on the 'lazy native' and his questioning of the actuality of terror/unfreedom.

20 Generally speaking, workforce restructuring by means of introducing or reintroducing unfree relations corresponds to deproletarianisation (or the economic and politico-ideological decommodification of labour-power), a process of class composition/recomposition which accompanies the

struggle between capital and labour. In contexts/periods where/when further accumulation is blocked by overproduction, economic crisis may force capital to restructure its labour process either by replacing free workers with unfree equivalents or by converting the former into the latter. The economic advantage of deproletarianisation is that such restructuring enables landholders/planters first to lower the cost of local workers by importing unfree, more easily regulated, and thus cheaper outside labour, and then to lower the cost of the latter if/when the original external/local wage differential has been eroded. In this way it is possible either to maintain wages at existing (low) levels or even to decrease pay and conditions of both components of the workforce, thereby restoring/enhancing profitability and with it the accumulation project in (or linked to) the capitalist labour process. In ideological terms, the object of the deproletarianisation/decommodification of distinct forms of labour power employed by capital is either to prevent the emergence of a specifically proletarian consciousness or to curtail the latter where it already exists. Hence the utilisation of unfree components from the industrial reserve army of labour not as an addition to the existing (free) workforce but rather as a substitute for—and thus competitors with—the latter has dire consequences for the development of working class political consciousness, in agriculture no less than manufacturing. There are numerous instances of racist responses on the part of an existing agrarian workforce displaced by the nationally/ethnically/regionally specific labour-power of cheap/unfree migrants recruited by planters, landowners or rich peasants engaged in the restructuring of the labour process. Where an initially progressive proletarian class struggle shows signs of being/becoming effective, the attempt by capital to demobilise it by means of workforce restructuring may convert what is an actually or potentially revolutionary situation into a politically reactionary combination of nationalism and racism.

21 Much the same can be said on his attempt to inscribe 'resistance' into spirit cults in south Bihar [Prakash 1992b].

22 For earlier, non-revisionist, accounts by the same author of unfreedom in Guatemala, see McCreery (1983; 1986).

Principles and Practices of VALUE ADDED TAX: LESSONS FOR DEVELOPING COUNTRIES

235 + XII pages* Rs 250, US \$ 30*
Cloth Bound* 1993

In the light of the experiences of more than 60 countries all over the world, this book by Prof. Mahesh C. Purohit of the National Institute of Public Finance and Policy, New Delhi 110 067 presents lessons to be derived for commodity tax structure of India as well as for the other developing countries. It provides an intensive study of the system of value added tax in various countries, especially in France—the pioneer of VAT. The coverage includes an in-depth analysis of the rates, bases, exemptions, taxation of services and harmonisation of tax rates among EEC countries. It also includes an extensive discussion of the administrative, organisational and operational problems encountered in different countries with special reference to the forfait system of France in dealing with the small dealers.

The book has been greatly appreciated by Indian as well as foreign fiscal experts and is highly recommended for students, teachers, researchers, policy makers and tax administrators in developing countries in general and in India in particular.

Famine Mortality

Elizabeth Whitcombe

The giant misery of starvation caused by the alarming incidence of famine in the later 19th century was compounded by the appalling conditions of migration and over-crowding into which the starving poor were driven, often literally to death, conditions exacerbated by the official measures devised for famine relief. Worse, in the great famine years, by perhaps the cruellest of the many cruel ironies of famine history, rain which might have been expected to bring respite to the survivors of the drought instead intensified their suffering: epidemic malaria took its colossal toll. In other years drought, where it persisted, ironically limited mortality. But this saving grace was denied to the wretched populations of the submontane marshland and the waterlogged districts along the lower Western Jumna Canal, where irrigation, intended to solve the problem of famine, added its quota to the principal cause of famine mortality, malaria.

The history of famine mortality raises many questions and the search for answers should lead to an understanding of famine more commensurate with its complexity. With the available groundwork of the detailed accounts of the outbreaks of famine in every province of British India and the manifestations of disease and the physical conditions associated with them, an epidemiological history of famine in south Asia becomes not merely desirable but a practical proposition.

IN response to the alarming incidence of famine in the later 19th century and the escalation of its economic and social costs, the British government of India devised a systematic policy for the assessment and relief of famine and scarcity. Famine was determined by a specific sequence of events. Insufficient, or untimely, rainfall led to the failure of not one but a succession of harvests. Prices of foodstuffs rose, prompting government to predict that

eventually prices will rise so high that the labouring classes cannot, with the wages they earn, buy enough food to keep sufficient health and strength for daily labour; then, unless assisted, they must gradually become weakened until they are unable to work at all and death by slow starvation follows; or if labour fails synchronously with the rise in prices, the same end results but more rapidly.¹

The rise in prices was taken as the index of distress; and mortality, presumed to be the direct consequence of starvation, the index of a famine's severity.

Government's intention was that measures for the relief of starvation should be implemented on receipt of notification of rising prices, to prevent, or at least limit, mortality. Assistance to the distressed was not to be provided in the form of foodstuffs, an interference with private commerce warranted only "if the safety of the lives of the population is incompatible with the freedom of trade".² Instead, district officers were to prepare programmes of public works with a scale of wages such as would enable labourers to buy food. Camps were to be established to house the labourers and feeding-centres

for the hopelessly destitute who could not work.

In the event, this policy did little to mitigate distress and less to prevent mortality. An explanation may be found in the events of the famine years; not merely in economic and social events, for which an impressive literature is now available, but in the peculiar and dramatic sequence of climatic events and the clinical and pathological history of famine years, which may be reconstructed from observations filed weekly by officers of the departments of revenue and agriculture, public works, and sanitation of the provincial and central governments. The reconstruction of this famine history calls into question the assumptions upon which government's famine policy was based. Rising prices proved to be unreliable as a distress signal. The relation of prices to quantities of foodstuffs was never established; nor was the critical point determined which prices must reach for government to respond with the greatest efficacy. Relief schemes therefore could not but come into operation piecemeal, wherever district officers could convince their superiors, by the pertinence of their observations, of the necessity for intervention. Mortality, moreover, on the colossal scale recorded in famine years, was not simply the direct consequence of starvation, but the outcome of a far more complex set of conditions than official policy allowed for. What these conditions were and how patterns of mortality characteristic of famine years were determined by them can be demonstrated by the history of Madras, 1877-78, compared with Punjab, 1896-97 and 1900-01. No wretchedness, on such a

scale, has ever been better documented. It is possible therefore to conduct an autopsy of famine mortality, to clarify the nature of the problem in its complexity: who died, and where; when did they die and how, of what cause, and why.

I

Madras, 1877-78

The years of famine, 1877-78, were distinguished not by unrelieved drought, but by months of drought succeeded by rain, tempestuous especially in coastal districts, from May to June, giving way to drought again in July to return from August at greater than average rate of precipitation (Table 1 and Figure 1).

By the beginning of 1877, scarcity had been officially declared in Madras town and in seven districts: Nellore, Cuddapah, Bellary, Kurnool, North Arcot, Coimbatore and Madura. By March-April, prolonged drought converted scarcity, "as evidenced by rocketing prices", into famine in South Arcot, Trichinopoly and Tinnevely. Malthus' predictions were not borne out. The coastal, intensively irrigated districts of Tanjore, Ganjam, Godavary and Kistna, with populations of 540 per square mile and above, were prosperous and escaped while famine ravaged the up-country districts where population barely averaged 150 per square mile.³

Drought, scarcity, hunger and the death of cattle compelled the villagers in the famine districts from late 1876 to migrate in search of food and work. They followed routes long established by seasonal migration: from Nellore, Chingleput and North

• Arcot in the direction of Madras; from north Nellore and Kurnool to the Kistna delta, from Salem to Trichinopoly and Tanjore, from Coimbatore to Trichinopoly and Malabar. At the height of the famine, from April to July 1877, the migration was enormous, certainly tens of thousands, probably hundreds of thousands, of "labouring poor". Migration from Madura and Tinnevely, for example, to the coffee estates in Ceylon and the Travancore hills more than doubled. Government policy encouraged migration, to towns where foodgrains were stockpiled by private trade, at the behest of official policy, and to the public works and relief camps.⁴

The Madras famine was "the first in which official arrangements were made for the systematic inspection of the distressed people". In March, April, May and July 1877, the Sanitary Commissioner, Dr W R Cornish, toured the famine districts, making a clinical inspection of labouring gangs on the public works and the destitute in relief centres. Cornish physically examined some 3,000 persons. In March, he noted "a general tendency to leanness of all classes—ribs, collar and shoulder bones are all unusually prominent. But many had a fair amount of muscular development and clean, glossy skins". Colonel (later Sir) Richard Temple, seconded from Bombay for famine duty in recognition of his expertise in the design and implementation of relief schemes had toured the famine districts shortly before Cornish. Temple had been impressed by the muscular physique of the labourers. Concluding that the scale of wages was pitched too far above the bare necessity of relief, Temple had ordered a reduction.⁵ Cornish, whose clinical eye had been caught by the incongruity of 'muscular destitution', took a history which showed the error of Temple's interpretation. Some nine-tenths of these labourers were "of the animal food eating castes [and] had largely subsisted on bullocks which had died or been destroyed on account of famine. In March, April and May, in many districts, beef was weight for weight the cheapest food procurable".

The presence of these apparently well-fed individuals in the labour gangs, caused superficial observers to draw wrong inferences as to the extent and severity of the distress amongst them. They ate meat because the famine had brought an abundance of it, temporarily, to their doors, and the food nourished them, but the supply was of very precarious and uncertain duration, and the fact ought to have been accepted as a sign of the severity of the food dearth, instead of which there is reason to believe that the ruling authori-

ties were at one time misled as to the real nature of the calamity, by glowing reports week after week of the physical condition of the labouring classes.⁶

Scarcity had already had severe effects on the old and young. Once the meat supply was exhausted, the condition of the labourers deteriorated rapidly. In Bellary in April Cornish found some 30 per cent of the gangs to be in a state of emaciation, in July, "nearly all the people on the works were wasted".⁷

His inspections provided Cornish with a superabundance of the physical signs of starvation. Wasting "the most general physical attribute of the famine-stricken observed to follow a characteristic sequence: first, the loss of body fat, manifested in the disappearance of the rounded contour of the buttocks, later, the loss of muscle tissue from limbs and trunk, detectable in the abnormal protrusion of elbow and knee joints, in the wide spaces between closed legs, in the prominence of ribs. Anaemia, the characteristic pallor of mucous membranes of the eyes and mouth, cracking and ulceration of the corners of the mouth and of the tongue, the sign of iron deficiency, the "drawn" expression of women and children, the increase in heart-rate, "the movement of the heart, knocking against the ribs, [visible] even at a distance of some yards". Scurvy observed in the early stages of the famine, since green vegetables had disappeared from the markets before foodgrains, and in March already, in North Arcot and Cuddapah, the heart of the famine tract, the normally ubiquitous lime had become unprocurable. The characteristic deep, purplish-blue discoloration and thickening of the gums, ulceration, bleeding and loosening of the teeth were repeatedly found on physical examination. Famine-skin, "dirty looking", scaly, degenerate epithelium, and a striking reddish pigmentation of the hair, now known to be indicative of kwashiorkor, hypoprotein

aemia. By July, Cornish estimated that some 60-70 per cent of the labouring population of the famine districts were suffering from scurvy, anaemia and generalised wasting. The physical signs of starvation, he noted, were "significantly absent in cooks and others employed in camp kitchens".⁸

In women and children, in addition, there were the signs of arrested growth and development. Children born in the camps had "the wizened and spider-like appearance of the half-starved", from defective nutrition *in utero*. Of girls aged 12 to 14, barely 20 per cent had reached puberty. Menstruation in young women was

Sources: Government of Madras, *Review of the Madras Famine 1876-78*, Madras, 1878, *Annual Report of the Sanitary Commissioner Madras* 11 1876, 14, 1877, 15, 1878, *Report of the Revenue Administration Madras* 1876 1877 1878

scanty and irregular, and in severe emaciation, ceased altogether. The population of pregnant women was remarkably low. These findings were confirmed in the decline in birth-rate in 1877, 25 per cent, in 1878, 50 per cent below the average of the two previous years. Analysis of the breast milk of mothers in the camps showed it to be no more than a thin, watery secretion, deficient in solids, salts and casein.⁹

Starvation was unmistakable, widespread and unmistakably severe.

At the height of the famine, from April to July 1877, "the labouring poor, destitute of food and work, forsook their village homes to an enormous extent." Government also saw in migration the prospect of relief, and actively encouraged it. Attempts were made to open up new routes from the famine districts, from Bellary and Cuddapah, for example to the Buckingham Canal works on the Nellore coast. Government and the migrants were deceived. The drought which had driven them out deprived them of food, and water, on the way to the towns and camps. Foraging killed the migrants, the necessity to "resort to unusual—repulsive and noxious—kinds of food" the result, diarrhoea, and death from dehydration. Wells and tanks had long dried up. Such water as was available was mostly contaminated with the risk of drinking it, diarrhoea and death from dehydration. The excessive heat of the famine months heightened the risk of dehydration. The planned migration to the Buckingham Canal served merely to demonstrate the cruel futility of the expedient. The "line of migration" selected was "out of the usual course", understandably, since it lay "across a barren mountain range." "The experiment had ultimately to be abandoned as unsuccessful and full of disaster to the people."¹⁰

Most of the migrants were the able-bodied poor. How many died *en route* will never be known. These deaths went for the most part unregistered. Circumstantial evidence suggests many thousands. Of those who survived the journey, hundreds of thousands were to die at their destination, "victims", as Cornish put it, "of the circumstances of the food dearth [which brought] the people under peculiar insanitary conditions. Hundreds of thousands of destitute poor crowded the relief works and centres and towns where food is to be had; all this contributed to disorders of digestive functions, often with fatal consequences." The principal cause of death and disease was the "deterioration" in the water supply.

The usual surface wells and tanks have dried up and the sources that are available are so much polluted, that even persons

who are particular about the quality of their water are unable to procure a wholesome supply. When the people, therefore, are accumulated by thousands on various road works and the wells were few and far between, it was no cause for surprise that sudden explosions of cholera occurred amongst them.¹¹

An abundant water-supply and efficient 'conservancy' were provided for in camp plans. Estimates of the population to be provided for were wretchedly inadequate. Camp facilities were overwhelmed from the outset. Explosions of cholera were

recorded early in the famine, declining by March, when migration intensified, to be overtaken by other diarrhoeal diseases with similar fatal outcome. "Some form of bowel disorder", Cornish estimated from the weekly returns of camp hospitals, accounted for at least three-quarters of the mortality.¹²

Post-mortem evidence substantiated Cornish's estimate. From December 1876 to July 1877, 3,250 persons were admitted to the hospital of a relief camp on the outskirts of Madras, of these 1,117 (34 per cent) died. Porter, the medical officer in

FIGURE 7: PUNJAB—REGISTERED MORTALITY, 1896, 1897—MONTHLY DISTRIBUTION

charge, performed 459 autopsies. The bodies were "greatly emaciated":

Average Ht Average Wt (lb)
Normal Autopsy

Tamil men (181) 5' 7" 110-120 54-113
women (121) 5' 2" 95-105 40-102

The skin was dry and scaly. Most bodies showed oedema—swelling due to the accumulation of fluid—of the feet; some, generalised oedema. The internal organs were 'wasted'; the brain markedly atrophic and reduced in weight. The most significant changes were found in the gastrointestinal tract: loss, and in many cases ulceration, of the mucosal lining, a gross reduction overall in the absorptive surface of the intestine. Porter identified some cases of cholera; most he diagnosed as 'terminal dysentery and diarrhoea of famine'. The pathological appearances he describes are consistent, in a modern interpretation, with bacillary dysentery, the immediate cause of death being gross fluid loss.¹³

Registration, while approximate and inaccurate in detail, provides an adequate source for overall estimations of mortality by region, principal cause, and by season.¹⁴ Mortality during the months of drought, from late 1876 to July 1877, the mortality, principally, of migration and of towns and camps, of diarrhoeal diseases, famine mortality in the strictest sense, may have amounted to some three-quarters of a million, a provisional estimate based on camp and municipal returns. The total mortality for 1877, however, was officially estimated at 1.5 million and calculated by Cornish to be in excess of three million. An examination of the monthly returns for the famine years shows not one but two phases (Figure 2). 'Phase I', mortality of the months of drought, to July 1877, was the mortality from cholera and

bacillary dysenteries, the diarrhoeal diseases, for which the focus was the towns, and the famine camps. This was far exceeded by the mortality of 'Phase II', from August-September, distinct not only in the season of its predominance but also in its principal cause, "fever" (Figures 3 and 4).

This fever, described in the field observations of medical officers in 1877-78 as "predominantly of the malarious type", was the greatest single cause of mortality in Madras in all years (Table 5).

The mortality curve of the famine years differs not in seasonality, nor in principal cause, but in amplitude. In 1877, mortality in Phase I, mainly from diarrhoeal diseases, at a record level, was succeeded by a huge epidemic wave of malaria. The following year, characterised by a more equable rainfall, there were far fewer camps and most closed by the third quarter. Cholera and the dysenteries were

much less in evidence in the mortality returns; smallpox, always associated with drought, was negligible; the autumnal wave of malaria returned to near-normal proportions.

Early in the famine in 1877, medical staff remarked on the significant absence of the "usual" amount of intermittent fever in the famine area. It remained absent "as long as the drought continued". As late as May, no case of "ordinary intermittent fever" had been recorded throughout the famine camps and hospitals. But after the heavy cyclonic storm at the end of May, "agues" characteristic of malarious fever were widely reported. In September and October, "the long delayed rain fell in unusual quantities and... febrile affections, always of the malarious type, either intermittent or remittent, were exceedingly prevalent, especially in the famine districts: fever of 10 to 15 days' duration, exacerbated at night, complicated by dysentery or oedema, followed by recovery or more often death within a month. All classes of the population were vulnerable. In Kurnool and Cuddapah, "public business nearly collapsed on account of the subordinate classes [of officials being] stricken with fever". Throughout November, December, January, temperatures high by day and low by night "favoured the infection"; "thousands of the half-starved survivors of the worst period of the famine fell victims to the fever".¹⁵

Neither the climatic conditions which characterised the years 1877-78 in Madras nor the catastrophic consequences were isolated events. Cornish warned, from long experience and examination of the historical record, that "malarious fevers on an exaggerated scale" must always be anticipated in India where long droughts "were, as often, succeeded by inordinate and tempestuous rains": as in Rajputana

in the famine year, 1868; in Tonk in 1869, when an estimated 25 per cent of the population had died, 50 per cent of these from "the fever that followed the rains"; in the central provinces the same year, "the exceptional mortality" was reported to have begun just when the famine ended; the scourge of the times was "fever".¹⁶

The association of drought, excessive rainfall and epidemic malaria was thus well known. A noxious miasma, malaria, exhaled by saturated soil was generally believed to be the cause. Cornish subscribed to this opinion, and assumed that saturation of soil overheated by prolonged drought must intensify the exhalation. But he made a striking observation which was incidental to his analysis of fever mortality, and irrelevant to the ruling miasma theory: "malarious fevers following on famine are just as much natural phenomena as the enormous development of insectivorous life after prolonged drought".¹⁷ Insectivorous species thrive on the enormous proliferation of insects, amongst them the mosquito, unleashed in the intense humidity when the rains broke the drought. Two years after the Madras famine, Laveran in Algeria identified the malaria parasite, *plasmodium* spp. In 1896, Manson predicted that malaria in man would prove to be transmitted by mosquito. In 1898, Ross established by experiment that malaria in man was vector-borne, transmitted by the bite of the female anopheline mosquito, and determined the phases of the life-cycle of the parasite *plasmodium* in the vector anopheline. The vector was the key to the relation between climate and malaria, demonstrated by the catastrophic events in Madras, 1877-78.

Those years of famine were distinguished not by drought alone, but by drought and episodic, often tempestuous, rainfall. Drought and the scarcity of foodstuffs resulted in widespread starvation, confirmed by clinical examination, in migration and overcrowding in towns and camps where conditions favoured contagion and hundreds of thousands

died of dysentery and diarrhoea. This was the classic mortality of famine, provoked by starvation and aggravated by the precisely those measures devised by government to relieve it. But the greatest mortality in the famine years came after the drought had broken, from epidemic malaria.

Is this pattern of climatic conditions, not unrelieved drought but prolonged, intense drought broken at its height by rain, and this biphasic pattern of mortality, seasonal and skewed heavily to the 3rd and 4th quarters of the year, to be found in other great famine years distinguished by colossal mortality? Evidence from Punjab, from two years, 1896-97 and 1900-01, when scarcity and famine were officially declared, proves instructive.

II Punjab (1) 1896-97

The famine year, 1896, in Punjab was a dry year, a year in which drought was widespread and persistent and rainfall, particularly in the crucial third quarter, significantly below the average for the decade (Table 3 and Figure 6).

In the course of the year, prices rocketed in response to the drought, and the export-trade in foodgrains. Government set up public works camps in the worst-hit districts, Lahore, Hissar, Gurgaon and Ferozepore. Migration, however, was reported to be modest, and to have tailed off before the hottest months.¹⁸

Conditions in Punjab in 1896 differed strikingly from Madras in 1877. So did the seasonal distribution of mortality (Figure 7). The highest incidence is recorded early in the year, with no late peak. The figures for 1897, when the climate returned to 'normal', show the pattern of seasonal distribution characteristic of 'normal' years, and similar, in the shape of the curve for the later months, to the catastrophic year in Madras, 1877.

An examination of the distribution of mortality in Punjab by principal cause is illuminating (Figure 8). Smallpox, the

disease most characteristically associated with drought, reached record levels in 1896. The 'famine diseases', of overcrowding, cholera and the diarrhoeal diseases, were relatively insignificant. 'Fever' accounted for the overwhelming majority of deaths in both 1896 and 1897, as in every year in Punjab. The seasonal distribution of total mortality follows the curve for 'fever' mortality closely (Figure 9). 6,42,078 deaths were recorded for the famine year, 1896, in Punjab, 6,30,617 for the following year, a rate of 31.5 per mille, shockingly high; but significantly lower than the average death rate for the decade, 39 per mille.

The observations of the Sanitary Commissioner provide an explanation. Cholera, he reported, had been "introduced into many localities but conditions favourable to the growth and virulence of the micro-organism were wanting in most places".¹⁹ Four years earlier, epidemic cholera had swept through Punjab, accounting for nearly a third of the total mortality for the province in 1892, at a rate of 49.5 per mille. In 1896, the contagion was somehow contained. Relief camps were fewer, confined largely to the Delhi division, and wound up after a few months. The provision of disinfectant—potassium permanganate—for municipal water-supplies may have been effective. The level of immunity in survivors of the recent epidemic was no doubt high. Diarrhoeal

Sources: Reports of the Sanitary Administration, Punjab, 1896-98

diseases accounted for no more than 0.68 deaths per mille, for similar reasons.²⁰ Conditions, that is, drought, were eminently favourable to the transmission of smallpox. Mortality, at a rate of 2.19 per mille, was reported in a characteristic seasonal distribution, maximum in May at the height of the drought, minimum in September-October.

As in every year, so in 1896, fever was the largest single cause of mortality: over 3,90,000 registered deaths. But the rate of 19.15 per mille was more or less equivalent to that recorded for 1895, markedly less than the rate in 1894—25 per mille, and far below the decade average, over 29 per mille. The figures for 1896 came as no surprise to the Sanitary Commissioner:

In this Province (and generally in India), a deficiency of rainfall and a low death-rate from fevers are almost invariably associated...whereas heavy rainfall, followed as it is by the swamping of low-lying places, great floods, and excessive moisture in the soil is almost invariably followed by high fever mortality...the curve generally falling during the rain, while in the succeeding dry weather the cases increase. The rise and fall of the ground water, by causing variations in the amount of moisture present [in the soil] evidently plays an important part in producing or controlling outbreaks of paroxysmal fevers...With a permanently lowered sub-

soil water the general health of the population living on the land remains good.²¹

In 1896, rainfall was deficient throughout Punjab and the groundwater level low in most parts of the 20 districts of the plains. In 10 districts, high groundwater levels persisted even in the driest years: three in the submontane region to the north, and five plains districts, much of them low-lying, with extensive perennial irrigation from high-level canals. Marsh and waterlogging were familiar features in these districts. And in these districts, and these alone, the death rate in 1896 was the highest in the province, and fever mortality far in excess of the provincial average. The highest death rates from fever were recorded in the districts served by the lower reaches of the Western Jumna Canal. In less than a decade after its opening in 1820, this stretch of the canal had become notorious for persistent waterlogging from seepage and obstruction of natural drainage and a persistently high incidence of fever. Clinical surveys were carried out along it, in exhaustive detail, in 1846-47 and thereafter at intervals throughout the 19th century. Successive attempts were made to remedy the "unhealthiness" associated with the canal by realignment and surface drainage cuts. The canal however flowed through a shallow basin. The natural disadvantages

of drainage were not only not relieved, but compounded by the surface cuts, which tended to become pools of sluggish or stagnant water. Drought and famine in the early 19th century had in part prompted the construction of the western Jumna Canal.²² In the drought and famine year of 1896, mortality in the Karnal and Delhi

divisions of the canal was the highest for Punjab, and fever was its principal cause (Figure 10)

Quinine was now officially recognised as an agent of prophylaxis. But the prospect of prophylaxis was wrecked on the rocks of administration. An experimental system introduced in Delhi division, by which quinine was to be sold through the post office, had proved a failure.²¹ No alternative scheme was prepared.

(2) 1900-01

The famine year, 1900, was marked by a catastrophic coincidence of drought, and rain, conditions starkly reminiscent of the great famine year 1877 in Madras and reflected, as in Madras that year, in the scale, and the pattern, of mortality (Table 4 and Figure 11).

"The year 1900", Dr Bamber, the Sanitary Commissioner reported, "will long be remembered as one in which the Province suffered severely from famine,

then cholera, and lastly malarial fever".²⁴ (Figures 12 and 13)

Cholera struck hardest where famine struck hardest, in the south-eastern districts of Hissar and Rohtak, a continuation of an outbreak in 1899. The spread of the disease could be mapped with precision, from the movements of labourers to government's relief camps. On December 13, 1899, a tank used by famine relief labourers in Hissar was reported to be contaminated. Some of the labourers moved on to neighbouring Rohtak, where the first case for the district was reported on December 19, in a family of labourers on the relief works. On April 10, 1900, an outbreak of cholera was reported in a famine relief camp at Delhi, amongst a gang of chamars "imported from Rohtak". The medical officers of the sanitation department understood the situation perfectly and, since contamination of the camps' water-supply could not be prevented, knew that they were powerless to change it. "If the landless labourers

resorted to relief camps, as Dr Veroyanire observed, they "stood a greater risk of dying". Cholera raged on in the south-east, reaching its highest incidence in July. By November, the epidemic had, characteristically, "lost its virulence". By December, it had virtually disappeared.²⁵

In 1900, severe drought was followed by unseasonably heavy rainfall. 'Fever' then far outstripped cholera. Conditions in Ferozepore district were typical: epidemic malaria, following the very heavy rainfall late in September. Malaria accounted for nearly 6,86,000 deaths throughout Punjab in 1900, a rate of more than 33 per mille. Rainfall compounded persistent waterlogging and its noxious effects. Mortality, pre-eminently fever mortality, was again maximal in the districts served by the lower reaches of the Western Jumna Canal, bad in a dry year, and catastrophic in a wet one. Reviewing the mortality returns, the Sanitary Commissioner called again for attention to be paid to prophylaxis. Mortality in this famine year was the mortality of each and every year, writ large.

As fever causes more than two-thirds of the mortality in this province annually, I am strongly of the opinion that some special arrangements should be made for the distribution of quinine in all parts of the province.²⁶

In the Sanitary Commissioner's budget for that year, expenditure per district on quinine supplies came to Rs 60.

III Why Malaria?

"Malaria reaps the harvest prepared for it by the famine", or so it seemed to the distinguished malarialogist, Christophers, commenting on the Punjab epidemic of 1908.²⁷ A crucial part of the explanation lies not in 'famine' as such, but rather in the peculiar climatic character of the famine years marked by greatest loss of life, years not of drought alone, as in Punjab in 1896, but of extreme drought and of rain, as in 1900 in that province and in Madras in 1877. Christophers described the characteristic patterns of rainfall, temperature and sub-soil moisture associated with endemic and epidemic malaria.²⁸ His colleague Gill identified climatic factors which were critical in transmission: pooling of fresh rainwater, which provided the anophelines' breeding places, and atmospheric humidity, which regulated the longevity, and therefore the breeding-time, of the vector. A level of atmospheric humidity of 63 per cent, Gill suggested was critical; below this, the anopheline could not breed.²⁹

In 'normal' years, the persistence of high temperatures during the rains regu-

FIGURE 13: PUNJAB—REGISTERED MORTALITY, 1900, 1901—PRINCIPAL CAUSES: MONTHLY DISTRIBUTION

Sources. Reports of the Sanitary Administration, Punjab, 1899-1901

larly created conditions which favoured the proliferation of the vector, and a 'normal' autumnal wave of malaria regularly followed. In years of drought, high temperatures with little or no rain drove atmospheric humidity well below the critical breeding level, the incidence of malaria, and annual mortality fell below 'normal' levels. The history of Punjab in the famine year of 1896 demonstrates precisely this: mortality in the drought-stricken districts of the plains below the average for the decade, while mortality in the perennially waterlogged and "pestilential" districts of the Western Jumna Canal, by contrast, was far in excess of provincial rates. In the famine years of greatest mortality, the association of prodigiously high temperatures with 'unseasonable' rain greatly increased the level of atmospheric humidity and prolonged it, creating the optimal conditions for a massive proliferation of vectors and an uncommon increase in their longevity, signalled by that "extraordinary development of insectivorous life" which Cornish had observed in Madras "whenever unseasonably heavy rain followed drought".

Proliferation of anophelines on such a scale favoured an increase in infectivity sufficient to destabilise the precarious equilibrium between infection and immunity which obtained in areas where malaria was endemic in 'normal' years. The intense and prolonged drought so characteristic of these famine years may also have played its part in destabilisation. In 'normal' years, anophelines feed on cattle, in addition to human, blood in a ratio of perhaps 3:1 blood meals. It has been observed that outbreaks of cattle plagues, of rinderpest for example, with its huge cattle mortality, were followed not infrequently by an epidemic of malaria.³⁰ Deprived of cattle, anophelines fed increasingly on humans, thus increasing the rate of transmission of the parasite. In the months of drought in famine years cattle died in far greater numbers than from

plagues. The vector population, swollen by the enhanced rate of proliferation induced by the heightened humidity when rain followed the drought, fed almost exclusively on humans. Cattle mortality in all probability contributed significantly to human morbidity and mortality in these catastrophic years.

These factors alone may have been sufficient to overwhelm host defences. The relation of infectivity to the nutritional status of the host is even today obscure. In the months of drought and worsening scarcity, the incontrovertible physical signs of starvation were repeatedly observed. Drought and starvation drove the labouring poor into the insanitary conditions which took so great a toll in the famine. Here, in the first of the two great phases of famine mortality, "it was not the heat of the sun which scorches, but the sand which is heated by the sun". The risk was recognised. Kipling's heroic "William the Conqueror" organised the distribution of his foodgrains in the famine, very possibly the Madras famine of 1877-78, by carts amongst the villages precisely to minimise the risk of contagion associated with famine camps.³¹ In the camps, first with cholera and then other diarrhoeal diseases, no case of fever—malarious fever, the greatest killer in the famine years as in all years, had been reported as late as July. In Madras, 1877 and 1878, and in Punjab in 1900-01, but not in 1896-97, a huge rise in mortality came with the huge increase in the incidence of malaria, from late August through September, October, November, December. Malaria took its toll on all classes of the population. It is conceivable that the starving poor were less susceptible to malaria than the well-fed, as the Woodhead commission was to suggest in reviewing the evidence of the Bengal famine of 1943. Such observations are consistent with Murray's recent hypothesis, from field studies in Africa, that "refeeding" may enhance susceptibility to malaria.³² The traditional practice of

treating malaria by *lunkernam*, starvation, or, more properly, abstinence, as surgeon Sturmer, for example, observed in Nellore in 1877³³ may well be pertinent. How precisely the fasting, or starving, state may protect the host remains to be determined. It is conceivable that anaemia, an inevitable concomitant of famine, could play a specific part, perhaps by denying the parasite its required nutrient in its passage in the red blood cell.

The picture which emerges from this brief sketch is frightful. The giant misery of starvation was compounded by the appalling conditions of migration and overcrowding into which the starving poor were driven, often literally to death, conditions exacerbated by the official measures devised for famine relief. Worse, in the great famine years, by perhaps the cruellest of the many cruel ironies of famine history, rain which might have been expected to bring respite to the survivors of the drought instead intensified their suffering: epidemic malaria took its colossal toll. In other years drought, where it persisted, ironically limited mortality. But this saving grace was denied to the wretched populations of the submontane marshland and the waterlogged districts along the lower Western Jumna Canal, where irrigation, intended to solve the problem of famine, added its quota to the principal cause of famine mortality, malaria.

The history of famine mortality raises many questions. The search for answers should lead to an understanding of famine more commensurate with its complexity. The observations set out briefly here are not unique. Outbreaks of famine in every province of British India were documented, and while few observers may have possessed the acumen of Cornish and his pathologist Porter, all reported in detail the manifestations of disease and the physical conditions associated with them. The overriding importance of malaria in famine years is well described, notably in

the extensive review of famine demography by Dyson.³⁴ With such groundwork, an epidemiological history of famine in south Asia becomes not merely desirable but a practical proposition.

One cannot but marvel at India's instructiveness: so terrible a history, but one which can be known better than any other by reason of the incomparable wealth of its documentation. No one appreciated better the richness of India's record than Daniel Thorner, nor better understood how to use the lessons of its past to illuminate the present. His explorations, with Alice, of modern India are informed at every turn by history, every observation sharpened by comparison with the written record. Their work is honoured in the way they best deserve, in the inspiration given to others to continue it, many with the help of this great scientific institution, the Indian Statistical Institute, many with the active encouragement of Daniel and Alice. Our debt to Alice is beyond measure, for her generosity in keeping this great friendship with India so wonderfully alive.

Notes

[This paper is a revised version of the fourth Daniel Thorner Memorial Lecture given at the Indian Statistical Institute, Calcutta, in January 1991. My most grateful thanks are due to Lola Nathaniel, who compiled the tables and figures; to the Wellcome Trust, for the research grant which made it possible to draw on Lola Nathaniel's expertise; to David Arnold, for providing an introduction to the famine literature of Madras; to David Bradley, for an introduction to the epidemiology of malaria; to Harold Lambert, for advice as to the interpretation of medical observations; to Tim Dyson, for assistance with demographic records.]

Nehru Memorial Museum and Library

Nehru Memorial Museum and Library offers Fellowships under the following projects:-

1. Modern Indian History and Contemporary Studies

Senior Fellowships in the range Rs 4500-7300 are open to scholars of distinction who have made a significant contribution to knowledge and have experience of guiding research. Fellowships in the range Rs 3700-5700 are also open to scholars of proven ability, with appropriate publications and experience of guiding research. In addition, allowances will be admissible as per rules and a contingency grant of Rs.7500/- per annum for Senior Fellowships/Fellowships is available. Scholars applying for Fellowships may work on the nationalist movement, or on Modern Indian History, or on diverse facets of contemporary Indian Society. The Fellowships will be for three years, renewable for another two years. The Fellowships are open to scholars working in the social sciences.

2. Changing Relations Between and Within Supra-National Regional Economies in the World Polity

Senior Fellowships in the range Rs.4500-7300 plus allowances as per rules, and contingency grant of Rs.7500/- per annum, are offered to scholars of distinction for undertaking research on relations between and within supra-national regional economies in the world polity. Fellowships are for two years, renewable for another year.

The Nehru Memorial Museum and Library reserves the right of publication of research papers and monographs prepared by Fellows during the tenure of their Fellowships. The Fellows will be based in Delhi. The Selection Committee would have the right to recommend award of Fellowships to scholars who may not have applied.

Those who wish to be considered for the above Fellowships should send a note, not exceeding 1,000 words, on the project proposed to be undertaken alongwith the following information to the Director, Nehru Memorial Museum and Library, Teen Murti House, New Delhi - 110 011 within 30 days of the publication of this notice (1) Name (2) Address (3) Date of Birth (4) Academic Record from high school examination (5) Details of Post-graduate work and list of publications with copies (6) Details of how employed so far, and (7) Names and addresses of two referees. Candidates already employed should apply through proper channel.

BARCLAYS BANK PLC

INDIAN BRANCH

(Incorporated in the United Kingdom with Limited Liability)

Schedule 17-Notes Forming Part of the Accounts for the year ended 31st March, 1993

1. Principal Accounting Policies

(a) General

The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country.

(b) Transactions involving foreign exchange

(i) Monetary assets and liabilities have been translated at the exchange rates prevailing at the close of the year. Non-monetary assets have been carried in the books at the contracted rates.

(ii) Income and expenditure items have been translated at the exchange rates ruling on the date of the transaction.

(iii) Outstanding forward contracts have been revalued at the exchange rates prevailing at the close of the year.

(c) Investments

Investments in Government and other approved securities in India are valued at cost. Market value as on 31st March, 1993 is Rs. 162,747,000/-.

(d) Fixed assets

(i) Premises and other fixed assets have been accounted for at their historical costs.

(ii) Depreciation has been provided on the straight line method at the rates specified by Barclays Bank PLC. In respect of subsequent additions depreciation is provided with effect from the quarter in which the additions are made.

(e) Staff benefits

Contribution to the Gratuity Fund has been made as per actuarial valuation.

(f) Net profit

The net profit disclosed in the profit and loss account is after:

(i) Provisions for taxes on income in accordance with statutory requirements

(ii) Other usual or necessary provisions.

2. At 31st March, 1993 the bank's risk weighted capital ratio was 8.29%.

3. The previous year's figures have been regrouped wherever necessary.

Auditors' Report on the Indian Branch of Barclays Bank PLC.

We have audited the attached Balance Sheet of the Indian Branch of Barclays Bank Plc. as at 31st March, 1993 and also the annexed Profit and Loss Account of the Indian Branch of the Bank for the year ended on that date.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and the Profit and Loss Account, are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are therefore, drawn up in conformity with Forms 'A' and 'B' of the Third Schedule to the Banking Regulation Act, 1949.

We report that in accordance with sub-section (3) of Section 30 of the Banking Regulations Act, 1949.

a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them to be satisfactory.

b) The transactions which have come to our notice have been, in our opinion, within the powers of the Indian Branch of the Bank.

c) In our opinion, proper books of account as required by law have been kept by the Indian Branch so far as appears from our examination of those books.

d) The Balance Sheet and Profit and Loss Account of the Indian Branch of the Bank dealt with by this report are in agreement with the books of account.

e) In our opinion and to the best of our information and according to the explanations given to us, the Balance Sheet and Profit and Loss Account, together with the notes thereon, give the information required by the Companies Act, 1956, in the manner so required for Banking Companies and give a true and fair view of the state of affairs of the Indian Branch of the Bank as at 31st March, 1993 and of its profit for the year ended on that date.

Rational Expectations and Price Behaviour in India

Pulapre Balakrishnan

It has been claimed that a principal proposition of the New Classical Macro-economics, namely, the neutrality of anticipated monetary growth under rational expectations, is applicable to the Indian economy. I provide evidence to refute this view. The results presented here bear a greater claim being based, as they are, upon superior modelling and more acceptable econometric practice. They suggest, among other things, that the monetary authority in India cannot be certain of containing inflation solely by implementing a pre-announced reduction in the money growth rate, leave alone being able to do so costlessly.

I

Introduction

E GHANI has claimed [Ghani 1991] that output and prices in the Indian economy behave as envisaged by the proponents of the new classical macro-economics. Before I re-work his exercises according to what I argue is, in the context, the appropriate econometric methodology, I need to very briefly spell out the new classical view.

When the theory of rational expectations is combined with the assumption of instantaneous market-clearing, only unanticipated money-growth can affect the level of output, anticipated money growth affecting only the price level. This simple idea is summed up by the 'surprise' [Lucas 1973] supply function

$$Y_t - Y_n + \lambda(p - p^e)_t + \varepsilon_t \quad (1)$$

where Y = output (subscripts 't' and 'n' denoting the current and natural levels, respectively), p = the inflation rate (superscript 'e' denoting the expectation), and $\lambda > 0$. Now if it is taken as given that the inflation rate is entirely determined by the growth of the money stock, equation (1) is appropriately re-written with the money growth terms, actual and anticipated, having been substituted in for the inflation terms. The supply function then sustains the interpretation that the deviation of the actual output from its 'natural' level is a function of the extent of unanticipated money growth.

The first attempt to evaluate the Lucas proposition empirically, which also meant devising an appropriate test, was due to Barro [see Barro 1977]. While more or less accepting Barro's implementation of the test of the natural-rate proposition, *per se*, Pesaran (1982) pointed out that Barro's Econometrics was incomplete because it did not test alternative explanations (say, for instance, the Keynesian) of the determination of output. As far as possible, I have adopted Barro's specifications. Since the new classical proposition was rejected by the data, I have not proceeded to implement Pesaran's suggestion that alternatives to the natural rate-rational expectations

model to be tested. I present my results below, turning to Ghani's paper at the appropriate state.

II

Modelling the Money Supply Process

Following Barro (1977) money growth is specified as an autoregressive distributed-lag model featuring *inter alia* the behaviour of the monetary authority. Regarding the latter, for the US economy Barro considers the money supply implications of the counter-cyclical stance of the Federal Reserve and of the tendency of money growth to accelerate when the real expenditure of the federal government exceeds the norm. Of these, I ignore the latter on the grounds raised by Pesaran that to assume that agents know the level of current real expenditure involves assuming that they know the general price level with certainty. This must go against the spirit of the surprise supply-function which construct is based on the idea that agents predict the general price level only up to a random term. Note that this is the assumption so crucial to the postulate that unanticipated money growth increases output. As for the monetary policy stance of the Reserve Bank of India, India's monetary authority has tended to target the inflation rate rather than to stabilise the level of output. These considerations lead to a specification of a money growth (Dm) equation in the deviation of agricultural output from trend (X_a/X_a^*) and in its own past values. A priori, one would expect the former variable to appear with a positive coefficient for in periods of agricultural expansion the monetary policy stance is expected to slacken, with the monetary authority tending to allow a higher rate of expansion of money because of a reduced threat of inflation. In the Indian economy, agricultural supply shocks are perhaps the single-most important determinant of the inflation rate.

General-to-specific modelling resulted in the following (best) estimate of the

money-supply process in the Indian economy over the period 1952-80:

$$\Delta m_t = .03(X_a/X_a^*)_{t-1} + .76\Delta m_{t-1} \quad (2)$$

(6.31) (2.18)

(t-values in parentheses, lower case denotes logarithms)

$$R^2 = .91, \text{ s.e.e.} = .032, \text{ auto-correlation } (1 - M) \chi^2(1) = .09, \text{ Chow } F(10, 16) = .84$$

Note that the auto-correlation statistic is not significant, and that the result of the 'Chow-test', implemented for the last ten years of the sample period, signals structural stability. It needs also to be noted that this model has an explanatory power (measured by the R^2) of over a third higher than that of Ghani [Ghani, p 301]. This is apart from the fact that the present model is more credible as a model of expectations formation actually used by agents. It is indeed perplexing to be told (Ghani, p 301) that agents in the Indian economy consider the growth of money in the OECD economies a determinant of money growth in India.

III

Money, Anticipations, and Output

The combined hypothesis of rational expectations and money neutrality implies the following specification [Barro 1977, 1978 and Pesaran 1982]:

$$Y_t = Y_n + \sum_{i=0}^{\infty} \alpha_{ii} \text{DMR}_{t-i} + v_t \quad (3)$$

where 'DMR' is the unanticipated growth in money and $\alpha_{ii} > 0$. The natural level of output ' Y_n ' has mostly been proxied by the time trend [see Barro 1978]. I stick to this procedure. The best estimate of (3) using the residuals from (2) as the unanticipated growth in money (DMR) is:

$$\log Y_t = 3.87 + .03t + .18\text{DMR}_t + .39\text{DMR}_{t-1} + .02\text{DMR}_{t-2} \quad (4)$$

(0.02) (0.01) (0.37) (0.30) (0.25)

heteroskedastic-consistent estimates of the standard errors in parentheses $T = 1954-80, R^2 = .99, DW = 1.77, \text{ s.e.e.} = .031$

Notice that the standard errors that have been reported are heteroskedastic-consistent estimates. Here I replicate Ghani's procedure. A brief statement is perhaps in order though. It has been suggested that when regressions (such as 4) use the output (predictors or residuals) of supplementary regressions (such as 2), OLS estimates may be inconsistent, and hence any inference invalid, requiring a correction of the standard errors. Pagan considers this issue and concludes that when only the residuals appear in the final regression "the estimated variance from an OLS regression programme would be correct" [Pagan 1984, p 233]. On the other hand, when predictors are used, the OLS estimates can no longer be correct, but, interestingly, these "are no greater than the true standard errors" [Pagan, p 234]. Despite this very clear verdict, and even though the regressions here use only residuals and not predictors from a supplementary regression, I shall only report 'corrected' (i.e., heteroskedastic consistent) standard errors so that my procedure is, throughout, comparable to Ghani's, even though at one stage (as I shall indicate) this causes my argument to appear as less forceful than it actually is.

The lag length on the DMR terms was chosen with an eye to the available degrees-of-freedom and by the criterion of whether the fit improved sufficiently with additional lags in the equation (this principle will be adopted throughout in this paper). In the present case, the unanticipated money growth terms as a whole do not add to the overall explanation. The F-statistic for their joint significance is $F(3, 21) = 1.083$, which is less than the critical value of 3.07.

Given that unanticipated money growth cannot explain fluctuations in output, I do not consider it necessary to proceed with further tests of the natural rate hypothesis as suggested by Pesaran (1982). However, I wish to record the result of estimating a version of the above in which the definition of output was altered. Now industrial production rather than aggregate output was chosen on grounds that the latter includes agricultural production. It is not unreasonable to view agricultural production as supply-constrained in the short run. That misperceptions about the current inflation rate cause adjustment to capacity utilisation during the cropping year is not credible. Agricultural supply based on prices expected in the future is obviously an awkward category for the 'natural-rate' theory. Thus some category of non-agricultural output may be more appropriate as the dependent variable in a test of the proposition in the Indian case, where the economy is dominated by the

agricultural sector. Quite simply, if money is to 'elicit' output it can do so in the short run only in the non-agricultural sector of the developing economy. And models such as (3) above are essentially short-run models. Even though Ghani has used aggregate output as the dependent variable in his test of the natural-rate hypothesis in the Indian context, it was felt that the hypothesis ought to be given a greater chance of validation. However, re-estimation of the model (3) using the logarithm of the index of industrial production (the segment of aggregate output in a developing economy least likely to be supply-constrained) as the dependent variable did not alter the nature of the result. The test for the joint significance of the money-surprise terms now yields the statistic $F(3, 21) = 5.20$.

The substantially greater explanatory power of the model of money supply (in turn an input into the test for neutrality) in this study must be borne in mind when comparing the results reported here with that of Ghani (1991). Reference must also be made to Ghani's representation of the economy's terms-of-trade as the determinant of the natural level of output in the Indian economy. Despite the statistical significance of the relevant terms in his estimates [Ghani, p 307] it is absurd to suggest that in an economy in which the external sector constitutes about 10 per cent of GNP, output is entirely driven by the economy's external terms-of-trade. From such a point of view, sticking to Barro's method of proxying the 'natural' level of output by the time trend is more appropriate.

IV

Money, Anticipations, and the Price Level

Precisely because unanticipated money growth is said to cause an increase in output it is believed to bring about a reduction in the price level. For, when prices are market clearing, increased output must imply a lower price. An econometric representation of this idea would be

$$\log(P)_t = \beta_0 + \beta_1 \log(M)_t + \sum_{i=0}^{\infty} \beta_{2i} \text{DMR}_{t-i} + \mu_t$$

$$\beta_1 = 1 \text{ and } \beta_{2i} < 0 \quad (5)$$

with M = money stock, P = price level, and, as before, DMR = unanticipated money growth. The expression is arrived at by solving a standard demand for money function and substituting out Y in terms of (3) above. I have ignored the rate of interest which must appear in the demand for money

function and the time trend which appears in the expression for the natural level of output, because the tests I propose to rely on do not depend upon their inclusion in any way. I first present the best estimate of (5).

$$\log(P)_t = -1.83 + .73 \log M_t - 1.62 \text{DMR}_{t-1} - .43 \text{DMR}_{t-2} - 1.16 \text{DMR}_{t-3} \quad (6)$$

(0.22) (0.03) (0.90) (0.57) (0.50)

heteroskedastic-consistent estimates of the standard errors in parentheses

$T=1954-80$, $R^2 = .99$, $DW = .71$, $s.e.e. = .054$

It is striking that all of the coefficients of the unanticipated money growth terms are indeed negative, as predicted by the new classical theory. However, before taking this to be a confirmation of the natural rate-rational expectations hypothesis I present the estimate of a regression that includes actual money growth in (6)

$$\log P_t = -1.16 + .74 \log M_t + 14.8 \text{DMR}_{t-1} + 10.3 \text{DMR}_{t-2} - 52 \text{DMR}_{t-3} - 16.2 \Delta \log M_t + 1.6 \Delta \log M_{t-1} + 7.6 \Delta \log M_{t-2} \quad (7)$$

(0.44) (0.06) (8.99) (8.36) (1.19) (9.18) (12.08) (6.46)

heteroskedastic-consistent estimates of the standard errors in parentheses

$T = 1954-80$, $R^2 = .99$, $DW = .93$, $s.e.e. = .046$

Now note that the only variable with an estimated coefficient that comes close to being statistically significant and negative is current actual money growth. It must be stated here that when 'uncorrected' standard errors are used, the coefficient on ΔM_t is statistically significant (with a 't value' of 2.49). As I had argued at an earlier stage, correction is not necessary here, but I persist with it to maintain comparability with Ghani's procedure. On the negative coefficient associated with actual money growth *per se*, I shall have more to say subsequently.

Ghani's test of the proposition that only unanticipated money-growth affects the price level is inadequate. His procedure is to compare the standard-error of estimate of equations such as (6) estimated with unanticipated and actual money growth in separate runs. Strangely, when the equation is run with actual money-growth the level of the contemporaneous money stock is left out [Ghani, 305 and 308]. This must load the procedure in favour of the Barro hypothesis. Moreover it is shoddy, for no old-fashioned (Friedman-like) monetarist would accept as his or her

position the view that the price level is determined by the rate of monetary growth as opposed to the level of the money stock. But the essential criticism of Ghani's method is that the true test of the Barro hypothesis is not achieved via a comparison of the standard errors of regressions involving actual and unanticipated money growth, respectively. Rather, it entails the test of whether addition of actual money growth to a regression with unanticipated money growth alone in it (such as (6) above) significantly enhances its explanatory power. For, it is quite conceivable that the specification with actual money growth alone has higher standard error than the one with unanticipated money growth alone in it, while actual money growth still retains some power to explain movements in the price level. The natural rate rational expectations hypothesis postulates the irrelevance of actual money growth in explaining the price level once the effect of money surprise is allowed for. The pivot of it all is the Lucas supply function discussed earlier: accordingly only unanticipated money can affect output, hence only unanticipated money growth can affect the price level (negatively, because it increases output). Thus the appropriate test is the classical F-test applied to the addition of actual money growth to the specification in (6). This is Barro's procedure [Barro 1978]. A replication of it in the present context yielded $F(3, 18) = 3.57$ when as many lags (two) of Δm as 'DMR' were added. The critical value for $F(3, 18)$ is 3.16. Thus the data reject the idea that a distinction between anticipated and unanticipated money growth is helpful to understanding movements in the price level in the Indian economy. Now only curiosity value remains in recording that the classical proposition that the stock of money enters the price level equation (6) with a coefficient of one was also rejected ($F(1, 21) = 256.9$). Clearly, there is no one-to-one correspondence between the money stock and the price level.

It may be added that the negative coefficient on actual (current) money growth in (7) need not come entirely as a surprise in the light of existing econometric evidence pertaining to the Indian economy. We already know that the aggregate industry mark up is counter cyclical [Balakrishnan 1991a]. The negative coefficient associated with money growth, then, could well be capturing the direct effect of money on output in the industrial sector, and the slower rate of inflation this entails. There is perhaps a more important explanation of this phenomenon though. This is that in an economy yet dominated by the performance of the agricultural sector, expansion in agricul-

tural production leads to expansion in the economy as a whole [Balakrishnan 1991b]. If the growth of the money stock is endogenously determined, in response to economic activity, we would now have a higher rate of money growth. With the price of agricultural goods, unlike in industrial ones, responsive to excess demand, expansion of agriculture implies a slower rate of growth of agricultural prices, thus inflation. With a positive supply-shock to agriculture leading, as it may be expected, to an expansion of non-agricultural activity in the economy, a slowing of inflation and a faster growth of money go together. That this is not an unlikely story is suggested by Ghani's own estimate of an allegedly "Keynesian" price equation which reveals economy-wide 'excess demand', measured as the deviation of output from trend, as affecting price negatively [Ghani, p 308].

V

Conclusion

Ghani has claimed that evidence provided by him "suggests that anticipated reductions in money growth in India result in contemporaneous reductions in the price level, while the unanticipated changes affect output" [Ghani, 296]. I have here provided evidence resulting from tests in the spirit of Barro that is contrary to this claim. The sample period of this study straddles almost fully that of Ghani, while being substantially longer. Moreover, its results bear a higher claim in that they are based on a more successful attempt to model the money supply process, and above all, that they are the outcome of a methodologically more correct procedure.

To recapitulate, the proposition that fluctuations about the natural level of output are driven by money surprises is rejected for two categories of output in the Indian economy, namely, aggregate output and industrial production. In the case of prices, the Barrovian proposition that actual money growth is irrelevant once money growth surprises are allowed for, is rejected too. Ghani has stated that "The empirical findings on the responsiveness of prices to anticipated changes in demand are important for the resolution of a wide variety of policy issues, e.g., the costs of anti-inflation demand strategies associated with stabilisation programmes" (1991, p 309). Precisely. The results presented here suggest, among other things, that the monetary authority in India would be wrongly advised that it can be certain of containing inflation solely by implementing a pre-announced reduction in the money growth rate, leave alone doing so costlessly.

Appendix

DATA DEFINITION AND SOURCE

M = money stock (M_1). The only available continuous series of this measure of money has been used. A Vasudevan (1980), "Money stock and its components in India, 1950-51 to 1979-80, A statistical account", *Indian Economic Journal*, 28, 130.

X_t = agricultural output, *Agricultural Situation in India*, February 1981.

Y = National Income at 70-71 prices, *National Accounts Statistics*, February 1983. (Results of having re-estimated (3) using the index of industrial production were also reported. Here, since no continuous series exists for the period considered as a whole, several series were spliced. *Economic Survey*, Government of India, New Delhi.)

P = price level (index number of wholesale prices' base 1970-71=100). *Wholesale Price Statistics*, Economic and Scientific Research Foundation, New Delhi and *Report on Currency and Finance*, Reserve Bank of India, Bombay.

[An early version of this paper was presented at the Indian Statistical Institute at New Delhi in January 1991. I thank Dilip Mookherjee and Partha Ray for comments. I am grateful to Kunal Sen for alerting me to the issue of inference in the presence of generated regressors. Errors that might yet remain would be mine.]

The Aged, Their Problems and Social Intervention in Maharashtra

Kumudini Dandekar

In India the problem of the aged had not until recently attracted much attention. With the changing demographic profile of the population some attempts are being made to document the living conditions of the old, their economic, social and psychological status, their problems, society's response to them and the attempts of the state to resolve these problems. This article is based on a survey of the aged undertaken in Maharashtra.

FOR thousands of years people probably have strived to live longer. In the latter half of the 20th century they seemed to have approached their goal. But when it comes to it they do not know what to do with added years of life. Nor is the success in attaining longevity trouble-free since often the survival is of the unfit. The result was that the whole advanced world which achieved the best success in increasing longevity had to face problems of old age. These problems deserved a very high priority there since many of the economic problems were more or less solved. But the conditions in India or Maharashtra were different.

In a country like India which has to face such an enormity of problems, the question of the old did not seem significant until recent times. India had not attained a longevity of 60 years even till 1981. The population of the old was, however, increasing fast in developing countries like India. Hence the problems of the old had to be faced earlier in such countries. Moreover its links with other phenomena such as declining mortality, increasing population and harrowing poverty enhance the urgency of the problems of the old.

THEORIES AND HYPOTHESES REGARDING THE OLD

Various theories prevail on the inter relations between old age and economic development are reviewed. There are theories and hypotheses such as 'Modernisation reduces the respect for the old' or 'the olden days were golden for the old'. These may be partly true but partly they may be based on misconceptions. At times looking at the conditions of the old in 'nursing homes' in a country like the United States, one may form an impression that people make enormous profits by trapping the disabled in these nursing homes and be cruel to the old. But one has to remember that these homes included only 5 per cent of the old in the United States. They were mostly terminally ill people 80+ or 85+ years of age. Moreover the old in these institutions

would be a problem wherever they were. One has to leave these disabled old out because the terminally disabled ones cannot be integrated with the others. As for the other old, modern times provide such a range of tools that taking care of the old seems easier now than was the case in olden times. The growth of individualism accompanied by better economic circumstances probably came in the way of emotional attachment between the old and the rest.

For instance the need of proximity of children is common to both the kinds of populations as shown in the report with data for Britain, Denmark and United States and India. Love of living in the family rather than among the peers in an old age home is also common to both. The give and take of finance, child care or care of the sick between generations also seems similar in the two types of countries. It is the difference in the economic circumstances with the capacity to have separate housing units, the level of education, the increasing out-of-home employment of women in developed countries which come in the way of showing love and respect to the old. It seems that innermost instincts of love and need of closeness to family could not be suppressed easily with modernisation. Moreover in a country like India there was no medicated survival to worsen the problems of the old. There was more tolerance among the poor as poverty had made their reactions blunt. Expectations of the Indians were not many and philosophy to face death gave them relatively better strength as discussed in the report.

Not much literature is available on the conditions of the old in India. There are some stray surveys based on small samples and these too did not necessarily stand the tests of scientific methodology. In many of them old age was defined as more than 60 years. About 6.5 per cent of the population was found to be old in India (Maharashtra). One may note that in highly developed countries more than 15 per cent population belonged to this

category. However, the rate of increase of old population was much higher (29 per cent) than that of the total population (23.5 per cent) for 1981-91 India. And this rate of increase was faster in many more recently developing countries than the developed ones. It meant that the problem of the old would have to be faced in these countries much earlier than in the other developed countries.

There are very few publications on the subject of the old. A few hotchpotch subjects are discussed below for illustration. For instance, a published paper compared living arrangements of the old in Madras city with those in an Italian city of Milan. In Madras the old were found to live with their married sons much more than they did in Milan. The reason was obviously economic since the old in Madras could not afford separate housing units away from their married sons.

Another subject discussed in this stray literature was the life cycles in various countries. While discussing the conditions of the old it is worthwhile looking at them from the point of view of their completing responsibilities with regard to their children. For instance one could consider the life cycles of women in the various countries and answer questions such as: Do the women live long enough to see their youngest child attain adulthood? Is the education of the last child complete before the women die? Are the women free of their children's responsibility before death? How long in years do women live responsibility-free? Do they have time enough to look after their own interests?

Such comparison of north Indian women in 1956 with those in the US, 1950 showed that north Indian women died before seeing their last child attain adulthood. Women from the US lived 34 years after the last child attained adulthood. This was mostly due to two reasons. One was that Indian women had shorter life spans and they also produced children till a late age. Even the cohort of women in the US of 1880 lived 21 years after the attainment of adulthood by the

last child: Similar comparison of the life cycle of women in rural India of 1990 showed that women lived only 10 years after their last child attained adulthood. Those women could not complete their responsibility, since they could not educate their children. The life cycles of Japan in 1940 and in 1972 and India of 1990 were compared more elaborately. Besides the death of the mother, attainments of education to stand on one's own feet by the children, children's marriages and death of the father were also considered to see how far the mother and father completed their responsibilities of giving children an education and making them self-supporting. In Japan in 1940 both the parents died before completing their responsibilities with regard to children. But in 1972 the conditions were dramatically changed so that both husband and wife carried out their responsibilities and lived long after attaining a responsibility-free state. Under certain assumptions a picture of 1990 India may be drawn. As far as longevity was concerned, the mothers or parents were doing just right in the sense that both the parents 'saw their children through'. But the main problem was how did they see 'their children through'? The average child if female was still illiterate and so also the male child who was just above literacy level. This did not equip the children to be self-reliant. What they achieved was 'somehow eking out a living' which they did almost till the end of their life. They hardly saved anything for their old age and they could not be capable of taking care of their old parents or their own children's education, or attending their marriages, etc.

One has to remember that the present picture of 1990 India does not look so bleak, because of relatively shorter longevity of 60 years or less. But in future the longevity is bound to increase and if by that time people had not learnt to save for old age, they would be doomed since there would be neither any old age security nor any help from one's own savings. Therefore what was needed badly was to save for old age before one started having greater longevity beyond 60 years of age. The capacity to save could come from two sources. One by reducing the load of child-dependency and secondly by equipping every child with education and employment skills. With the prevailing poverty conditions these two alternatives were not available because if one did not economise on the number of children, educating the children became impossible. Hence limiting the number of children was a must if in future, longevity was going to increase. Otherwise with increasing

longevity, suffering was going to get compounded. Ideally two children before 28 years would enable the Indian women to live and equip their children with education and save for old age. In the present circumstances interdependence of the old and the young continues till death and so also continues the living in squalor.

Work participation of the old was another subject which has been discussed in this literature. With economic development men worked more in the organised sector and they retired after the age 65; but not so the men in the developing countries. They had to work till the end for lack of savings for old age and they stopped working only when health did not permit. Work participation for women in the developed countries changed in the opposite direction with time. Work participation of women increased in the developed countries so that they could not look after their old. This aggravated the problem of the old in developed countries.

Poverty among the old seemed a subject common to many countries. Firstly, the aged were not earning. Secondly, their savings fell in value because of inflation. Thirdly, they had to spend disproportionately more on medication. In countries like India because of the deterioration of health in old age, people had to stop working though they needed the income.

Employment in the organised sector always offers old age security in developed countries or even in developing countries like India. But such employment being available only for a handful in India most old people had no old age security. However, there are attempts at present to give such security with old age pensions in many states of India. They however cover only an infinitesimal proportion of the needy population.

A very rich source of data on the subject is the 42nd round of the National Sample Survey (NSS) in India conducted for the year July 1986 to June 1987. Here was a rich fund of data on 20 items regarding the old based on 50,000 households. For Maharashtra too there were 4,366 households surveyed, 2,248 in rural and 2,118 in urban Maharashtra. The range of subjects covered by the survey included demographic profiles such as age, sex-ratio, marital status, number of sons or children, economic dependence partial or total, living arrangements with members of the family including living alone, help in illness, mobility level, illness or chronic diseases, hospitalisation, gainful and other activity status; for those who did not work the reasons for it, the age at retirement, financial assets and property; the

willingness of the old in going to an old age home (OAH); the participation of the old in the social and religious life of their home village or town; and so on.

The idea of looking at Maharashtra in the setting of all the states in the country is to scrutinise the differences in the old in various regions and analyse the causes behind the variations. However data from most of the major states did not differ significantly and one could conclude that the reasons behind such a state of affairs was that the conditions of the old were interlinked with poverty, illiteracy and dependence on agriculture which were so rampant all over the country. One should bear in mind that Maharashtra was similar to average India in almost all the matters unless stated otherwise.

Surprisingly the sex ratio, i.e., the number of old females compared to old males in India is smaller. This kind of phenomenon is rarely seen and specially in the developed countries. Perhaps the old women outnumber men almost everywhere except in India. Biologically the number of women should predominate that of men in old age. The reverse case in India speaks for their higher mortality due to social encumbrances. This no doubt is a grave matter and should attract attention in handling of Indian social problems. One may however note that the proportion of women among population in old age is more than found in the earlier ages. Among the various states of the country the number of old females *vis-à-vis* the males was found to be particularly low (646 females/1,000 males) in rural Jammu and Kashmir, 721 to 1,000 in rural Assam and 727 to 1,000 in rural Haryana and nowhere was it made up by a large number of females in the respective urban areas.

Loneliness is one of the major problems of old age which makes people feel helpless. In the advanced world and particularly the US the old women are more alone than men. But in India it is the men who are alone both in rural (12.4 per cent) and urban areas (9.5 per cent). The percentage of such women is very low (nearabout 1 per cent) both in rural and urban areas. There are two reasons for this low number of lonely women. One is that the number of old females itself is not what is expected elsewhere. Secondly, the peculiar social conditions in India leave the old women to hang on to some family such as the son's, daughter's or other relative's often in a difficult position. In the US the number of women living alone far exceeds that of men because women live much longer than men and they can

LETTERS TO EDITOR

Pressures on Film Industry

WE are distressed about the pressures being mounted on the film industry by communal parties and organisations. We are particularly anxious that this will threaten institutional procedures for monitoring the content of films and create a system of private censorship, deriving its clout from the brute capacity for street violence against all citizens. This is clearly an incipient fascist attempt to legislate the nature of the images which will represent our society.

The Bombay film industry has over the decades of its existence been plural in its recruitment and composition, and has usually been hybrid in its language, music and cultural references though often not so in its dominant themes. The present attempt, however, to suppress this hybridity, is not based on any appraisal of Bombay cinema but constitutes an attempt to control the most powerful existing popular medium. We fear that this may also be an attempt to communalise the film industry with the help of methods being used against other industries in Bombay in the last four months.

Central to the agenda of communal groups has been a 'code of conduct'. It is remarkable that organisations and parties which have consistently broken all laws and codes of conduct in acts of violence, especially against women as in Surat, should have the temerity to represent themselves as upholders of social morality. Their strictures against 'underclad' women on screen echo the repressive, anti-women dimensions of fundamentalist movements everywhere. Further, they take recourse to the cliched rationalisations of male violence as is evident in Shatrughan Sinha's remark that "a man can't help reacting on seeing" a representation of an underclad woman "and acting upon it" (*Sunday Observer* interview, May 16). Unlike these groups feminists have long campaigned against the representation of women as sexual objects but as part of a wider agenda for social change which will free women from patriarchal restrictions.

Clearly communal organisations are not concerned about the betterment of women just as they are not concerned with improving social relations as a whole. For instance, their insistence that no temple can be shown as a venue of criminal activity is a red herring. It displaces attention from the fact that a number of religious institutions have been misused as sites of communal propaganda and incitement to violence in the past decade, and temples are no exception.

The government is not making a serious attempt to prevent either censorship of hoardings and films or coercion of individuals and film organisations. We strongly urge like-minded citizens to condemn such communal pressure and urge the government to fulfil its responsibilities.

New Delhi

Role of Civil Liberties Groups

K G Kannabiran's commentary on the Koyyuru kidnap (March 20-27) brilliantly analyses the state character and so-called progressive bureaucrats role in the establishment. In conclusion he has raised pertinent questions: what should be civil liberties organisations' relations with the radical and democratic movements? Should it play a transforming role? or confine itself to maintain a crime audit of the state?

In releasing Ranadeva, the AP government acted as if it has stuck to the rule of law in the past. It moved bail petitions in Warangal and Nagpur courts and put the entire state under a fear psychosis for nearly three weeks to demoralise the outlawed PWG.

The same party under the Channa Reddy regime had withdrawn as many as

2,400 cases relating to the arson and violence that took place in the wake of murder of Congress(I) MLA V Mohan Ranga Rao in December 1988. Violence erupted after the assassination of Rajiv Gandhi and the cases filed against the mafia were also withdrawn by the notorious chief minister Janardhana Reddy. In the same way the present C M K Vijaya-bhaskar Reddy withdrew cases relating to the killings organised to dethrone Channa Reddy by the then dissident group led by Janardhana Reddy and Y S Rajasekhar Reddy.

This sort of 'administration' not only leads to the breakdown of the autonomy of the police in criminal investigation and subverts the judicial process but also, the criminal turned politicians gain social respectability. Simultaneously, it encourages the dangerous nexus between and among criminals, politicians, bureaucrats and the police. This is what happened in the case of the late IGP Vyas, who was accused in the timber smuggling case and the late H K Babu, an IAS officer who accumulated illegal property (and wives) and, of course, justice Ramaswamy. These are the 'types' our 'democratic' institutions have produced.

In a statement recently issued to the press from Karimnagar, Balagopal stated among other things that revolutionary parties had distributed five lakh acres of land within the span of 20 years, whereas the government has distributed only 75,000 acres to the girijans through the Land Tribunal. While these are the visible ground realities, one cannot stick to the strict legal perspective or maintain only a crime audit of the state. Certainly, one day or the other we should join hands with the forces that fight against the ogre.

End of the Road?

DANGER signals for the republic are being heralded not simply by developments involving the persona of the prime minister. Going by the evidence, the chief election commissioner is also energetically at work to ensure that this republic comes to a speedy surcease. Despite vicissitudes, the survival of the country as a parliamentary democracy depends on the people being able to regularly elect their representatives to the legislative bodies as per the directives of the Constitution. Under Article 324 of the Constitution, the conduct of elections to parliament and state legislatures as well as to the offices of president and vice-president is vested in the election commission. The election commission is charged with the responsibility to organise and supervise these elections. In case the commission fails to arrange for any of the elections according to schedule, obviously there is, to that extent, a failure of the constitutional process and therefore a failure of the system.

This is precisely what has actually happened with respect to one of the states constituting the Union of India. Under the Representation of the Peoples Act, each state must have a chief electoral officer to preside over the elections in the state under the overall guidance of the chief election commissioner. The latter selects the chief electoral officer in consultation with the state administration, there is a further stipulation: that the person selected has to be an officer of the state government concerned. Last January, the officer holding the position in West Bengal had to undergo surgery in order to have her gall bladder removed, since she was concurrently the state's health secretary, she applied for leave to the state government. The leave was granted, and she adjourned to the operation table. The chief election commissioner reportedly took umbrage because she did not seek leave from *him*. The chief electoral officer was peremptorily removed from her post. What has since ensued is both comic opera and absurd drama. The state government, according to its claim, has been submitting, one after another, names for the consideration of the chief election commissioner for possible appointment to the vacant slot; the chief election commissioner, on one ground or another, has been rejecting the names. The controversy was initially triggered off by a disputation over the state government's view that the chief electoral officer could work part-time, combining the office with the performance of concurrent other official responsibilities in the state. The chief election commissioner demurred, and insisted on a full-time officer. The government of West Bengal finally relented on the point, but meanwhile the chief election commissioner, who enjoys a reputation of easy irascibility, has decided to widen the field of battle. In the case of all states, he has ordained, the chief electoral officer, along with other employees of the state

government on deputation to the election commission, must be under the latter's total jurisdiction, should any of these employees be found remiss in his or her functioning while with the commission, the latter must have the prerogative to punish him or her. Not just the government of West Bengal, a number of other state governments too, besides the union government itself, are experiencing difficulty in accepting this view. As a result, the fat is on the fire. Till as long as the government of West Bengal does not accept in full his point of view in the matter, the chief election commissioner is determined not to appoint a chief electoral officer for the state. While elections and by-elections are being held elsewhere in the country, these are therefore in abeyance in West Bengal. Three by-elections are pending for the state assembly for nearly a year, what is much more important, six out of the 16 seats allotted to West Bengal in the Rajya Sabha are currently lying vacant and are likely to remain so when parliament convenes for its monsoon session.

As far as precedence goes, the Constitution actually ranks the Rajya Sabha ahead of the Lok Sabha. That apart, the Rajya Sabha, as its very nomenclature suggests, was conceived of as the chamber where problems specifically related to the states are to receive priority in discussions. If, whether because of the whims of the chief election commissioner or because of other factors, a state is prevented from electing representatives to the Rajya Sabha to the extent of 40 per cent of its total representation, at least some people belonging to that state might legitimately begin to think that they are being pushed out of the Union of India. That thought could lead to far-reaching consequences. In effect, therefore, the chief election commissioner's intransigence is almost tantamount to de-stabilisation of the polity, something which is the ruling party's particular bugbear.

It is a most unusual situation, where the election commission instead of holding elections is holding them up. Comments on aspects of the imbroglio, which has now reached the courts, have been diverse and wide-ranging. One extreme suggestion is to impeach the chief election commissioner on account of his intransigence, since impeachment is the only procedure the Constitution has provided for his removal. As the V Ramaswamy affair has however so convincingly demonstrated, that kind of action is more easily proposed than implemented. Another proposed way out is to amend the Constitution so as to render the chief election commissioner altogether powerless to create situations in future of the kind he has at present created. No constitutional amendment is in fact necessary for the purpose, Article 324 has already provision for making the election commission a multi-member body, all the union government has to do is to appoint two or three additional election commissioners

so as to cramp the peremptory style of functioning of the incumbent chief election commissioner. According to reports, the prime minister is extremely reluctant to have to resort to this easy procedure. He evidently does not want to offend an official who has rendered signal service to the ruling party and might continue to do so during the remaining part of his tenure. There is also the absurd—but not necessarily unbelievable—story that since the present chief election commissioner was appointed on the recommendation of Rajiv Gandhi, to do anything which rouses his ire would cause offence to the lady ensconced at a certain Jan Path address.

The suspension of the electoral process in West Bengal has, at the same time, created a predicament for the ruling party. It was hoping to elect the commerce minister, at the moment without a seat in parliament, to one of the six seats currently lying vacant from that state. If elections for those slots are not to be held for some more while and the minister stays unelected, he ceases to be a minister by the middle of July. Desperate situations call for desperate remedies. Two extraordinary proposals have now emanated from ruling party circles. First, the minister should be nominated to the Rajya Sabha under sub-clause (b) of clause (1) of Article 80. There is a problem here too though. Members nominated to the Rajya Sabha, the same article states categorically, shall consist of persons having "special knowledge or practical experience" in respect of literature, science, art and social service. While a dignitary of the ruling party may *ipso facto* claim to have expertise in social service, issues of both propriety and precedents might rear their head: no person, nominated to the Rajya Sabha under this provision, was in the past ever chosen as minister; the only occasion when a minister was appointed by the president from amongst nominated members, the person concerned immediately resigned his nominated membership, and preferred to be elected to parliament through other means.

The other proposal mooted to ensure the tenure of the minister has even more far-reaching implications. Other things remaining the same, the commerce minister would of course cease to be so on a given date in July since the Constitution says that one can continue to be a minister without being a member of parliament only for a period of six months and that period would be over on that date. It has nonetheless been suggested, apparently with a straight face, that he could be re-appointed as minister the very next day and thereby continue for another six months without being elected to parliament; the sequence could be stretched indefinitely until the cows come home. This would imply his remaining minister with-

out ever being elected to parliament. Parliamentary democracy thus promises to come to a cheerful finale in the country.

THE ECONOMY

Claiming Too Much

THE government has taken to issuing hand-outs on the state of the economy, generally patting itself on the back. These official reviews have been very selective with regard to the data put out and the aspects of the economy covered. Even from the government's point of view, it may be asked, what purpose is served by thus creating exaggerated popular expectations?

The latest such review expectedly makes much of the fall in the inflation rate, the narrowing of the fiscal deficit and the stabilisation of the balance of payments situation. It is claimed that as a result of the tight monetary policy and the fiscal correction bringing down the fiscal deficit to 4.7 per cent of GDP in 1993-94, the rate of inflation measured by the wholesale price index, which had reached a peak of nearly 17 per cent in August 1991, had declined to around 6 per cent, with the decline being particularly marked in primary articles including foodgrains. This is not being altogether honest about the facts or about the factors responsible for inflation control. In the first place, much the larger part of the reason for the deceleration in the inflation rate lies in the break of inflationary expectations following the good agricultural output in 1992-93 and again this year. Secondly, the claim of tight monetary control has long ceased to be valid. There has in fact been a significant relaxation of monetary measures—quite correctly—and inflation does not seem to be linked to them either way. Apart from the three-step reduction in the minimum lending rate from 19 per cent to 16 per cent in the space of less than three quarters of a year, the banks' cash reserve ratio (CRR) has been reduced as part of financial sector reform. No impact of monetary restraint is discernible in any of the monetary variables. Net RBI credit to the centre, the monetised deficit of the central government, had reached Rs 13,661 crore as on June 4, 1993—a level over 50 per cent higher than it was a year ago (Rs 8,933 crore). Besides, within a period of two months (April-May 1993), M₁ growth has been as much as Rs 17,985 crore (or 5 per cent) as against the policy goal of containing annual monetary expansion to 12 per cent in 1993-94. True, the expansion of Rs 19,204 crore (6.1 per cent) in the comparable period of April-May 1992 had been higher, but that was due to some exogenous factors. Finally, the government cannot really claim credit for reducing the inflation rate from 17 per cent to 6 per

cent, for the 17 per cent rate was caused by the government's own two-step devaluation of the rupee in July 1991. The inflation rate was about 12 per cent when the Narasimha Rao government took over in June 1991; it was still 13.6 per cent after nine months at the end of March 1992. The inflationary pressures were really contained only after the prospects of a good agricultural crop in 1992-93 became known. The fiscal compression no doubt played some role, but its contribution was more to creating recessionary conditions in industry than to containing inflation. Over the past one year, while primary articles' prices have increased by 2 per cent, the prices of manufactured products have risen by 6.7 per cent. With the cost-plus pricing policy generally adopted by Indian industry, manufacturing prices have been stubborn in many cases even after the radical reduction of excise duties in the 1993-94 budget.

The claim that the foreign exchange reserves have been stabilised at \$ 6.67 billion is similarly factually flawed. Foreign currency assets, including SDRs, which had crossed \$ 7 billion as on April 30, this year have since fallen to \$ 6.3 billion. This is despite import levels having been sluggish because of the recession in industry. If imports of petroleum products and general imports now start to grow at a faster rate, as they are likely to, the pressure on foreign exchange reserves will mount once again in the coming months.

There are a number of aspects of the economic situation about which the government's reviews should have been more forthcoming. Apart from the severe recession in industry on which the government seems quite clueless, even the official response to the currently abundant stocks of foodgrains with the public agencies because of the large procurement of rice and wheat has been notably unimaginative—with the focus on possibilities of export, though there exists much scope for generating employment as well as building capital assets in rural areas through food-based employment programmes.

Finally, all official reviews of the economic scene are silent on employment. The reason is, of course, that all indications are that non-farm employment growth has been minimal. During the 1980s, manufacturing enterprises in the public sector were the only part of the organised sector where some additional employment was being generated. But more recent data for 203 central government enterprises now reveal that there was an absolute decline in the number of employees from 18.93 lakh at the end of March 1990 to 18.87 lakh at the end of March 1991 and further to 18.45 lakh at the end of March 1992. Statistics from employment exchanges also point to a

growth in the non-

farm sector. The number of applicants on the live registers of employment exchanges reached 36.76 million at the end of December 1992, an increase of 1.3 per cent over the level (36.3 million) a year ago. This is despite the fact that with the reduced ability of the employment exchanges to secure placements, the number of fresh registrations is not growing as fast as in the past. There has occurred a steady decline in number of vacancies notified by the employment exchanges. In 1992 such notifications numbered 4.21 lakh as against 4.60 lakh in 1991, a fall of 8.5 per cent; the peak level of vacancies notified was 5.99 lakh in 1989 which fell to 4.90 lakh in 1990 and 4.60 lakh in 1991. Similarly, the number of placements effected through the exchanges has been falling steadily; it was 2.54 lakh in 1991 which fell to 2.4 lakh in 1992; the number of placements had already declined from 2.89 lakh in 1989 to 2.66 lakh in 1990.

GOLD BONDS

To What Purpose?

THE gold bonds scheme, which has been on tap for three months from March 15 to June 14, has, it is claimed, more than fulfilled the government's expectations. The government had expected subscriptions of only 7.2 tonnes of gold valued at about Rs 300 crore, whereas the scheme has actually netted as much as 40.89 tonnes worth Rs 1,631 crore. Further, when the government had launched similar schemes in 1962, 1977 and 1980, it had been able to collect only 13 tonnes, 16.3 tonnes and 6.1 tonnes, respectively. These claims, however, need to be taken with a pinch of salt for a variety of reasons.

First, the gold bond scheme is, and has always been, meant for large unaccounted money and asset holders whose command over resources has expanded tremendously in recent years. As a proportion of gross domestic product or as a percentage of household financial and physical assets, the hidden incomes and assets of the rich would have increased many-fold since the mid-60s or the mid-70s. The gold bonds scheme 1993 was especially generous in terms of tax benefits: total exemption from capital gains, wealth and gift taxes; interest income free of income tax; and, above all, complete immunity under all tax laws to the subscriber against disclosure of the source of acquisition of the gold. All studies of unaccounted income in the country have concluded that if such income had constituted 25 per cent of GDP in the mid-60s, it would now have crossed 50 per cent of GDP (to put it in terms of broad magnitudes). The base of unreported income and wealth, out of which subscriptions to the gold bonds

in the past when the earlier schemes were floated.

Second, there is a distinct change in the government's approach to tax evasion and holding of black income and wealth. There is much less fear of the tax authorities and consequently much less nervousness about the possible consequences of disclosure than in the past. A third important factor is that the stock of gold in the country has been substantially augmented, essentially through smuggling. Between 1964 and 1992, about 3,250 tonnes are estimated to have been added to private stocks of gold. This may be said to have been done with the connivance of the government machinery and also with the tacit support and even inducement provided by government policies. Thus the 16.3 tonnes collected in 1977 probably constituted about 0.30 per cent of the then gold stock estimated at about 5,460 tonnes; the 40.89 tonnes collection in 1993 constitutes about 0.55 per cent of the current estimated private stock of about 7,500 tonnes—not as much higher as the difference in the absolute quantities of gold collected might lead one to expect.

There is, however, an all-important fourth factor. Quite unlike in the past, there is now available an officially recognised route of gold import into the country, with tax immunities of all sorts including from gift tax so that gold holdings can be nominally divided among one's kith and kin. Holders of unaccounted money can thus easily convert their black money into NRI-imported gold and subscribe to the gold bonds. This is exactly what seems to have happened. It is significant that the bulk of the gold invested in the bonds is known to be primary gold and not gold jewellery unlike in the past. Cities and towns of the two states of Maharashtra and Gujarat have accounted for 17.49 tonnes (or 42.8 per cent of all the gold collected under the scheme). Bombay city alone has accounted for 9.45 tonnes (or 23 per cent). Under the NRI gold import scheme, 92 tonnes of gold had been imported up to the end of December 1992, but with the approach of the closing date of the gold bond scheme NRI imports began to shoot up. Total imports under the gold import scheme had touched 153.15 tonnes by the first week of June.

A more candid assessment of the gold bonds scheme would be that it was a thoughtless exercise which will cost the public exchequer dearly. First, it is not domestically held gold that has been invested in the bonds; it is essentially primary gold imported through the NRI scheme or smuggled gold, both of which generally get financed through the 'havala' route. They involve diversion of the country's foreign exchange earnings—current

and potential, directly and indirectly. Secondly, the whole venture has given the authorities less than 10 per cent of official holdings of gold (including the RBI's holdings of 353 tonnes), the equivalent of about \$600 million at the price prevailing in the Indian markets and a little less than \$500 million at the international price. While this can hardly be of much support to the balance of payments, it is a moot point if the whole exercise would earn for the Reserve Bank the cost of operation and interest which may together amount to Rs 200 crore or so.

ARMED FORCES

IMET and Human Rights

A correspondent writes:

DEFENCE ministry officials are sulking over an amendment passed by the US House of Representatives recently, which, if made into a law, may cut off US funds to India for training in superior military technology and upgrading its indigenous defence R and D. The final shape of the amendment—which will have to pass through the US Senate—hinges on the US view of the government of India's human rights record.

The House of Representatives adopted the amendment which seeks to deny \$3,45,000 allocated for India in the US foreign aid bill under the IMET (International Military Education and Training) programme for the fiscal year 1994. The amendment said that India should be given the amount under the IMET only after the president had certified in writing to Congress that New Delhi had improved its human rights record.

Although the amount is considered insignificant by both Washington and New Delhi, the IMET allocation has important implications for the Indian armed services in terms of their exposure to the latest defence technology. Since 1947-48, when India became a beneficiary of the IMET programme, and till 1990, 800-odd Indian staff level officers and technical personnel had been trained in various professional military education courses. The number of trainees again may appear insignificant. But their role assumes importance at crucial moments, as during the first Indo-Pak war, when their training in flying Sabre jets under IMET stood them in good stead.

But the IMET programme has a sinister aspect. The major beneficiary-trainees of the programme are army and police personnel from Latin American countries like Peru and Colombia. On the plea of suppressing the gangsters of the narcotics mafia in those countries, the US Congress (under the Anti-Drug Abuse Act of 1988)

permitted IMET funds to be used for training courses and munition donations for these members of the armed forces. The US Congress did not impose restrictions requiring the recipient country to maintain a democratic government under which law enforcement agencies did not engage in a consistent pattern of gross violations of internationally recognised human rights. As a result, the military aid given to the Andean armed forces for the 'war on drugs', in reality, instead of curbing the flow of drugs in the recipient countries, aggravated the violation of fundamental human rights in these countries. Human rights groups have documented cases of torture and killings of political dissidents in Peru and Colombia by members of these armed forces who had been trained under IMET. These groups have been pressurising US Congressmen to stop further military aid to these countries, until their governments show political will to investigate, prosecute and curb brutality by their military and police forces.

It is against this background of domestic pressures on the US government to stop military training of armed personnel of states which are notorious for violating the human rights of their citizens that the latest step by the House of Representatives in relation to India becomes significant. New Delhi's record of human rights violation in Punjab, Kashmir, the north-east and other parts of the country is fast reaching proportions that resemble the performances of the minions of the tinpot dictators of Latin American countries. It is yet to be proved however that there exists a direct relationship between the US training courses under IMET and the abuses committed by Indian army men and security forces. To establish whether or not such a relationship exists, it is necessary to gather information about the nature of training imparted to the Indian servicemen. Did it include counter-insurgency training? Similar training to military personnel in south-east Asia and south and central America had led to some of the worst crimes against humanity.

GOVERNMENT ENTERPRISES Starved of Investment

THE way the public enterprises in this country are treated as handmaidens of politicians in power and considering the additional costs that they have to bear under this dispensation, one can only marvel at their survival as operating entities. And now they are facing additional pressure under the structural adjustment programme of the government. One dominant element in this programme is

the direct and subtle attempts to reduce the role of the public sector in the Indian economy on the unproven premise that public enterprises are, by their very nature, inefficient and high-cost. Given freedom and operational flexibility, the professional managers of these enterprises, who have filled a major entrepreneurial vacuum in the Indian context, would have shown greater dynamism and produced better results. Apart from creating an industrial base in the country, many a public enterprise has helped to expand India's technological base and offered stiff competition to multinationals as well as private industrialists in India. As for their costs and efficiency, any simple comparison with private sector companies is bound to be odious, for public enterprises generally have significantly different capital structures, pricing policies and social obligations and, therefore, they cannot be judged entirely by conventional commercial standards. Also, if public enterprises incur some extra cost in terms of employing more persons than required and generally show more inefficiency in deploying personnel and materials, private enterprises inflict on the economy other costs; quite a few of them hoodwink shareholders, consumers and government and siphon off resources from corporate bodies to private coffers. The large number of financial companies that private sector manufacturing and processing companies float as a matter of course is evidence of this.

While comparisons can be misleading, some of the findings of a study by the Centre for Monitoring Indian Economy (CMIE) on central government enterprises are interesting. First, the operating profit to sales ratio of public enterprises has been generally close to that of private sector companies: 10.33 per cent in 1989-90, 9.92 per cent in 1990-91 and 10.28 per cent in 1991-92 for the former as against 9.63 per cent, 10.35 per cent and 10.67 per cent, respectively, for the latter. For similar levels of sales turnover of Rs 1,37,745 crore for public enterprises and Rs 1,35,856 crore for private sector companies in 1991-92, the levels of operating profits were again close to each other, Rs 14,155 crore and Rs 14,495 crore, respectively. It is in the subsequent apportionment of the operating profits that there are significant differences. Public enterprises paid as interest Rs 9,308 crore as against Rs 7,179 crore paid by private companies—that is, about 30 per cent more because they have higher debt capital. It is partly because of this and partly because of their capital-intensive nature that the return on capital of public enterprises is lower than that of private sector companies.

Secondly, there is no doubt that for the same level of sales turnover, the public enterprises paid higher wages: in 1991-92, Rs 11,393 crore as compared with Rs 10,455 crore paid by the private sector companies, i.e. higher by Rs 938 crore. As against this, so-called 'other variable expenses' incurred by the private sector companies were higher by Rs 3,816 crore, that is, Rs 9,511 crore in contrast to only Rs 5,695 crore in the case of the public enterprises. Quite a substantial part of such variable expenditure could be eliminated if a closer scrutiny of them were undertaken.

While admitting that there is much scope for improving the operational efficiency of public enterprises, it is necessary to put in a word of caution. The current emphasis on financial restructuring of public sector enterprises, while it may be necessary, ignores the need to restore to public enterprises their broader goal of strengthening the technological base of Indian industry and thus achieving an increasing degree of self-reliance, particularly in respect of technological upgradation. Indian private entrepreneurship is incapable of adopting an independent path in this respect, what with its tendency to cling to foreign technology, foreign tie-ups and foreign brand names. An efficient public sector with an aggressive investment programme supported by the state is a necessary condition for rapid development at the present stage.

Apart from technological independence, there is the employment angle to development. Without public sector involvement and in the absence of some forward-looking policies on industrial employment, the incidence of unemployment is likely to rise. As it is, it is found that employment in the 203 central government enterprises studied has registered a significant fall in the two years of stabilisation and structural adjustment, from 18,92,538 persons in 1989-90 to 18,87,021 in 1990-91 and further to 18,45,251 in 1991-92—a loss of 2.5 per cent in two years in contrast to an annual growth of 2.5 per cent in public sector employment in the 1980s. If the government has found labour redundant in certain industries, such as heavy and light engineering, coal, and textiles, where the above decline in employment has occurred, it is entirely because the budgetary policies of the government have prevented the fulfilment of planned investment, expansion and technological upgradation in these industries. It is this aspect of government policy which requires a fresh look as otherwise the recessionary conditions in Indian industry will remain unabated, for the private sector cannot fill the gap in terms of the size and structure of investment created due to retrenchment of the public sector.

Prospering in Changed Fertiliser Scenario

Jairaj Kapadia

GUJARAT NARMADA VALLEY FERTILISERS COMPANY (GNFC), Bharuch, has recorded improved sales turnover and excellent production and capacity utilisation in 1992-93. This has been achieved despite annual shutdown of 27 days. Almost all products have contributed to increase in the sales turnover. GNFC has achieved a rare feat in the production of ammonium nitrophosphate (ANP) during the year. In the second year of its commercial operation, the ANP plant has been run full steam with a capacity utilisation of nearly 100 per cent. This rare accomplishment has enabled GNFC to meet the challenge of providing phosphatic fertilisers to farmers, despite

market odds, thus ensuring essential balanced application of fertilisers.

GNFC produced 5,05,429 tonnes of ammonia (capacity utilisation over 113 per cent) and 6,60,818 tonnes of urea (capacity utilisation over 111 per cent). The nitrophosphate plants produced 1,41,491 tonnes of ammonium nitrophosphate (1,23,654 tonnes in the previous year), 93,807 tonnes of calcium ammonium nitrate (62,526 tonnes) and 6,823 tonnes of formic acid (6,803 tonnes). The electronics division showed spectacular results with a growth rate of 61 per cent in printed circuit boards and 43 per cent in rural automatic exchange (RAX) and EPABX.

Intensifying its promotional and marketing operations, GNFC recorded a turnover of Rs 582.70 crore thus improving its performance by 7.9 per cent over last year's figure of Rs 539.79 crore. In fact, the sales and other income of the company has crossed the Rs 600-crore mark at Rs 606.30 crore compared to Rs 543.24 crore in the previous year. Except for ammonium nitrophosphate, price realisation was higher in all other products. Sales aggregating 8,91,944 tonnes (previous year 8,58,197 tonnes) comprised 6,56,356 tonnes of urea, 1,41,846 tonnes of ammonium nitrophosphate and 93,742 tonnes of calcium ammonium nitrate. Sales of industrial products comprising methanol, formic acid, concentrated nitric acid, weak nitric acid, ammonium nitrate and liquid nitrogen increased to a new high of Rs 122 crore compared to Rs 107 crore in the previous year. These constituted 18.4 per cent of total sales turnover. Sales of electronics products amounted to Rs 23.65 crore against Rs 15.29 crore previously, showing a significant rise of 55 per cent. During the year, the company exported directly goods worth Rs 2.68 crore as against Rs 1.13 crore exported in 1991-92.

GNFC has earned about the same profit of Rs 196.09 crore as in the previous year before interest, depreciation and taxes. After providing for interest, depreciation and taxation for the year as well as arrears of depreciation for the previous year, the balance for appropriation amounts to Rs 20.92 crore. Dividend is maintained at 15 per cent. Reserves and surplus at the end of 1992-93 amounted to Rs 163.99 crore. Out of term loans of Rs 1,112.96 crore Rs 574.84 crore were repaid during the year. Gross block at the close of the year stood at Rs 1,051.04 crore.

Satisfactory progress was made during the year in implementation of new projects entailing an investment of Rs 958 crore. The 100 per cent export-oriented acetic acid plant is being implemented ahead of schedule. Process design package received from BP Chemicals, UK, as well as I inde for acetic acid and CO plant respectively has been approved. Mitsui Engineering, Japan, has started basic engineering work based on process design package documents. Humphreys and Glasgow, Indian contractors, have started detailed engineering work on items being procured indigenously. Against total project cost of Rs 199.56 crore, Rs 115.74 crore have been committed. The new project to produce 10,000 tonnes per annum TDI and 20,000 tonnes per annum aniline by a new company, Narmada Chematur Petrochemicals promoted jointly by Chematur AB, Sweden, and IBI Chematur has been proceeding ahead of schedule. The project envisages a total investment of Rs 308 crore as appraised by the IDBI and

assistance.

The TV glass shell project of Videocon Narmada Electronics in collaboration with Videocon International is running on schedule and is expected to be commissioned in 1993-94. This project will have a total investment of Rs 450 crore.

MACHINO PLASTICS

Maruti Link Helps

Machino Plastics is another company serving the automotive sector to have done better despite the latter's passing through difficult times. The company is engaged in manufacture of plastic moulded components for automobiles and is the sole supplier to Maruti Udyog. As Maruti Udyog is pushing on with its production plans with another model of cars being put on the market, Machino Plastics expects to be thriving with MUL's expansion.

The results for the year ended March 31, 1992, have shown increases in both sales and profits. Again, as in the case of Mipco Seamless Rings, profit as return on sales has worked less, but as a ratio to investment it has improved. Turnover ratio, too, has amounted more at 1 per cent compared to 0.77 per cent for the previous year. Return on equity as well as EPS have worked out lower, which is due to an increase in share capital during the year. The dividend is raised on increased share capital from 10 per cent to 12 per cent.

Long-term loans as at the close of the year have declined from Rs 777 lakh to Rs 551 lakh. However, borrowings are to increase following a proposal of cash credit facility of Rs 350 lakh made by the Bank of Tokyo, New Delhi. There is a proposal by the company to diversify its business. It has been approached by leading manufacturers of fully automatic washing machines for development of plastic moulded washing tubes and other components. The company has taken up production of the same.

MIPCO SEAMLESS RINGS

Improved Working

With the working for the year ended March 31, 1992, Mipco Seamless Rings (Gujarat), the automotive rings company which earlier encountered problems of rectification of its plant, has made a breakthrough. And this despite the automotive industry, particularly passenger cars and trucks, still witnessing recessionary conditions in the market. With the latest concessions in the union budget for this sector by way of reliefs in excise and customs duties, a company like Mipco Seamless Rings in the automotive components business is bound to do still better.

Production for the year 1991-92 increased in quantity from 30,18,763 to 33,77,292 pieces and so also sales from 30,29,095 to 33,42,176 pieces and in value from Rs 1,131

as return on sales declined from 22.36 per cent to 20.52 per cent, the return on investment significantly improved from 24.49 per cent to 29.67 per cent. With a restraint on loan funds employed in business, interest charges were restricted despite the high rates prevailing at Rs 43 lakh against Rs 40 lakh for the previous year. And though net profit due to a provision of Rs 57 lakh for tax amounted less at Rs 151 lakh against Rs 163 lakh for the previous year, the company declared a modestly higher dividend of 15 per cent against 12 per cent for the previous year.

These highlights of the year's working point to a distinct turn for the better for the company which the tight reins on the finances by the management (receivables reduced from Rs 133 lakh to Rs 112 lakh and loans and advances maintained at Rs 22 lakh) further strengthen. Even as due to the prevailing market conditions Mipco Seamless Rings scrip is going abegging at a price-earnings ratio of 5.95, it provides a welcome opportunity for investors. Meanwhile, the company has further cleared production bottlenecks with addition of certain balancing equipment and experienced a steady rise in sales further during 1992-93.

MULLER AND PHIPPS

Changed Business Strategy

There is a sort of a secret in the far expanded business of Muller and Phipps (India), the company known for the 'Cuticura' talcum powder, during the year to March 31, 1992. Sales income for the year has registered a sharp rise from Rs 743 lakh to Rs 1,182 lakh thanks to the company employing its marketing network and taking on distribution of other companies' products. The returns on this are not any high, but they come free of manufacturing costs. For the year under review they have certainly made a fair contribution to profits. No wonder then that the directors have decided to consolidate the distribution house business, especially in areas where the marketing and sales staff have established a strong reputation. This is likely to stand the company in good stead, since the directors state in their report that inflationary pressures have lowered the company's margin on its own products. The change made in business strategy has meant also a higher dividend of 20 per cent for the shareholders.

ACC

Depressed Demand

Associated Cement Companies has reported for the year ended March 31, 1993 a sales turnover of Rs 1,520 crore as against Rs 1,417 crore for the previous year. However, operating gross profit before interest, depreciation, extraordinary items, tax and prior years' item has declined to Rs 181 crore

profit after interest but before depreciation and extraordinary items to Rs 124 crore from Rs 283 crore. Profit before tax has worked out to Rs 80 crore against Rs 213 crore for the previous year and profit after tax to Rs 70 crore against Rs 110 crore. The company has maintained dividend at Rs 30 per share on the capital increased by a 2:5 bonus issue made during the year.

Production of cement during the year was 74.81 lakh tonnes against 77.59 lakh tonnes the previous year. Capacity utilisation was 98 per cent as compared to 102 per cent previously. The plants at Gagal, Madukkarai and the new plant at Wadi recorded once again highest ever clinker production with capacity utilisation exceeding 110 per cent. Shortfall in production was mainly on account of planned stoppage of Gagal plant for 25 days prior to commissioning of the expanded capacity of the existing plant and unprecedented power shortages in the states of Bihar, Madhya Pradesh and Karnataka. Sale of cement by the company was 75.09 lakh tonnes against 76.14 lakh tonnes for the previous year. However, sale of purchased cement was higher at 5.94 lakh tonnes against 3.67 lakh tonnes previously. Export of cement was a record 1.38 lakh tonnes against 0.55 lakh tonnes for the previous year. The refractory business achieved a turnover of Rs 58.11 crore compared to Rs 37.89 crore during the previous year. The sale of refractory products from the plant at Katni was higher by 18 per cent over the previous year.

Several new products were introduced to the Indian market for the first time with in-house research and technical collaboration from leading international refractory producers. The Research and Consultancy Directorate of the company achieved a billing of over Rs 12.21 crore as compared to Rs 7.62 crore in the previous year. The company's personnel at Yanbu cement plant in Saudi Arabia achieved record production for a third successive year and also earned highest ever bonus of Rs 1.03 crore.

The setback in profits is due to prices of cement remaining depressed throughout the year while the operating cost increased steeply due to unprecedented rise in the administered cost of coal, power, rail freight, diesel oil, etc. The cost of labour also increased steeply with the four-year settlement arrived at with the recognised unions on a bilateral basis for the first time. The recent upward revision in dearness allowance rates payable to workmen in public sector enterprises has also increased the wage bill in view of similar benefits applicable to the company's workmen. These inflationary conditions coupled with demand recession experienced by the cement industry for the first time in 10 years along with the significantly reduced purchase of cement by government agencies adversely affected the profit margin during the year. Profit before tax was further adversely affected by increased interest charges on account of higher working capital requirements.

Nikumbh Dairy Products

NIKUMBH DAIRY PRODUCTS is establishing an integrated dairy project at Shahpur, Thane, and expanding its existing dairy at Kolhapur in Maharashtra. The processing of milk and the production of milk-based products like pasteurised milk, flavoured milk, ghee, dairy whitener, instant tea and coffee-mix, etc, will be undertaken at the Shahpur unit. Commercial production for the expanded capacity at Kolhapur is expected to commence by August 1993 and the Shahpur unit by October 1993. As per the appraisal done by Bank of India, a turnover of Rs 32.27 crore and a net profit of Rs 1.85 crore in the first full year of operation are expected to be achieved. In the second year they will be Rs 45.43 crore and Rs 1.99 crore respectively. To finance in part the total project cost of Rs 670.50 lakh, the company is entering the capital market with a public issue of 27,13,700 equity shares of Rs 10 each for cash at par aggregating Rs 271.37 lakh on July 12. The shares will be listed at the Bombay, Ahmedabad, New Delhi and Pune stock exchanges. BOI Finance and Reliance Capital and Finance Trust are the lead managers to the issue.

Uniworth India

Uniworth India, promoted by Woolworth (India), a 100 per cent EOU in the field of worsted yarn, and the Lohias, has a proposal of establishing a global marketing network for export and trade in consumer goods at a cost of Rs 7.30 crore. It is making a capital issue of Rs 17.70 crore. The excess after meeting the project cost is earmarked for investment by the promoters in a forthcoming project, Fabworth India, which is expected to make a public issue by the end of this year. The capital issue by Uniworth India is in the form of a new instrument of Equipref shares as is conceived by the lead managers, SBI Caps. It is to comprise 48 lakh Equipref shares of Rs 50 each at par of which part A of Rs 20 is to be converted into two equity shares of Rs 10 each at par and part B of Rs 30 into an unspecified number of equity shares at 30 per cent discount of six month average of the market price after five years. The company has projected for Rs 177.83 crore income in 1993-94 to fetch a profit of Rs 4.95 crore and yield an EPS of Rs 3.31. By 1996-97, income is expected at Rs 211.77 crore, net profit at Rs 6.80 crore and EPS at Rs 5.06. The promoter company Woolworth (India) has recorded a 250 per cent growth in sales in the last two

years, from Rs 8.47 crore to Rs 71.81 crore. The Lohias have promoted companies like Indo Rama Synthetics (Indonesia), Ashok Textiles (Nepal) and Indo Rama Synthetics (India) at Pithampur, M.P. Fabworth, the projected company, is to be setting up a Rs 81 crore project for manufacture of fashion fabrics for export markets. The novel Equipref instrument that Uniworth is employing for its capital issue is a mix of equity and preference shares, since part B for conversion into equity after five years of issue is to carry interest at 10 per cent yearly till conversion. Further, holders of Equipref shares are to carry a preferential position in any rights or public issues of shares by any of associate or group companies. However, there is a time lag in returns on investments.

Teknomin Aqua Exports (India)

Teknomin Aqua Exports (India) is setting up a 100 per cent export oriented unit comprising a shrimp hatchery, grow out farm and shrimp processing plant under one roof at a capital outlay of Rs 7.65 crore. The company has a tie up with J.V. Marine Enterprises, Taiwan, for shrimp hatchery for which the company has to pay \$45,000 as technical know how fees. The company plans to use in house technology for grow-out farm and shrimp processing. To part finance the project the company is making a public issue of 41,00,000 equity shares of Rs 10 each at par totalling Rs 410 lakh. Out of the project cost of Rs 7.65 crore as appraised by Federal Bank, term loan from State Bank of Travancore stands at Rs 2 crore. This amount has been sanctioned only in principle and final approval is awaited. Out of the total equity, the promoters' stake is about 26 per cent. Projections put the EPS at Rs 1.84, Rs 5.29 and Rs 6.88 for 1993-94, 1994-95 and 1995-96 respectively. The issue opens on July 5. Listing in four stock exchanges at Hyderabad, Ahmedabad, Bombay and Madras is being done. Federal Bank and Inter Corporate Financiers and Consultants are the lead managers to the issue.

Pressman Leasing

Pressman Leasing, closely tied to the more famous Pressman Advertising and Marketing, provides lease and hire purchase finance to business and industrial groups like RPG Enterprises, Macneil and Magor, Balmer and Lawrie and Grindlays Bank. It has won the IMM LIC Award of Excellence and has received clearance from the SFBI to act as Category I merchant

banker. The company was started in 1983 by Niren Suchanti and is now expanding its leasing and hire purchase business. Its proposal has been appraised by the ICICI, which has estimated the requirement of funds for 1994 at Rs 14.36 crore. The company is meeting this with a rights cum public issue of share capital for an amount of Rs 10.71 crore and internal accruals of Rs 1.48 crore. The capital issue comprises offer of 17.55 lakh equity shares of Rs 10 each at a premium of Rs 10 per share on a right basis in the proportion of 1:2 and 35.98 lakh equity shares of which 5 lakh shares to the NRIs and 30.87 lakh shares to the public on the same terms. The issue opens on June 28 under ICICI Securities and Finance as lead manager. As per ICICI's appraisal Pressman Leasing's total income and net profit are to rise from estimated figures of Rs 6.85 crore and Rs 2.63 crore, respectively, in 1993-94 to Rs 10.13 crore and Rs 3.56 crore.

Alpine Housing

The NRIs, S.A. Kabeer and G.H.S. Gupta, apparently driven by the concessions allowed to non resident Indians by the government in investment in real estate and housing—freedom to repatriate sale proceeds of land purchase three years after acquisition of land and to invest in two houses instead of only one hitherto—have come together with land developer S.A. Rahman in Bangalore to set up Alpine Housing with proposals of investing in real estate and developing property in Mangalore where housing activity is now fast growing. The company has drawn up a project on these lines which State Bank of Mysore has appraised is to cost Rs 3.50 crore. All of the project cost is being met with equity, with the promoters contributing 40 per cent of the share capital and raising the balance 60 per cent from the public. Projects worth Rs 1.25 crore have been signed by the company of which Rs 3.60 crore cover two projects of procurement of land for building complexes and the balance amount is for undertaking construction activity. These are to yield, according to projections made by the company, a sales turnover of Rs 8.23 crore and net profit of Rs 53.38 lakh during 1993-94, with EPS of Rs 1.53. By 1995-96 the turnover is to increase to Rs 15.10 crore and so also net profit and EPS respectively to Rs 1.42 crore and Rs 4.07. Out of a share capital issue of 34.99 lakh equity shares of Rs 10 each at par the company is offering 21 lakh shares to the public on June 30 under SBI Caps and State Bank of Mysore as lead managers to the issue.

Notes: (1) Superscript numeral denotes month to which figure relates, e.g., superscript¹ indicates that the figure is for January and so on.
(2) Figures in brackets denote percentage variations over the comparable period of the previous year.

Calcutta Diary

AM

The Arabs, after Ayodhya, hate us, we therefore hate the Arabs and cross over to the Israelis. The latter however go calling on the Bharatiya Janata Party. The Israelis have declared their abhorrence of terrorism and fundamentalism and endorsed all the way our stand on Kashmir; but you never know, they may go even further and endorse the BJP proposition on Article 370 too

CHOOSING sides is an awkward exercise. Ask the Poles. They loved Solidarity, they adored Lech Walesa, loving Solidarity however meant loving the Pope as well—they constituted a joint supply. But the Pope has snatched away from Polish women the right of abortion, which was bestowed upon them by totalitarian communism. Or consider the case of the Americans. They were at the receiving end of the fury fundamentalists had unleashed in Iran. Curiously enough, in neighbouring Afghanistan, where it was a question of resisting the expansionary devices of the evil empire, the fundamentalists were a godsend to them. The US administration is in a similar bit of dilemma in Bosnia. The humanitarian lobby is clamouring for help, including active military assistance, to be immediately organised to save the beleaguered Muslim community from wholesale liquidation. On the other hand, scratch a Muslim and is he not, in 99 per cent of the instances, a fundamentalist at heart? Should not moral issues hence be shoved aside and Muslims allowed to die like flies?

Such dialectical problems bob up endlessly as one keeps hopping from one country to the next. With the collapse of the Soviet monolith, there is no dearth of countries to target for this hopping around business. On some grounds, the Azerbaijanis ought to get your vote, should you stumble on some other grounds, you would opt for the Armenians. To take yet another example, Latvia and Lithuania were amongst the earliest republics to rise in revolt against Soviet hegemony. Russian troops, out, out. A most noble sentiment. At the same time, Boris Yeltsin, president of the Russian federation, is such a dedicated foot soldier for democracy. He is dearly in love with the idea of letting his troops elongate their stay in the Baltic lands. So what does Foggy Bottom decide?

The Americans are not the only ones befuddled by dilemmas of this nature. We, the poor Indians, are equally in a blue funk. The decision makers in New Delhi have been facing a particularly excruciating predicament for some years. Whatever its hue, fundamentalism without question has to be got rid of—it strikes at the root of the nation's unity and integrity. Be honest though, fundamentalism has its

good points too. In the season of parliamentary elections, it can be put to effective use, by availment of the media, to entrap dumb voters in this the world's largest democracy. But there are other complications. The slogans called for for evoking fundamentalist emotions amongst the majority community could alienate the minority community. The latter form an equally solid vote bank—it has delivered faithfully ever since the first general elections held more than 40 years ago, would it not be a bad trade off to give up the bird in hand for the sake of the two in the bush? Further instances of dichotomised choice are not difficult to come by. Love the Bharatiya Janata Party, it has endorsed the new economic policy, beware of the BJP, it has walked away with our Aryavarta constituency. Love the farm lobby, they deliver the rural vote, look askance at the farm lobby, their tantrums make it impossible on our part to satisfy the Fund Bank conditionalities in entirety.

The presence of such contradictory pulls and pressures has had one major consequence. The old British shibboleth in regard to the collective responsibility of the council of ministers has fallen by the wayside. One minister is dead certain about the hidden Pakistani hand triggering off the Bombay explosions, according to another minister, no concrete evidence has yet been unearthed to entertain any such suspicion. One minister airdashes to Madras to seek Kumari Jayalalitha Jairaj's forgiveness, let bygones be bygones and the great Tamil Nadu concordat, symbolising the communion of the Ganga and the Cauvery, be restored to full glory. Another minister stops just short of describing Kumar Jayalalitha Jairaj as a congenital practitioner of terminological inexactitudes. Sometimes the same minister contradicts himself between one day and the next, on day one Jyoti Basu must be sent to the gallows, on day two Jyoti Basu is the kindly light who will lead us out of perdition.

Much of this is however quite in line with the basic tenets of Hindu philosophy, you can switch your faith from the *advaita* doctrine all the way to one which defends to the hilt the notion of a polypoly of the gods. Such switching and re-switching could turn out to be a non-stop exercise,

still, neither you nor your adversaries need be overly concerned over the constancy of your inconsistency. If it is March 1992, the finance minister has not the least doubt that the post budget share market boom bears testimony to the wisdom the budget was stuffed with, if it is June 1992, the finance minister has other things to do, he could not afford to lose his sleep if some wretched share prices went up or down or moved laterally.

In the immediate post independence years, choices were relatively less complicated. Assessed in the light of ancient history, the sympathies of our rulers were with the Zionists. Once the context was shifted to more recent history, these were for the Arabs. Since Jawaharlal Nehru loved to move with the times, the Arabs were the obvious favourites. With Kashmir increasingly becoming the local issue in debates with Pakistan on United Nations forums, our mind was made up for us. Pakistan must not be permitted to take for granted the support of the Islamic countries. Have we not invested a great deal of material resources and spiritual energy on nurturing the non-aligned movement, have we not chanted one utilitarian invocation after another in praise of Afro-Asian solidarity? Some Arab countries, the United Arab Republic the foremost amongst them, were therefore bound to be with us were matters over Kashmir to come to a head, at least they would not be, for politeness sake, against us. In effect, we leaned on the principle of reciprocity—it was good, clean fun. Every Arab cause was an Indian cause, and, we hoped, it would be vice versa. In odd years, we even remembered that we are the largest Muslim nation on earth, edging out Indonesia. We applied humilful of a feeling of legitimacy for membership in the Organisation of Islamic Countries. While the issue of full membership remained indeterminate they at least did not deny us observer status. One or two dialecticians back home entered a mild caveat about a secular republic pretending to join a denominational jamboree. Indian metaphysics, the jokers should have known, is capable of making mince meat of run of the mill scepticism.

Since Ayodhya, things have become somewhat stickier. A standing committee of the Organisation of Islamic Countries—or is it of the Islamic Economic Council?—has passed a resolution recommending the imposition of a trade embargo on India, since our government allegedly merely looked on while the Babri mosque was razed to the ground. The OIC countries are toying with the idea of denying us further supply of petroleum crude. This is of course absurd, but we are somewhat handicapped in launching a vigorous counter attack because of one or two extraneous factors. Following the demise of the eastern bloc, the non-

aligned movement too has chosen to go into hibernation. The NAM was originally set up as a bargaining counter. It was a remarkable beauty, it enabled us to develop the panache to play one superpower against another. Now that there is only one superpower left, the occupation of bargaining is gone. No virtue is to be squeezed out of non-alignment, NAM has thus been rendered a non-combatant. Our contacts have loosened, it is no longer possible to buttonhole Arab friends at all times of the day. Desperate situations call for desperate remedies. Besides, were not our wise men of yore wont to advise always maintain a cool head on your torso? On account of the ghastly occurrence on December 6 last and subsequent events, we are, as of this moment, without too many friends in the Arab world. We accept that reality. But precisely because we have few friends left amongst the Arabs consequent to the doings of the Vishva Hindu Parishad, we decide to go the whole hog and embrace the foreign policy of the VHP: we go all out to woo Israel. That is to say, we decide, for a change, to return to the cool waters of ancient history. Or if it pleases you, our stance is akin to following the precept underlying a song once much in favour in American playpens. 'Lost my partner, what shall I do; I'll get another one prettier than you'. The Israelis are for the present to be preferred to the beastly Arabs, who are threatening not to sell us oil. True, this revisionism would not solve the problem of shortage of petroleum crude, more so since we abhor the stick in the mud ideology of self-reliance and will not, as a matter of principle, raise our domestic output of crude. But there are compensations. The Israelis have apparently promised to lend us one or two Mossad contingents who will help us catch that beast Velupillai Prabhakaran. On the other hand, Israelis have a long memory, perhaps because they have a long history. Their foreign minister quoted from both Jawaharlal Nehru and Ved Mehta. So far so good. When it was after hours though, he called on Lal Krishna Advani, whose party had been ever since antiquity against the Arabs and for befriending Israel. We, meaning our leaders, are once more caught in the contradictions of hypotheses. The Arabs hate us, we therefore learn to hate the Arabs, and cross over to the Israelis. The latter however go calling on the Bharatiya Janata Party. A matter of some solace, the Israelis have declared their abhorrence of terrorism and fundamentalism and endorsed all the way our stand on Kashmir, but you never know, they may go even further and endorse the BJP proposition on Article 370 too.

In the circumstances, our poor prime minister is forced to go fishing in Tashkent, Alam-ata and even remoter tracts in central Asia, the Karimovs and

Nazrayevs have to be assured that we are not totally sold on Israel, we are merely worried over the spread of terrorism and fundamentalism. Is not fundamentalism proving an equal threat to each of the erstwhile Soviet republics in central Asia: Uzbekistan, Tadzikistan, Kirgizistan, Turkmenistan and so on? If ever they are in need of friends, they should not be bashful, they should just call us, we will co-operate with them to organise an Asian Solidarity Front Against Fundamentalism. Meanwhile, as token of earnestness on our part, here is ten million dollars apiece in convertible currency. This too is a hoary central Asian custom, the expression, *baksheesh*, is itself of central Asian origin.

Walking up and down on both sides of the street is nonetheless a game ridiculously easy to pick up, and by any party. The central Asian republics we want to befriend against Muslim fundamentalism do not mind being part-time fundamentalists themselves. They want to keep their options open, some of them have applied for membership of the Organisation of Islamic Countries—or is it of the Islamic Economic Council?—on the wise principle that if you cannot beat them, join them. Unlike the philosophers infesting India, they are a pragmatic lot, in case the only way to save themselves from fundamentalism is to embrace it, why, they will not mind changing the colour of their ensign.

Such *realpolitik* should not actually scandalise the mandarins in New Delhi, who have of late developed a taste for the free market. Once the world of ideology recedes into oblivion, the market principle begins to hold sway in each and every sphere. Soccer players are known to sell themselves to the highest bidders. Two decades ago, Jacqueline Kennedy exchanged her status from that of American presidential widow to that of bedmate to Aristotle Onassis reportedly for a cool one billion dollars, with a couple of yachts thrown in. These are prime examples of the letting the market decide doctrine. In case you are without a permanent ideology, you can then afford to be without permanent friends as well, you sell to the highest bidder. To describe this ambience as lack of moral principles is fiddlesticks. Principles are a product of ideology, once you are bereft of ideals, you cannot evidently fall back on principles. Rather, you drift from betrayal to betrayal, you betray and are betrayed in turn. Mikhail Gorbachev for one can take much credit for the emergence of this world *sans* morality. He has succeeded to encapsulate in his utterances the spirit of the times. He now advertises himself as a freelance statesman. You can hire him whatever the cause, if you pay him right, he will do an excellent job on your behalf. Did he not break up, so splendidly, Stalin's abominable empire?

CIVIL LIBERTIES

India-China Pact on Human Rights

A G Noorani

India signed a sordid pact with China on the issue of human rights because it is opposed to the setting up of UNHRC office on the spurious ground that it would interfere in the "sovereign working of nations". The implications of the pact are startling.

EVEN to those (like this writer) who support early settlement of the border question with China and good relations with that country, it must come as a shock that India concluded a sordid deal with China at Vienna to present a joint front before the western countries. The implications of such a pact are startling.

The *Indian Express* of June 18 carried this PTI report from Vienna, "India and China have agreed to unitedly oppose imposition of a western concept of human rights on developing countries. An understanding to this effect was reached during a meeting between the minister of state in the prime minister's office, Bhuvnesh Chaturvedi and the Chinese deputy foreign minister Liu Huaqui at the World

Human Rights Conference here. Chaturvedi said the Indian and Chinese delegations also opposed the creation of the post of a United Nations Human Rights Commissioner. Both feel that the new post would be a hindrance to the functioning of the United Nations secretary-general, result in the overlapping of functions and interfere in the sovereign working of nations." What a performance by India at the UN World Conference on Human Rights!

To begin with it is strange that an 'understanding' of this nature or for that matter of any kind should be concluded by some one in the prime minister's office rather than by an official of the ministry of external affairs. Secondly,

India and China have two basically different political and social systems due to basically different political ideologies. It will not do for any one, whether Bhuvnesh Chaturvedi or even the PM to prattle about the "western concept of human rights". The chapter on fundamental rights in the Indian Constitution is very much based on the western, particularly the Anglo-Saxon, concept of human rights. Our Supreme Court and high courts freely draw on British, American, Australian and Canadian case law. Chinese courts function differently.

Thirdly, the solicitude about the smooth functioning of the office of the UN secretary-general without the overlapping authority of the UN's High Commissioner for Human Rights will fool nobody. The secretary-general has not complained. Why are we trying to be more royalist than the king?

But the cat does not take long to come out of the bag. The truth is that India decided to make common cause with China because it is opposed to the establishment of the office of the UNHRC on the spurious ground that it would "interfere in the sovereign working of nations". It would do so no more than does the UN Human Rights Committee set up under the International Covenant on Civil and Political Rights which India has ratified. India is bound to submit reports to the committee on its observance of human rights.

It is puerile to defend India's dismal record on human rights—though it is better than that of any other third world country—by thus belatedly taking shelter under the rhetoric used by dictatorships in the third world. Human rights are not an impediment to development. The right to property can be if construed in the 19th century spirit. But we do not need child labour or forced labour or bonded labour for development.

Incidentally while berating NGOs like Amnesty and Asia watch for their criticisms of India's record, the government of India responds calmly to the US government's annual 'Country Report on Human Rights' which has a chapter on India. The latest report published recently has sharp comments on India. It is too late in the day for any country to challenge the established principle that respect for human rights is a matter of international concern.

Consider the following portions of the US report. Can the government contest the facts it sets out?

The government (of India) estimates that there are approximately a quarter of a million bonded workers in India, of whom 223,108 had been "rehabilitated, by March 31, 1992. Other sources, including the Bandhua Mukti Morcha and the Gandhi

Peetee Foundation, however, estimate the number at 10 times the government figure. Private and autonomous social organisations, such as trade unions, the council for advancement of peoples' action and rural technology, and action for welfare and awakening attempt to identify cases of bondage and pursue them with the appropriate officials. However, even with better co-ordination and increased resources to central and state governments the eradication of bonded labour is proceeding slowly.

Minimum Age for Employment of Children

Article 24 of the Indian Constitution prohibits employment of children under 14 years of age in factories, mines, or in other hazardous employment; Article 45 encourages states to provide free and compulsory education for all children up to the age of 14. However, these constitutional provisions have had little impact. As in the case of bonded labour, the central government often blames divided jurisdiction with state governments for its inability to curb the practice. Poverty, social acceptance and the failure of state governments to make primary school education compulsory make child labour an especially serious problem. According to a labour ministry survey, one out of four Indian children between the ages of 5 and 15 is working. Government statistics put the total at 17.5 million in 1985. Other figures, including those cited by ILO, put it as high as 44 million.

On Kashmir the US report says:

Human rights abuses by both militants and security forces continued unabated in Jammu and Kashmir, India's only Muslim-majority state. The Muslim population in Kashmir valley has become severely alienated both by the central government, because of the repressive tactics used by its forces to combat insurgency, as well as by the militants for acts of wanton violence sometimes directed at innocent civilians. Hundreds of thousands of Indian army and paramilitary forces remain in the state to maintain law and order and check the militant separatist movement. Under the Jammu and Kashmir Disturbed Areas Act and the Armed Forces (Jammu and Kashmir) Special Powers Act, both passed in July 1990, security force personnel have sweeping powers, including authority to shoot to kill suspected law-breakers or disturbers of the peace and to destroy structures suspected of harbouring militants or arms.

Paramilitary and army forces used excessive force against mass gatherings, as well as in retaliation against attacks on them by armed militants. On May 5, security forces killed four bystanders and wounded seven when returning fire in a militant attack on a motorcade accompanying the union communications minister in Srinagar. Kashmir observers report that house-to-house searches, torture, and gang rapes of innocent civilians (especially in

remote villages) increased following the launch of Operation Tiger and Shiva by security forces in September and October. These operations reportedly involve intensive cordon-searches, large-scale burning of homes and businesses suspected of aiding militants, and faked 'encounter' killings of militants in police custody. On October 1, nine people in and around a village north of Sopore were reportedly killed and three women (including a 60-year-old and an 11-year-old) were raped following a militant attack on an army convoy one-half mile away in which a security force member was killed. Homes and cattle reportedly were burned and apples recently harvested were destroyed. Kashmiris allege security forces steal food, money and personal property. Kashmiri human rights activists report that medical personnel also have been the targets of violence. The Indian government reports that in Kashmir 33 army and paramilitary personnel were imprisoned (27 received sentences of one month or less), 18 were dismissed, and 45 were demoted or reprimanded. In Punjab, 135 policemen were dismissed and 75 were prematurely retired. In three cases, senior officers were given jail sentences.

Except for granting a brief visit in 1990, the government has resisted offers by the International Committee of the Red Cross to visit Kashmir in order to monitor and report confidentially on prison conditions and treatment of civilians.

Militants maintained a reign of terror in the valley throughout the year, targeting security forces personnel public employees, supposed police informers, members of rival groups, and others perceived as opposing their cause. Invariably, innocent civilians were caught up in the violence. On October 7, for instance, 13 people were killed and about 50 injured when a bomb allegedly placed by militants destroyed an overcrowded bus in Jammu. Militants routinely planted bombs in and around military and paramilitary installations, as well as at bridges and communications targets. Militant groups kidnapped dozens of government officials, family members of prominent politicians and businessmen, killing some of them. *Kashmiri militants, unlike their counterparts in Punjab, have not routinely engaged in mass killings.* They also carried out extortion and protection rackets.

Yet, by any account, the security forces have perpetrated in Kashmir outrages of the kind unheard of in Punjab—setting fire to houses.

Revisiting the National Literacy Mission

Sumanta Banerjee

The experience of the National Literacy Mission serves to underscore that social activists who seek to use the 'democratic space' in state-patronised programmes will have to develop an autonomous interventionist potential that can sustain their activities even if, or when, the 'space' is withdrawn from them by the government. Much of the success in developing new strategies of participation in the process of transforming rural society depends on the ability to map the space available in different projects. This mapping is necessarily a critical exercise, and is different from acts of submission or co-optation.

THE recent decision of the Union Ministry of Human Resource Development's Department of Education to set up a committee of experts for evaluating the Total Literacy Campaigns (TLCs) launched under the National Literacy Mission (NLM) since the period 1990-91, meets the long overdue need for a thorough stock taking exercise. Both the euphoric claims about the success of the programme made by some of the districts and the misgivings voiced by a section of the press and educationists questioning those claims require a serious investigation.

One also hopes that the committee confronts some of the larger questions that have arisen from the NLM experiments during the last two years. Can literacy alone—divorced from a simultaneous radical transformation of the rural socio-economic system—succeed in improving the 'economic status' of the poor, as claimed by the NLM? While the government is promising to 'empower' the poor with skills to improve their 'general well being' through 'functional literacy', why is the same government 'empowering' the enemies of the poor with unlettered rights to exploit and oppress them? Is this contradictory approach in official policies and practice a case of inadvertence—the left hand not knowing what the right hand is doing? Or, is the government trying to lull our people with the message of literacy as a soft educational substitute for the hard option of a political struggle to solve the country's major social and economic problems?

A brief recapitulation of the NLM objectives and a general review of its outcome till now can help us to locate these

questions in their right perspective. Launched in 1988 as one of those much publicised missions of the late Rajiv Gandhi, the NLM aimed at imparting 'functional literacy' to around 80 million illiterate persons in the 15-35 age group by 1995. Later the 9-14 age group was also included, raising the target by another 47 million. 'Functional literacy' implied for them (i) achieving self reliance in literacy and numeracy, (ii) becoming aware of the causes of their deprivation and moving towards amelioration of their condition through organisation, and participation in the process of development, (iii) acquiring skills to improve the economic status and general well being, (iv) imbibing the values of national integration, conservation of the environment, women's equality, observance of small family norm, etc.

The duration of the initial literacy programme was to be of 200 hours spread over five to six months. This was preceded by a long campaign of motivating the would-be learners and recruiting volunteers to teach them, through environment building and mobile cultural performances. Resource centres were set up in states and at district levels consisting of specialists in adult education to fashion model primers for the learners. The initial programme of 200 hours—known as the Total Literacy Campaign (TLC)—was to be followed by a Post Literacy Campaign (PLC) as a part of the continuing education process for the neo literates.

The district was chosen as the basic unit of operation. State governments were persuaded to bear one third of the total cost of the TLCs in selected districts of their states, the rest to be borne by the NLM.

District literacy committees were set up headed by the collectors, followed by sub-committees at the block and village levels. Panchayat representatives and activists of voluntary organisations were made members of these committees. From 1990 onwards, literacy centres started functioning in most of the selected districts. The teacher student ratio was fixed at 1:10. The NLM decided that at the end of the 200 hours of teaching programme, institutions of social science research, universities and voluntary organisations would be invited to undertake summative evaluation of the functional literacy acquired by the students.

THE OUTCOME

According to the NLM, about 150 TLC and 42 PLC projects had been sanctioned in selected districts and blocks in 18 states and three union territories so far (till May this year).

Among the positive results, one notes a general rise in the enrolment of children (of the neo literates) in primary schools, wider acceptance of the immunisation programme, and a growing desire for literacy among the scheduled tribe people and women (Muslim women in particular), in successful TLC districts.

But reports from other districts indicate certain disturbing trends. First, although the programme has run for well over a year in several districts (where the literacy campaign has obviously been extended beyond the original six month 200 hours schedule), their performance level still remains below 20 per cent of the target, or they have not reported at all. While half of them are from the Hindi speaking areas—the low literacy states of Uttar Pradesh, Madhya Pradesh, Rajasthan and Bihar (where the average literacy rates vary from 38 per cent to 43 per cent), the rest are from Andhra Pradesh, Karnataka, Maharashtra and Tamil Nadu. In at least two districts (Tumkur in Karnataka, and Medak in Andhra Pradesh), fresh grants are being released to salvage the TLCs under 'Operation Restoration'.

Secondly, very few among the districts, at the end of their TLC programmes, appear to have gone in for a summative evaluation by any external agency as envisaged by the NLM. Several district authorities had approached the NLM with claims of having achieved total literacy on the basis of some 'internal evaluation' and sought approval and financial assistance for launching the PLC. There are suffi-

ment regions to believe that in a number of districts where the PLC had been sanctioned, the backlog of illiterates continues to outnumber the neo-literates. In Narsinghpur in Madhya Pradesh for instance, while the district authorities claim an achievement level of over 50 per cent external evaluation has revealed a level that is much lower. Shimoga in Karnataka was declared totally literate by the state's chief minister in May this year, while the latest external evaluation report shows an achievement level of 45.46 per cent only.

Thirdly, even in some districts—like Burdwan—where external evaluation by experts had confirmed that 60 per cent to 80 per cent of the illiterates had reached the NLM norms of literacy a year ago or so, there are disquieting signs of a relapse among a large number of them. This could be due to several reasons—lack of interest of the district literacy committee in pursuing the PLC seriously; inability of the instructors to sustain their voluntary efforts any longer; inadequacy in the level of literacy acquired by the learners; or a long gap between the end of the TLC and the launching of the PLC, making it difficult for the neo-literates to resume practice.

Fourthly, political and economic hurdles have come up as serious obstacles in the path of the literacy campaign in some districts. In Kerala, the Congress government soon after coming to office suspended the literacy classes—on the plea that the organisers of the literacy campaign during the earlier Leftist regime were guilty of corruption! Although widespread criticism of the Congress government's partisan politics forced the authorities to resume the literacy classes after some time, the break in the continuity of the programme meant that many learners had to start all over again from the beginning. Similarly, in Andhra Pradesh, although the government finally conceded to the popular demand for an end to arrack auction, its earlier foolish decision to withdraw textbooks and stop publication of broadsheets for the neo-literates (in retaliation against their anti-arrack agitation) disrupted their learning process.

The economic hurdles are more difficult to cross and have far-reaching effects on the literacy campaign. In Pudukkottai in Tamil Nadu, which has had a successful total literacy campaign in the 9-45 age group, the next phase—the PLC—is now facing a threat because of the severe water crisis there which is forcing the potential learners in the PLC phase to migrate to other places. This implies not only a relapse among the adult learners, but also a setback for their children who were about to join the schools. In the inaccessi-

ble, tribal-inhabited districts of Orissa, even before any talks of literacy campaign can be initiated, immediate problems of survival, like starvation, lack of drinking water, dearth of medicines and health care need to be tackled first so that the potential learners can, to start with, find themselves in the necessary physical and mental shape to attend the literacy classes.

Given this ground reality, it will be quite a job for the committee of experts to penetrate the opaque screen of the bureaucracy and get down to 'analyse the estimated number of persons made literate by gender, age groups and social groups'—one of the objectives set before the six-member expert group for status-cum-impact evaluation of TLCs.

SCOPE OF INVESTIGATION

Among other things, the committee is expected to measure 'the outcome of literacy campaigns among learners and participants with respect to prescribed level of literacy per NLM norms'; 'the processes and effectiveness of environment building, mass mobilisation through mass literacy campaigns', 'involvement and partnership between government bodies and voluntary groups in literacy campaigns'; 'duration of implementation of the campaign with special emphasis on the duration of teaching/learning'; 'resources available and mobilised for mass literacy campaigns including the cost effectiveness of the campaign'; and—more importantly from the wider socio-political point of view—to study and assess the fallout and impact of the literacy campaigns on related socio-economic development programmes, such as primary education, health, nutrition, family welfare, gender sensitivity, women and child development programmes, national integration, etc'.

While an evaluation of the quantitative dimensions of the TLC experiment (e.g., 'number of persons made literate', 'prescribed level of literacy per NLM norms', 'duration of teaching/learning', 'cost effectiveness of the campaign', etc) is surely necessary, an assessment of the qualitative impact of the experiment on the learners as well as on those involved with them (including the instructors and the administrators at the various levels of the system) becomes essential in the context of the NLM concept of 'functional literacy' which envisages assertion of rights by the neo-literate poor through organisation, and their active role in crucial issues like national integration and movements for women's equality.

From a purely target-oriented, statistical approach, literacy can be recognised and

measured in terms of the learners' aptitude in the three R's. The ability to write one's name for the purposes of the census may produce a sharp rise in the national literacy rate (52.1 per cent in 1991). But is it enough to effect those changes in the personal beliefs of the individual learner and in group behaviours that are expected to help the shaping of a qualitatively different society? As a 19th century British observer aptly put it: "Reading and writing are no more knowledge or education... than a knife, fork and plate constitute a dinner... [They are the] tools for gaining knowledge; they are not crop, but plough and harrow" (W B Hodgson in *Transactions of the National Association for the Promotion of Social Science*, 1867).

In a large number of TLC districts, the administration appears to be contented with providing the learners with just the 'plough and harrow' without suggesting to them the 'crop' of knowledge that can be cultivated with the newly acquired tools. In fact, there is a general feeling among the administrators that the TLC should concentrate only on imparting alphabetical and numerical literacy and reach whatever targets have been fixed by the government, and leave it at that—instead of extending it to 'functional literacy' (i.e., making the learners aware of 'the causes of their deprivation', 'values of national integration, conservation of environment', etc). At a meeting of district collectors in Delhi some time ago, which this writer attended as an observer, several participants—mainly from the then BJP-ruled states of the Hindi belt—expressed their reluctance to introduce topics like anti-communalism and anti-casteism in literacy centres, as it might lead to explosive situations! It was quite obvious that they did not want to draw the ire of the ruling politicians.

In some districts, where a few enthusiastic collectors and volunteers did dare to introduce lessons on economic problems and social issues, it indeed led to 'explosive situations'. Chittoor and Nellore in Andhra Pradesh are classic examples, where lessons describing women's mobilisation against the sale of arrack acted as a catalytic agent in spreading the anti-arrack movement which had earlier remained confined to a few districts of the state. When life really began to imitate the lessons, the ruling Congress party and its leaders (many among whom themselves were arrack-contractors) forgot their late beloved leader Rajiv Gandhi's NLM and its commitment to 'functional literacy', and rushed to withdraw the 'explosive' lessons!

LIMITS TO 'FUNCTIONAL LITERACY'

Thus, 'functional literacy', if taken seriously and followed to its logical extent, poses a threat to the ruling powers, irrespective of their political hues—whether they belong to the Congress or the BJP. They can switch it off and on, depending on their interests. District authorities and voluntary organisations involved in the NLM's literacy campaign are therefore perpetually nagged by uncertainties: how far will the Establishment allow 'functional literacy' to be translated into action? And, in what way?

It would be interesting, in this context, to watch the fate of the TLC in Faizabad, which was recently approved by the NLM executive. It will be launched soon with the 'twin objectives of spreading knowledge and secularism', the idea presumably being that literacy will change people's attitude towards the restoration of communal harmony in Faizabad (along with its twin town Ayodhya). This approach raises several problems.

First, the district administration of Faizabad, as it is well known, has acquiesced in the construction of an illegal religious structure on the site of the demolished Babri masjid. This act of official complicity with the Sangh parivar is in total violation of the ideas of 'secularism' as well as the laws of the land. If the TLC in Faizabad seeks to inspire the learners with ideas of communal harmony, should it not as a part of 'functional literacy', help them to identify those who are reinforcing communal tensions by illegal acts (in this case, the district administration in collusion with the Hindu communal outfits)? How can the people take seriously a literacy campaign claiming to spread secularism, being presided over by a district administration which itself is guilty of subverting secular values? If the learners in the Faizabad TLC—initiated into 'secularism'—dare to question the palpably un-secular acts of the district administration, will the latter treat it as a law and order problem (as happened in Andhra Pradesh during the anti-arrack agitation)?

Incidentally, even before taking off, the proposed TLC for Faizabad has run into trouble. The district collector who submitted the TLC proposal to the NLM (and who was reputed to be committed to its implementation) has been transferred because he refused to allow the godman Chandraswamy to hold a 'yagna'—yet another instance of political pressures from the top that interfere with the launching and functioning of TLCs. The fate of the Faizabad TLC—originally scheduled to start from July this year—looks a

bit uncertain now, what with the appointment of a new collector and the changed priorities of the district administration which at the moment appears to be more concerned with 'yagnas' than literacy.

Secondly, although Ayodhya had been the nerve centre of the recent communal tensions, the majority of the Hindu communal fanatics who demolished the mosque came from outside Faizabad. Is it not more important to instill the values of communal harmony in these people from among whom the Sangh parivar recruited the 'kar sevaks'? Or, in Bombay, Surat, Bhopal and other places where the local mobs backed by a considerable amount of public support massacred innocent people?

Finally, can a literacy campaign *per se* make people secular-minded? Are our political leaders (most of whom are well-educated and claim university degrees), less communal, less casteist, less obscurantist? Has the gift of literacy made any difference to the thinking and behaviour of the Advanis and Murli Manohar Joshis?

INHERENT TENSION

This brings us to more fundamental questions. Is it 'functional literacy' that motivates the people to become 'aware of the causes of their deprivation' and to move towards 'the amelioration of their condition through organisation'? Or, is it the other way round?

There is a tension between the idea of making literacy the kingpin in social transformation on the one hand, and that of placing it as one of the many essential components in a holistic programme of socio-economic transformation on the other. The first idea implies an effort to solve certain socio-economic problems indirectly through literacy instead of directly through politics. This tendency places enormous burden on those carrying out the literacy programme and creates inordinate hopes and expectations among them.

As is happening in a large number of TLC districts at the initial stage, the organisers tend to cast education as a leading weapon in everything—from the war on poverty to the fight against communalism! In the environment-building campaign (an essential part of the preparatory work for any TLC), they come up with simplistic messages suggesting that once the poor get literate, they will get their minimum wages, medicines and health care, better jobs, etc. There is also a tendency among them to equate illiteracy with ignorance and regard the il-

literate as a sick person who needs to be cured.

While it is undeniable that the acquisition of literacy makes the illiterate people more aware of the mechanisms of the system that deprives them of power, and helps them to conceptualise this awareness, it is to be admitted at the same time that incapacity to read and write has never been an impassable barrier against participation in political struggles and socio-economic movements by the illiterate. In fact, in several areas where the recent literacy programmes have taken roots, it has been found that it was these initial struggles and movements that paved the way for the popular acceptance of literacy classes. Literacy in these areas—often under the aegis of political or voluntary organisations—came in organically in a process, in the course of a movement for survival, when it became the felt need of the adult learners. It is often forgotten that the anti-arrack agitation had started in Andhra Pradesh long before the TLC began. The controversial lesson in the primers in the TLC merely reflected the surrounding reality. The learners, already aware of the struggle, were quick to respond to the lesson. In Pudukkottai in Tamil Nadu, it was the mobilisation of women quarry workers to run their own quarries that created the motivation for learning among these women who felt the need for writing accounts, fighting the contractors on their own terms and strengthening their economic and social position. Similarly, the success of the literacy campaign in places like Kerala, or Burdwan in West Bengal, can be explained to a large extent by the already existing high level of political consciousness and critical awareness that had developed through years of organised peasants' movements. This could have created the social basis for a felt need for literacy.

Thus, the alternative concept—mentioned earlier—of recognising literacy as one of the many essential components in a larger programme of socio-economic transformation (instead of investing it with the almost supernatural capacity to bring about decisive changes), allows literacy to gain easy access to the poor households. It becomes a comrade-in-arms to the other daily concerns and interests of the poor—the need for food, minimum wages, better health care, employment—which drive them 'towards amelioration of their condition through organisation' and struggles against the oppressive powers.

This concept, for various reasons, may not find favour with administrators and policy framers who in their excessive haste

and optimism need the literacy campaign as a convenient instrument for showing quick results, or—at a political level—as a safe substitute for mass militant actions. The latter motive becomes clear in an official report on the TLC in the Naxalite affected district of Nizamabad in Andhra Pradesh. The report states that one of the 'broader aims of the campaign' is "how are they [the learners] going to fight against extremist thinking and action". It then goes on to say "With the Naxalites on one side and the literacy movement on the other, there is a clear perception before people whether they want a violent revolution or a silent revolution for bringing about the much needed change in the state of affairs. Literacy is perhaps going to be a better weapon for people to fight for their rights and ideals, maybe also an enabling factor for performing their duties as citizens" (*Literacy Mission*, Vol XV, No 3, March 1992, New Delhi).

The emphasis on 'performing their duties as citizens' is significant in the context of Andhra Pradesh. While literacy is being sold to the people as a 'better weapon to fight for their rights and ideals', when they really fight for their rights (as they did during the anti arrack agitation), the state comes down heavily upon them to remind them of their 'duties as citizens'. Is literacy then expected to provide a deferential labour force?

Similar questions can be raised about the relations between 'functional literacy' and the anti communal campaign in the present socio political context. If a communally surcharged environment is allowed to be built up all over the country by the ruling powers—both at the centre and the states (as happened during the Ayodhya crisis)—will mere lessons on national integration help the neo literates to resist and conquer such an environment? While the primers in the literacy centres may urge upon the learners to get rid of religious prejudices and obscurantist beliefs (to which communal feelings are closely linked), the ministers at the top reinforce these same prejudices and beliefs by paying visits to Shankaracharyas and godmen and seeking their blessings, by kowtowing to the charlatan 'sants' and mohants of the VHP and the gangsters of the Shiv Sena. What sort of an example has been set for the learners by Arjun Singh himself (whose ministry of Human Resource Development has taken over the responsibility of bringing enlightenment to the poor illiterate people through the NLM) who in February this year went to Bhopal to attend an 'Ashwamedh yagna' where firewood and ghee costing several lakhs were wasted on the hocus pocus? Do such actions of their ministers help the learners

to imbibe progressive values like 'conservation of the environment' (one of the aims of 'functional literacy'?) While the tribal learners in the TLC districts are reprimanded for collecting firewood (one of the major sources of their livelihood) on the ground that it destroys forests, the Hindu religious quacks are allowed to do the same for the luxury of a 'yagna' to be watched by a minister!

Whether in the area of 'general well being', or of 'national integration', the success of functional literacy depends on the political will of the Indian leaders to effect radical changes in economic relations, personal beliefs, individual and group behaviours and the functioning of the major institutions (the latter having lost all credibility among our people). Since that will is lacking, the NLM concept of functional literacy will keep floundering in practice. It faces resistance from the very power structure on which the government (which constituted the NLM) rests.

FROM 'FUNCTIONAL LITERACY' TO 'FICTIONAL LITERACY'?

If we leave out the qualitative aspects of functional literacy, and try to assess the quantitative achievements of the TLCs in terms of imparting just the skills of literacy and numeracy, the picture is no less gloomy.

As we mentioned earlier, in many districts the target reached so far is less than 20 per cent, the number of illiterate people continue to constitute a substantial backlog in spite of more than a year of TLC, and occurrences of relapse had been reported from some districts which were declared totally literate.

To go back to the beginnings, the NLM sanctioned the TLCs in these districts a couple of years ago (1990-91), following submission of project proposals from representatives of the district administration. They assured that there were enough volunteer teachers available to take care of the learners, that the learners were adequately motivated and that the functionaries had been well trained to conduct the literacy centres in their respective districts.

But after the sanction of the projects, the campaigns did not progress according to the calendar of events drawn for the projects when presented before the NLM executive. Either the literacy centres could not take off on the scheduled dates, or even if they did, they could not stick to the schedule. Natural disasters like droughts or floods in some districts and elections, communal riots, harvesting and sowing in some other districts, interrupted the classes. As the classes had to be

extended from the original six-month schedule, the enthusiasm of the volunteers as well as the learners waned, and many dropped out. In some areas, the volunteers were not properly trained and failed to motivate the learners, which affected adversely the outcome. In fact, by the end of 1991, the NLM executive was already apprised of the situation and it felt that the lag was mainly because of the fact that adequate preparatory work had not been done before the projects were sanctioned.

Meanwhile some districts and states, like Burdwan and Pondicherry, were declared totally literate, and began to attract international acclaim and awards. The West Bengal government received the UNESCO Nema award in 1991, and the King Sejon award of UNESCO was bagged by Pondicherry the next year. This appeared to give a fillip to the other districts, and there began a regular scramble among the district collectors for recognition of their districts as totally literate. In their haste and over-optimism, they quite often ignored the facts and gave out figures (of totally literate people) which, on external evaluation, were found to be far in excess of the actual achievement.

Now that indications of the actual state of attainment of literacy and numeracy standards by the learners in the TLC districts are available to some extent, it is necessary to adopt a cautious attitude towards claims about both pre TLC preparatory work (e.g. environment building, motivation of the people, identification of the volunteer teachers, etc.), and later achievements (in terms of fulfilling the NLM requirements). This is not to undermine the enthusiasm that might be generated among the learners at the initial stage, or the sincerity of some dedicated collectors, subdivisional officers and block development officers. But we should also remember that in a highly competitive atmosphere, the ambition for promotion and desire to impress political bosses can also play an important part in gearing up a target-oriented campaign like the TLC. The determination to show results or pressures from above, can often drive the officials or functionaries to inflate figures. This can be attempted in various ways. Some external evaluation teams have complained about samples of writings that were palmed off as the handiwork of the learners while actually they were written by the volunteer teachers!

Such trends in bureaucracy dictated literacy campaigns in some districts have eroded the credibility of official claims, and one suspects that the original notion of a quality conscious 'functional literacy' is being traded off for a quantitative ex-

pension of 'fictional literacy'

Curiously enough, both the positive and negative experiences of the NLM of the last few years (some of which have been touched upon in this paper) are not peculiar to the NLM, but have been common to previous adult education programmes too. Evaluation reports of the SAEF (State Adult Education Programme) and similar programmes by several social science institutes between 1978-85 (56 reports in all) have emphasised certain common problems—poor quality of training of functionaries, misreporting and lack of credibility of the monitoring system, irregular participation by learners, considerable drop-out, relapse to illiteracy, and low level of literacy achievement.

The experts' committee needs to analyse why the same negative trends are repeating themselves in the TLCs in spite of the NLM's professed commitment to a campaign approach based on people's participation (as distinct from the centre-based approach of the earlier adult education programmes). Are the problems then more deep-rooted? Why do they keep cropping up irrespective of the changes made by the government in the strategy and tactics of its adult education programmes?

AN 'AUTONOMOUS SPACE'?

The NLM has succeeded in drawing into its fold a wide variety of social activists, members of voluntary organisations, political workers, women involved in struggles for their rights, and people engaged in protecting the environment, among others. Many among them feel that if the democratic potential of widespread literacy can be extracted from a government-sponsored programme, socially conscious and politically advanced forces may take root in our society. 'Organic intellectuals', in the Gramscian sense, are expected to emerge from among the neo-literates. The expectation is based on the assumption that the TLC offers a democratic space to these activists who have decided to join the programme as organisers or volunteers with the hope of using the limited space to try to open the space further.

The experience of the last two or three years in several TLC districts has however knocked off this assumption. Despite the official promise of 'decentralisation and functional autonomy' in the management of NLM programmes, both the ruling political parties and the top bureaucrats in the states (where the TLCs are in operation) have seen to it that the learning teaching process in the literacy centres remains firmly held under their control.

Whenever it showed signs of acquiring an autonomy of its own (as in the literacy centres in Nellore and Chittoor), the state administration did not hesitate even to ban or censor the teaching materials. The Andhra Pradesh government justified its action on the ground that it could not allow the display of 'anti government' messages in a government funded programme (since it was bearing one third of the expenditure on TLC). In Pondicherry (which won an international award for achieving total literacy), during the post literacy phase, the chief minister took umbrage at a song in a primer that asked 'Freedom for the country, but why poverty for us?' Key officials who supported the programme were transferred and the voluntary agency which had implemented the TLC was delinked from the PLC. Few post literacy centres are functioning in Pondicherry today. In some other districts, politicians and officials are quite often reported to have pressurised the organisers to delete lessons that exposed corruption in government offices or cheating by fair price shop dealers—on the plea that such lessons would give a bad name to the administration!

Since the state government can always assert their right to run the TLCs according to their own requirements, the scope of autonomy for the organisers and volunteers is extremely limited. Central intervention by the NLM in favour of such autonomy is also unlikely.

The non official participants and functionaries in the TLC are therefore facing a dilemma. Forced to accept the constraints imposed on them by a government sponsored programme, some are reconciling themselves to a conceptual narrowing or reduction of 'functional literacy' to a primarily production related programme (of imparting lessons on how to increase agricultural productivity, fill up forms to get loans from banks, make use of developmental projects, etc). This kind of functionality is far removed from their original expectation of using the space of NLM to prepare the learners for challenging the *status quo*, and changing the balance of forces in their favour in rural society. Instead, they find themselves co-opted into a government run mass programme that for all practical purposes may be reinforcing the subordination of the rural poor in the garb of teaching them 'functional literacy'.

CONCLUSION

It is like running an obstacle race that leaves most of the expectations of these enthusiastic organisers and learners sprawling helplessly on a scrum of com-

peting interests. Those TLCs which limp into literacy may collapse exhausted after struggling through administrative tangles and political obstacles that are rooted in the deadlock of entrenched interests. They may be too enfeebled to face the challenges when they reach the threshold of the PLCs. As for the other TLC districts which even after more than a year are still trailing behind, they cannot be abandoned by the NLM. Apart from the fact that the money spent on the TLCs there cannot be written off, they have produced a few neo-literates who cannot be left hanging in mid air. If therefore the NLM wants to salvage these TLCs, it will have to inject fresh funds to revive the environment and start anew the literacy centres on the one hand, and provide post literacy facilities for the neo-literates who might have emerged from the past experiments on the other. One wonders how many bouts of 'Operation Restoration' will be necessary to salvage the moribund TLCs.

But it is not only the old TLCs that are posing a problem. Almost every month the NLM is flooded with new proposals for launching TLCs from different districts. There is a mad rush among the district collectors who seek grants from the NLM and assure it of mass mobilisation and of fulfilling the targets set by the NLM within the required period—the same promises which their counterparts in other districts made two years ago. One fears that after a couple of years again, the NLM may be saddled on the one hand with yet another set of dying TLCs which will have to be written off, or retrieved through 'Operation Restoration', and embarrassed on the other hand by a number of TLC districts with their dubious claims of total literacy. It seems that the NLM is caught up in the toils of an ambitious target oriented programme that was launched in 1988 in an excess of haste and over optimism by the government which continues to display a lack of understanding of the complex human situation, and an absence of will to resist the economic and political pressures at the ground level.

In such a situation, those social activists who seek to use 'democratic space' in state patronised programmes will have to develop an autonomous interventionist potential that can sustain their activities even if or when, the 'space' is withdrawn by the government from them. Much of the success of developing new strategies of participation in the process of transforming rural society depends on the ability to map the space available in different projects. This mapping is necessarily a critical exercise and is different from acts of submission or co-option.

Problems of Left Assertion in Bihar

Patna Poll Lessons

Tilak D Gupta

The results of the by-elections from Bihar indicate a slight decline in the Janata Dal's influence and a corresponding gain for the BJP, which has left the Congress behind in all the constituencies. In the circumstances, the left in Bihar faces an uphill task in channelling the slowly growing discontent of the masses with the Laloo Prasad regime along a progressive and democratic direction

FOR those acquainted with the nuances of Bihar politics, the clean sweep made by the Janata Dal and its allies in the recent by-elections in the state did not come as a surprise. The ruling Janata Dal won the Patna parliamentary and the Garhwa assembly seats, defeating its nearest BJP rivals, and helped the CPI to retain the Goh assembly seat.

As a matter of fact, the electoral battles in Bihar over the last few years have more often turned out to be between the Janata Dal and the Election Commission, than among the different political outfits. Countermanding of elections, repoll in a large number of booths, delayed counting of votes and late publication of results have, indeed, become almost an integral part of the state's electoral process. This time, T N Seshan had dealt a particularly nasty blow by depriving the Dal of its popular election symbol, the wheel.

That the Dal could still manage to emerge victorious in the polls testifies to its continuing hold over a large chunk of the state's electorate. The Congress and BJP, for obvious reasons, have sought to ascribe the Dal's victories to widespread rigging by the ruling party with administrative connivance. But what is surprising is that even a section of the left forces in the state tends to overplay the aspect of poll manipulation because of their reluctance to recognise the ground realities of politics in the state. Whether one likes it or not, it has to be conceded that Laloo Prasad has, in this part of the world, forged a formidable backward caste Muslim alliance under the Dal flag that works as a double-edged sword. Objectively, this alliance has a progressive social content so far as it obstructs the return of the upper class-caste dominated Congress and prevents the BJP from spreading its tentacles in Bihar. But at the same time it has made the independent assertion of left forces in the state all the more difficult.

The humiliating defeat of the CPI candidate in the Patna parliamentary by-election is a case in point. The CPI candidate, supported by all the parliamentary left formations except the CPI(M) and enjoying the backing of the Janata Dal (Ajit) and Samajwadi Party of Mulayam Singh, came a poor fourth behind the BJP and the Congress. Evidently, this unimpressive performance of

the CPI calls for some introspection on the part of the left forces in a state where they are on a somewhat stronger wicket than in any other part of the Hindi heartland.

The CPI, however, has not come out with a review of its debacle in Patna, even a month after the declaration of the poll results. In fact, the only response of the party's national leadership till date has been to reprint a news item from *The Hindu* in its central party organ, *New Age*, that curiously gives prominence to the allegations of the state Congress and BJP leaders about widespread rigging of the elections by the ruling party. That is, to say the least, a strange way of expressing resentment over the Janata Dal's alleged electoral malpractices by a party that happens to be an ally of the Dal.

It is not that the allegations of poll rigging by Laloo Prasad's party are untrue, even if they come from the mouth of past masters at the game like the state Congress legislature party leader, Jagannath Mishra. One can also argue that electoral malpractices have become even more flagrant these days under the Laloo Prasad regime. But that can hardly explain the major reverse suffered by the CPI in a constituency that had sent the party's candidate thrice to parliament on earlier occasions.

Poll rigging is almost as old as elections in Bihar. The capacity of a mainstream party to rig the polls here by and large approximates its hold over the dominant class-caste combines in the countryside during a particular election. And if the Janata Dal presently stands ahead of others on that count, the reasons for it have to be sought in the changing power equations in the Bihar villages, favouring for the moment Laloo Prasad. As for the rural poor, many among them, except in traditional communist or socialist pockets, are yet to see the inside of an election booth.

That, of course, leaves us with elections that are less than reliable indexes for gauging the people's political mood. But for political organisations entering the parliamentary arena, election results, despite all their limitations, become the only available indicator of their strength for the public at large. Seen in this context, the failure of the CPI to make its presence felt at Patna—historically an electoral stronghold of the party—deserves serious analysis.

There was a sense of jubilation in a section of the left in Patna when the CPI decided to contest the by-election, despite the failure of seat adjustment with the Janata Dal. On the face of it, the past record of the party in the constituency did justify the CPI staking its claim. More important, it was felt that the party had, at long last, chosen to opt for an independent left assertion by letting go of the apron-strings of the ruling party. But few realised at the time that the political situation at the grassroots had dramatically changed over the years, partly due to the loss of the CPI's living links with the masses.

The late Ramavatar Shastri, the popular CPI leader who represented Patna in parliament a number of times also happened to be a Yadav and enjoyed the backing of the majority of his castemen in the then upper caste-dominated political environment. But with the emergence of Laloo Prasad as the living expression of Yadav political power, the CPI candidate this time, though also a Yadav, was in no position to get the backing of this electorally dominant caste.

More to our point, the CPI, though still the largest left party in Bihar, has long since turned into a flabby parliamentary formation trailing behind this or that party of the bourgeoisie for immediate electoral gains. As the Patna result confirms, the absence of sustained political campaigning and mass movements to defend the toiling people's interests has reduced this once-powerful organisation to an 'also ran' status in its old stronghold. It also confirms the widely-shared belief that the party's present impressive legislative strength in Bihar (24 MLAs and 8 MPs) is to a great extent the result of its electoral alliance with the Dal rather than a reflection of its own mass base that has been considerably eroded over the past decade or more. Consequently, the attempted independent electoral assertion by the CPI without corresponding mass activities was destined to suffer a setback.

The CPI (M L)-IPF combine, which supported the CPI in the by-election, has in a recent review of the Patna poll strongly defended the CPI decision to put up its own nominee for projecting a united left alternative to face the communal fascist challenge. According to the review published in the central Hindi organ of the CPI(M L), that was necessary not only to help the left to assume a leading role in the anti-communal campaign but also for linking it with the broader task of building a democratic India. The review also implicitly points out, with some justification, that the policy of tailism so far pursued by the CPI had been mainly responsible for its defeat in the election.

While there will be little disagreement in principle about the need to establish left hegemony over the anti-communal struggle, there remain sharp differences about the tactics to be adopted for realising that ideal. Besides the fact that the CPI candidate backed by IPF, an important political force in the region, fared so badly also reveals

an erosion of popular support for the CPI(M-L)-IPF combine. And it is surely time for the CPI(M-L) IPF to examine whether the combine's growing preoccupation with elections and national level initiatives have adversely affected its mass mobilisation at the ground level. The explanation offered in the review that the supporters and the cadres of the combine, because of their political immaturity, did not enthusiastically rally behind the CPI candidate, even if true, may only amount to telling half the story. Looking at the voting trends in the areas under IPF influence, it seems that a section of the organisation's supporters cast their votes in favour of other candidates, often on the basis of caste considerations.

The CPI(M), which supported the Janata Dal candidate in Patna now claims that its stand has been vindicated by the election results. According to the arguments advanced by *People's Democracy*, the party's central mouthpiece, the CPI(M) decided to back the Dal at Patna as its candidate was the "best choice to defeat the BJP", and the key question in the Patna polls was to "ensure that the BJP does not win, especially in view of the big united campaign by the left and secular forces in Bihar against communalism". Though the party has now sought to give a political colour to its decision by referring to the united anti-communal campaign, the truth is that it was prompted to support the Dal even at the risk of jeopardising left unity, only on the basis of electoral calculations.

While the CPI and the IPF may be accused of overestimating their own influence at

Patna as well as of failing to correctly read the political situation, the CPI(M) stand smacks of a narrow parliamentary attitude that overlooks the larger long term goals of the left. Talking about the party's weaknesses in dealing with bourgeois landlord parties like Janata Dal, the political review report of the CPI(M)'s 14th Congress, held last year, says that "we also become victims to parliamentarism under one pretext or the other. In our anxiety to get some seats in the regions where we are weak, we completely surrender our masses to these parties even at a time when elections enable us to propagate our views and policy issues. Can be posed very clearly". One only hopes that the party will re-examine its tactics in Bihar in the light of its own Congress document.

Deciphering the overall signals emanating from the Bihar by-elections, it seems that there has been a slight decline in the Janata Dal's influence and corresponding gain for the BJP, which has left the Congress behind in all the constituencies that were at stake. In these circumstances, the left in Bihar faces an uphill task in channelling the slowly growing discontent of the masses against the Laloo Prasad regime along a progressive and democratic direction. Given the current political situation in the state, that calls for a complex tactical relation of unity and struggle with the ruling Janata Dal with growing emphasis on the latter. But such political struggle has to be firmly rooted in sustained mass action at the grassroots for defending the people's interests to tilt the political balance gradually in favour of the left.

ected seed, he had the right to use it to produce seed for himself for as many generations as he liked.

In 1991, however, under tremendous pressure from the US, UPOV was compelled to amend the provisions of the PBR, making it more or less the same as patents. The Breeders' Exemption has been done away with completely. The Farmers' Exemption has been made optional and can only be granted if the PBR holder whose legitimate interests may not be jeopardised, allows it. This, it can be understood, will almost never happen. Every PBR holder will want to maximise his sales and will certainly not allow farmers to produce seed for themselves, which they would otherwise have to buy from him. Thus the amended form of PBRs offer the same kind of ironclad protection that patents do.

The commerce ministry claims that the rights of our farmers and breeders will be protected fully if we accept the Dunkel Draft. These statements are patently false and deliberately misleading. The farmer whose traditional rights include the right to save, modify and sell seed, will be severely handicapped by the conditions of the Dunkel text.

The government has failed to get any guarantees to protect the farmers' rights contrary to what it claims. Even if farmers could save seed, they still lose the right to modify the seed to suit local requirements. This is a commonly prevalent custom and one responsible for the successful adaptation of new technologies at the village level.

Even worse, the traditional practice of selling seeds to other farmers, another custom which has been responsible for the quick dissemination of new, improved seed to remote, interior areas, will be abolished. The rapid distribution and acceptance of high yielding or improved disease resistant varieties has been possible because of a strong and viable inter farmer network that allows technology to trickle down.

One of the major reasons why India could so quickly become self sufficient in food was this network by which improved seeds could spread outwards from the government seed store to reach further and further removed villages. For small farmers in remote areas who do not often manage to reach the district or even tahsil headquarters where seed stores are located, this network is their only access to new technology.

The government's contention is that farmer's rights will not be affected because the "limited exchange of seeds according to prevailing traditional customs" can be retained under *sui generis* protection. This statement like others is deliberately misleading. The fact is that Indian farmers do not engage in "limited exchange of seeds". Of the 600 000 ton seed requirement of Indian agriculture, not more than 38 per cent is met by formal agencies like the National and State Seed Corporations. The rest, 68 per cent of our needs are provided by inter-farmer sales. This huge volume of trading in seed in the informal sector between farmers is the lifeline of Indian agriculture.

Dunkel Draft is Bad for Agriculture

Suman Sahai

The commerce ministry's claim that the rights of our farmers and breeders will be protected is deliberately misleading. In fact, under the Dunkel conditions, even if the farmer can save seed, they still lose the right to modify the seed to suit local requirements.

NEWSPAPERS lately have carried prominently displayed interviews with the commerce minister that India would not accept patenting of seeds. What the minister neglected to point out is that the *sui generis* system of protection that the government has accepted is little better and will severely restrict the rights of farmers and breeders in this country with grave consequences for self-reliant growth in agriculture.

A highly controversial issue in the Dunkel Text on which the government has come in for massive attack is the demand in the section on Trade Related Intellectual Property (TRIPs). According to this, India will have to accept patents or an effective *sui generis* system to protect plant varieties.

The *sui generis* system commonly refers to the system of Plant Breeders Rights

(PBRs) which operate in Europe and other western countries where seed production is in the commercial sector. They do not operate in India where seed production and distribution is in the public domain. This form of protection confers on the holder of the PBR the exclusive right to produce seed of the protected variety for the seed trade and control of its marketing. Codified in the Union for the Protection of New Plant Varieties (UPOV), PBRs offer monopoly on sale of the variety but not on the variety itself or its genes.

Thus any plant breeder could use any protected variety for further breeding work. This was referred to as the Breeders' Exemption. The other exemption granted under PBRs is the Farmers' Exemption. According to this, once the farmer had bought the pro-

Draft is accepted. This will have a highly negative impact on agricultural growth and the rights of farmers to control their means of production

BREEDERS' EXEMPTION

Yet another red herring drawn by the commerce ministry relates to the Breeders' Exemption, which the ministry claims will be allowed should India accept the *sui generis* form of protection. What is in fact permitted under *sui generis* protection is the researcher's exemption as distinct from the Breeders' Exemption. What will be taken away is not the right to research but the right to use the fruits of research.

We can, so to speak, continue to study problems relating to protected varieties in a laboratory, but we cannot apply this research or make commercial use of it. This difference needs to be understood to realise that we will lose the right to derive benefit from protected genetic material, which in most cases will in any case be ours. Not having the Breeders' Exemption will mean that our scientists and breeders will not have free access to protected plant varieties to breed new improved varieties suited to our particular agricultural conditions, since this would amount to commercial application of research.

As if to underscore their determination to enforce patents on genetic material, senior American officials have recently threatened to withdraw funding from Indo American research projects, particularly on biological materials, that could lead to commercially marketable products and processes, unless India accepts intellectual property protection in this area.

Research aimed at basic science could continue but anything that will have a practical application will be stopped until the Americans get the right to patent processes and products in the field of life sciences, medicine, environment and ecology as well as physical and material sciences. The commerce minister's assurances of all safeguards being secured, coming a day after the American statement erodes the government's battered credibility.

In order to counter criticism that it had not succeeded in protecting the rights of our farmers and scientists, government representatives sometimes rashly assert that we need not accept the existing *sui generis* system, that is PBRs amended by UPOV in 1991. The commerce ministry claims that it has acquired the right to frame its own *sui generis* system to suit India's needs. In that case there should be no problem at all.

Armed with this extraordinary flexibility the government has now no excuse not to incorporate at least those four or five conditions which are vital to the country's interests, into the *sui generis* system it devises. These would include unrestricted rights for our farmers and breeders to use genetic material. It would also include placing Farmers' Rights on par with Breeders' Rights, a condition acknowledged by the

FOOD AND AGRICULTURE ORGANISATION (FAO) which has adopted a bill on Farmers' Rights. Farmers' Rights, not to be confused with the Farmers' Exemption allowed under PBRs are the acknowledged rights of the farmers of the third world who have carried the burden of creating, refining and maintaining the major portion of the genetic resources of the world.

Few people realise that wheat or cotton or other food and cash crops were not lying around in forests. These crops were created out of wild plants by the constant labour and ingenuity of the farmers' living in tropical areas and gifted to the world community. Nor is this activity a thing of the hoary past, the farming community and the indigenous people of the third world continue to be the custodians of the world's genetic diversity. FAO accepts that if breeders of plant varieties can claim payment for their work, so can farmers whose contribution to the breeding of plant varieties, cannot in any way be considered less significant. Apart from including Farmers' Rights into our *sui generis* system, government will definitely have to include the condition that genetic resources found in India will have to be considered India's property and will have to be paid for like we have to pay for oil and copper that we obtain from other countries.

At present genetic resources which are concentrated in the third world are treated as the common heritage of humankind because of an absolutely dishonest international convention. As a result of this, India and other countries of the third world do not get paid for the use of their genes from which the economies of the north have benefited to the tune of billions. Finally, there will have to be a guarantee that genes stored in international gene banks cannot be protected by any system of intellectual property rights. This is because most of these genes have been collected from the fields of farmers in the third world. Consider as an example the 30,000-odd rice varieties that are banked in International Rice Research Institute (IRRI), Manila, over which we would lose control if companies could patent genes from IRRI's bank.

Besides the issue of protecting seeds, the government has also listed several other reasons why we have nothing to fear from the Dunkel Text in agriculture, making the highly controversial proposals sound like the panacea for all of India's ills. Take the case of its doublespeak on agriculture subsidy. The extent of agriculture subsidy that a country can give is calculated by a highly complex and ambiguous system called the aggregate measure of support (AMS). There are so many variables in this method that it is open to several interpretations. Officials of the commerce ministry themselves admit that if the assumptions for calculating the existing AMS are changed, our subsidy level could exceed the allowed 10 per cent. The ministry also says that the way the AMS is calculated leaves room for doubt that our problems with respect to certain products would be taken care of.

THE LINK TO THE ISSUE OF MINIMUM Compulsory Access in agriculture according to which we will have to import between 2 to 5 per cent of our domestic consumption whether we need it or not. The ministry's stand that this does not apply to us since we have a balance of payment problem is not substantiated by anything in the Dunkel Text. The balance of payment (BOP) provisions in the Dunkel Draft are such that the IMF would have to certify that a BOP problem exists. According to the IMF, a country facing BOP problems needs to open its economy. In our case, as soon as we liberalised our economy, we faced a BOP crisis, forcing us to go to the IMF which suggested more liberalisation. This precisely is the trap.

The BOP provisions in the Dunkel Text are contained in Articles XII and XVIII where the main emphasis is on elimination of all quantitative import restrictions, including those on BOP grounds. The provision is that all such restrictions will be identified and a general commitment undertaken to eliminate these in a time-bound framework. There are no sweeping provisions for elimination of quantitative restrictions in either of these articles.

The government's position is that since we are maintaining restrictions on BOP grounds, we will not be required to tariffify these restrictions and that so long as we do not assume tariffication obligations, we will not be required to provide the Minimum Compulsory Access. None of this finds mention in the Dunkel Text. Moreover, there is no logical connection between minimum access and obligation to tariffify. The logical conclusion would be that a country that maintains no restrictions on agricultural imports and hence is not required to tariffify will also have to undertake minimum access obligations. The government's reasoning and assurances in this regard would regrettably appear to be rooted in wishful thinking rather than facts.

In recent weeks government seems to have singled out the Dunkel Draft for attention. After close to two years of resolute silence on the issue, Doordarshan could not get in enough discussions on the controversial proposals. In the traditional manner of using state controlled media for propaganda purposes, all these debates conveyed to the casual viewer that the Dunkel Draft was actually quite good for India and accepting it would be in our national interest. The reasons for the government's sudden chattiness after a policy of confused secrecy is not far to seek. They lie in the sustained pressure brought on it from various groups and now political parties. Members of political parties including the Congress have begun to speak out against the Draft, particularly the seed protection clauses. Is it a coincidence that explanations and assurances have begun to flow thick and fast from the government after the redoubtable Mulayam Singh Yadav has launched a vigorous attack against the Dunkel Text in the politically sensitive state of UP?

Notes forming part of the accounts for the year ended 31st March 1993

I. Principal Accounting Policies

1. General

The financial statements have been prepared on the historical cost basis.

2. Foreign Currencies

(i) Assets and Liabilities in foreign currencies are translated at the rates prevailing at the end of the year.

(ii) Outstanding forward exchange contracts are revalued at the rates prevailing at the end of the year and the resultant gains or losses are accounted for. However, the contingent liability in respect of outstanding foreign exchange contracts is included at the contracted rates.

3. Investments

In accordance with the Accounting Standards for Investments laid down by the Reserve Bank of India, investment portfolio is classified into "Permanent" and "Current" categories.

Permanent investments are stated at cost adjusted for any premium or discount amortised from the date of purchase to date of maturity on a straight-line basis.

Current investments are stated at the lower of cost and market value.

The aggregate market value of Investments as at 31st March 1993 is Rs. 801,082,771.

4. Advances

Provisions for bad and doubtful advances have been made to the satisfaction of the Auditors:-

(i) in respect of identified advances, on the basis of norms laid down by the Reserve Bank of India for identification of and provisioning for non-performing assets.

(ii) in respect of other advances, as a percentage of the total pre tax profit for the year, after taking into account general factors that relate to latent doubtful debts which are not separately identified.

Loans and advances are stated net of provision made under (i) above.

5. Revenue Recognition

(a) Interest income on all advances other than non-performing assets is recognised on accrual basis. In respect of non-performing assets interest is recognised on cash basis.

(b) Income from investments is accounted on accrual basis.

(c) Commission, exchange and brokerage is accounted on accrual basis.

6. Depreciation

Depreciation is provided for on fixed assets on the written down value basis at the following rates which are equal to/higher than those prescribed under Schedule XIV of the Companies Act, 1956

Office Equipment	25%
Office Furniture	10%
Computers	40%
Vehicles	20%

7. Gratuity

The liability for gratuity is accounted for on the basis of actuarial valuation carried out once in two years. Gratuity liability for 1992-1993 has been provided for on the basis of actuarial valuation carried out upto 31st March 1993.

8. Net Profit

The net profit disclosed in the profit and loss account is after:

1. Provisions for taxes on income in accordance with statutory requirements,
2. Provision for doubtful advances;
3. Transfers to contingency funds;
4. Other usual or necessary provisions.

II. The difference as at 31st March 1993 between the book value and the market value of permanent investments has not been provided for, since these investments are intended to be held upto maturity and, in the opinion of the management of the Branch, the fall in the market value does not affect their realisable value at maturity.

III. Change in Accounting Policy.

From the year 1992-1993, the investments are being accounted as detailed in Note I(3) above as against being accounted at cost till last year. As a result of this change, profits for the year are understated by Rs. 96,937.11 and Reserves and Surplus and Investments as at 31st March 1993 are understated by same amount.

IV. Previous year's figures have been regrouped wherever necessary to make them comparable with the current year.

BOMBAY BRANCH

Report of the Auditors

We have audited the attached Balance Sheet of the Bombay Branch of Bank of Bahrain and Kuwait B.S.C. as at 31 March 1993 signed by us under reference to this report and the relative Profit and Loss Account of the Bombay Branch of the Bank for the year ended on that date.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 read with provisions of Sub-section (1), (2) and (5) of Section 211 and Sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account together with the notes thereon are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The Accounts are, therefore, drawn up in conformity with Forms A and B of the Third Schedule to the Banking Regulation Act, 1949.

We report that subject to and read with the foregoing remark:

- a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;
- b) The transactions of the Branch which have come to our notice have been in our opinion, within the power of the Bombay Branch of the Bank;
- c) In our opinion, proper books of account, as required by law have been kept by the Branch so far as appears from our examination of those books;
- d) The Balance Sheet and Profit and Loss Account of the Bombay Branch of the Bank dealt with by this report are in agreement with the books of account;
- e) In our opinion, and to the best of our information and according to the explanations given to us, the said accounts read with the notes thereon, give the information required by the Companies Act, 1956, in the manner so required for Banking Companies and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Bombay Branch of the Bank as at 31st March 1993 and the Profit and Loss Account gives a true and fair view of the Profit of the Bombay Branch for the year ended on that date.

Globalisation and 'Muslim Belt'

Reshaping of British Racism

Kalpana Wilson

Over the past few years, images of Muslims have acquired an important place within the racist discourse of the British establishment. To understand and combat this new aspect of racism, we need to look at how it is linked to shifts in the balance of power in the world, and especially in south Asia since the late 1980s.

ON May 28 this year, Winston Churchill, a Tory MP and grandson of the famous wartime British prime minister, publicly claimed that the 'British way of life' was under threat from a 'relentless flow' of immigrants from the Indian subcontinent. What distinguished this speech, which made front page news, from previous outbursts such as Enoch Powell's notorious 'rivers of blood' speech of 25 years ago, or for that matter Margaret Thatcher's 1978 warning against 'swamping' by immigrants, was not its fascist overtones, its cold-blooded manipulation of popular racism, or its blatant falsification of facts and figures. It was the fact that, for Churchill, 'Asian' appeared to be synonymous with 'Muslim' and the threat posed by 'immigrants' was described in religious terms. Britain would soon have "two million Muslims", 50 years from now, "the muezzin will be calling Allah's faithful to the High Street mosque".

This reflects a new element within the racism faced by Britain's Asian communities, who form a substantial section of Britain's black working class. Over the past few years, images of Muslims have acquired an important place within the racist discourse of the British establishment. The widespread portrayal of Asian Muslims in Britain as barbaric, violent 'fundamentalists/fanatics' dates back to the events which followed the publication of Rushdie's *Satanic Verses* in 1988. During the 1991 Gulf War, this anti-Muslim hysteria reached a new pitch. Iraqis, Palestinians and other people from west Asia were randomly interned in the streets, mosques were burnt down and racist attacks escalated. Asian men, Hindu as well as Muslim, found themselves taunted as 'Saddam Hussain': every Asian was now a Muslim and a 'terrorist'.

More recently, however, these attacks have both intensified and become more specifically targeted. For the first time explicit distinctions are being made between 'Hindus' and 'Muslims' and racist statements like Churchill's are being expressed ostensibly in terms of religion.

The nature and content of British racism has always been shaped by the particular needs of the British economy, as well as the dynamics of global political

and economic relationships. In order to understand—and combat—this new aspect of racism, we need to look at how it is linked to shifts in the balance of power in the world as a whole, and in particular in south Asia, since the late 1980s. In doing this, we need to consider the extent to which the nature of capital itself in the 1990s has affected the dominant ideology of advanced capitalism and the role of the nation state within it. And we need to look at the specific changes which have taken place within the British economy during the same period, and their significance for Britain's black communities.

FROM COLD WAR TO NEW CRUSADES

Since the collapse of the Soviet Union, capitalism has emerged as the globally dominant economic system, but it is capitalism in crisis, with desperate needs for new markets and sources of cheap labour. To meet these needs, new demands are being made upon the countries of Asia, Africa and Latin America. Those countries which (like India) have established an industrial base and some independence from western capital are being forced to liberalise, implementing policies which lead to heavy dependence on imports and on footloose foreign investors, massive indebtedness and spiralling unemployment. Meanwhile those countries where the markets and infrastructure required for this type of exploitation do not exist are being turned into dumping grounds for western arms manufacturers with a series of devastating wars being kept alive by covert, and not so covert US activities. Yet in all these cases, imperialist forces are encountering resistance in one form or another from the peoples of these countries. With the cold war over, the centrality of the contradiction between these people's movements and the imperialism of globalised capital is clearer than ever.

To explain and justify these battles, a new enemy has been constructed in the west. The new 'Evil Empire' is the 'Muslim belt'. During the Gulf war we were told that this stretched from the Muslim ex-Soviet republics in the west, through Iran to Pakistan in the east. In 1993 the concept is being applied even more widely. For example the 37-year old war for in-

dependence of southern Sudan can now be described as an attack by the "Muslim Arab north" on the "Christian African south" and juxtaposed (as in a recent feature in the British *Guardian* newspaper), with the rise of fundamentalist forces in Egypt who are opposing the effects of president Mubarak's IMF-dictated economic reforms, under the heading of "Islam on the warpath..."

With the enemy thus defined in religious terms, the struggle for capitalist domination can be portrayed even more explicitly as a battle between 'good' and 'evil' with the forces of good represented by the inseparable trinity of Christianity, Democracy and the 'free' Market. The late colonial myth of 'progress' and 'backwardness' is there too of course, with a package of enlightening IMF conditionalities constituting the 'white man's burden' of the 1990s. But the imagery of this latest imperialist offensive is altogether more violent, reminding us of a much earlier phase of accumulation—Europe's plundering raids on the countries of west Asia, which it glorified as the Crusades.

This moral, 'good vs evil' element of the new ideology is crucial. During the cold war era, any aggression could be justified on the basis of the need to defend the 'free west' against the growing military strength of the communist 'bloc' (even though the cold war was being fought out in third world countries like Vietnam, Korea and Cambodia). Now, however, the perceived threat is not from militarily powerful states like the Soviet Union, but from people's movements whose military strength is negligible compared to their adversaries. But with capitalist expansionism portrayed in the terms of a war against evil, against alien gods, then as in the Crusades and the Conquest of the Americas, any degree of brutality becomes justifiable in this new phase of economic plunder.

IMPERIALISM AND GLOBALISATION

There is clearly a strong relationship between the new emphasis on a constructed Islam in imperialist ideology and global political and strategic shifts. But how far have the related changes in the actual nature and form of contemporary capitalism shaped this construction?

By the early 1980s, TNCs and MNCs had emerged as major forces in the world economy. The 1980s saw increasing fragmentation of the production process, largely driven by the continuous search for sources of cheaper labour. As Carl Hahn, a representative of Volkswagen stated explicitly in 1991: "A global strategy means fine tuning an international division of labour, segmenting work, taking advantage of wage differentials—the different price sensitivities of products, the different contributions products make to our overall productivity and so on" (*Harvard Business Review*, July/August 1991, p 111).

A relatively new development during the 1980s was the massive growth of financial operations taking place on a global scale. As C T Kurien (*EPW*, April 10, 1993, pp 655-65) recently pointed out, in a climate of volatile exchange rates, "shrewd financial transactions, buying and selling of shares, buying and selling of enterprises, take-overs, mergers and all forms of 'paper entrepreneurship' are becoming the best ways of making profits" for TNCs and MNCs. It is this mushrooming of financial speculation at the expense of actual production, which has (even more than the complex division of the production process or the multinational ownership of MNCs and TNCs), led to the suggestion that capital is now genuinely 'globalised', and that these units can be seen as independent of any national economy or government.

Yet for these processes to continue requires certain conditions to be maintained through the policies of third world governments, including unrestricted freedom of movement across national boundaries for capital and goods, convertibility of currencies, and economic and social policies which perpetuate the supply of cheap labour. Movements of people's resistance to these policies must be suppressed, if necessary through the encouragement of reactionary chauvinist or blatantly fascist forces. Institutions like the IMF and World Bank as well as the governments of advanced capitalist countries are still playing a central role in maintaining these conditions.

The perpetuation and justification of this role through the ideology of imperialism also continues despite the 'globalisation' of capital. But inevitably new aspects of this ideology will reflect this globalisation, while remaining rooted in the history and culture of the western societies where it originated. This is perhaps one reason why instead of championing the interests of nation states or strategic blocks, the emphasis now is on the defence of a vaguely defined but world scale 'civilisation' against an equally global enemy, 'Islam', with no controlling centre (unlike its predecessor, world communism) and few unifying features beyond a perceived threat to capitalism. What is clear is that the relationship between capital, the nation state and ideology in the 1990s has become a vital issue for the left to address.

The recession and the devastating consequences of a decade of Thatcherism—which meant the effective dismantling of Britain's manufacturing industry during the 1980s—has left Britain trying to attract investment from foreign-owned MNCs and TNCs on the basis of its cheap labour and lax labour protection laws. The dogged refusal of the British government to accept Maastricht proposals limiting the number of hours per week employers can demand from workers to 48 recently underlined the

implications of such a strategy. While successive pieces of legislation have removed whatever legal safeguards existed for workers (the most recent is the Employment Bill, under which Wages Councils, which set a minimum wage for some of the lowest paid sectors of the economy, are to be abolished) the trade unions have been systematically attacked and their effectiveness undermined. Union membership has fallen from 53 per cent of workers in 1972 to 37 per cent now. But this also reflects underlying changes in the structure of production and the character of the workforce itself. Britain now provides workers at the least skilled levels of globalised production processes, through small scale subcontracted factories and sweatshops scattered throughout its ex industrial wastelands, surviving precariously on contracts from large firms and paying wages far below any estimate of an acceptable minimum wage. The white male skilled workers who formed the traditional base of the trade union movement until the late 1970s have been virtually eliminated. Employment here is often temporary and/or part time (two British workers in five are now outside permanent full-time employment), and is offered largely to women. And it is here that black workers fit into the British economy in the 90s—while London's service sector, which has grown along with the ever-expanding demand from the City's financial sector, maintains its profits increasingly through the exploitation of recent refugees from third world countries, outside London men and particularly women from the established Asian and African-Caribbean black communities of the Midlands and the north of England are finding that the only available jobs are in the small factories which supply companies like Ford, Nissan, IBM and Xerox. But these factories are also today one of the few sources of workers' militancy, and workers there are finding new ways of organising, going beyond the limitations of the traditional trade union structures, as at Burnsall, a metal processing factory supplying car parts to the big manufacturers, where a strike led by Asian women workers has been going on for over a year.

CHANGING FACE OF BRITISH RACISM

Black people first came to Britain as workers in significant numbers in the early 1950s, in response to the needs of the booming post-war British economy. As the expectations of white workers rose, black workers were systematically recruited to do the worst paid and most unpleasant jobs, providing labour for the newly established national health service and for London transport, and working night shifts in mills and foundries while the day shifts were kept for white workers. The racist ideas which had evolved out of—and reinforced—the systems of surplus

extraction from Britain's colonies now allowed black people in Britain to be exploited to the full.

But while images and assumptions inherited from colonialism continued to shape black people's experiences in Britain in the 60s and 70s racism developed a whole new dimension which was rooted in the role of black workers in the British economy and the relationship between black communities and the state in Britain.

In order to enforce Draconian immigration laws, whose role was both to regulate the labour supply and to limit and control the establishment of settled black communities who could demand basic rights, Asians were defined in popular racism as 'illegal immigrants'. Denied access to decent housing, they were accused of creating squalor and overcrowding.

In the 1980s, with growing unemployment and increasingly organised resistance to state policies from the black communities, repressive policing and surveillance of these communities was intensified. At the same time however subtler forms of control emerged which involved the appropriation and reconstruction of particular cultural identities. 'Multicultural' policies apparently recognised the specific needs of so-called 'ethnic minorities' in the fields of education, social services and access to resources for community organisations. But underlying this was an attempt to reverse the process through which a 'black' identity had emerged out of a series of shared struggles against racism as a political identity through which people could define themselves in relation to the British state and white society. Cultural identities were redefined as a static set of 'traditions' which denied the reality of struggle and change. Black was divided into Asian and African Caribbean, and Asian in turn was divided into Gujarati, Punjabi, Bengali. These 'divide and rule' policies were strengthened by making organisations representing these 'ethnic' communities, often led by the most reactionary elements within the community, compete with each other for state funding. Significantly however, during this period the ethnic identities which the state imposed on Asians were linguistic ones: country of origin never came into it, and religion was merely touched upon.

Clearly therefore, the new wave of British racism expressed in specifically anti Muslim terms is rooted in specific economic and political changes which have taken place relatively recently. Firstly, the recession and the economic policies of the 1980s have led to a sharp polarisation between the standards of living of rich and poor and massive unemployment among Asians. Hindu Muslim and Sikh. And without an industrial base, the British establishment is no longer confident and secure—as we have seen economic survival now depends on attracting

foreign investment and on the goodwill of America, Germany and Japan. This has engendered a paranoia, a fear on the one hand of the 'underclass', the dispossessed who at any moment may rise up and demand their share and on the other of 'outsiders', the 'enemy within' who are working to undermine the fragile fabric of society.

This was the mentality which informed the documentary 'Underclass in Purdah' which was shown on the BBC's long-established documentary series 'Panorama' a few months before the Winston Churchill speech. The film provoked widespread anger with its portrayal of Bangladeshi and Pakistani Muslims in Britain as an 'underclass' of "criminals, drug-pushers and pimps". It is present too in the media's coverage of the establishment of Muslim schools in Britain, full of dire warnings about the undermining of British 'traditions' of democracy and liberalism; or in the variety of implicit and explicit media comments on the 'loyalty' of British Asian Muslims, ranging from responses to anti-Gulf war protests to coverage of England-Pakistan Test Matches.

The fact that the Panorama documentary chose to emphasise the 'close ties' of the Asian Muslim communities with Pakistan and Bangladesh highlights a key change in the character of British racism. For the first time since the height of the anti-colonial movements, we have entered a phase where the dominant perception of black people in Britain is being largely determined by struggles between imperialism and third world peoples, and specifically by Britain's relationship with their countries of origin. In this period of acute economic crisis and globalisation of finance and production, the outcome of these struggles is vital for British capital. Equally importantly, as we have seen, the few jobs which are available to black people in Britain now incorporate them into a dispensable globalised workforce, alongside workers doing identical jobs in third world countries, and into economic relationships which extend beyond the boundaries of the British state. Not surprisingly then, whereas previously the position of black people in racist ideology was defined by their role as workers in British industry, it is now defined increasingly by their real or imaginary connections with anti-imperialist forces.

For the British state then, black people bring back to Britain the threat which third world peoples are posing to its interests on a global level. In fact, the connection between black communities and the threat of third world revolution is made explicit in European-level policy formulation, where issues of combating 'global terrorism', preventing immigration, and deterring asylum-seekers have become inextricably linked in the discourse of 'Fortress Europe'.

In this context, Britain's differential relationship with the countries of south Asia has become an important factor shaping the experiences of Asians in Britain. While western governments continue their covert support for pro-western Islamic organisations like Bangladesh's Jamaat-i-Islam, in a reversal of earlier positions India has in the last few years emerged as the favoured ally of the west, the enthusiastic proponent of IMF-dictated liberalisation policies—a position which is unlikely to change even—or especially—if the Hindu fascists' project of capturing state power were to be successful.

Of course, the British government has always had a 'special relationship' with the Congress Party and the Indian authorities—but recently this has been noticeably strengthened. We have seen a spate of top-level official visits, notably John Major's Republic Day presence in the wake of Ayodhya and its aftermath, widely regarded among Asian communities in Britain as an endorsement of the Indian state's role in those events. And India's new economic policies are receiving an ecstatic prodigal's welcome: Manmohan Singh, as *Guardian* readers were informed recently, is a man whose "vision of human beings" would "help create wonderful dreams instead the living nightmares of hell called the daily lives of ordinary Indians". (For the British public, familiar with the film 'Gandhi' such unworldly saintliness is only to be expected in an Indian leader.)

This portrayal of India as a bastion of democracy and the free market, and its position at the heart of the supposed 'Muslim belt' fits well into the 'Islam vs civilisation' world-view. And it has serious implications for Asians living in Britain.

For the first time Asians are being characterised within the dominant discourse as Indians, Pakistanis and Bangladeshis. Indians, we are told, are more hardworking, better educated, more law-abiding, and, presumably as a result, wealthier. The stereotype of the successful Asian shopkeeper, elusive in real life (most Asian shopkeepers from all communities went into business as the only alternative to the crushing racism of factory work, and remain in business only through superexploiting themselves and their family members) is now being used to distinguish, in racist mythology, 'decent' Hindu Indians from 'criminal' 'fanatical' and 'irrational' Muslims and Sikhs. These new distinctions are used—like the old ones—to divide and weaken the black communities.

On another level, the commitment of the British and Indian governments to "co-operate in the fight against terrorism" which was formalised during the home secretary's 1992 visit to India, has had several concrete consequences. Applications by Indian nationals for political asylum in Britain are now largely being

rejected, sometimes on the basis that these people pose a threat to Britain's own 'national security'. For British immigration officials and police, Sikhs and Kashmiris settled in Britain are no longer simply 'illegal immigrants', but potential 'terrorists' as well. This has been used to justify intensified harassment and surveillance (through, for example, the proliferation of passport checks for any kind of state benefits) of working class Asian communities. And while in several cases organisations representing opposition to the Indian state have been investigated by the authorities here and had their funds seized, British-based 'NRI' businesses continue to provide large-scale financial support for the BJP and the VHP unhindered by the British government. In fact, the VHP currently controls a number of Hindu 'community' organisations which have received funding from the British state—and continue to do so despite their blatantly communal position—another example of the British state's strategy of promoting the most reactionary elements within the black communities.

These changes in British racism—and the shifts and transformations which have produced them—raise a number of questions of strategy for anti-racist forces.

One of the most striking implications is that if struggles taking place in third world countries are now once again directly shaping British racism, it is vital that progressive black organisations in Britain develop a clear international perspective, and in the case of groups based in Asian communities, that strong and effective links are forged with anti-imperialist, democratic and revolutionary people's movements in the countries of south Asia. All too often in the past, these black groups, fighting urgent daily battles against the state, against fascists on the streets, and within the community itself, have limited their wider vision to symbolic identification with the straightforwardly anti-racist, anti-imperialist struggles of the peoples of South Africa and Palestine. They have succumbed to the British media's deliberate mystification of south Asian politics which is portrayed as unimaginably complex and motivated by irrational and inexplicable passions. Now however this is changing—there is a growing recognition that not only do we need to understand this politics in order to make sense of our own experiences in Britain, but in a future of globalised capital, active alliances between exploited peoples will play a vital role in the formulation of strategies for resistance and revolutionary transformation.

[Many of the ideas in this article have developed out of discussions in South Asia Solidarity Group.]

When is Access to Health Care Equal?

Some Public Policy Issues

V R Muraliedharan

The purpose of public policy, both in market and non-market economies has always been to reduce barriers in access to health care. To achieve this purpose, it has to address certain questions: What does equality of access to health care mean? What can be done to promote equality of access, however it may be defined?

I

THE issue of equality of access to health care has two related questions—access to whom and access to what? They seem to have a simple answer: there should be access to health care services for anyone in need of it. Specifically, it means that, non-medical features of individuals (such as their community, sex, geographical location, or ability to pay) should not determine their access to health care. While public policy in the past has tended to remove some of the important barriers in access to health care, it has had to face more acutely the question, access to what.

Whether or not policy-makers believe in greater intervention by the state, or in market forces for providing health care, they should be concerned with the following central questions:

(a) Does it improve the access to and maximise the quality of health care?

(b) Does it minimise the cost of health care? and

(c) Will it be politically and otherwise feasible and acceptable?

These questions may be stated in different ways, but the issues remain the same all over the world. The available resources are limited and therefore every rupee committed to health care would mean a rupee less for other things. We must know what we would have got for every rupee that we give up. The trade-off issue involved between cost of care and effectiveness (at individual and societal levels) is becoming more and more difficult to resolve over the years as advances in medical technologies take place. The importance of this critical trade-off issue lies in the fact that the outcome of these decisions will determine 'who shall live'.

There are a number of macro decisions that need to be considered while designing a health-care system for a country. These macro decisions determine (a) what kind of health care services will exist in a society, (b) who will get them and on what

basis, (c) who will deliver them, (d) how the burden of financing them will be distributed, and (e) how the power and control of these services will be distributed.¹ These decisions, which critically affect the level and distribution of our well-being ("the risk of our getting sick, the likelihood of our being cured, and the degree to which others will help us when we become impaired or dysfunctional") involve issues of social justice. The issues of social justice are: How much of equality should there be? What inequalities in access to health care are morally acceptable? How should the burden of achieving that equality be distributed? We are yet to evolve a framework and a set of principles which may serve as a 'public and final' basis for resolving disagreements about how basic institutions, such as health care institutions, should be designed; so far, there appears to be no consensus on any set of principles to resolve the conflicting claims advanced by different groups within a society.

Some believe that an appeal to the notion of right to health care will help redesign the system which can eliminate inequalities in the distribution and access to health care. But it should be noted that a clear distinction between right to health care and right to health is not always possible. The notion of right to health care is too broad and vague unless they are specified further. Things become a lot more complicated, when we want to express our concern for equality while talking about right to health: do we want 'equal right to health', or 'right to equal health'? The right to health includes a much broader range of actions—some of which are normally not considered as part of health services—that affect health. A right to health care could mean different things to different people, both with regard to the scope of what is being claimed and with regard to the justification it needs. In general, a right to health care

may be decomposed into the following:²

(1) Society has the duty to its members to allocate an adequate share of its total resources to health-related needs, such as the protection of environment and the provision of medical services;

(2) Society has the duty to provide a just allocation of different types of health services, taking into account the competing claims of different types of health needs;

(3) Each person is entitled to a fair share of such services.

But none of these helps (that is, asserting a right to health care does not help) us in anyway in deciding about the following policy issues:

(1) What share of total resources is adequate for servicing health needs?

(2) How should such a share be divided among the different types of health needs?

(3) What is an individual's fair share of such health services? This includes an answer to the question, who should pay for the services?

The right to health care is thus very vague and this does not help us settle the complex problems about how health services should be financed.

It appears as if the most important question underlying the above discussion is: 'Is health care special?' Should we view it as we view other commodities in our society so that inequalities in access to health care may prevail with inequalities in other respects; or, should we view it as 'special' because of its very specific functions and its effects in improving the quality of our life in various ways? Irrespective of the position we may take, it should be noted that the question: Is health care special? determines the basic structure and design of a health care delivery system. As the special nature of health care continues to occupy the minds of academics and policy-makers, there is a strong view emerging all over the world that there are reasons of justice for distributing health care more equally. This has played a significant role in regulating the structure of the delivery system: these include regulations about the extent of capital investment in health care, containing cost of care through various cost-sharing and budget-capping proposals, restricting the autonomy of providers, etc.

The tremendous increase in the cost of delivering health care, which is one of the direct consequences of its increasing dependence on high technology, has posed more sharply the question of access. The purpose of public policy, both in the market and non-market economies, has always been to reduce some of the important barriers in access to care. In fact, the two most important goals, namely, (a) to have an universal access to health care and (b) to contain the cost of obtaining care,

have largely guided the policies of many countries; the primary health care (PHC) model adopted at Alma Ata conference in the late 1970s was largely guided by these two considerations. But whether or not and to what extent such policies in fact have helped achieve full or greater equality in the distribution of health care is not our main concern here. We are more concerned with asking, what does equality of access to health care mean? What can we do to promote equality of access, however it may be defined? The former is dealt with in Section II and the latter in Section III.

II

The literature on access to health care is quite extensive, covering a wide range of issues, one of which is the measurement of the inequality in access to health services. It is often in the selection of criteria for the measurement of inequality that disagreements arise. What follows is a brief discussion on some measures of equality of access to health care, as proposed by Julian Le Grand, and Jones and Mooney.¹⁴ The measures that we consider here are (1) Equality of public expenditure, (2) Equality of cost of health care, (3) Equality of physical accessibility, (4) Equality of use (use per need), and (5) Equality of outcome. This list is certainly not exhaustive, it is possible to add a few more.

EQUALITY OF PUBLIC EXPENDITURE

This argues that resource allocation for health care to individuals should be made on per capita basis. This will result in allocation of the available resources to the members of the society in equal proportion. The weakness of this apparently just approach is that different individuals may have different health care needs and therefore equality of public expenditure may in reality be inequality. There may be no consistent bias or a pattern of disadvantages against any particular class, but if its health care needs are taken into account (say, based on the reported level of illness of the individuals), they might be spending much less than they ought to have been.

EQUALITY OF COST OF HEALTH CARE

This argues that the cost of obtaining a health service should be the same for all the individuals. While it establishes equality in terms of cost of care, it clearly ignores the principle of ability to pay. In fact, much of our confusion about equality of care arises because not all members of a society belong to the same economic class and have the same purchasing power. Financial barriers lie at the centre of our discussion about equality. Individuals belonging to different economic classes but with equal need for a par-

ticular health care service would suffer from unequal access to it if the cost of obtaining it is the same for all. So obtaining equality of cost indeed will result in inequality of opportunity to access.

EQUALITY OF PHYSICAL ACCESSIBILITY

The role of space in defining equality of access is very important, as the distance an individual has to travel to reach a health care facility has a direct bearing on the extent to which he/she will use it. Some studies have shown that the use of health services is a direct consequence of proximity to those resources.¹⁵ In essence, one may say that there is a "distance decay in the number of patients registered with a particular doctor with distance from the doctor's surgery".¹⁶ Travelling a long distance to make use of a health care facility will affect the actual use of it, for it involves loss of time, effort and money. This deficiency may be remedied by recognising the social groups for whom distance is a major barrier to access and locating the facilities in discrete positions. Measuring inequality of access using physical accessibility is very useful for micro-level understanding of the prevailing conditions. The trouble with this measure is that it may not cater adequately for the regional need. In a sense, it is similar to the notion of equality of per capita expenditure just as it does not in general satisfy the needs of different individuals, the equality of physical accessibility too does not in general cater to the needs of a region. It may be that a region well provided for (relatively speaking) might in fact need more resources to meet the required level of care.

EQUALITY OF USE

Another view is that there should be equality of opportunity to use according to the needs. Various attempts have been made to infer this from measuring 'equality of utilisation per need'. This is an important criterion, perhaps the most appealing of all mentioned so far, since it demands that individuals will have access to health care whenever there is a medical need. In effect, it states that only health status should determine access to health care—equal treatment for equal need. But we know that there are several factors other than health status that have an effect on the use of health care and therefore we require a way of testing whether these other factors actually do have a significant effect on access (measured in terms of actual use). These other factors may be termed potential access factors, some of them are related to the structural features of the health care system such as the availability of physicians, hospital beds, patient doctor ratio, distance, etc., and some of them reflect the 'predisposing and enabling' features of the individuals in the population, such as age, social and

cultural background, income and insurance coverage level, etc.¹⁷ All these play an important role in determining the level of access to health care achieved by an individual. Our task is to understand and explain how much of the variations in actual use of health care is due to need and how much due to potential access factors. If our policy is to allow access to health care based on need alone, then we must eliminate all of barriers arising from the potential access factors which produce intergroup variations on realised access (utilisation rates). If a potential access variable, say waiting time for an appointment (sometimes also called a process variable in the literature), is found to have no effect on utilisation rates for population subgroups, then it is not causally significant according to the criterion being proposed. The test of equality of opportunity to use is the actual use, it may be claimed, because, "the proof of the pudding is in the eating".¹⁸

But we must be careful about this logic. It is true that measuring equality of access as use per need has certain relative advantages over the others. But there can also be several objections to using such a measure. (a) variations in potential access factors can have serious equity implications even if they do not show up in utilisation rates. Time spent in the waiting room, or the money spent out of pocket may not affect the utilisation rates, but may have a significant effect on the satisfaction with care. Equal utilisation per need does not necessarily mean equal efficacy of the services delivered. The quality of services might vary though use per need is similar. The issue is also closely linked to the patients' perception of quality of care received by them. (b) It is therefore arguable that 'uniformity between subgroups in utilisation rates (use per need) is not even a necessary condition for equitable access'.¹⁹ For example, some subgroup variations might be explained by differences in attitudes toward health care. One can give several examples in this respect. One might underuse a health care facility simply because one is averse to it on some moral or philosophic grounds. There may be some religious and aesthetic reasons as well for not using a service. It may be due to ignorance, or due to informed (principled) choice. Perceived subjective needs (i.e. one's perception of when one is in need of medical care) play an important role in seeking health care. So, clearly the 'equality of use' approach leaves much room for modification. Equity of access must ensure equality of quality of care. This condition is perhaps the most difficult to ensure and none of the above measures can capture this aspect adequately. In fact as we shall see below, the quality of care (as felt and realised by the patients) has now become an important component in evaluating the effectiveness of medical services.

The measures that we have discussed so far are concerned with equalisation in the provision of health resources. Equality of outcome attempts to measure the outcomes of such provisions of health care, rather than merely on the amount spent on the various sections of the society. To the extent there is equality in health, it may be argued, we may say that equality of access has been achieved. This is closely akin to the issue of right to equal health, referred to in Section I. This is a much larger issue. We may measure the outcomes of health care provision, say in terms of age specific death rates, life expectancies, and so on and compare them across various populations. But such comparisons do not recognise the genetic, cultural and other exogenous factors that have a bearing on the health of the people. We do not have a neutral definition of health that can be applied to individuals from diverse cultural and social backgrounds. Some individuals may not desire, for example, the same years of life, or may (in fact, do) view illness differently. The definition of good health is perhaps the most vexing and frustrating of all issues. In fact, a new movement is taking place in redefining 'outcomes' of medical interventions. Traditionally, safety and efficacy of medical treatments were measured using clinical, physiological and biomedical indexes. Now the range of outcomes has been expanded to include the following: functional status, emotional health, social interaction, cognitive function, degree of disability and so on.¹⁰ The information on these can be obtained only with the help of patients which will be subjective. Although these are still imperfect measures, it is hoped that they will greatly enable the providers, the employers, the policy makers and other concerned parties (like insurance companies) in evaluating more rigorously the effectiveness of outcomes of medical services. Understanding how different interventions affect ('such factors as physical and emotional function, social activity, and return to work') will provide a more sensitive gauge of the effectiveness of interventions. Providing such information to doctors and patients may lead to wiser decisions.¹¹ The point made here is that use of traditional measures of outcomes to infer the level of access to health care is highly inadequate and is no more considered satisfactory in evaluating effectiveness of medical services. Therefore, such measures cannot adequately reflect the equality of access to health care achieved.

III

When is then access to health care equal? and how do we measure it? Each of the above mentioned measures of equality of access fails on many grounds,

particularly in meeting 'needs'. The identification and measurement of need is central to the promotion of equality of access. It appears that neither equity nor need can be defined precisely. To what extent each of the measures discussed above answers the two interrelated questions, access to whom and access to what? Should we allow universal access to all forms of available and validated health care services or only to select health services? The issue is one of achieving a balance between horizontal and vertical equity. The discussion invariably leads us to defining health care needs, and still further, to questioning whether each of such needs (however they may have been estimated) should necessarily be fulfilled. There is in fact yet another deeper problem in the whole exercise, namely, the presumption in all our discussions that for every medical need there exists a remedy, even though often there is none.¹²

It appears that it is impossible to define basic health care needs, strictly speaking, for all the individuals in the society. It varies from region to region and from decade to decade, because our capabilities develop with changing technologies and knowledge-base. Yet at any given point of time we are forced to set our priorities, and decide who shall get what and how much. Every country in the world at present has been attempting to define its basic health care needs, which boils down to prioritising the various health care programmes and each one of them has been experimenting with a combination of different mechanisms for delivering health care to achieve equity in health care provision.¹³ Some countries have largely relied on market forces to deliver health care, some have chosen to deliver solely through public funds, and there are some other countries which have adopted a combination of these two methods to different degrees. But what ever be the mechanisms adopted or been experimenting with, there has been increasing evidence of widening disparity in access to health care across various social classes.

As for India, a recent study undertaken on behalf of the World Bank, laments that "if maternal and child health, rural health services, and control of infectious diseases are high priorities in government health policy, the policies have not yet been effectively translated into budget priorities".¹⁴ It finds a strong urban bias to spending—the share of the urban residents of the total public health spending is nearly 2.5 times their share in the population. It also finds that state level health spending is higher in states that are richer and in those that have lower infant mortality rates. States with higher infant mortality rates are found spending lower per capita, and these states also have a low per capita income. Generally speaking, there is a negative relation between infant mortality rates and state spending. The relation

between income and infant mortality rates and plan (special projects and capital) expenditure are similar. Apart from suggesting that urban spending be frozen and that expenditures are targeted to rural areas, it offers two specific suggestions to promote equity in health care.¹⁵

(a) User fees and insurance can be used to support private goods (such as curative services), with government funds allocated to programmes that provide benefits extending beyond individual (such as communicable disease control) and that lend themselves to geographical targeting, and

(b) Government should target its expenditures effectively to poorest areas and those with the worst health indicators.

The study urges the central government to play a much larger role to improve the health of the poor, for they cannot expect much benefits from private sector or insurance expenditures. Such a policy, the study suggests, is a better way of dealing with the following equity issues.¹⁶

(a) To what extent is public expenditure targeted to address health problems whose mitigation would generate benefits beyond individuals? and

(b) To what extent is spending targeted to socially disadvantaged population groups who might consume fewer health services than socially optimal if they had to bear the full cost of those services?

The policy of targeting public spending on poorer areas with high mortality rates in fact attempts to promote equality of health outcomes, and also particularly of real income. While, as we shall elaborate later, the allocation of public health resources generally has significant effects on health status and efficiency and equity of health sector spending, it is not yet clear as to which of the public health programmes should have higher priorities. No one would oppose that programmes to reduce maternal and infant mortality should have a high priority. But as we compete with other public health programmes, such as control of infectious disease, how do we set the priorities and allocate the resources?

There are two difficulties here. The first one already referred to is that we do not know, strictly speaking, what basic health care is. The second difficulty is the assumption (the hope) that the market or the state could fulfil those needs. Till today there is no satisfactory answer to these two fundamental issues. Yet, choices will have to be made for allocating resources for various health programmes, and they will be arbitrary so long as we do not have satisfactory guidelines that will take into account not merely economic but medical and ethical considerations as well.¹⁷

To be medically justified, rationing decisions have to be personalised, because no two patients are exactly the same and the anticipated benefits of a given procedure vary from patient to patient.

any plan to assign priorities to specific medical interventions on the cost-benefit considerations must take into account individual circumstances, balancing costs against potential benefits in each patient...

With each procedure, the cost-benefit assessment depends so heavily on individual circumstances that it is almost impossible to devise medically sound rules applicable to all patients. In fact, the task is so formidable that no one has yet offered a practical suggestion about how personalised rationing might be carried out systematically and on a wide scale.

Shall we then conclude that because equity in access to health care can never be defined to the satisfaction of every concerned party, we should abandon our efforts to define and measure it? The answer is an obvious No. While we may differ in defining basic health care needs of a society, who should get access to what and how much and many other related issues, it is possible to think of certain aspects of health care which are indispensable for promoting equality of access to health care. They are absolutely essential whether or not we are able to define clearly our basic health care needs and irrespective of the extent to which we depend on market forces to deliver the goods. They are:

- (1) Prevention of illness, through health education;
- (2) Caring for the patients;
- (3) Regulations to protect the interests of the patients as well as the providers.

These are intangibles, but they will contribute greatly towards achieving equity in health care, and health. Public health programmes will certainly go beyond the individuals and confer definite benefits to the society. But we also require some systemic behavioural changes (items 2 and 3 above) which are closely linked with changes taking place in the society at large. As Le Grand puts it, "there is little the health service can do to reduce inequality in its use or in the private cost of that use. The principle determinants are largely beyond its control. Rather, they stem from basic social and economic inequalities".¹⁸ Equality of access to health care cannot be achieved by merely tampering with certain parameters within health sector alone; much of the solution lies outside the health sector. But it should also be noted that changes required within this sector to achieve equality of access will also contribute towards achieving equality in the broadest sense of the term. Clearly, items 2 and 3 mentioned above are products of the overall changes taking place in the society and they in turn bring about some changes elsewhere. They are by themselves qualitative in nature and they add to the quality of health care in a way other elements of the system cannot. Quality of care is perhaps the most difficult to define and measure, but one can certainly decompose it into certain elements, such as those mentioned above. These elements have begun to receive

more attention of late in the discussions on equality of access to health care. What follows is a brief comment on each of these three elements.

PREVENTING ILLNESS

This requires not only medical but social interventions as well. Sometimes, these are not distinguishable. Take for example, health education. This is very much an aspect of the social infrastructure required for social welfare; and this is also an effective medical intervention to maintain and promote health. Health education should result in generating more demand for health care, while at the same time it should also result in minimising the burden of care (by preventing illness) in future. It thus performs a dual role. It may increase the present load of work for the physicians and for the state, because it may increase the demand for health care; but this will be offset by the reduced incidence of ill health in the future. Such a reduction in the incidence of ill health will mean a saving in the society's resources which becomes available for other programmes. Hence, access to health care will improve over time. It is in this sense that health education programmes become cost effective, although it is not possible to measure precisely how cost effective they are. The level of health education is not only a causative factor in improving the access, but it is by itself also an indicator of achieved equality of access to health care at a given point of time. Health education is also aimed at improving the participation of the people in maintaining and promoting their health. As Hiatt puts it, "the quality and acceptability of the outcome [of health care system] rest upon the degree of public participation not only in the decisions themselves, but in the details that leads to those decisions".¹⁹ Thus, progress in health education, an effective way of preventing illness, is also a good indicator of the progress we make towards equity in health care. It will indicate the qualitative improvements made in delivering health care. There appears to be "overwhelming evidence of health education effectiveness, in marked contrast to the paucity of health education efficiency", and this is explained as due to the fact that "health educators lack the skills for educational diagnosis, which is basic to the selection from methodological options that may be applicable to a given situation".²⁰ However, the policy implication is very clear: spend more on health education. In India, we have no health education programme worth its name. It hardly reaches the masses of the people and especially the poor; the famous ICMR/ICSSR report of 1980 described it as one of the most neglected areas in the health field.²¹ In fact, health education can no longer be justified purely from humanitarian grounds. They play a complementary role

in the delivery of health services, be it curative or preventive. It is a part of preventive as well as promotive strategy. There are some who even argue that "health education strategies could even stand on their own as better alternatives to other intervention options currently favoured by health workers".²² It is true that preventive medicine is not always cost effective from the standpoint of either the society as a whole or the individual. But, in many circumstances, preventive medicine is cost effective and more attractive in terms of its net benefits than many forms of rescue medicine.²³ Cost effectiveness as a criterion poses a number of difficulties in evaluating medical intervention. There are several ethical and conceptual difficulties involved in judgments of cost effectiveness.²⁴ It is difficult to judge the cost effectiveness of many preventive and curative programmes and develop a mixture of them that will most reduce levels of morbidity and mortality.²⁵ In view of these, it is argued here that we should accord a high priority for health education programmes which will not only be cost effective, but can even make many competing intervention options redundant over a period of time.

CARING FOR THE SICK

What can we say about 'caring' for the sick? Caring essentially means, "listening to the patient, identifying and relieving anxiety, recognising and managing pain and other symptoms, compassionately attending to the general and specific needs of the patient and family".²⁶ Caring is even more qualitative than health education, and virtually impossible to measure, but can be felt only by the those who receive health care.

It is hard to deny the fact that delivery of care has become more institutionalised and depersonalised, as the scientific benefits of medicine have been extended. As one critic puts it, 'as medicine progresses, physicians regress'.²⁷ Medical care has certainly become more commercialised, too entrepreneurial and the reputation of medicine as a trusted profession as well as the profession's own view of its basic values have undergone some significant changes. As Relman puts it while commenting on the state of modern medicine in America:²⁸

It is hard to predict what our health care system will look like in the year 2000, or what the conditions of medical practice will be. What seems clear, however, is that physicians will have little opportunity to help shape the future if they do not retain their public credibility... If physicians choose to act from self-interest, or even if they merely put themselves in positions that suggest self-interest, they risk damaging their most precious possessions—the trust and respect of their patients and the esteem of the general public.

There has been an increasing level of

discontent on the humane and compassionate aspects of modern medicine. Several reasons are cited for this deterioration.²⁹ Some have argued that the inequity within the profession itself, measured in terms of the differential rewards physicians receive, has been one of the causes for the present disharmony in the system.³⁰ Many solutions have been offered depending upon what they consider to be the root causes. A very widely held view is that there is something inherently contradictory between science and humanity, between technology and compassion. Another explanation for the lack of compassion among the physicians is that their education has become very narrow over a period of time.³¹ The list of such factors can be extended. The physician being largely a reflection of society exhibits the basic values governing the society. As Glick puts it:³²

the fundamental problems lie for the most part outside the medical establishment, within society as a whole... The student's basic motivations, goals, codes of ethics, and concern for others are already established when medical studies begin, and the medical school must work within these major constraints. Unfortunately, medical training can disillusion and render cynical even some quite decent students, but rarely can it convert a basically self-centred and egoistic person into a humanitarian

The question is: can science train individuals for moral behaviour better than religion can? As western societies changed from being religious to secular societies, changes also occurred in the goals and behaviour of their citizens: "the crisis of humane medicine is the result of the failure of secular democratic societies to inculcate moral and ethical values into their educational systems".³³ We must address the issue of basic education towards ethical and moral values from infancy onwards. That might be achieved either with religion as a means or with some other substitute. But the training in ethical values is an urgent need. To use Glick's expression again, "our societies must come to grips with this problem, because this problem transcends medicine; it threatens the very fabric of [our] social structure and its future".³⁴

Glick's diagnosis of the basic problem and his suggestions are not new. Many have made these suggestions in one way or another. In fact, the following words of the ICMR/ICSSR report of 1980 reflect the same diagnosis of the malady:³⁵

Health care differs from other societal activities in the greater expectations of the public that in addition to technical competence, personnel should have an abiding spirit of social service and should bring concern and humanity to bear on their activities. Unfortunately, the current trends in this regard are far from happy. The impersonal callousness which is bred in large hospitals is spreading and the system is

getting dehumanised and even mercenary and corrupt. The public dissatisfaction against these trends is manifest and spreading... the only way is to reverse these trends and reinfect the health services with a spirit of service. This is partly a responsibility of training process.

PROTECTING PATIENTS' AND PROVIDERS' INTERESTS

The third indispensable element for establishing an equitable and sustainable health care system is to introduce checks and regulations to protect the interests of the patients as well as the providers. This is required whether or not the health care industry is market-driven or centrally controlled. The importance of a Consumer Protection Act in delivering a better quality of care cannot be over-emphasised. We have entered an era in which 'high-technology' has become indispensable for the survival of the medical industry. But this has also led to overuse of technology, which forces the patients to spend more than necessary. Overuse of technology in treatment could be due to several reasons. A very important reason could be that the concerned physician may be having a financial stake in referring his patients to a particular facility.³⁶ This has been observed to take place all over the world. Wide variations in the use of several medical procedures have been documented across the regions in the US even after controlling for severity of illness.³⁷ This has led to the question whether the differences reflect unnecessary costs in high-use areas or less than optimal care in low-use areas. This has been one of the important reasons for the renewed emphasis in the developed countries on the assessment of effectiveness and outcomes (discussed in Section II).

The other factors that contribute to overuse of technologies and procedures are: pressures from patients or family, peers and supervisors, the convenience of the tests ordered, the desire to avoid malpractice claims, physicians' personal whims and practices, curiosity about test results, ignorance of characteristics of tests, etc.³⁸ The physicians' "inordinate zeal for certainty" is also a leading cause of excessive testing. Many tests are carried out merely to confirm a diagnosis that is virtually certain, although it cannot be said that all duplicate testing is redundant: several studies have found "virtually no difference in value between treatment without further testing and the performance of more tests".⁴¹ There is no easy way to solve this problem. The causes are many and it is inextricably linked with the training given to deal with uncertainty. Any cut in testing capacity may seriously affect the quality of decisions taken. But the question still remains: at what point will the restriction on testing impede quality? To this end, we need "clinical trials, decision analyses, and clinical-efficacy projects based on literature

reviews, expert consensus and unaided assessments...", and "the potential rewards of this painstaking assessment are the preservation of high-quality care and the channelling of the resources saved into testing that we deem essential and into the provision of basic services".⁴² Sometimes it is not known whether or not to continue with the life-sustaining procedures for a patient.⁴³ In such situations the question is who should take the decision (the patient or his surrogate, or the physicians), to continue or discontinue such treatments which may end the patient's life? Obtaining informed consent is indeed a very complicated matter, to say the least. The right of a patient to accept or refuse recommended treatment requires careful assessment of his or her capacity (in terms of skills such as communicating a choice, understanding relevant information, appreciating the current situation, and its consequences, and manipulating information rationally) to take a decision.⁴⁴ Competent patients may also make 'irrational choices' for several reasons, sometimes supported by physicians themselves.⁴⁵

The point made here is that it is time we looked into these matters more closely and evolved procedures through consensus to protect the interests of both the providers and the patients. It is true that different panels of experts will often disagree. Protecting the interests of the patients and the providers necessarily involves a redefinition of outcomes of medical interventions, as mentioned earlier. Several cases of malpractice, negligence, and overuse of technology resulting in irreparable losses, physical and/or otherwise to the patients, have been reported almost everyday. It is equally important to recognise the interests of the providers of health care as well, and be cautious in blaming them for all the ills of the system. We (the patients as well as the providers) need access to justice in protecting our health and life. While we are being forced to rely more and more on market forces to obtain health care, as is done in industrialised countries, we must also have the checks and regulations that they have developed to control the behaviours of the providers of health care. The various professional bodies should come forward and work together in enforcing such regulatory measures. The Indian Medical Association is not in favour of including medical profession under the purview of the Consumer Protection Act (COPRA, 1986), for reasons that are not difficult to imagine.⁴⁶ It should be noted that the medical ethics of the physicians and their employers, the patients and the policy-makers are rarely identical and this difference is likely to have adverse effects on society as such. "The real issue", as one critic put it recently, "is almost never who should go to the court, but what decision must be made, who should make the decision, and on what basis".⁴⁷

Rationing is inevitable. How far the market should be allowed to take care of rationing health care is a hotly debated matter. In some market economies, as in the US, one can see an increasing support from certain sections for more centralisation of funds in delivering health care.⁴⁸ At the same time, we also notice that there are tendencies in certain other developed countries, as in UK for example, to apply more market principles for delivering health care.⁴⁹

Providing equal access to health care to all sections of the society is fraught with all kinds of complex conceptual, measurement as well as ethical problems. While we must continue to find better ways of defining such concepts and measure them, we should simultaneously pay attention to preventive and promotive programmes (such as, health education), 'caring' for the patients, and protecting the interests of the consumers and providers. These three aspects are only illustrative. There may be other such indispensable elements for developing a fair health care system. It is said that the health care system is an organism "desperately in need of a central nervous system that can help it cope with the complexities of modern medicine".⁵⁰ Such a 'central nervous system' consisting of elements such as those discussed in Section III is essential whether or not we have faith in market forces in delivering health care. Such a 'central nervous system' is also needed for sustaining the health care system, whether or not it is suffering from a serious cost crisis, lack of manpower, over use of technology, or such other undesirable phenomena. Ultimately, the political and community commitment and involvement will determine the "foundations for a just health care system".

Notes

[This paper was presented at the 23rd Annual Interdisciplinary Research Methodology Workshop on *Health and Human Resource Development*, organised by the Madras Institute of Development Studies and Indian Council of Social Sciences Research, at Vellore (Tamil Nadu), June 8-11, 1993. Section I contains only a summary of the original paper as presented at the workshop.]

I wish to thank all the participants of the workshop for their critical comments on this paper. My special thanks to S. Ambirajan whose critical comments, during the discussions I have had with him in the recent past, helped me immensely in preparing this paper. I wish to also record my thanks to D. Veeraraghavan for his comments.]

Ashok Mitra

Leaven from a Diary by Syama Prasad Mookerjee, Oxford University Press, Calcutta, pp 240 + VIII, Rs 300

SYAMA PRASAD MOOKERJEE died in a Kashmir sub jail exactly 40 years ago. Perhaps the facilities available in that sub-jail were inadequate, perhaps there was also some absent mindedness on the part of the authorities over there. Whatever that be, his death provided bigots of one particular hue an opportunity to keep targeting at Sheikh Abdullah. It is possible to speculate whether Jawaharlal Nehru himself had remonstrated with any seriousness with the Sheikh for the latter's apparent failure to look after the health of the Jana Sangh leader, thereby creating a *cause celebre* for the conservative opposition. Conceivably what raised Nehru's greater hackles was the Sheikh's emergence as the Lion of Kashmir. That was competition, for was not the valley Nehru's pocket borough? Matters soon came to a head in Kashmir, it was Sheikh Abdullah's turn to get arrested and substituted, as the state's chief minister, by a common crook. It has been an altogether chequered history since then. If the Americans, to whom we have already surrendered comprehensively our economic sovereignty, now keep rapping us on the knuckles and try to pry Kashmir loose from the tentacles of the Indian army, the haughtiness of the Nehru Gandhis could be largely held to be responsible for that development. A not insignificant share of the blame would however belong to the myopic communalists for whom Syama Prasad Mookerjee, partly on account of the manner of his death, became a kind of martyr philosopher.

All that was in the lap of the future though. This compilation of diaries Mookerjee kept, some in English and some in Bengali (presented here in English translation), and some letters he wrote to the governor of Bengal and the viceroy of India, covers the period between 1939 and 1946, before his emergence as a full fledged politician on the national scene. The diaries and letters have no particular literary merit, nor do they encompass any noteworthy reflections on contemporary political issues. Their interest lies elsewhere. Mookerjee fitted into the standard mould of pre independence Indian politicians, whose preferences and prejudices were narrowly determined by sectarian and provincial considerations. Politics was the avocation of society's superstructure, and the diaries reveal the

milieu of a Calcutta based practitioner of the art who was, at about the time, endeavouring to make the grade from being a run of the mill provincial politician to a leader of some national stature. In the case of Mookerjee, a further process of transition was at work. He had his early grounding in academic politics, his drifting into politics proper was a step-by-step externalisation of that role. The British were shrewd imperialists. Of course they took to the stratagem of divide and rule as a duck takes to water. But they also opted for a second device, the selective corruption of the indigenous gentry, ensuring for the latter a bad name. Two arenas which they opened up for native corruption were educational administration and local self government. In the context of Bengal, the institutions selected for the respective purposes were the University of Calcutta and the Calcutta Corporation. The corporation was captured at its inception by the Congress party, it has remained a den of venality ever since. The University of Calcutta became the fief of Asutosh Mookerjee and his family. Syama Prasad Mookerjee, the second son of Sir Asutosh, was a man of academic credentials and had both ability and talent in ample proportions. The fact however remains that he inherited the university fiefdom, and the advantages flowing from it had the hallmark of unearned income. He became vice-chancellor of the university at a relatively young age and occupied that position for long years. Even after he stepped down, he remained the king maker. As these diaries bear witness, the pettiest appointments in the university had to be cleared with him. His vexation with his successor, who was, to boot, a Muslim, was because the latter, how dared he, tried to initiate measures which cut athwart the doctrine of indisputability of Mookerjee's sacrosanct extra constitutional status. Conforming to the standard practice in the 20s and 30s, Mookerjee started out as a Congress politician. But he soon had his problems. The Communal Award and the Government of India Act 1935 arrived. The Muslims constituted the majority of Bengal's population. Following the 1937 provincial assembly elections, for whatever reason the Congress high command did not give permission to Sarat Chandra Bose to form a coalition with the

Krishak Praja Party leader, A K Fazlul Huq. Huq migrated to the Muslim League, which began, with great flourish, to rule the roost of provincial autonomy. Not altogether unreasonably, the League wanted a share of the educational pie, thereby entering into an antagonistic relationship with the Mookerjee family. Syama Prasad Mookerjee knew that the Congress, ostensibly still very much a party of nationalism and secularism, would have little heart to back him in his private battle against the League. He therefore travelled toward the direction of Vinayak Savarkar's Hindu Mahasabha, it was a bit like switching from one salon to another. These diaries provide interesting details as much of this phase in Mookerjee's political career as of the brittle nature of contemporary Bengal politics. As is only to be expected, there are several references to Subhas Chandra Bose and Sarat Chandra Bose and, less often, to B C Roy. Mookerjee's admiration of Subhas Bose as a person and as a brilliant mobiliser of mass emotion finds full expression in the diaries, so too does his immense dislike of what Mookerjee considered Bose's tactics of appeasing the Muslim leadership, exemplified in the manner he went about conducting Calcutta Corporation affairs. There is, predictably, strong condemnation of Mahatma Gandhi's dissembling stance following Subhas Bose's thumping victory in the Congress party's presidential elections in 1939. But this was not on account of any natural sympathy for radical stirrings within the Indian National Congress, it was Bengali chauvinism in full bloom.

By far the most interesting section of the diaries concerns the story of how Sarat Chandra Bose, in late 1941, succeeded in wooing A K Fazlul Huq away from the clutches of the Muslim League, and how he hammered out a broad based so-called 'progressive coalition' consisting of Huq's followers, 'suspended' Congressmen (that is, those belonging to the provincial Congress committee controlled by the Bose brothers and suspended by the party high command, as opposed to *ad hoc* Congressmen, meaning those belonging to the provincial committee nominated, on an *ad hoc* basis, once more by the high command) and even Hindu Mahasabhaites like Syama Prasad Mookerjee. At that juncture, ideology was obviously most vaguely defined, and the ease with which politicians changed their party labels strongly suggests that the tribe of Bhajan Lals, Devi Lals and Bansi Lals are the most genuine legatees of India's political tradition. John Herbert, the Bengal governor, could not but swear in such a minis-

try, since it commanded a majority in the provincial assembly. But the proposed induction of Sarat Chandra Bose in the council of ministers, and that too in charge of the home department, was out of the question. He was therefore conveniently arrested under the Defence of India Rules and put away. His followers went into the government along with Huq and Mookerjee; Mookerjee was designated the finance minister. His diaries narrate in expansive detail the hollowness of so-called provincial autonomy: the ministers were little more than dummies; British civil servants, directly advising the governor and in turn directly advised by him, conducted the administration much according to their own whims. Apologists on behalf of the imperial rulers might argue that since a war was on, and the Japanese were knocking at Bengal's borders, no risk could be taken and ministers carried away by narrow patriotic emotions had to be restrained. Be that as it may, these diaries somewhat come to life while describing the tension that steadily built up on the issue. Matters were brought to a head by the wholesale arrest of Congress leaders in August 1942 and the subsequent mass upsurge all over the country. The Bengal ministers belonging to the 'progressive coalition' government watched helplessly as the police went on the rampage, picking up indiscriminately young men and women—amongst them Subhas Bose's devout followers as well as orthodox Congressmen—and indulging in horrendous repressive measures. The next grim sequel was the famine of 1943 which took the toll of five million lives. Bengal had a good crop that year and was by no means deficit in food in normal parlance. But the British panicked; they were worried that most of the harvest would fall into the hands of the advancing Japanese; orders were issued banning inter-district movement of food and boats were seized to enforce the ban. Public procurement, which could have been facilitated by the ban on inter-district movement, was never seriously tried; the civil servants perhaps did not care and the ministers, although they would not admit it even to themselves, were inexperienced.

Syama Prasad Mookerjee was perspicacious enough. He resigned in November 1942, and the progressive coalition ministry collapsed soon after. The Muslim League marched back into Writers' Building and was seen to be in charge at the time of the famine. That hardly cost them much in terms of future returns. Mookerjee had several caustic things to say though about the League's role and the role played by the British governor and senior civil service in messing up the famine administration.

The appendix to the volume carries the text of four letters, three to the governor

of Bengal and one to the viceroy, written by Mookerjee on the eve of his resignation; it also includes the text of the statement he issued on the day he resigned. These are long—no question the politicians had time at their disposal then—and full of regulation fulminations against the inequities of foreign rule and foreign

prescriptions. Such righteous indignation makes for bemused reading at the end of this half-century.

Up to a point, these diaries enlighten, but they are also frightening: they reveal the narrowness of the space an archetypal Indian politician's mind used to occupy in the pre-independence days.

Religion and Nationalism

Bidyut Chakrabarty

Utopias in Conflict: Religion and Nationalism in Modern India by A T Embree; Oxford University Press, Delhi, 1992; pp xii + 144, Rs 175.

DESPITE the availability of innumerable monographs on 'religion and nationalism in modern India', the subject does not seem exhausted ever primarily because of its relevance even to the present day. The freedom struggle which ended in the bifurcation of the subcontinent of India demonstrated the extent to which religious passion, genuine or otherwise, could be overplayed to attain the goal of Pakistan which, in fact, questioned the basis of the nationalist campaign itself. Politically, Jinnah's clamour for a separate state on the basis of 'the two nation theory' was probably justified; but the fact that the proposed Pakistan, divided internally on fundamental grounds, was untenable became true with its dismemberment in 1971 following the creation of Bangladesh. So, the 1971 division of Pakistan shows, *inter alia*, the fragility of the so-called unity based on religious homogeneity. In other words, the process contributing to or destroying a nation and nationhood appears more complex than we seem to think.

Religion projecting a particular 'world-view' is probably one of the significant forces cementing a bond among the otherwise disparate groups under a specific historical conjuncture. What is suggested here is that the same combination of forces may not work favourably at times and hence religion may not always be crucial in grasping the dynamics of a specific situation. Since there is not a strait-jacket formula in explaining the role of religion in politics in a transitional society like India what is therefore incumbent on a scholar striving to unfathom the complexity of the relationship is to take into account the socio-political and economic processes both in their spatial dimension and long-term perspective.

The book underlining the intimate interaction between religion and nationalism in modern India is a serious endeavour in this direction; therefore not only is the attempt thought-provoking, by raising new types of questions, the author has also added altogether new dimensions to the enquiry itself. Comprising articles already published, the book builds up an argument drawing on the complex interplay of

factors influencing India's socio-economic and political development over the years. In order to 'tie together in the thought the past, the present and the future' (p xi), the author considers "the formation of modern state of India" as an important event in the transformation of the world system. The statement underlining the significance of the emergence and firmness of the democratic political forces in the post-1947 India brings out the author's uncritical faith in the western liberal democracy. The argument therefore runs that despite the recrudescence of violence challenging the very basis of Indian democracy, the future of India as a democratic polity is well secure precisely because of the vibrant nature of the political institutions sustaining the appropriate value system. Given the elections at regular intervals, the argument seems viable and the effectiveness of the apparently well-entrenched political institutions in strengthening democracy is therefore well-demonstrated.

What is however problematic is the view that political institutions nourishing the democratic spirit in a people embedded in the so-called primordial value system failed to provide an effective alternative system of thought despite the triumph of modernisation in India, both during the freedom struggle and after. The author explains the failure of the political institutions in terms of 'utopias in conflict'. Although the term utopia has not been adequately spelt-out, Embree defines the concept as the aspired goal based on idealism. According to him, religion and nationalism provide two competing visions of just societies; conceptually, however, religious visions of the good society can never be coterminous with the nationalist one and hence the tensions which shape the social and political life of the people in question. The process thus unfolds, leads inexorably to conflict highlighting the two different world-views—one based on religion and the other on nationalism. Such a distinction, though purely analytic, may be misleading at times because 'religion and nationalism', as the author points out, "reinforce each other" (p 7) in every society more so

of a transitional society like India. In other words, since religion provided a ready-made structure of organisation across the subcontinent of India, nationalism appeared invincible in the anti-British campaign, and hence nationalism and religion were complementary to each other at one level; at another, religion and nationalism drawing on the respective world-views, paved the ground for conflict of massive proportions, evinced particularly during the Hindu-Muslim communal encounters. What it thus reveals is the complex nature of the interaction between religion and nationalism which can never be understood merely by reference to 'utopias in conflict'. Despite the apparent viability of the formulation, much of the intricacies of the dialogical network between religion and nationalism can therefore never be grasped, if not misjudged, in relation to the fast changing socio-economic and political reality. So, what is necessary in this context is to focus on the interplay of factors and not on a single factor only.

Although the introductory section of the book has so many loose ends it serves a useful intellectual purpose by striving to review the interaction between religion and politics in the changed scenario. The author has a point when he argues that religion and politics continue to be decisive in the social and political life of the contemporary India despite India being secular. The argument, thus made, hinges on familiar assumptions relating to the nature of India's secularism which entails both tolerance and coercion. As a value of the Constitution, secularism is a highly cherished ideal championing equal respect for all religions. In practice, however, secularism is nothing but *soft Hinduism* which appeared significant in the events following the demolition of the controversial Babri mosque in December last year. Despite the irreparable damage the December episode caused, for many supporting the Hindu resurgence it was a struggle to establish Hindu cultural hegemony over society and to redress the historical humiliation of Hindus in the past. The immediate outcome of such an engineered effort is the polarisation of communities and religion consolidating the divisions. At one level, such a process is a threat to India's multi-cultural socio-political life, at another, it breeds and sustains hatred among the communities disrupting the highly cherished ideal of communal harmony in a society which suffered heavily in the wake of the 1947 partition. So, whatever the merits of religion as an organising tool, its utilisation for specific political gains may lead to disastrous consequences. The notion of 'utopia' has therefore to be handled carefully since it runs the risk of being manipulated to satisfy narrow political aims. Similarly, nationalism as an organising principle projects a world-view which

may be interpreted differently depending on the circumstances. Offensive nationalism evinced during the fascist aggression, for instance, connotes a planned attack on the basic human existence and hence the utopia it puts forward is neither socially encouraging nor politically welcome; while defensive nationalism in the freedom struggle against the subjugating colonial power unfolds processes, considered significant for the advancement of human race as such. This brief discussion shows that despite the analytical value of the concept 'utopia', its explanatory capacity depends a great deal on how it is utilised to articulate a specific situation. So, Embree by underlining the importance of utopia as an intellectual category has revived the debate initiated by Karl Mannheim with the publication of *Ideology and Utopia* in the 1930s.

For those not acquainted with the contemporary Indian reality the book serves a useful purpose. Not only is the exercise an endeavour to apply a particular model of analysis it also provides a thorough account of what had happened in India in the last decade. Embree deserves appreciation for having collated relevant information to build his story which is at best a fantastic journalistic account. The book, though dealing with more or less familiar events, is an eye-opener to many of us reluctant to see the extent to which religion and nationalism, as ideological principles, can be devastating under a favourable confluence of factors. Apart from high-

lighting the probable consequences of specific kinds of world-views, the book also draws our attention to the continuity of historical waves over time. For example, Hindu-Muslim chasm which, *inter alia*, caused the 1947 division remains a crucial factor in India's socio-political life even today despite the high cost of the partition. What is however new is the utilisation of such a well-entrenched schism for the creation of mutually inclusive vote-banks which are manipulated by the opinion-makers to satisfy the preferred political aims. The process, thus unleashed, will not only sustain the age-old fissure between the communities for political dividends but also aggravate the situation further by linking the present with the past attributing 'a history' to communal disharmony. Hence what began as a mere aberration of history becomes a part and parcel of India's socio-cultural life. Underlying this argument lies the assumption that communal schism is the product of a particular socio-economic and political metamorphosis. Despite the apparent validity of such a formulation, the argument appears slightly limited in scope given the recent researches showing that 'communalism is more a created than natural phenomenon'. So, though the compilation may not have provided a satisfactory explanatory scheme, the exercise is commendable because it has drawn our attention to the major factors shaping the prevalent socio-economic and political life of India.

DECOLONIZATION AND DEVELOPMENT

Hind Svaraj Revisioned

MAKARAND PARANJPE

Forty-six years after independence, India's struggle to achieve svaraj (or selfhood) on various fronts—economic, political, cultural—is far from over. Given the powerful and pervasive presence of Western ideas of modernity, the need for decolonization is as urgent today as it was in Gandhi's time.

Written as an extended imaginary dialogue between student and teacher, this absorbing book creates space for the neo-Gandhian perspective in current debates on decolonization and development. It critically examines the relevance of Gandhi's ideas while raising questions such as: Who are we? What is the nature of our relationship with the West? What is meant by decolonization?

Auditors' Report on the Financial Statements under Section 30 of the Banking Regulation Act, 1949

We have examined the balance sheet of the Bombay Branch of Credit Lyonnais (incorporated in France with limited liability) as at March 31, 1993 and the related profit and loss account for the year then ended. Our examination was made in accordance with generally accepted auditing standards and, accordingly, included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances. We have also obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purposes of our examination and have found them to be satisfactory.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, and the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the financial statements are not required to be, and are not drawn up, in accordance with Schedule VI to the Companies Act, 1956. The financial statements are, therefore, drawn up in conformity with Forms A and B (revised) of the Third Schedule to the Banking Regulation Act, 1949.

In our opinion, the accompanying financial statements give a true and fair view of the state of affairs of the Bombay Branch of Credit Lyonnais as at March 31, 1993 and of its profit for the year then ended.

Furthermore, in our opinion,

- (a) the transactions of the Bombay Branch which have come to our notice have been within the powers of the Bombay Branch of Credit Lyonnais;
- (b) the balance sheet and the profit and loss account are in agreement with the books of account, and give the information required by the Companies Act, 1956 in the manner so required for banking companies; and
- (c) the Bombay Branch has maintained proper books of account as required by law insofar as appears from our examination of those books.

'Dying Hindus'

Production of Hindu Communal Common Sense in Early 20th Century Bengal

Pradip Kumar Datta

The discursive power of Hindu communalism does not spring exclusively from single texts or even a chain of them as from the swift creation of a popular network of certain tropes, themes, structures of apprehension and reform, at the heart of which functions a single mobile trope to provide the necessary ideological orientation. This produces a formation of immense potency and amazing flexibility. For, it constantly accretes new meanings, whole traditions to itself producing from its formative moment a web of thought that ranges from stereotypes to statistical and sociological analysis.

ONE of the first markers of difference between 'Hindu' and 'Muslim' I learned as a child, was the 'fact' that Muslims married four times. I did not question this assertion; not even when, many decades later during the Muslim Women's Bill agitation, Hindu communalists cited it as a privilege that was sought to be protected by the Muslim community as a whole. Though now the venom with which it was invoked made me a little uncomfortable. A few years later, my credulity was rewarded with a grim retribution. While investigating a riot—one of the many that the Ram Janmabhoomi agitation has produced—a key characterisation of the Muslims that was made to us, by all shades of fighters for the Hindu 'cause', was their alleged marital excesses. It was claimed that this allowed them to proliferate in numbers; hence it would be a matter of time before they overran the country. The 'fact' that I had learned 'innocently', now revealed paranoia and violence. Yet its projection seemed unimaginably remote. Where then did the intensity of this fear come from? Was this, I wondered, something that was dormant, that what we were hearing today was a trace, which was being bloated to produce yet another story of mangled bodies and torn minds. But in that event, could the trace be made to reveal the power of a past deposit? Together with the nature of the formation?

Inspecting the shelves of the library, I was struck by the title of a publication of the Hindu Mahasabha called, *They Count Their Gains—We Calculate Our Losses*, which had come out in 1979. The foreword said that the title was taken from a statement of Bhai Parmanand; the book itself tried to raise a scare of the rising population of Muslims and Christians.¹ Soon I discovered evidence from an earlier period. Writing to Malaviya about his impressions of a talk with a British states-

man aboard a ship, sometime during the communally charged period of the mid-20s, Lajpat Rai reported the following: "The chief hope [of the British] seemed to have so far been on the chance of thinning their [the Hindus'] numbers with a view eventually to make them politically impotent."² Whether this was accurate was not my interest; it was only a step in confirming the preoccupation with Hindu numbers in the mind of one who was engaged in trying to produce a Hindu constituency. A more decisive fact followed in the tracks of the last: in 1925, Swami Shradhdhanand had declared in the course of a speech in Patna, that he had been seized by the problem of the dying out of the Hindu 'race' after reading a book by one U N Mukherji entitled, *Hindus—A Dying Race*.³ Later I learned that it was as early as 1912 that Mukherji had actually met Shradhdhanand, to convince him of his thesis;⁴ Mukherji's own book had been published three years earlier, in 1909. Another surprise awaited me: the quotation so authoritatively attributed to Parmanand, actually formed one of the concluding lines of Mukherji's text. This was not simply a case of the discourse outliving the author. What I was confronted with was a text that had become 'common sense', repeating, as it circulated across this century, an antagonistic notion of communal relations, while it accreted to itself new contexts and meanings and established different tonalities of estrangement.

But it was more than simply the tenacity of this preoccupation that aroused my interest. What was at stake was an understanding of one of the primary sources of communal power: its ability to perpetually renew itself through the reiteration of stereotypes, without necessarily sounding repetitive. What is more, although the relationship between different, stereotypical 'observations' seemed random, as say, the juxtaposition of Muslim fertility

with their alleged proclivities towards violence, the fact of their mutual proximity ultimately defined them as part of a network of meanings. They tended to create a disposition, which complemented an ideological 'line', without appearing to be ideologically interested. Their authority lay precisely in the assumption that they were common truth, a product of social 'good sense'.

Hindu communal thinking around the census seemed a good entry point into this perplexing and powerful web of banalities, whose operations remained nonetheless opaque. For one, this could be traced to an author; more pertinently, *Hindus—A Dying Race* (hereafter ADR)⁵ dealt with a vast range of subjects and themes, including ideas of fertility, economics, organisation, the body, space, drawing at the same time on the disciplines of Sociology, Philosophy and History amongst others. Mukherji provided the spaciousness of a world—view that could lend itself to growth and consolidation. Equally important for my purposes was the way a vast constellation of significations created itself through processes of association, displacement, observation and analysis: this text offered the first large window on the logic of the seemingly random selection of stereotypes. Further the way its theme was taken up by other texts, which improvised their own meanings, often aligning it to changed preoccupations; the process by which its origins in texts produced by individuals gave way to more organised mediations: its conversion into oral communication the fact that the concern with declining numbers of Hindus was provided with different positions of importance, from occupying the place of the central problem to being included as a rhetorical appendage, even as it was being coupled with other anxieties which, by the end of my period of study, displaced the focus of in

terest onto themselves: all this pointed to the emergence of a 'common sense', which could cut across disparate concerns and institutional formations. In effect, it offered an opportunity to study a peculiarly polysemic and polymorphic discourse, the growth of which depended on both its inner logic and on a multiplicity of extra-discursive happenings.

Given its location amongst heterogeneous voices, the common sense around the census also raised the question as to whether all varieties of discourse that had the 'Hindus' as their reference point, were communal. A recent study by Papia Chakravarty⁴ has assumed that all strands of Hindu 'self-strengthening', including the pronouncedly communal assertions of U N Mukherji, went into the making of a single Hindu identity. This begs important questions: how was, for instance, Vivekananda's ideas of Hindu reform, which are not energised by communal imperatives, appropriated by thinkers like Mukherji? This linked itself to another question: the vitality of the process in which a range of concerns were made to intersect at the 'census', raised questions about the responsibility of colonialism. Did the categories of the census provide the formative discourse that built the communal prison which we continue to inhabit?

II

In his remarkably perceptive essay, Kenneth Jones sums up the decisive effects of the census, as: 'Religions became communities mapped, counted, and above all compared with other religious communities.'⁷ However Jones belies expectations by going on to simply describe how the formation of Hindu identity is preoccupied throughout its career with the census; although the logical move would have been to consider its momentous significance for communalism. The evidence for such a reading, it may be added, is overwhelming. H H Risley, home secretary, government of India, who proposed the partition of Bengal in 1903, for instance, is as frankly excited as a bookie at a horse race, when he declares: "Can the figures of the last census be regarded in any sense the forerunner of an Islamic or Christian revival which will threaten the citadel of Hinduism or will Hinduism hold its own in the future as it has done through the long ages of the past?" Risley's comments were overdetermined by the 'calculations' made by O'Donnell, the census commissioner for 1891, who on the basis of slower growth rates of Hindus relative to the Muslims, leapfrogged across simple statistical logic to deduce the number of years it would take for the Hindus to disappear altogether! Even as late as the 1911 census, when it had

become absolutely transparent that such speculations could arouse tremendous communal antagonism, observations to the same effect were reiterated.⁸

A year before this, an even more blatant act of colonial engineering was proposed. E A Gait, the census commissioner, passed a circular proposing five 'tests' to discover who was a Hindu, even if the person/s concerned subscribed to this nomenclature. This involved a questionnaire that would basically make a four-fold query: whether, the would-be respondents, worshipped the 'great Hindu gods', were allowed entry into temples and offerings to the shrine; if the brahmins who administered to them were 'degraded' or even recognised as brahmins by their supposed caste members, and what was the status of the respondents regarding untouchability. Obviously there was a tremendous analytic acumen at work here, since the questions were designed to confirm both brahmanical exclusiveness, as well as low caste anger. Given the upper caste character of the leaders of the Swadeshi movement, this 'test' was designed to encourage the detachment of low castes from the 'Hindu' category, reducing the numbers on whose behalf the upper castes claimed to speak. Horrified, Mukherji observes in *Hinduism and the Coming Census* (hereafter *HCC*), written as a response to this challenge: "It will break into two communities those that hitherto had been regarded as one!"¹⁰

Such evidence, by itself, argues for a Pavlovian relationship between communalism and the colonial dispensation. It hammers in the 'truths' of Said. But it also encourages a circularity of argumentation that confines all potential enquiries within the limits of critiquing colonial power-knowledge. Other questions remain unasked. Could, for instance, colonial classifications be regarded as origins or as renewal and reaccentuation? Lucy Carroll has made a distinction between caste associations that sprang up to claim privileges before each census, rapidly withering away thereafter and those which, in their more permanent and evolving history, testified both to more long-standing sources of collective aspirations, as well as their shaping by colonial classifications.¹¹ Without elaborating the obvious answers as to whether there existed 'Hindu'/'Muslim' identities prior to colonialism, it may be observed that the census explains the stabilisation of these identities around new orientations (of the sort mentioned by Jones), backed up by institutional 'facilities' such as reserved educational and employment quotas. But it does not explain much of what the texts discussed below, revealed: how, for instance, were relations of untouchability tackled by upper caste representatives,

especially the communalists. Or, how the 'common sense' around the census was co-extensive with the development of a world-view grounded in communal stereotypes. For it soon became clear that it was not an anthropologised history of collective affiliations one was confronted with, a stable, collective self that was inherited either from an unchanging past or from a power-knowledge formation, but an unfamiliar ideological terrain that retained its marks of apparently improvised and dislocated growth.

All this cannot be explained in terms of its colonial origins alone. The 'origins' require location within a broader process of identity formation. Recently, Gyanendra Pandey has made such an effort, but his thesis remains moored to a notion of discrete communities, being (mis)represented in the discourses of those who control the powers of disseminating their representations. Pandey's efforts are directed towards uncovering the 'truth' of these separate communities, an enterprise that tends to assume that communalism is the effect of (power-laden) prejudices alone.¹² This does not explain the process by which an ideological unity of different identities is sought to be erected through communalism, nor the vulnerabilities that it reveals. An understanding for which one of the possibilities could be to look upon it as a discursive area that is fraught with inner tensions; in which the claims of other collectivities—which are themselves wrestling with inner schisms—are sought to be either reoriented, displaced or actively opposed; which are reshaped by the logic of events and the relationships with 'others'. In short, to understand it in its twin movement towards stabilisation and dispersal.

III

The *ADR* gestured at its later importance by producing a fair amount of success and controversy on its appearance. It was serialised in the *Bengalee* during the month of June in 1909, a period that saw this newspaper in a communal temper.¹³ It was published twice as a book in 1910 sold at a price of 4as, which for its English language readership was very affordable. The author followed this up by writing *HCC*, a Bengali translation of which he distributed 25,000 copies free of cost. Another 25,000 copies of a modified Bengali version of *ADR* called *Hindu Samaj* was also distributed free.¹⁴ Mukherji's thesis was criticised, most notably by Sakharam Ganesh Deuskar, a major extremist leader, whose reply we will consider later. But bigger fears dispelled these attacks. On the one hand was Ameer Ali's petition on behalf of the London branch of the All India Muslim league, made in the context of the Morley-

Minto reforms of 1909,¹⁵ that called upon the authorities to effectively detach the lower castes as a bloc from the Hindu category; on the other, increasing demands were being made by influential sections of the so-called backward castes for autonomous and preferential consideration.¹⁶ Moreover, the debate on the census was acquiring nationwide importance since it seized communally disposed leaders of the Punjab as well.¹⁷ It was therefore a sign of the times that Mukherji's investment was rewarded by an invitation to guide the specially constituted 'Social Conference' of the Provincial Congress in 1911.¹⁸

Given the importance of *ADR*, it would be useful to start with a brief summary. Mukherji develops his argument by comparing a monolithic Hindu society with equally singular conceptions of Muslim and English societies. Proceeding from O'Donnell's warning, he asserts that the fundamental cause for the decline of Hindu numbers was because their peasantry was poor. Further, Hindu influence on village life was also declining because of the shrinking power of the mahajans. Conversely, the Muslim peasant was becoming wealthier and buying up land. In Calcutta too, the labour market and petty artisanal enterprises were being taken over by immigrants, since Hindus (implying Bengali ones) were prevented by caste rules from changing their inherited occupations and competing with them. Muslim immigrants were religious, hard-working, and ate well; Hindu low castes drank liquor, were unkempt and lazy. Mukherji then contrasts England with Hindu society. The latter was characterised by immense gradations of caste; shared occasions like the Durga puja served to emphasise caste divisions since the low castes were kept at a distance. This state of affairs remained unregenerate, because upper castes were either actively complicit or simply disinterested. On the other hand, social classes in England were bonded by the same feelings on common occasions such as those provided by sports, defence requirements and church activities: an ability that accounted for the overwhelming organisational power their society possessed. Islam too had produced a sense of commonness through masjid congregations. As a matter of fact, their reform movements of the 19th century were responsible for both their wealth as well as their unity under British rule. Hindus, however, faced disaster from three sources: Morley's equivocating reply to Ameer Ali's petition;¹⁹ the pulverisation of Bengali industry by the British; and now, dispossession of land by Muslims. The cause of their helplessness, Mukherji reiterates, lay in caste exclusivism.

Why is English society given such prominence in this argument? And what does this imply for the conception of Muslims? In England, Mukherji argues, the combined effects of the various institutions produces a common relationship with the self; thus, although a person may think of himself as an individual, "as a matter of fact he is a [sic] unit and generally a very intelligent unit of a huge organisation where everyone, irrespective of rank or class, has a common idea and a common object". The result is an awesome prospect, epitomised by English industry: "Here Indians had to hold their ground against a set of men who after hundreds of years of work and experience had reduced the art of making money into something like an exact science, men in possession of every possible information... carefully weighed, sifted and tabulated, with all the advantages that capital and combination could secure..." The tone is lyrical; possessive. Figures of completion abound: 'hundreds of years', 'exact', 'every', 'all'. The rhetoric is frankly grounded in the idea of British superiority, which in the 19th century the moderates had assumed would be beneficial for the development of their own society. But here it carries other resonances. The English maybe a model, but the lyricism also confesses the impossibility of attaining it. Hindus cannot match the investment in competitive time, nor command a comparable volume of knowledge. Desire is shrouded in disenchantment.

The disenchantment was unavoidable, for in the years preceding 1909, the prospect of rivalling British industry (in addition to elements of its administrative machinery, such as Swadeshi arbitration courts providing an alternative to the judiciary) had enthused the Swadeshi movement; but by 1908, it was becoming apparent that all these initiatives were collapsing.²⁰ But nationalism had not lost its pride, nor the sense of outrage. Mukherji's concluding lines in the passage cited above runs: "If ever there was an unequal fight it was this." The Swadeshi movement had left anger in addition to disenchantment—making it doubly impossible to regard the English as a model.

But the shutting out of one possibility opens another: "There is nothing in the laws that specially affects the Hindus unfavourably", Mukherji states, adding: "The superiority of the...Mohammedans is entirely due to their religious revival and systematic moral training..." Of course Mukherji does not specify how the Muslims had suffered under colonialism to make their condition comparable (this could conceivably spoil the argument by arousing sympathy for them); but also, Muslims *need* to remain superior, since the

argument demands they be a viable model for emulation. The insistence on this allows Mukherji to tap the resources of another discourse. Muslim superiority stems from religion, a sphere that was 'guaranteed' by Queen Victoria's Proclamation of 1858 (and referred to by all parties as a kind of Directive Principle), to be autonomous of the administration. Tagore had already drawn a distinction between 'rashtra' (state) and 'samaj' (society), finding in the latter a province that allowed independent initiatives; recent work suggests that such a structure of thinking was present even earlier.²¹ The Islamic reform movements allow an opportunity to recast this aspiration for self-strengthening in a space independent of the state via its reinscription in this image of a triumphant Muslim society. And Mukherji spares no efforts in making this image vivid. The locus of this renaissance is the village masjid, cared for by the 'mollah', who, though learned, belongs to the same background as his congregation which has the power to elect him. Every Friday, prayers are followed by a 'waz' or sermon which consists of: "simple morality, simply told". All this—it is reiterated—is done independently, without any central organisation, state help, obligatory payments or church laws. Above all, the greatest contribution of the reform movement, it appears from this representation, seems to lie in producing the drive to self-organisation.

Mukherji skirts the borders of stereotyping here: the notion of Islamic 'fanaticism' is as old as the Renaissance, and it is no coincidence that this formulation about Islamic reform in Bengal is derived from the famous passage in Hunter's history, which our author approvingly cites.²² But it would be self-defeating for Mukherji to identify his argument with the stereotypical, for the latter denotes final ontological conditions. His aim is change through emulation of the other; and this involves self-reform. Mukherji thus carries out a more subtle exercise, throughout the course of his argument: appropriating the weight of antagonism that stereotypes offer, while orienting these to the object of reform. Such negotiation is evident from the onset of the self-critique. Mukherji asserts from his 'observations' that the cause of Muslim proliferation lies in the desire of Hindu widows for Muslim males. This is a radically new departure from late 19th century discourses on the Hindu female which had idealised the notion of inviolate chastity.²³ Moreover Mukherji's 'fact' pulls a constellation of discourses around it. There is the centuries-long image of the sexually powerful Muslim male; which in colonial Bengal is tied to the internalised

British stereotype of the Hindu male.²⁴ However, the very unresolvability of the dialectic between desire, resentment and anxiety that these stereotypes produce, is sought to be redeemed by shifting its burden on to the supposed desire of the Hindu widow. A special connection between the Muslim and the Hindu widow had already been established and publicised during the Jamalpur riots of 1906.²⁵ But the focus then had been on the abduction of widows: the fault lay solely in Muslim aggressiveness. On the other hand, by making the widows culpable for the connection, Mukherji taps the legacies of guilt, fear and humanitarian concern which the 19th century Hindu proponents of widow remarriage had tried to arouse.²⁶ Viewed from this frame, to resolve the problem of widowed desire would also settle a larger assortment of more recognisably male dilemmas.

"After Ceres comes Venus": the epigrammatic style hurls the argument from one point to the next, allowing it to amass a wealth of discursive associations, but not providing space to interrogate the series of displacements. Resonances of 19th century reformist discourse are utilised to reorient the argument to the different possibility of economic reform. The fatal desire of widows is explained by Hindu peasant poverty. This is so, Mukherji asserts, because Hindu males cannot afford to remarry, in turn producing larger numbers of unsatisfied widows; conversely, Muslim wealth gives to them a 'superior physique'. It may be noted that by blending the sexual into the economic, Mukherji is enabled to harness the anxious energy of stereotypes to a condition, which, since the drain-of-wealth theory, had been recognised as man-made.

The Muslim is saddled with a double burden. By surrounding his figure with a plethora of discourses, this text aspires to make suspicion of the Muslim a key structuring principle of existence itself; by the same token, to defeat their silent machinations promises to resolve far-reaching problems. The encoding of hopeful expectation within fear provides a powerful world-view. Not only can it hold the anxieties of established discourses, but it is made to absorb more immediately political and social challenges.

Let me begin with one already touched upon, namely, the utility of the Muslim in providing a release from the cul-de-sac scenario at the end of the Swadeshi movement. Concerns that were integral to it, such as economic self-reliance, the cultivation of the body, organisation through faith, can now be conjured up through encounter with this new enemy. Though the Muslim represents an attenuated space for these initiatives, for that very reason, it

becomes even more important to cling to. Secondly, there is the problem of a shift in the regional composition of Calcutta's population, which Mukherji is among the first to underline; it later becomes a major preoccupation with Sir P C Ray. From Mukherji's figures (which show that the population profile of Calcutta has one Bengali Hindu to 25 Bengali Muslims and about 100 upcountrymen, without including the Chinese, Marwaris, etc), it is clear that Muslims form only a part of the overall deluge.²⁷ Yet precisely because the particular section is left hanging here, the chauvinistic anxiety produced by the prospect of the political and cultural capital of Bengal becoming non-Bengali, is relocated in the Muslims who, needless to add, are seen as the heart of a general danger. This of course, involves the removal of distinction between Bengalis and non-Bengalis. Finally, and most significantly, the Hindus' condition is signified overwhelmingly by the low castes. This has much larger consequences than the relatively straightforward one of displacement. It needs separate consideration.

IV

Mukherji's representation of the low caste condition is one of unmitigated degradation: it acts as the ever-present inversion of the idealised Muslim. Consider the following description of the low caste bagdi, which is typical: "He is poor, eternally poor... He is lazy, thriftless, unreliable... Hope, ambition, self-respect, self-reliance have no meaning for him, and things have been like this ever since he has been a bagdi". Further, "There is no object for which they can unite...". The subjectivity attributed to them by Mukherji is not one that is conducive to unity. Quite logically, they cannot resist the hegemony of the brahmins, from which flows the strictures on untouchability. Low caste movements for self-assertion—in which Mukherji includes Vaishnavism, the Charak festival, sects such as the Kartabhajas and caste association movements—are either absorbed by brahmins, which results in the internal decay of their initial aims, or they assert superiority over others, increasing the centrifugal tendency amongst themselves.

Certain assertions stick out like sore thumbs in this portrayal, most notably, the one relating to the evaluation of caste association movements. Since they cannot be said to have been appropriated by brahminism, Mukherji dismisses them for militating against Hindu unity. He does not consider their improvement ideology, their growing prosperity and a commitment to combination, or anti-brahminism (all of which characterise the powerful

Namasudra movement, for instance).²⁸ From where does the driving necessity to create this, negative, dependent image of the low castes spring?

An obvious explanation is that it saves Mukherji from having to contrast the upper castes with the Muslims, a framework—given the visible social and economic privileges of the former—would have made it impossible for Mukherji to substantiate the master metaphor of impending death. Even though, it may be observed, this trope is crucial (its importance being expressed in becoming an accepted feature of Hindu communal rhetoric). The threat of demographic deductions involved far-reaching changes in the opportunities that the colonial administration offered for the different castes. For the first time since the birth of the Bengal Hindu colonial middle class, there was a decisive and immediate threat to their hegemony. By absenting them as an index to the Hindu condition, Mukherji allows the threat to privilege to be presented as the plight of the oppressed.²⁹ But this conceals another displacement. The Swadeshi movement had failed to galvanise the low castes; in the case of powerful caste bodies such as the Namasudras, there had even been proclamations of loyalism.³⁰ By drawing an absolute, inverse relationship between the Muslim and the lower castes, he can both shift the anxiety caused by the former, and recreate the lower orders as an object of paternal concern, at a time when this was under strain.

By doing this, Mukherji also alters the discourse on reform of the low castes, which had been established by Vivekananda. For the latter, upper caste paternalism was necessitated by a combination of fear of low caste rebellion against the authority of the upper, as well as an humanitarian commitment. For Mukherji the problem of low caste breakaway could not be admitted, precisely because the problem was now manifest. But the overall situation presented space for another possibility, to which his discourse could be productively aligned. The relationship between the Muslim and the low castes held complicated possibilities. Prospects for an alliance were counterbalanced by indications of antagonism that became pronounced in the years immediately following the publication of this pamphlet.³¹ Obviously, Mukherji's framework of antagonistic comparison was designed to encourage the growth of the second tendency. However, this by itself, is not sufficient: the antagonism with the Muslim need not necessarily lead to the 'Hinduisation' of the low castes. It is to fill this lacuna that the brahmin enters apportioned the burden of humanitarian concern.

In the fifth section of the book, Mukherji identifies six broad caste clus-

tera. The common index by which their hierarchy is mapped out, is the manner in which different groups relate to brahmins: the latter then are given the status of a structuring principle. Obviously, this corresponds to their hegemonic position, although Mukherji characterises it in negative terms: "He [the brahmin] claims superiority over all, but admits of no obligation or duty towards any." Significantly, Mukherji does not contest the proclamation of superiority, but the inability to support it. Though this is couched in terms of mutual obligations, the issue is one of power: the brahmins need self-reform to save Hindu society from dismemberment—which includes their superior social position in it.

Talking of the reasons why Hindus do not meet together, Mukherji observes that when a low caste meets a brahmin, he does a 'dandabat', that is, prostrates himself "like a log of wood—not like a human being..."; at sites of common festivities, a stray dog is treated better than a Hari or Dom if they happen to enter. Mukherji bemoans the resultant lack of self-respect that the low castes imbibe, which provides an explanation for their allegedly immoral culture and lack of subjective motivation. Underpinning this pronouncement is the presumption that brahmins determine their self-image. However the brahmins are themselves victims of minute and rigid intra-caste discriminations, being divided by region, and by sub-classifications such as 'gotras', 'mel' and 'sanatan'. For the brahmins, unity is as imperative as it is for other groups.

Brahmins had a special status in Bengal, since there were no intermediate varna caste between them and the shudras who occupied the lowest rung in this order of ranking¹²—which is a possible explanation for the importance given to them in many schemes for constructing alternate Hindu societies. Mukherji's positioning of the brahmin draws from two discourses around them. On one hand was the reformist project of Vivekananda, which argued that since brahminhood was an ideal, the ultimate goal of Hindu society ought to be the raising up of all castes to the status of brahmins.¹³ On the other hand were the turn-of-the-century revivalists, including figures such as Satishchandra Mukherji and Rabindranath Tagore (who briefly went through this phase) called for the maintenance of the caste system and appointment of brahmins as "disinterested intellectual leaders".¹⁴ Mukherji follows Vivekananda in privileging brahmins as educators, but differs from the latter by concentrating exclusively on this aspect. Again, in the emphasis on brahmanical self-reform as a prelude to Hindu reform, he draws upon Vivekananda's orientation. But there is a subtle

negotiation involved. Brahmins are urged to educate all castes in order to uphold their inherited privileges: effectively, what is offered to the brahmins as compensation for the loss in social prestige (by giving up discriminatory practices in social relationships), is a much broader vista of hegemonising Hindu low castes directly, making brahminism itself a supra-caste ideology, without entailing the loss of caste identity. A reformulation of revivalism is delicately suggested.

The inherent conservatism of this project regulates the outlines of Mukherji's overriding objectives, which is expressed in rhetoric that tends to posture a little. For instance, a key requirement, which is again inherited from Vivekananda, is that of egalitarianism. And with his mentor, Mukherji shares the attenuated definition of egalitarianism as basically denoting the suspension of untouchability. In the earlier project, it arises from a sense of expediency (to avoid the prospect of low caste revolution and possible breakaway), as well as righteous anger against their treatment. However, Mukherji shrinks the meaning of egalitarianism further, by making it a purely functional precondition for brahmins to teach the low castes, and by denuding it of the quality of indignation.

It may be remarked that the proposal to educate the low castes by the brahmins originates from Vivekananda again. The word that Mukherji uses, however, is 'training': implying a pedagogy that is more applied, technical. More than anything else, it carries the implication that the object of attention is 'character': "A trained man is superior to a man who is not trained", declares Mukherji. In other words, justifying the production of a common personality (since the training programme is obviously deemed to be common) on grounds of efficiency. But the tropes of subjectivity also imply the conversion of a mechanical social organisation into an organism, seeking to create an inter-connectedness that is intimate without surrendering the idea of instrumentality. Further, Mukherji uses the figure of the body to establish a comprehensive ellision between the 'personal' and 'social'. Castes are chastised, for instance, since each is a 'self-contained body'. Given the framework of the weak Hindu confronted by the unremitting antagonism of the immediate and overwhelming power of Muslim personality and more remotely, the British, it follows that Hindus must develop a larger, unified personality.

It will be recalled that we started with egalitarianism: we can now see that it is premised on a necessary inequality with others, accrued as a consequence of a failure of subjectivity (in being broken and disunited), rather than of a difference in

social opportunities. Egalitarianism then indicates the overriding necessity to constitute a sameness of subjectivity. Incidentally, for Mukherji, this does not signify the obliteration of individuality: on the contrary, strong self-respecting individuals, as Muslim and English societies indicate, are necessary as 'intelligent units' to power the social machine. The ultimate lyrical prospect is however the German 'Volkschule', defined in a later pamphlet entitled *Hindu Samaj* (hereafter *HS*),¹⁵ as an education system which compulsorily removes "difference between untouchable or respectable, rich or poor amongst the boys and girls...[since they possess] the same book, the same education, the same rules".

However, the idealisation of egalitarianism as sameness, is modified in this pamphlet. There is a reinscription of the England of *ADR*. The main feature of English society represented here, is its loose educational system, which allows for the differences of denominational education, is held to be more relevant. This goes together with the discovery of a distinctively brahmanical educational institution. The 'tol' (shorn of its brahmanical exclusiveness) is advocated, not only because it has maintained traditional learning at the cost of great self-sacrifice on the part of brahmins, but more importantly, in view of its relevance for modern conditions, that had apparently been proved by its adoption in England as the bell system.¹⁶ It can be argued that the alterations in *HS* are necessitated by the limitations of *ADR*'s prescriptions, in producing a Hindu society. But the haste with which these proposals are displayed (*HS* was published in 1910, only a year and a half after *ADR*) testifies to the urgency produced by a circular released by E A Gait, the census commissioner, which dramatically and perilously posed the question, who is a Hindu.

ADR makes engrossing reading. The line of argumentation flows, one cause leading seductively into another, the whole being packaged by a ringing, epigrammatic style. One forgets that at important points, Mukherji avoids mentioning established explanations, such as, the determining role that upper caste customs play in preventing widow remarriage. The economic explanation of Hindu poverty that is offered in its place is, in turn, stripped of questions such as redistributing land and tenancy reforms, and propped up on simple personal observation alone. Economic conditions are regarded as a matter of individual motivations (much in the style of conservative Victorian social thinkers, assuming as they do, that opportunities are equal for everyone), the energies for which are located in religious reform.

This brief recapitulation suggests that Mukherji could easily have jumped from his initial diagnosis of a dying Hindu community to his concluding position, without going through the intermediate steps: a religious community self-definitionally requires religious revival to resuscitate it. But in that event, a world-view would not have been produced. As I have shown, the flexibility of the argument allows it, like a magnet passing through metal filings, to draw various kinds of discourses, which had become part of the common sense of the Swadeshi movement, into another seemingly coherent stream of argumentation, so that another world-view can be produced, fattening itself on traces of older ones. An identity then emerges, not as simple nomenclature alone, but as a many faceted 'world', where the network of causality is comprehensive enough to link, for instance, economic problems with those of religious reform.

This is accomplished moreover without surrendering the major source of popular energy for the production of such communities, that is of stereotypes. We have seen how the model of inverted characteristics exacerbates the load of anxiety, while the careful avoidance of ontological fixity paves a credible path for the corresponding desire to fulfil itself. But this does not move the vision away from the parameters of stereotypes. In fact it makes them sophisticated, enlarges them so that they can contain a world-view. Ultimately, *ADR* leaves the reader with a pictorial evocation: a dying (low caste) Hindu, self-divided and physically weak, surrounded by an already overwhelming and progressively expanding presence of the Muslim, who in their self-engineered growth, suck out the life-blood of their rivals. A contest between two bodies, two personalities, two societies; each with a history, together with a corresponding explanation for their conditions.

All in all this is a neat edifice, that rests on the assumption that there was time for a single Hindu society to be produced through reform. By 1910 however this luxury was over. Mukherji's response to the Gait circular was one of desperation. *HCC* disavows the imperative of a mechanical Hindu organisation, that presupposes a singular collective identity. Here Hinduism is defined as a system that possesses 'belief without authority'. The relationship with the Other (which is represented here by Christianity, since Mukherji's aim is to convince the authorities with instances familiar to them), is now one of the differences that should not be bridged. For, although Christianity is divided into sects and schools, they are united by a common belief in the "idea

of authority-claiming supremacy imposing restrictions issuing licence..." On the other hand, Hinduism is not only heterogeneous, but also valorises its plurality.³⁷ In other words Mukherji here affirms the *status quo*. Hinduism is in fact portrayed as an utopia, where there are no problems of power. It is not surprising to find that Mukherji jettisons all proposals for reform. Even untouchability is justified—as the comparison of a housewife cleaning her rooms to prepare for puja, to an operation theatre where precautions are taken against infection—on the improbable grounds of hygiene.

Two texts, the *ADR* and the *HCC*, separated by only a year, with a deep line of contradiction running through. However, the criticality of the schism does not put an end to the search for a definitive Hindu community: as *HS* indicates, it makes this desire more urgent. Too much power is at stake and the fear of the detachment of the low castes too perilous. The increasing prestige of the preoccupation with the census becomes evident in the way Mukherji's assertions withstand a scathing critique from within the Congress. It is this which I will now briefly consider.

V

By 1910, the year he wrote his critique of *ADR*, Sakham Ganesh Deuskar was already, unlike his antagonist, a highly revered leader. In 1905, this domiciled Maharashtrian introduced the Shivaji Utsav (a festival started by Tilak in his home province, which had mobilised Hindus against colonial rule at the cost of alienating the Muslims) in Bengal, following this up with authorship of *Deshar Katha*, an indictment of British rule that became a standard reference work for Swadeshi activists. His book, *Bangiya Hinduja Ki Dhangshaner Mukhe?* (hereafter *BHD*) was written partly because of Mukherji's silence on the criticisms of Kishori Lal Sarkar, a high court 'vakil', in the pages of *Amrita Bazar Patrika*.³⁸ Despite Deuskar's credentials as a Hindu nationalist, *BHD* did not make a popular impression.

For the most part, *BHD* is a rigorous statistical and political analysis, which ruthlessly shows up the many inconsistencies and suppressions that underpin Mukherji's deductions. Deuskar concludes that while the Hindu population grew slowly during 1872-1881 (by 3.65 lakh, while Muslims increased by 5.18 lakh), between 1891-1901 their numbers accelerated (rising by 14.62 lakh above the 1891 figure, while the Muslim population added 24.97 lakh to itself). These figures, for Deuskar, make nonsense of Mukherji's

claims, since both caste structure and the level of poverty remained constant during the period of accelerated growth. Alternatively, he traces the fallowness of the 1872-81 period to the ravages of malaria, which afflicted the western parts of Bengal, extracting a much higher toll than the floods and even outbreaks of malaria in the eastern parts, which in contrast to the 'west' was populated mainly by Muslims.

Even more effective is the critique of suppressions. For one, it is pointed out that Mukherji does not take the figures for certain areas (Srihatta and Kachar) into account. More crucial is the silent suggestion that Mukherji is deliberately whipping up anxiety, which is implicit in Deuskar's observations that Mukherji does not specify O'Donnell's calculation, which asserts that it would take a lengthy 650 years for the Hindus to disappear altogether: a figure that would not harmonise with the immediate prospect of disappearance that *ADR* paints. Later *BHD* goes on to assert that, in fact O'Donnell had wilfully classified tribals who had come under the influence of fallen brahmins, as 'animists', without extending the principle to converts of other religions. Nor does *ADR* mention the higher longevity rate amongst Hindus. Besides, it manipulates figures for education. For instance, the figures of Muslim 'muchis' provided to dramatise the superiority of Muslims' educational attainments are undoubtedly impressive; but the reader is not informed that these figures are only for Darbhanga. On the other hand, if only low caste Hindu male muchis were to be included, the number of educated amongst them would rise from 8 per 1,000 (which is Mukherji's figure) to 232 per 1000!

Deuskar does not stop here. Being an activist, he possibly felt the need to address the anxieties engendered by changing power relations. He offers three causes for the comparatively slower Hindu growth rate. The first is the practice of prohibiting widow-remarriage, which was being taken over by sanskritising castes. Secondly, there is casteism, suggesting here the possibility of a future caste war, that would obviously lead to a delinkage from the low castes. And finally, Deuskar advances a cultural cause, stating that Bengalis have declined physically because their hearts had been conquered by western customs.

The problem with these explanations is that the discourses of rigorous statistical explication and the more speculative one of reform do not coalesce, except for the question of widow remarriage. And that is discussed with a measure of empirical persuasiveness by Mukherji. On the other

hand, the east-west schema involves such an abrupt switch from the physical to the cultural (without the mediations that Mukherji makes), that it seems more of an excuse than an explanation. But more than anything else, it is Deuskar's inability to grapple with Mukherji's persuasive portrayal of the double Other, that explains its limits. As we shall see, it is the latter's explication of the caste problem that popularises the anxiety of Hindu numbers. But Deuskar seems to be caught on the wrong foot on this problem. He only acknowledges the caste factor, without elaborating upon it. Consequently, he can neither decisively repudiate the connection between caste structure and demography, nor propose an alternate programme of caste reform. On the other hand, while he appears to understand that Mukherji's text is part of a larger process of ideological consolidation of a Hindu-Muslim divide, Deuskar's strategy is to merely reassure the Hindus about their ability to reproduce. Which, along with his inadequate social prescriptions, ultimately belie a sharing of anxiety. The problem is that like most other Swadeshi leaders, Deuskar is unable to realise that the concept of Nationalism needed to develop from its 19th century moorings in an implicit Hindu identity, to attempt an alternate theory of Hindu-Muslim relations. Without that urge, good intentions remained merely good.

VI

Papia Chakravarty's book (cited above) breezily admits that Mukherji may have made committed some statistical errors in his 'enthusiasm', while loftily conceding that Deuskar had shown "ingenuity in mathematical calculations". Nevertheless, Chakravarty feels free to incorporate most of Mukherji's arguments in her own. This does not raise the biggest question however. She concludes that the upshot of Deuskar's talents was that he "misunderstood its [ADR's] underlying purpose", which was the "rejuvenation of the entire Hindu society."¹⁹ The cheer-leading by a professional historian for the conclusions of a text that is unsupported by its self confessedly/evidently statistical assumptions, is not only affirmative of the influence of this communal common sense I have talked of, but raises a problem retrospectively. Is there something in ADR itself which lends itself to such a cavalier treatment of its assumptions?

At the very beginning, ADR raises the question, as to whether Hindus were faced with an absolute or relative decline. Mukherji's figures indicate that the answer lay obviously with the latter. But he never does get around to discussing the question. Instead his intensely negative

picture reiterates the assertion made in his title. The sheer weight of 'argumentation' then, paradoxically detaches it from its basic assumption: the statistics regarding Hindu demographic decline is not only divorced from the necessity of disciplined explication, but becomes a signifier of an entirely different story. The statistical becomes a trope of imminent death. And Mukherji spares no effort in exhibiting it as such. The first page of HS is adorned by a simple census table containing the numbers of Hindus and Muslims since 1872 in Bengal, with a two line statement below, stating the relative numerical extent of Hindu decrease. This little introduction expresses the author's confidence that his analysis has become common sense: he no longer has to explain anything. On the other hand, the census has become a visual clock, analogous to the Disaster Clock of our times, that measures how close our planet is to destruction every day. Two sets of numbers, one of time, the other of the numerical size of the communities: within less than a lifetime, the Hindu population is shrinking even as the Muslims are growing. Each moment becomes crucial.

We have already seen that Mukherji's structure of argumentation allowed a great deal of swift movement across different preoccupations, encouraging the use of displacement as a consistent method. The surreptitious conversion of the statistical into the purely tropological, enormously expands the range of concerns to which traces of ADR can be attached. In fact, the anxiety of Hindu numbers is made to lend its weight to nearly all the important problems that confront the construction and activation of a monolithic Hindu society. In the second decade of this century, this meant its conscription by explorations of the caste problem that were not engaged in whipping up a Muslim antagonist.

The Gait Circular was withdrawn; but the apprehensions it caused were enough to make Mukherji an authority on casteism. As I have mentioned, Mukherji was invited to address the United Bengal Provincial Congress held at Faridpur in 1911, "to improve the status of the Namasudras and other 'depressed classes' and to bring them into the fold of organised Hinduism".⁴⁰ Mukherji went on to build a network of contacts with low caste leaders, especially with Damodar Das, a representative of the Mali caste.⁴¹ However the most interesting man he was to influence was Digindranarayan Bhattacharya, a dynamic brahmin reformer.

Mukherji's attitude to the main objects of his reform, the rural low castes, is managerial; distanced. He claims authority on the basis of his knowledge of their

lives, an understanding that is held up for general inspection to his urban upper caste brethren. Bhattacharya's tone, by contrast, is always that of one who is in the thick of battle. Maybe this has something to do with his life which was almost the inverse of his mentors'. Mukherji belonged to the upper echelons of anglicised Calcutta 'bhadralok' society, being a son-in-law of Sir Surendranath Bannerjea and a member of the Indian Medical Service. Bhattacharya hailed from Serajgunje, a small town in Pabna district and came from a Vaishnav family that traced its genealogy to an associate of Chaitanya himself. Moreover Bhattacharya expanded his influence, without disavowing his role as an 'organic intellectual'. His career did not follow the accepted trajectory of a Bengali rural intellectual which till as late as *Pather Panchali*,⁴² is one of abandoning the rural for city life. He travelled extensively in the interiors, addressing meetings, engaging in many acts of reforming habits of caste intolerance. He was a prolific author. According to the biography by his admirer, the low caste Poundra Khattriya (originally called Pod) leader Manindranath Mandal, Bhattacharya had already written 22 books in Bengali (some being translated into Assamese and Telugu) and widely read in the villages.⁴³

Mukherji appears to have been the main source of encouragement from amongst the Calcutta intelligentsia, having written a highly laudatory 'Preface' to Bhattacharya's major work on caste reform, entitled *Jatibhed*.⁴⁴ This book received acclaim from urban reformer intellectuals, including Tagore, Sir Surendranath Bannerjea, Sir P C Ray, and even Swami Shradhanand. Significantly this general commendation coincided with a general lessening of upper caste apprehensions regarding Muslims. The withdrawal of the Gait Circular was succeeded by the reunification of Bengal in 1912. On the other hand, communalised Muslim leaders like Ameer Ali were being displaced by young, anti-British ones epitomised by Fazlul Haq who sought to come closer to the Congress. This trend was to crystallise in the Lucknow Pact of 1916 and culminate in the Non-Cooperation/Khilafat movement. Nevertheless this pattern in communal relations was not accompanied by a corresponding move in relations between the upper and low castes in Bengal. Namasudra demands for declassifying themselves from the Hindus remained while the announcement of the Montagu Chelmsford Committee to study reforms triggered off, as we have seen, demands for separate electorates.⁴⁵

Since a major part of Mukherji's preoccupations had to do with caste, there was

bound to be a great many common problems that Bhattacharya was likely to share with him. The intellectual link was further crystallised through the common interest in Vivekananda. But within these shared areas, Bhattacharya produced his own resolutions. His major contribution was to assimilate the undoubtedly marginal position that reformist discourse occupied to the more deeply entrenched and widespread ideas of Vaishnavism: an act that complements his efforts at widespread geographical and social dissemination of caste reform.

Chaitanya was held to be a major transgressor of caste divisions since he popularised the notion that low castes could achieve salvation in the 'Kali Yug',⁴⁶ through proper recitation of the Divine Name alone. Bhattacharya extends the prospects of spiritual egalitarianism that are offered thereby and does this through the popular and attractive form of a creation myth. His story also resolves the schism, between the focusing on singularity and the celebration of plurality that separated the two texts of Mukherji's. Starting from the Vaishnav tenet that creation was the product of 'lilakhela' (divine play), he reinscribes its meaning to assert that it was characterised by two principles: egalitarianism and variety. Thus although there were different castes, races, nationalities etc, the Lord looked on all equally. This inheritance was however subverted mainly by the brahmins, producing a state of degeneration that could not be endured by the Lord, whose initiative is described thus: "The pleading, soul-piercing wail of the ignorant low classes stook the throne of God's Heaven, and unable to remain still any longer... He divided himself into crores...of pieces and entered the hearts of the oppressed...in the form of a new Chaitanya." 'Chaitanya' here refers simultaneously to both the saint, as well as the general consciousness of rights, embodied in the minds of the low castes, the *double entendre* rewriting and radicalising the notion of the Brahman, the one and many.

This structure of comprehension allows Bhattacharya to identify active reform work as part of his inherited religious responsibility. This is important because Bhattacharya goes further than his mentors. Not only does he engage in active reform in rural areas, but he writes texts for the low castes. Both Vivekananda and Mukherji wrote their major works in English, linguistically underlining their perspective that it was primarily the upper caste elite who needed to reform their attitudes. On the other hand, Bhattacharya pens origin myths for different castes, a textual procedure that was an essential ideological resource for castes

seeking to improve their status. Further, it explains why he was very encouraging to Manindranath Mandal when the latter broached the proposal to form the Bangiya Jana Sangha in 1922, an organisation that sought to unite all low caste organisations. It was only in the fitness of things that Mukherji who was approached first proved to be discouraging:⁴⁷ after all, ADR assumed that reforms would be carried out under the tutelage of the upper castes.

But Bhattacharya too is committed to a reassertion of Brahmanical leadership, and his criticism of them, like that of his mentors', is directed towards that end. However he stirred much greater hostility,⁴⁸ not only on account of his sharpness, but more importantly, because his observations were articulated in low caste gatherings. Points similar to Vivekananda's and Mukherji's, articulated amongst low castes, as happens in Bhattacharya's case, has the very different impact of galvanising critiques of caste from below. In fact, unlike both Vivekananda and Mukherji, he seems to privilege reform of low castes over the necessity of organising the Hindus. Even though the latter is a major preoccupation with him, as can be evidenced in *Jatibhed*, which opens with a panegyric to the sacred geography of the nation and the need for Hindu unity to fulfil itself.

There are two more substantial—and consequential—traces of this drive. We have already seen the importance Mukherji placed on the institutionalisation of certain privileged spots of space and time (such as the 'waz'), in producing spatial egalitarianism and organised endeavour. Mukherji's assertion of its absence amongst Hindus, implies a critique of the unsuccessful Swadeshi modes of mobilisation of low castes, which involved propaganda in fairs and religious festivals. Bhattacharya's moorings in Gaudiya Vaishnavism (of Chaitanya), an ideology that was premised on the creation of a common, inter-caste disposition through music, enables him to offer a credible alternative. Music had already played an important mobilising role during the Swadeshi movement. But what Bhattacharya proposes is the 'kirtan', which involves a daily congregation built around music.⁴⁹ "Everyone should become part of a single life, a common mind. Let the sweet sounds of *harikirtan* enhance villages each evening", exhorts Bhattacharya: a recommendation that binds egalitarianism and sameness on a regular, everyday basis (as recommended by Mukherji), provides a simultaneous rooting in popular, rustic culture, along with mobilising a traditional ideological sanction for routinely overcoming caste barriers for a limited period, and all these

combined in a simple, accessible tradition! It was an extremely influential suggestion, for the identification of Hinduism with music became an imperative condition for the proclamation of Hindu rights in the contentious music before mosque issue, that fissured the 20s.

There is, in fact, something pernicious in *Jatibhed*; an inheritance of Mukherji, that could permit the conscription of Bhattacharya's recommendations into a communal cause. And this lies in the use of Mukherji's census table, which is presented at the beginning of *Jatibhed*. Obviously Bhattacharya uses it as a figure of anxiety alone, for his argument is not elaborated on the basis of antagonistic comparison with the Muslims (as a matter of fact, it is only Christianity that arouses his ire), which does not improve matters, since the table is allowed to remain like weeds in a boat propeller. On the other hand, this trope is ingenious, for in it the decline and impending doom of Hindus, is indissolubly indentured to comparison with a Muslim Other. The power of the tabular trope lies in its refusal to allow a comprehensive reinscription of itself. Its internal structure of antagonistic comparison remains stubbornly encoded, even as a different chain of significations is being attached to it. The triumph of this sign is that it seduces by the rhetorical potential it offers for reformist mobilisation, but its very use confirms a communal habit of viewing as common sense, silently imbricating it as such into the new territories of thinking in which it is made to move.

An even more vivid instance of its ability to introduce a surreptitious crack; in fact, even go against the grain of a particular line of enquiry, without appearing to create disharmony, can be found in Tagore's *Gora*. It is a story about Gora, an extremely gifted and idealistic brahmin youth, who believes in neo-brahminism with missionary zeal. The discovery that he is actually an English orphan brought up by brahmin parents questions all his assumptions, in the process radically destabilising all notions of identity drawing on a Self-Other polarity. But tucked into a corner that one may have difficulty in remembering, but which occupies a fairly strategic position in the plot, is a more familiar story. Pareshbabu, a person committed to a liberal, universalist notion of identity, is confronted by Sucharita, his doting ward, who seeks his advice on her desire (produced largely under Gora's influence) to convert to Hinduism. As he starts to remove the intellectual grounds from her impulse, she bursts out to say that the superiority of Hinduism lay in its survival. Pareshbabu's clinching objection comes here: he patiently replies that Hin-

dus were actually disappearing, and that if present conditions continued, it would become impossible to call the country Hindustan, since Muslims would become the majority.³⁰ Not only does Sucharita retract, but this point marks the reversal of Hindu influence in the novel. After this, Gora also begins his journey of self-realisation when he starts living in a village and encounters the problems of casteism amongst the Hindus, and a corresponding unity among the Muslims, in fact a picture that recalls Mukherji's!

Gora was published in the same year as *ADR* and there is no way of knowing whether this passage was inspired by the latter. The point is that this piece of common sense, which actually involves a structure of comprehension, plays a decisive role in a text that seems to align it to another path. Seems, because although this trope is used as part of the questioning of the narrowness of identities, its internal constitution remains unaffected. In fact the contrast with the Muslims is crucial to hammer in the pressure of impending doom. The power of this trope is even more evident than in *Jatibhed*, precisely because the rest of the novel diverges so radically.

What we have here is something akin to a free signifier, allowing itself to be redirected, without however surrendering its inherent and inflexible communal code. The consequence is that it accommodates itself to a large variety of understanding, insinuating itself into non-identical, even contrary discourses, splitting and problematising them, without casting ripples. The net result is the production of the Gramscian understanding of common sense, which referred to the fragmented, contradictory character of popular consciousness, that amalgamated traces of disparate world-views into itself. But the story of the 'census' reveals that these traces did not remain as such. A different matrix of political forces changed all that.

VII

The new development in the 'life' of this common sense in the 1920s is that the Hindu Mahasabha emerges as the authoritative organisation of Hindu communalism in the country. It had been inactive during the greater part of the Non-Cooperation/Khilafat (hereafter abbreviated as NC/K), being revived by Malaviya only in 1922. Its swift assumption of an all-India character was not only because communalism filled in the gap left by the disappointment of the 'Bardoli retreat', but equally, because their members were simultaneously part of the Congress, allowing them the opportunity to expand their network alongside that of the Congress. But Bengal had additional reasons

for its receptivity. The first of these returns us to the problem of numbers again. Hindu intellectuals in Punjab (which was a major centre of the Mahasabha) were thinking of it at the same time as their peers in Bengal, if not a little earlier. It acquired its definitive shape there, in Lala Lal Chand's 'Self-Abnegation in Politics', which was published in the same year as *ADR*.³¹ There was also a more grim aspect to this relationship. Punjab and Bengal provided two of the heaviest centres of rioting in the 1920s. The initial wave of major riots which followed the NC/K, took place in Punjab, starting in Multan and Amritsar; while the frenzy of rioting gripped Bengal a little later. Calcutta had the dubious distinction of hosting in 1926, the biggest riots known till then in the history of the subcontinent. The combined impact of all these accounts for the swift spread of the Bengal Hindu Sabha. Though it was formed as late as August 1923,³² we can find its imprint almost immediately, not least in the orientation towards organisation in the pamphlets we will examine.

Two of these, Saileshnath Sharma Bisi's *Hindu Samajer Bartaman Samasya* (*The Contemporary Problems of Hindu Society*), and Sir P C Ray's pamphlet entitled simply as *Faridpur Pradeshik Hindu Sabha*, are reprints of speeches, delivered as chairman of the reception committee, Serajegunge Provincial Hindu Mahasamimilani (The Great Hindu Conference at Serajegunge) in 1923, and as president of the Faridpur Provincial Hindu Sabha in 1925, respectively. The third pamphlet, entitled *Bangla Hindu Jatir Khoy O Tahar Pratikar* (*The Decay of Bengali Hindus and Its Remedy*), is purely a mobilising tract, brought out directly under the authorship of the Tangail Hindu Samaj Sangrakshini (Preserver of Hindu Society in Tangail) in 1924.³³ Together they indicate the presence of organised power in promoting the concern with Hindu numbers, propelling its articulation in three different places in three successive years. This development holds out methodological consequences. Being now faced with a network around the 'census', it would be appropriate to treat them as a composite, even if loosely affiliated, group of meanings, instead of exploring individual accentuations.

The hardening and consolidation of communal consciousness that we see in the 1920s, is obviously built on the many failures of other initiatives; but the one most closely related to our particular enquiry is that of the aspirations aroused by and represented in Bhattacharya. In many ways the man was a phenomenon. We have already seen the adulation he received in upper caste reform circles. His

following amongst low castes was even stronger—which makes him an unique figure amongst upper caste reformers. In his biography (cited above), Mandal, a leader of the Poundra-Khattiya caste, wrote that Bhattacharya was not only greater than Rammohon Roy and Vivekananda, but actually superseded Chaitanya in his commitment to removing untouchability. A special song was composed for him when he presided over the Kalna Nikhil Bangiya Vaishya Teli Sammilani (the 'telis' being a low caste oil-pressers), which proclaim him to be an 'avatar' of Hari (the other name of Vishnu, whose incarnations include Krishna, the dominant figure of worship in Gaudiya Vaishnavism). Obviously Bhattacharya realised in his person the desire for a consensus on reform. He represented a 'historic bloc' of the upper and lower castes, demonstrating to both that brahminism could be reinvented. The problem was that this was a possibility that was individual, at a time when influential caste groups from opposite sides, such as the Brahman Sabha and Namasudras, remained unwilling to strive for such a prospect. Bhattacharya was thus fated to represent at best a (desire for) temporary alignment.

Bhattacharya was influential enough to leave traces of his ideas, though they were now harnessed to a contest with the Muslim Other. We have already seen his contribution in the kirtan suggestion, which provided an ideological imperative to the revival of the music before mosque issue. Less dramatic, though arguably as important, was his propagation of Vaishnavism. The Tangail Hindu Samaj Sangrakshini pamphlet (hereafter THS), brings the heritage of both Mukherji and Bhattacharya together, by first reciting Hunter's claims about Islamic reform approvingly cited in *ADR*, at this point, it suddenly breaks off to offer 'pranam' (salutations) to Chaitanya. It then proceeds to repeat the assertion that the saint had introduced equality among castes through 'sankirtans' and 'mahasabhas', but edges in a revealing comment. It says that Vaishnavism provided a religion where the upper castes could suspend caste rules regarding the acceptability of water, etc, without having to surrender their 'respectable' status. The excessive emphasis on egalitarianism present in Bhattacharya is thereby pruned away, and Mukherji's imperative of hierarchical organisation warranted by an Islamic challenge is preserved—without departing from Vaishnavism. An even more straightforward harnessing of Vaishnavism to exclusively organisational imperatives is present in an article written by Piyush Kanti Ghosh, the editor of *Amrita Bazar*

Patrika and a leader of the Bengal Hindu Sabha, which is revealingly entitled, 'The Best Way to Organise the Hindus'. Although it mouths warnings of a low caste upheaval, the anger against upper caste discrimination which accompanied these warnings in both Vivekananda and Bhattacharya is absent here. On the other hand, the real emotional centre lies in its proclamation that "it is on the grounds of religion that the Hindus must meet", for, "on no other basis will the unity last long". And this unity, it can be guessed, is compelled by Muslims; Ghosh advises 'brahmacharya' (celibacy) and 'suitable physical exercise' for Hindu offsprings. They could then die "defending his [the Hindu's] religion and home and hearth", a common newspaper phrase that invariably implied a Muslim threat.¹⁴

In a way, the shift to an overwhelming concern with Hindu organisation also made Mukherji's privileging of caste relations its victim. For, despite the efforts of reformers, caste remained a signifier of vertical cleavages that were insoluble within the framework of brahminism. This did not mean that caste problems would disappear from the rhetoric of communal Hindu reform, since its manifest reality was far too forceful.¹⁵ As a matter of fact, caste remains a major preoccupation in all three texts (with Ray beginning his speech by mentioning his indebtedness to Mukherji). But what it did entail was the subordination of caste to the more fearful question of gender.

VIII

The new temper is enunciated in its most extreme form by Bisi. The explanation he offers for declining Hindu numbers has nothing to do with caste; on the contrary, it leads him to a consideration of 'unproductive' marriage customs, that is focused on the ban on widow-remarriage, which he claims is responsible for many social abuses. Bisi does discuss the problem of untouchability, but separately—suggesting a certain move towards its marginalisation. It is true that the others bring in caste more directly in their demographic considerations. But with a difference. For instance, *THS* asserts that the decline in Hindus is due to the low castes. But instead of discussing inter-caste relations like the earlier generation, it blames their marriage practices and recommends widow-remarriage, which would not only lead to the multiplication of Hindu children, but would also dispense with the dowry system. The importance of widow-remarriage is underlined, by reiterating its necessity in the conclusion. Sir P C Ray begins his speech by declaring the ban on widow-remarriage to

be the cause for the drop in Hindu numbers; he deviates thereafter into Mukherji's analysis of peasants (the Hindu lacking initiative, the Muslim possessing it), but comes back to offer widow-remarriage as the first item on the list of solutions. He highlights its importance by providing another table showing how the numbers of Hindu widows outstripped those of Muslims, in the 15 to 30 years age group, which complements his citation of Mukherji's table.

What does the Widow signify? The self-evident motivation is that of resource optimisation, which relates to widows in the same manner as newspaper articles of this time did to cows: in both cases the major problem is that of efficient breeding. In the process, this consensus summons up the zeal and dignity of past reformers like Vidyasagar. But his humanitarian aspects, the deep though admittedly patriarchal outrage at the treatment of Hindu women, all these are absent. On the other hand, where Vidyasagar is recalled,¹⁶ is in the apprehension of moral contamination of Hindu society by sexually deprived and 'available' widows. There is actually a basic similarity in the way that both Muslims and widows are treated: both are seen as figures of potential sexual excess and hence of fear.

This penumbra of associations was widened by their position in the social relationships of rural areas. Apropos of allegations of abduction of widows in the Mymensingh riots of 1907, the district magistrate in his report stated that on enquiry these allegations were found to be "merely threats, the fact that Hindu widows are not allowed to marry again being always rather a subject of comment among Mohammadan neighbours".¹⁷ Obviously they represented a grim shadowy area in male society; being outside the protection that the domestic identity of female chastity provided, she was both an invitation and a threat. Matters were exacerbated by another likely phenomenon. Some Muslim newspapers claimed that many of the Hindu women who were reportedly abducted were in fact widows, who rescued themselves from the burden of their lives by eloping with Muslims.¹⁸ Besides making widows more 'attractive' as the explanation for Hindu numbers, it also led to an associated and in many ways, a more powerful concern in the 1920s.

After offering widow-remarriage as a remedy, Ray suddenly transits to a new recommendation, exclaiming: "All the wives of our kin, who are being abducted, and whom, because of our weakness and cowardice, we cannot rescue from the hands of the depraved—we should save them and give them a place in the bosom

of society." Likewise, while talking of widow remarriage, Bisi suddenly elaborates on the heartlessness of Hindu males and their disloyalty to the devi (goddess) ideal, evidenced in their refusal to take back their abducted wives. The point in both cases is that the suddenness of the transition to the abducted wife issue takes place in the context of a discussion on widows. The instance of Ray in particular indicates that the jump is occasioned by an irresistible power of association, the logic of which is suppressed. Significantly, these passionate lines are not repeated: it is as if they appear (or are made to), in spite of Ray's intention.

To account for the pressure of this rhetoric will take us to a point outside the province. In the speech that he delivers as President of the Hindu Mahasabha in 1923 at Benares, Malaviya provides one of the first attempts to create a history of abductions. He claims that the British incited the Muslims to attack Hindus, the first instance of which occurred in Bengal (referring possibly to Jamalpur) and was repeated in the Frontier districts: the common feature in both was the abduction of women. This was followed by the Moplahs (who besides converting also abducted Hindu females) and then by the sexual outrages of Amritsar and Multan. He then went on to deduce a moral from his claims by contrasting Hindu apathy with English belligerence when their women were insulted. "Behind English girls and women there is a national strength which protects them wherever they go. So also with Mohammedan women." The main reason for Hindu disunity, he continues, lies in their inability to defend their "religion and women".¹⁹

The abduction theme allows Bisi to make a similar point, when he asserts apropos of that discussion, that Muslims should not confuse Hindu liberalism for cowardice. 'Abductions' become yet another method of defining collective desire by first imputing a certain character to the other (in this case that of organisation), and then setting it up as a quality to be emulated. It recalls Mukherji's technique. Except that Malaviya's litany of riots, the portrayal of an immense conspiracy by Muslims and the British underlines the immediacy of this need. The prospect of a long-term, peaceful competition with Muslims that was offered in *ADR*, has completely disappeared.

In the course of 1925, one of the few anti-communal newspapers the *Mohammadi*, commented that cases of abductions had started to proliferate only after the formation of the Sangathan movement.²⁰ Undoubtedly the figure of the threatened woman has its advantages. The

election of woman as signifier and index of Muslim 'oppression', makes the very presence of the former a source of anxiety, which can only be constant and omnipresent. The figure of the woman as a potential site of outrage carries the fear of the Muslim into every home, consequently strengthening the drive for mobilisation. This representational process is accelerated by the print media of that period. Already during the Jamalpur riots, an important way of stimulating feelings of outrage was by carrying grossly exaggerated stories of abductions of Hindu females. The difference in the representations of the 1920s is that newspapers publicised stories that showed Hindu women abducted by Muslims in non-riot circumstances. Secondly, these women tended to be wives and not widows. These reports were normally small, but regular in frequency. Moreover they formed, as it were, satellites to some major sensational reports, such as the Barodasundari case, that had occurred in Rangpur in 1923, but which was kept alive as news through detailed reporting on the state of this case in the law courts even in 1925.⁶¹ It may be observed that gender-related issues were a major stimulus for early nationalism too, especially that of the Age of Consent bill agitation of 1891, which involved a mass movement for protecting the complete control of Hindu males over the sexual life of their wives. A problem with the earlier discourse was that it had to reject all signs of marital affect in favour of its assertions.⁶² The advantage here is that Hindu defence of their wives against a lusting Muslim introduces space for domestic affection to be reaffirmed.

The emotional physiognomy of this image indicates a more intimate threat from the Muslim than in the widow issue. Moreover it suggests a violation of mutual respect for the others' codes of domesticity: it signifies betrayal.⁶³ We may recall that the Muslim presence in Mukherji did not interpenetrate with the Hindus: its threat was an external one, as if it were a separate country, generating resources internally, to take over the Hindus. The difference between these two images corresponds also to the changed political circumstances of Hindu-Muslim relations. The NC/K was the first self-consciously joint Hindu-Muslim mass movement in the history of our sub-continent. Its symbol was (and still remains) the spectacle of Swami Shradhanand addressing a congregation at Delhi's Jaina Masjid in 1919. At the same time, the movement popularised the notion of the country as a federation to which even leaders like Lajpat Rai subscribed.⁶⁴ The effect of this was to locate the Muslim as an 'insider' to Nationalism—in sharp contrast

with the Swadeshi agitation, where the Muslim was excluded by the Hindu-oriented inheritance of nationalist discourse. Additionally, this inheritance was given a longer life in Bengal by Das' Bengal Pact designed to establish a stable alliance between Hindus and Muslims. Its impact is palpable in Bisi, whose explicit reference point, despite displays of aggression, remains that of making the pact workable. It was this discourse of mutuality that had to be broken, and the figure of the threatened woman provided the most potent instrument to do this.

IX

The trope of the census gains flexibility over time. Its qualities in this regard lie not only in allowing itself, firstly, to be used in an additive capacity (Bhattacharya), and secondly, its order of explication to be altered (as in the 1920s); but equally, in permitting the new bits attached to it their own independent significance. In the 1920s, the 'Threatened Woman' theme is felt to be so crucial, that it spawns its own organisation, the Women's Protection League. The reach of this new rhetoric can be seen in the changing attitudes of Chittaranjan Guhathakurta, a Swadeshi hero who had been beaten up by the police at the Barisal Conference in 1906. He was one of the few who openly criticised the *Suddhi* movement as anti-Muslim.⁶⁵ Three years later, he blithely delivered speeches calling for setting up self-defence committees at meetings of the Women's Protection League.⁶⁶

As I have implied, the Threatened Woman theme is more suited to the demands of mass communalism than the Census. A self-evident problem with the census concern is its baggage of statistics and fairly elaborate explications. It possesses a certain heavy, 'academic' air, which restricts its broadcast to pamphlets and speeches in gatherings of the politically literate. But in this period when mass politics had entrenched itself (not confined to 'peak' moments like the Swadeshi), political messages demanded an immediate receptivity. The surprising thing is that the 'census' does not wither away in these unfavourable circumstances. It adapts itself.

Interestingly, it is Mukherji who provides direction again. This lies in the invention and use of the phrase, 'the dying race'. The phrase 'packages' Mukherji's argument, detaching it from the elaborateness of the explication, without surrendering the pressure of fear and anxiety. This allows it to be used like a slogan, which through sheer rhetorical brevity, insists on immediate attention. Not surprisingly, at two important points in his life

Shradhanand writes books with titles that proclaim the need of 'saving', 'the dying race'.⁶⁷ Further, the retention of the emotional at the cost of the mathematical (already partially accomplished in the changeover from relative to absolute decline), allows the numerical aspects of the concern to be used freely. Thus for instance, Piyush Ghosh claimed it would take 400 years for the Hindus to disappear,⁶⁸ Ray in Faridpur identified it as 200-250, while Jagatguru Shankaracharya in a Mahasabha meeting at Nasik warned it would take merely a century!⁶⁹ Undoubtedly the conversion of the 'census' into a fully grown, popular communal knowledge, increases its flexibility even more drastically (without losing the authority of statistics), allowing much bigger effects to dramatise anxiety.

Further, the 'census' insinuates itself much more easily into related interests. In a public meeting held at a rice mill at Ultadinghee, an industrial suburb of Calcutta, Pandit Devratan Sarma, secretary, Hindu Mahasabha asserted that Hindus had physically and numerically degenerated. He then reportedly proclaimed: "Now if so deplorable was the condition of individuals, what could be expected of the nation composed of such weaklings? So when calamities like that of Kohat, Saharanpur, Malabar and Ajmer befell them, they were defenceless..."⁷⁰ The 'census' gathers new unstated implications: the Hindus could no longer resist the Muslims physically and in turn they were dying in greater numbers because of physical liquidation by Muslims. We come here, as close as we can possibly get, to the use of the 'census' as a battle-cry.

It is the notion of the threatened male body that permits this unmediated connection between Hindu numbers and riots. This recalls the sub-text of Mukherji's preoccupations, though it is necessary to remind ourselves that when he talked of the need for training, it was applied to the structure of morals and motivations on which rests his idea of Hindu subjectivity. The 20s see a preoccupation with the trained male body. After witnessing a display of physical exercises in a club, Piyush Ghosh declared: "Bengalees as a nation were degenerating and were a dying race. Physical culture was the only remedy to this race-degeneracy."⁷¹ His newspaper regularly carried articles that preached the virtues of physical fitness. A top level national leader like Lajpat Rai exhorted his audience to be like Arjuna as he faced his beloved enemy, Bhishma.⁷²

The defenceless female body is counterpointed by the necessity for a trained male body; both dramatise the necessity for conflict. And within this vortex of bodies is located the anxiety of Hindu numbers,

which triggers off fears of low caste breakaway. There are not only displacements involved here. As a matter of fact nothing is ultimately repressed. The position and nature of each theme is qualified by the addition of other ones, drawn from different points of time and brought together in the 1920s to produce a gigantic network that is as much an ideology as a call to physically inflict one anxieties on an enemy, that is needed for the self to be created in the first place.

X

In concluding it is obvious that we need to consider the implications of this network of common sense a little more. I have already mentioned Gramsci's notion. The precise definition is as follows: "When one's conception of the world is not critical and coherent but disjointed and episodic...". He further elaborates this as "a conception of the world mechanically imposed by the external environment".⁷³ Two implications follow. The one that Gramsci dwells upon is that it is not actively and critically acquired but remains a passive inheritance from more elaborated, unitary systems of thought (to the extent that 'traces' of 'high' philosophy⁷⁴ are absorbed: common sense also consists of other inherited ideas, possibly even 'Stone Age elements'.⁷⁵) The second that can be deduced and which I will focus upon is that such a structure of consciousness cannot interface with organised politics.⁷⁶

Much of what we have seen so far of communal common sense does not tally with Gramsci's characterisation. The crucial difference is its organised and active 'life'. This not only refers to its propensity for orchestrated articulation. In this connection, it will not be out of place to mention that the footnotes I have provided to demonstrate the shift to the mass appeal of the 'dying race' (in place of statistical elaboration) trope are drawn predominantly from the history of a single month—which preceded the Calcutta session of the Mahasabha in 1925: obviously common sense lends itself to be used for organised mobilisation. The less dramatic, but more important instance of this facet is that it possesses its own principles of structuration. It may be remarked that the discursive power of Hindu communalism, as we have seen, does not spring exclusively from single texts or even a chain of them, as from the swift creation of a popular network of certain tropes, themes, structure of apprehension and reform, at the heart of which functions a single, mobile trope to provide the necessary ideological orientation. And this produces a formation of immense potency and amazing flexibility. For it constantly ac-

quires new meanings, whole traditions to itself, producing from its formative moment a web of thought that ranges from stereotypes to statistical and sociological analysis.

But our reading also indicates how communal common sense hides its ideological orientation, making an existential statement of its ideological position; allowing itself thereby to permeate contrary modes of thought. Most of all, what it possesses is credibility.

Gramsci's definition of the disjointed, internally contradictory nature of common sense will be of help here to understand this phenomenon. Communal consciousness not only enters into contradictory relationships, as in *Gora*. If one were to also look at the different themes that make up the communal consciousness we have examined (e.g. dying Hindu/powerful Muslim, caste division, abducted widow/wife, threatened male body), without taking into account the history of interconnections, then one is bound to be struck by an impression of random and disjointed impulses. And in the articulation of these there need not be a necessary self-consciousness of the linkages. In this lies its authenticity. After all the freedom to articulate random views is also tantamount to experiencing oneself as removed from all unidirectional, and for that reason, partisan discourses. The disjointedness of common sense naturalises ideology by providing a form of thought that does not encourage a testing of orientations, precisely because questions of interestedness are made redundant. The credibility that accrues from this location, I suggest, is responsible for the ease with which communal elements percolate, reorient or appropriate. The apparent lack of any distinct ideological or political affiliation permits its imperatives to even seem as universally praiseworthy as something like altruism.

It is doubly important for communal ideology to take its credibility for granted, in other words, in preventing critical examination of its assumptions, for its signifiers are condemned to constant change. Contrary to the assertions of some contemporary commentators who argue for the purely discursive nature of identity formation,⁷⁷ it may be recalled that Hindu communal discourses in this paper are greatly shaped by the imperatives of displacement and reinscription of social tension spots, its choices in this matter being determined by alterations outside its control. Its dependence on changing correlations of political and social forces, as well as the discourses of others, necessitate constant change both in the selection and combination of signifiers, as well as in the significance they

occupy in varied approaches at different points of time.

But this also means that despite the camouflage of common sense, communalism is accountable to those who have no direct stakes in this world-view. It is no coincidence that Manindranath Mandal not only includes Muhammad in his pantheon of great reformers, but does not also refer at all to the need to contest Muslims, even though he imbibes many of the key concerns of Hindu reform that pertain to altering caste relations. It may be remembered that Mandal represents one of the possible points of entente between the high and low castes. By 1932 however, there is open belligerence towards the Mahasabha. The Pabna Depressed Classes Association, in demanding separate electorates, stigmatised the Provincial Hindu Sabha as an upper caste organisation, disavowing any effort to co-operate with them.⁷⁸

This does not imply that one can presume on social boundaries to determine those of the discursive: elements or even constellations of communal concerns may spill over into other groups, even if they do not yield organisational results at all points of time. The fundamental point here is that the case of communalised common sense indicates that popular consciousness is not only differentiated, but that there exist contestations within it. Studies of popular consciousness are normally carried out by those who do not belong to the 'popular' social sections, and unfortunately they are either (patronisingly) celebratory or dismissive: in either case they retain the marks of distancing which their society invests them. Popular consciousness is thereby erected as a monolith, evacuated of the changes of history, of the wealth of forms and structures of perception they possess.⁷⁹

It is possibly Gramsci who makes the decisive break here. He observes, "...there is not just one common sense, for that too is a product of history and a part of the historical process", and says elsewhere: "Every social stratum has its own 'common sense'".⁸⁰ The possibilities of mutual conflict between different formations of common sense, that we can read into Gramsci's definition is even more crucial in the present case. Common sense, as Gramsci states, is a site for multiple identities⁸¹—which makes it more urgent for identity-based ideologies to attempt a formal appropriation of common sense, in order to stabilise the singleness of a particular identity. That identity formation under the aegis of Hindu communalism has not been able to overcome the inherently unstable coalition of other identities subsumed by it, is a comfort, although it is not one we can take for

granted. More than anything else, it still leaves us with the problem of accentuating the necessary²² pluralism of identities by an ideological framework, that does not seek self-empowerment by provoking fear of the Other.

Notes

[This paper would have been impossible without the help of Sumit and Tanika Sarkar. My debt to them would be impossible to recount by footnotes. I am also very grateful to Tapan Basu for a major insight, which I am sure he will spot here.]

- 13 A few months before the serialisation of *ADR*, it carried daily reports (at times extending to a full page) of the Titagarh riots

(which had occurred in January 1909). Further it had played a leading role in criticising Ameer Ali's petition (see below). All this was in addition to large serialised articles on Hinduism.

- 14 Deuskar (publication details given below) and Chakravarty (op cit) provide contradictory figures. The latter claims that 50,000 copies of *HS* were distributed free. I have opted for Deuskar's figures, since they seem more in keeping with the practical disposition of Mukherji.
- 15 Cited in Chakravarty, op cit, p 44.
- 16 The precedence of the Morley Minto reforms encouraged the demand for separate representation. A Namasudra resolution gave the following reason: "though our religious rites and their observances and social customs are similar to those of high castes Brahmins, we have not the slightest connection with any of the Hindu communities." Sekhar Bandopadhyaya, *Social Mobility in Bengal in the Late Nineteenth and in the Early Twentieth Centuries*. (Ph D Thesis, Calcutta University, 1985), p 401.
- 17 Lajpat Rai's 'The Depressed Classes' (op cit) appeared only a month after the publication of *ADR* in *The Modern Review* in July 1909, and provided similar recommendations.
- 18 Bandopadhyaya, op cit, p 424.
- 19 *ADR* quotes Lord Morley's reply to Ameer Ali's petition, which typically encourages initiative from the latter by a non-committal attitude: "I submit it is not very easy [to carry out the exercise of separating out the low castes] and I have gone into the question very carefully to divide these lower castes and to classify them."
- 20 Sumit Sarkar, *The Swadeshi Movement in Bengal 1903-1908*, Peoples Publishing House, New Delhi 1973, pp 135-36. The Boycott movement was practically over in Calcutta by 1907, *ibid*, p 145. Highlighting the general failure was the parting of ways between the Moderates and Extremists in 1908.
- 21 A recent article by Tanika Sarkar has explored how in the 19th century, conjugality represented the only source for male Hindu control (and therefore 'autonomy') in a society that was increasingly being experienced as under the stifling control of a foreign power. 'The Age of Consent Rhetoric: Resisting Colonial Reason and the Death of a Child Wife', forthcoming.
- 22 Mukherji's citation of Hunter states how Muslims are no better than 'a mongrel breed of circumcised low caste Hindus'. After returning to their fundamental doctrines through their Reform movements, they had become dangerous, since, "a return to Mahomedan first principles means a return to a religion of intolerance and aggression", guided by the aim of "forcibly converting the world".
- 23 Tanika Sarkar, op cit. Although it may be added that there is a reaccentuation in Mukherji of an older strain of thought. For Mahesh Chandra Deb, one of the first of those who argued for a reform of the condition of Hindu women, an important im-

perative was: "...the most trying evil which they are obliged to undergo is the perpetual celibacy to which they are subjected. Many of them are young and beautiful and unable to subdue nature give way to those temptations which beset them on every side". However the consequent sin is that of killing illegitimate infants; it is not related to Muslims. 'A Sketch of the Condition of Hindoo Women', *Awakening in Bengal in Early Nineteenth Century (Selected Documents)*, Vol I, Goutam Chattopadhyaya (ed), Progressive Publishers, Calcutta, 1965, p 104.

- 24 Maculay, for instance, proclaimed: "The physical organisation of the Bengalee is feeble even to effeminacy....His pursuits are sedentary, his limbs delicate, his movement languid." Cited in Leonard A Gordon, *Bengal. The Nationalist Movement 1876-1940*, Manohar Book Service, Delhi, 1974, p 6. Vivekananda was to exclaim that the basic problem with Indians was 'physical weakness', which was responsible for one-third of their problems. 'Vedanta in its Application to Indian Life', *The Complete Works of Swami Vivekananda*, Vol III, Mayavati Memorial (ed), Advaita Ashram, Calcutta 1964.
- 25 The Jamalpur riots were associated with abductions from the very beginning; disturbances were apprehended during the 'ashtami snan' festival which involved ritual bathing by Hindu women. *Amrita Bazar Patrika* is specially mentioned as leading the province-wide campaign to highlight charges of mass violations of Hindu women, which were found to be untrue on investigation. What is interesting is the district magistrate's report which lists complaints filed by 'chaukidars' (watchmen), all of which feature allegations of abductions of Hindu widows. These were again found to be false. West Bengal State Archives, Pol Confidential, No 514 of 1907.
- 26 Thus Deb, for instance, in the passage cited above talks first about the 'utter misery' of the widows, op cit.
- 27 It is significant that the census states that out of a total of 949,144 persons in Calcutta and its suburbs, 615,419 were Hindus and 286,576 Muslims. The majority of the population (about 68.1 per cent) were immigrants—but 52.2 per cent of the 68.1 per cent came from Bengal itself, led by the 24 parganas. J R Blackwood, *Census of India, 1901, Calcutta, Town and Suburbs, Part IV*. Obviously neither set of figures could service Mukherji's arguments, which accounts for his reverting to impressionist calculations. The interesting thing here is of course the subtle opportunism of the argument that feels free to insinuate its inventions into authoritative citations.
- 28 Bandopadhyaya shows how the Namasudras started to take to settled agriculture and profitable occupations in the 19th century, in the latter half of that century Guruchand who became their ideologue and leader, produced an anti-brahmanical ideology that included elements of Vaishnavism, Christianity and a strong

moral imperative to self-improvement, op cit.

29 Mukherji is thus provided the opportunity to confidently make outrageous assertions, like the Muslims were more advanced in education than the Hindus.

30 One such resolution read "... [it is] simply owing to the dislike and hatred of the Brahmins, the Vaidyas and the Kayasthas that this vast Namasudra community has remained backward; this community has therefore not the least sympathy with them and with their agitation". Bandopadhyaya, *Social Mobility...*, op cit, pp 356-57.

31 Namasudras and Muslims were engaged in riots in Khulna in 1889. Bigger riots broke out between them in 1911, 1923-25 and 1938. In 1908 however they made a common cause against the upper castes, being politically aligned in their opposition to the Swadeshi, ibid, pp 345-48. Further, while referring to the riots of 1906, Mukherji mentions the attack on the Rajbansis (and Hindu women, another ideal figure of Muslim 'oppression', as we shall see), but suppresses the antagonism articulated against the upper caste Swadeshi volunteers by low castes.

32 Hiteshranjan Sanyal, *Social Mobility in Bengal*, Papyrus, Calcutta 1981, p.36. There were of course powerful jati caste groups, such as the Kayasthas, who from the 19th century began to claim they were Kshatriyas.

33 Thus Vivekananda proclaimed: "The ideal at one end is the Brahmin and the ideal at the other end is the Chandala, and the whole work is to raise the Chandala up to the Brahmin." However Vivekananda recommended that this process should be a gradual one since he did not want it to introduce antagonisms within Hindus. Further, he did subscribe to the relative superiority of brahmins, stating that they had produced more people imbued with brahminhood than other castes. 'The Future of India', op cit, p 295.

34 Sarkar, *Swadeshi...*, op cit, p 107

35 U N Mukherji, *Hindu Samaj*, Srikali Ghosh, Calcutta 1910

36 There is a slight inaccuracy here, since it was 'pathshalas' (institutions of primary education) which provided the model for the Bell system, rather than tols, which were centres of advance study.

37 Mukherji derives this notion from 'adhiakar bheda', which permits the use of a multiplicity of paths to attain absolute realisation. It was normally used as a justification for caste (the rationale being that the duties of each caste was its 'path'). Ramkrishna, the reformer-divine of the latter half of 19th century Bengal, democratised the implications through individual example. The famous one, often cited by Vivekananda, was that of doing the 'untouchable' work of cleaning latrines. What we have in HCC, however, is another form of individuation of adhiakar bheda, which transforms it into a pluralism that implies a freedom to choose one's beliefs, irrespective of social hierarchy, or the compulsion of ultimate realisation.

38 Sakshina Ganesh Deostkar, *Bangiya Hindujon Ki Dhangshammukhe?*, 1910, Calcutta. Other details are given in Chakravarty, op cit, p 35.

39 Op cit, pp 36-42.

40 Bandopadhyaya, op cit, p 424

41 Manindranath Mandal in his pamphlet quotes a letter from Das to the effect that Mukherji and he had been struggling unsuccessfully for 10 years in the caste reform movement *Bangiya Jana Sangha. Bengal's Peoples Association* ('Sanghashakti Kallai Jugey'), Satadalkanti Mandal, Khajuri village, Midnapore and Calcutta, 1923

42 Satyajit Ray's film by the same name, where the plot brings Apu, the child of a slow paced rural society and a poor brahmin father, to the sense of possibility that characterises Calcutta.

43 Manindranath Mandal, *Banger Digindranarayan*, Sannyasicharan Pramanik, Burdwan, 1926.

44 Digindranarayan Bhattacharya Vidya-bhushan, *Jatibhed*, Serajegunje. The author, f pub 1912, rpt 1924. All citations are drawn from this edition.

45 A Namasudra meeting was held in 1917 (attended by 30 representatives, elected by two million Namasudras) which drew attention to zamindari oppression, declaring that any additional powers for a few leaders would "make the future progress of the backward classes impossible". It approved of the setting up of the committee, and declared its loyalty. Bandopadhyaya, op cit, p 460. Another conference in 1918 demanded 'communal representation' (following the Lucknow Pact model), ibid, p 234.

46 For extended discussions of the social impact of this belief, see Kumkum Sangari, 'Mirabai and the Spiritual Economy of 'Bhakti'', *Economic and Political Weekly*, July 7, 14, 1990 and Sumit Sarkar, 'Kali Yuga', 'Chakri' and 'Bhakti': Ramkrishna and his Times', *Economic and Political Weekly*, July 18, 1992.

47 Mandal informs us that he took the initiative to mobilise for a meeting of representatives of namasudra, rajbansi, poundra khattriya, jhalla malla (khattriya), saha, mali among other low castes, at Calcutta in February of 1922. It was decided to start

NEW BOOKS

POLITICS IN INDIA : 1992-93

C.P. BHAMBHRI (JNU—New Delhi)

81—85402-30-2 xii + 308 pp Rs 350 (H.B.) Rs 130 (P.B.)

Many significant political issues and ideologies have been analysed to understand the dialectics of Indian politics. The most dramatic issue which dominated the politics during this period was the Temple-Mosque controversy and this issue became the agenda of politics. Its short-term & long term implications for the political process have also been analysed.

ECONOMIC DEVELOPMENT : THE CHALLENGES

K.S. RAMACHANDRAN

81—85402-27-2 viii + 184 pp Rs 215

The massive financial irregularities have posed challenges to the development process. With the Government on a correction course, it will have to depend increasingly on banking sector for support and with fiscal restraint banks have to shift from a social to a commercial orientation.

Political Factor, Financial Sector, Securities Scandal, International Issues, Trade Issues, Management and other related issues have been discussed in the book.

AS THE MIND UNFOLDS

ISSUES AND PERSONALITIES

PROF. MADHU DANDAVATE

81—85402-19-1 xx + 322 pp Rs 350

Four decades writings of an eminent social and political analyst.

- an umbrella organisation of the low castes. Mandal spells out details of his encounter with Mukherji and Bhattacharya and dedicates his pamphlet to the latter. *Bangiya...*, op cit.
- 48 Mandal, *Banger...*, op cit, reports that Bhattacharya was attacked by the orthodox brahman sabha, spearheaded by his own pupil clearly indicating the extent of animosity, that could even make an orthodox brahmin publicly challenge his teacher!
- 49 A comprehensive analysis of the underlying tenets of the 'kirtan' is available in Hiteshranjan Sanyal, *Bangla Kirtaner Itihas*, K P Bagchi and Company, Calcutta 1981.
- 50 Rabindranath Tagore, *Rabindra Rachanabali*, Vol 9, West Bengal Government, Calcutta, 1961, p 310.
- 51 The preoccupation with the census has a long history in Punjab, starting from the Arya Samaj's objection to naming themselves as Hindus in 1883, followed by discussion of the alleged problem of declining Hindu numbers in Jammu and Kashmir in the 1890s. Jones, op cit, pp 86-88. Chand's later article, 'Self-Abnegation...', dwelt on the decline of Hindu numbers as an index of Hindu weakness and Muslim strength, and advocated the setting up of party devoted exclusively to Hindu interests, *ibid*, p 90.
- 52 Richard Gordon, 'The Hindu Mahasabha and the Indian National Congress, 1915 to 1926', *Modern Asian Studies*, 9, 2, 1975.
- 53 Citations from these three texts are drawn from Saileshnath Sharma Bisi, *Hindu-Samajer Bartaman Samashvu*, Address of the Reception Committee at Serajegunje Provincial Hindu Mahasammilani, Sir P C Ray, *Faridpur Pradeshik Hindu Sabha*, 2 May 1925, Bengal Chemical Press, 1925 and *Bangla Hindu Jatir Khoy o Tahar Pratikar*, Tangail Hindu Samaj Sanghrakshini, 1924.
- 54 This two-part article appeared in *Amrita Bazar Patrika* on April 10-11, 1925.
- 55 For instance, even as the Provincial Mahasabha at Faridpur (which Sir P C Ray addressed) was deliberating, a meeting of 2,000 Namasudras was being held nearby, to decide on conversion to Christianity. Piyush Ghosh, who tried to stave off this embarrassment was not allowed entry into the meeting! *Amrita Bazar Patrika*, May 3, 1925. On the other hand, the refusal of the Mahasabha leadership to extend caste questions beyond a point where they would anger the orthodox, led a radical Arya Samaji like Swami Shradhdhanand to resign from the organisation. Jordens, *Shradhdhanand...*, op cit, pp 154-57.
- 56 An excellent discussion of Vidyasagar's reforms is available in Asok Sen, *Ishwar Chandra Vidyasagar and His Elusive Milestones*, Riddhi India, Calcutta, 1977.
- 57 Op cit.
- 58 The *Saryagrahi* claimed, 'As a matter of fact some of these incidents are due to Hindu social usages, Hindu widows often entering into illegal relations with Muslim males. When such an incident gets exposed Hindu social leaders flatter the blame on the untouchable despised Muslims and try to get him into trouble'. February 28, Report on Native Newspapers and Periodicals, National Archives of India. I am grateful to Indrani Chatterjee for drawing attention to this preoccupation in an unpublished paper, where she demonstrates it as a form of rejection of social bondage by Hindu widows.
- 59 Cited in the *The Indian Annual Register*, 1923 Vol II, H N Mitra (ed), The Indian Annual Register Office, Calcutta 1925, pp 130-31.
- 60 *Mohammadi*, March 13, Report on Native..., op cit. Its deduction gained substance from the results of an enquiry appointed by the authorities, which stated that between 1926 and 1928 incidents of abduction of Hindu women had been rising, but that number of Muslim offenders in cases where victims were Hindus was not 'unduly higher' than those of Hindu offenders. No 535/29, Government of Bengal: Political, West Bengal State Archives.
- 61 Significantly, the first of this wave of such cases occurred in a village called Charmanair in the Faridpur district, and those responsible were policemen; the women who were violated included Muslim widows, *Amrita Bazar Patrika*, June 17, 1923.
- 62 Tanika Sarkar, op cit.
- 63 A typical story was one of Sheikh Issaq, who rented a house at Tollygunge. His subsequent actions are represented in the following lurid plot. "The accused having an eye on the handsome girl made himself very thick and thin [sic] as a worthy neighbour with the father" *Amrita Bazar Patrika*, April 2, 1925.
- 64 Thus even in 1925, Rai declared in Calcutta that they did not want a 'Hindu Raj' and stated that, "The correct thing for us to do is to strive for a democratic raj in which the Hindus, Muslims and the other communities of India may participate as Indians and not as followers of any particular religion", although his speech was all about strengthening the Hindus, *Amrita Bazar Patrika*, April 12, 1925.
- 65 *Amrita Bazar Patrika*, August 9, 1922.
- 66 He reportedly claimed that unless they defended their women, Bengalis would be condemned to destruction, *Amrita Bazar Patrika*, April 25, 1925. A similar life-story can be seen in the case of Krishna Kumar Mitra, who was a patron of the Anti Circular Society, which had openly kept away from the Shivaji Utsav (see above) because they felt it would be hurtful to their Muslim members. In the 1920s, he emerged a major leader of the Women's Protection League.
- 67 Ten days after he established the Bharatiya Hindu Suddhi Sabha in 1923, Shradhdhanand issued an appeal entitled, 'Save the Dying Race' The second occasion was when he wrote *Hindu Sangathan, Saviour of the Dying Race* in 1924, after his retirement from Mahasabha activities. It was published in 1926: Jordens, *Shradhdhanand...* op cit, p 131 and pp 151-57.
- 68 'The Best Way...', op cit.
- 69 *Amrita Bazar Patrika*, December 2, 1925.
- 70 *Ibid*, April 7, 1925.
- 71 *Ibid*, April 28, 1925.
- 72 *Ibid*, April 8, 1925.
- 73 'The Study of Philosophy', *Selections from the Prison Notebooks*, eds, and translated by Quintin Hoare and Geoffrey Nowell Smith, International Publishers, New York f pub 1971, rpt 1983, pp 323-24.
- 74 *Ibid*, see footnote on p 326.
- 75 *Ibid*, p 324.
- 76 Most of all, common sense is characteristic of subaltern consciousness (although indications exist that Gramsci visualises a more complex interrelationship with 'high' traditions than the simple one of qualitative distinction).
- 77 In a recent essay, Chantal Mouffe argues, "The social agent is constructed by a diversity of discourses among which there is no necessary relation...". 'Citizenship and Political Identity', *October* 61, Summer 1992, Massachusetts Institute of Technology Press. Obviously, without evaluating the social referents of such discourses, neither the consent given to the latter, nor the ideological underpinnings of different kinds of identity can be explored.
- 78 Bandopadhyaya, op cit, p 537.
- 79 The Introduction to a recent collection of essays on common sense states, "An appeal to common sense is essentially an act of faith, the belief in the fundamental similarity of reasonableness of human beings". Beside putting all of common sense under a single rubric, what this enquiry ignores, is that while the notion of common sense is always appealed to as a consensual authority, the actual configuration of elements that make up a particular common sense formation may militate against a consensus even in the act of producing a collectivity. Although Siegwart Lindenberg's article, 'Common Sense and Social Structure: A Sociological View' does concede that it is not possible to achieve 'communality' in a society governed by power, this obviously rules out his belief that common sense is conceived as rooted in the 'uniformity' of human experience: the bias for the consensus approach however does not permit him to dwell on the implications of this irony. *Common Sense: The Foundations For Social Science*, Frits van Holthoon and David R Olson (eds), University Press of America, Lanham, London 1987.
- 80 Op cit, pp 325-26.
- 81 Common sense makes "one belong simultaneously to a multiplicity of mass human groups", op cit, p 324.
- 82 There is obviously a disagreement here with some suggestions in Gramsci that common sense, that is the plurality of identities, can be replaced by the unitary orientation of 'philosophy'. What seems a preferable exercise is to study how freedom to range across multiple identities can be assured, without losing the urge to pull their heterogeneity together for enacting change necessary for redistributing different forms of power.

BOMBAY BRANCH

Schedule 17—Notes on Accounts

I. Principal Accounting Policies

1. General

The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country.

2. Transactions involving Foreign Exchange

- Monetary assets and liabilities have been translated at the exchange rates prevailing at the close of the year. Non-monetary assets have been carried in the books at the contracted rates.
- Income and expenditure items have been translated at the exchange rates ruling on the date of the transaction.
- Outstanding forward contracts have been revalued at the forward exchange rates prevailing at the close of the year.

3. Investments

- The investments in approved securities are classified into "Permanent" and "Current" investments.
- Permanent investments are valued at cost.
- Current investments are valued at lower of cost or market value. In the absence of market quotation, carrying cost is adopted consistently.
- The broken period interest on purchase/sale of securities is treated as capital outlay/receipt.

4. Advances

- Provision is made in respect of identified doubtful advances to the satisfaction of auditors.
- Further provision is made for doubtful advances:
 - in respect of advances with outstanding less than Rs. 25,000 at 2.5% on an *ad hoc* basis;
 - in respect of other advances based on Management's estimate of potential exposure.
- Provisions in respect of doubtful advances have been deducted from advances to the extent necessary and the excess has been included under "Other Liabilities and Provisions".
- In consortium advances, the accounts are classified as per the decision of the lead bank.
- Advances are shown net of bills discounted with the Financial Institutions.
- Interest on non-performing advances are classified as per the norms prescribed by the Reserve Bank of India and is not accrued.

5. Fixed Assets

- Fixed assets are accounted for at their historical cost.
- Depreciation is provided for on the written down value method at the rates prescribed in Schedule XIV of the Companies Act, 1956.

6. Staff Benefits

The liability for gratuity benefits to staff has been calculated as per the actuarial valuation and paid to the approved Gratuity Fund of the Bank.

7. Net Profit

The net profit disclosed in the Profit and Loss Account is after:

- Provisions for taxes on income in accordance with statutory requirements.
- Provisions for non-performing advances.
- Provision for Head Office administration expenses for the year as advised by the Head Office.
- Other usual or necessary provisions.

II. Changes in Accounting Policies

- The entire investments in earlier years were valued at lower of cost or market price. During the year, the "Current" Investments continue to be valued at lower of cost or market price and the "Permanent Investments" have been valued at cost. Thus, there is a change in the method of valuation of "Permanent Investments" from "lower of cost or market price" to "cost". No provision is considered necessary for the difference at the year end between the book value and the market value of "Permanent Investments" of Rs. 4,693 (000's) since these investments are intended to be held upto maturity.
- The method of income recognition in respect of non-performing advances and provisioning thereof has undergone a change during this year due to norms prescribed by the Reserve Bank of India.
- Foreign currency forward contracts have been translated at the forward rates instead of spot rate as in the previous year.
- The impact of these changes on operational results for the year is not material.

III. Revenue and Other Reserves

- Include Head Office Reserves of Rs. 33,255 (000's) which represents funds remitted by Head Office/retained from repatriable profits to meet the cost of acquisition of residential premises, deposit/advance licence fee of Bank premises at Bombay, etc. as per Reserve Bank of India's guidelines.
- Deletion from reserves of Rs. 506 (000's) represents transfer from investment allowance reserve and is included in addition to General Reserve.

IV. As of 31st March 1993, the bank's risk weighted capital ratio was 9.93%.

V. The previous year's figures have been regrouped/rearranged wherever necessary.

**Auditors' Report on the Accounts of the Bombay Branch of
Abu Dhabi Commercial Bank Limited**

We have audited the attached Balance Sheet of the Bombay Branch of Abu Dhabi Commercial Bank Limited (incorporated in the United Arab Emirates with Limited Liability), as at 31st March 1993 and the Profit and Loss Account of the Bombay Branch of the Bank for the year ended 31st March 1993 annexed thereto.

The Balance Sheet and Profit and Loss Account have been drawn up in accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of Section 211 of the Companies Act, 1956.

We report that:

1. we have obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purposes of the audit and have found them to be satisfactory;
2. the transactions which have come to our notice have been, in our opinion, within the powers of the Bombay Branch of the Bank;
3. in our opinion, proper books of account as required by law have been kept by the Bombay Branch of the Bank so far as appears from our examination of these books;
4. the Balance Sheet and Profit and Loss Account dealt with by this report are in agreement with the books of account;
5. in our opinion, and to the best of our information and according to the explanations given to us, the Balance Sheet and Profit and Loss Account, read with notes thereon particularly, Note II regarding changes in accounting policies give the information required by the Companies Act, 1956, in the manner so required for Banking Companies and give a true and fair view of the state of affairs of the Indian Branch of the Bank as at 31st March 1993 and of its profit for the year ended on that date.

Paradox of Competitiveness and Globalisation of Underdevelopment

Kalyan K Sanyal

Probing the theoretical content of the concept of competitiveness, the author argues that it has a very deceptive appearance and as a result is easily misunderstood. Hidden under its apparent simplicity there are many complex facets, failure to recognise and take account of which may result in the wrong kind of globalisation. Given the structural characteristics of a typical less developed economy, it is essential that the notion of competitiveness is grasped in its full complexity before an appropriate reform package is presented. Unfortunately, there are reasons to suspect that this awareness is particularly lacking in the current Indian context.

He said 'I hunt for haddocks' eyes
Among the heather bright,
And work them into waistcoat-buttons
In the silent night.
And these I do not sell for gold
Or coin of silvery shine,
But for a copper halfpenny
And that will purchase nine.

—Lewis Carroll, *The White Knight's Song*.

IN justifying the structural reforms that are being introduced in the Indian economy, the advocates of these reforms have brought the question of competitiveness to the centre of the discussion. Their argument runs as follows. The Indian economy needs to be integrated to the world economy. Globalisation requires that the Indian producers be competitive in the global market. It is only through these reforms that they can acquire the competitiveness and therefore the reforms are essential prerequisites for successful globalisation. The word competitiveness has become almost a refrain for the chorus; whatever is being done is in the interest of competitiveness.

In this essay, I shall address the question of competitiveness in the context of an underdeveloped economy and try to figure out its implications for the globalisation strategy. What I want to make clear at the very outset is that it is not my purpose to offer a critique of globalisation as such. My purpose rather is to probe the theoretical content of the concept of competitiveness to point out that it has a very deceptive appearance and as a result is easily misunderstood. Hidden under its apparent simplicity there are many complex facets, and failure to recognise and take into account these complexities may result in the wrong kind of globalisation. Given the structural characteristics of a typical less developed economy, it is essential that the idea of competitiveness be grasped in its full complexity before the appropriate reform package is presented. Unfortunately, there are reasons for one to suspect that in the Indian context, this awareness is particularly absent.

DETERMINANTS OF COMPETITIVENESS

The notion of competitiveness is generally understood in terms of the price at which the seller offers his product in the market. He is competitive if his price is lower than the price charged by his competitors. To the extent that price depends on the cost of production, competitiveness in turn gets reduced to the ability to produce the commodity at a lower cost. In the global context, therefore, a country's competitiveness in certain lines of production means its ability to supply those products at a price that no other country can undercut, i.e., it can produce those products at a lower relative cost.

But looking at the question of competitiveness exclusively from the price and cost of production angle may be dangerously misleading, particularly so in the context of a less developed economy. Because the possible factors that may contribute to a lower cost of production are varied and many, and not all of them reflect the strength of the economy. On the contrary, it is the weakness of the economy that often manifests itself in an apparent cost efficiency. In a less developed economy, the very elements that constitute its underdevelopment sometimes provide the economy a competitive edge by allowing it to produce certain commodities at a relatively lower cost. Put differently, while the strength of an economy does get reflected in cost efficiency, the converse is not true. And if the analytical focus remains confined to mere cost comparisons and price advantage in the domain of the market, the complex nature of the determinants of costs remain out of sight. This may have far-reaching implications for the process of economic development. But before I elaborate along this line, let me take a quick look at how the mainstream theory of international trade has dealt with this problem.

Much of the traditional trade theory is devoted to seeking an answer to the question of what makes a country competitive

in certain products in the global market, i.e., what are the determinants of its cost efficiency? Ricardo's explanation located the basis of competitiveness in technological differences. According to the Ricardian notion of comparative advantage, competitiveness of a country is the reflection of its technology which permits it to produce a particular good at a lower relative cost. Different technology for Ricardo meant different climatic and environmental conditions which made each country a relatively more suitable place for the production of certain goods. What is more important is that competitiveness in the Ricardian theory is independent of whether the country has a technology that is superior/inferior in the absolute sense. Thus, a country may have a technology that is inferior compared to its competitor in all lines of production, yet it will be competitive in those goods in which its technological disadvantage is relatively less. To put it more rigorously, the Ricardian theory claims that even if a country is backward in every activity, it will still find at least one activity in which it can compete efficiently in the international market.

While technology does explain competitiveness in case of what the trade theorists call the 'Ricardo goods', it fails to provide an explanation of competitiveness in case of those goods for which the trading countries share the same technology, i.e., goods that are not location specific. A different line of enquiry within the mainstream theory has looked for a determinant of competitiveness in something other than technology. Known as the Heckscher-Ohlin approach, it identifies the relative availability of factors of production as having an influence on the relative cost of production. According to this approach, a country that has a large supply of one factor relative to its supply of other factors is said to be abundant in that factor, and the relative cost of production of the good which uses the abundant factor more intensively, other things

being the same, will be lower in that country, despite the fact that technology is identical across countries. The Heckscher-Ohlin explanation of competitiveness thus locates the determinants of cost efficiency in the structure of endowments.

These two explanations of competitiveness, however, do not exhaust the set of possible cases. It is a fact that a large part of the world trade flows occur among countries that are more or less similar in terms of both technology and the composition of endowments. The Ricardian and the Heckscher-Ohlin explanations are both inadequate for providing an answer to the question of what determines competitiveness in these cases. Recent developments in trade theory have looked for the answer in a number of factors such as the increasing returns to scale and product cycles.

As my chief concern here is the question of competitiveness in the context of less developed economies which are very different from their developed counterparts in terms of both technology and endowment structure, I shall confine the focus of the discussion to the first two determinants. What should be noted is that in both the Ricardian and the Heckscher-Ohlin theory, competitiveness is rooted in a set of initial conditions. It is seen as arising out of the state of technology or factor composition which are conditions a country starts with. Globalisation allows the country to specialise according to competitiveness and alter the division of labour but the alteration must take place within the same initial conditions. But once situated within the context of development, a tension arises between these theories of competitiveness and the content of the development process. In an underdeveloped economy, since it is these initial conditions that constitute its underdevelopment, competitiveness may be grounded in underdevelopment itself. On the other hand, economic development is radical transformation of these initial conditions. The process of development is meant to systematically undermine these conditions to create a new set of conditions within which self-sustained growth can occur. Thus, competitiveness grounded in underdevelopment gets eroded away as the economy develops. In other words, economic development erodes the basis of the competitiveness that an economy may enjoy simply because it is not developed. The implication of this is that if an underdeveloped economy globalises on the basis of such competitiveness, then the change in the division of labour that it entails has the tendency to be antithetical to

the development process—by reinforcing the initial conditions, it may in effect reinforce underdevelopment itself.

COMPETITIVENESS AND UNDERDEVELOPMENT

What is the nature of the competitiveness that arises out of backwardness? In exploring this question, I shall consider two broad classes in which the possible cases are likely to fall. First, consider the factor cost explanation presented by the Heckscher-Ohlin theory. The central feature of underdevelopment is the existence of a vast pool of surplus labour living in abject poverty. The wage rate at which these people offer their labour power is so low that it can make an entire range of activities competitive in terms of the relative cost of production, despite the fact that the technology used in these activities is much inferior compared to other countries. Not only can these activities stand the test of the market, they can even compete out similar activities in the developed countries. And if competitiveness is seen only from the price-cost angle, it will totally keep out of sight the fact that this cost efficiency, instead of reflecting the strength of the economy which development is supposed to generate, reflects its weakness that is associated with underdevelopment. It rests on poverty which is an antithesis of development.

What is not recognised in the popular understanding of competitiveness is that there may be an element of what is called 'distress sale' in the determinants of cost of production. What is more important is that it is not a mere special case that can be readily assumed away. In the case of a less developed economy, this element systematically permeates into the structure of costs and there is hardly any mechanism built into the market which can differentiate persistent distress sale from cost efficiency resulting from better technology and higher productivity. The market has a strong tendency to lump these fundamentally different cases together and treat them at par in its ranking. The important information that gets lost in the process is that while two activities producing a commodity may be equally cost efficient, they may have totally different content when judged in relation to the problematic of development.

Take, for instance, the carpet manufacturing sector of India or the garment sector of Bangladesh where imported cut cloth is sewn. Both these sectors are notorious for their use of child labour. Their competitiveness results largely from an infinitely elastic supply of child

workers who can be subjected to primitive labour processes. Yoking these children to these inhuman labour processes does not require coercion as it did in the case of slavery. But what is a better instrument of coercion than poverty? Ironically, the slaves, as it is well known today, thanks to the historians, were fed well by their masters because they were the latter's property. In today's market for child labour, the employer does not have to bother about the health and nutrition of the children he employs, for there is a huge pool of such children waiting outside the factory gate. The information that one gets about these labour processes makes one wonder about the relevance of the concept of efficiency wage in the context of these activities; the downward flexibility of subsistence consumption is simply amazing. Producers of many sophisticated goods in the developed countries have the final processing of these goods done in the less developed regions of the world. The basis of such vertical specialisation are cost calculations that explicitly take into account the existence of cheap unskilled labour in these regions. Even the standard textbooks on neoclassical trade theory clearly recognises that these cases do not reflect any genuine competitive advantage; they are a mere reflection of the concentration of poverty in certain parts of the globe.

The element of distress sale can influence the cost structure in a rather complex way. Production of a commodity requires many inputs which the producer has to purchase in the market. The producer may not be engaged in distress sale in the market in which he sells his product, yet distress sale may occur in any of the markets in which he purchases these inputs. It may occur in the labour market in which case the advantage accrues directly to the employer in the form of low wages, or it may occur in the market for other non-labour, material inputs where the sellers of these inputs may have to sell at a very low price. Again, the production of these inputs requires in turn another set of inputs including labour. Thus, the seller who sells an input to the producer of the final product may not be in a very weak bargaining position *vis-a-vis* the latter, but distress sale may still occur in any of the markets in which he purchases the inputs he needs. As one probes through these layers of production and exchange, one may find that the site at which the distress sale occurs is far removed from the production of the commodity whose competitiveness is being measured. Yet the cost advantage arising out of distress sale can transmit itself through all these layers

along the vertical spectrum of production to ultimately influence the cost structure at the final end of the spectrum.

Apart from distress sale, there is another type of competitiveness generated by backwardness. It is linked with the relationship between technology and the environment which is a widely discussed topic these days. Production of certain commodities requires technology that causes depreciation of the environment at a very high rate which not only affects the quality of life adversely but, in the long run, undermines the conditions of social production itself. As long as the producers are not made to pay for the damage, the environmental cost does not figure in the cost of production calculated by them. But strong preference for an unpolluted environment leads to the recognition of these externalities as cost borne by the society and in turn forces the producers to include them in their private cost calculations.

Now consider two countries, one advanced(A) and the other backward(B). Suppose B operates with a technology that is uniformly inferior in all lines of production compared to the technology A has access to. Furthermore, assume that the degree of B's technological inferiority is the same in all activities. That is to say that the cost of production (measured in terms of real resources) in B is x per cent higher than what it is in A for each and every good. In this case, the relative cost of production is the same in the two countries despite their technological differences and none enjoys any comparative advantage. There is thus no basis for any trade to take place. Trade however would have taken place if the degree of inferiority were different for different products in B; then B would have had comparative advantage, i.e., a competitive edge, in those goods in which it was relatively less inferior. Now if A has a stronger concern for the environment than B, then this asymmetry is likely to produce a comparative advantage for B in those lines of production in which the environmental cost is high, despite its general inferiority in terms of technology. To turn the coin over, A would in this case enjoy a comparative advantage in those lines of production in which such costs are low. And this pattern of competitiveness will stand the test of the market. If the task of deciding who produces what is left entirely to the judgment of the market, then B will devote more of its resources to the production and export of those goods which inflict severe damage on its environment, while A can safely engage in the production and export of 'environment friendly'

goods. Such specialisation involves high long run cost for B which may be unperceived now but may seriously thwart the development process in future. There is hardly any mechanism in the market that can differentiate such perverse competitiveness from genuine cost efficiency. On the contrary, the market has a strong tendency to support a very unequal distribution of the environmental costs. Its ranking, based exclusively on the private cost of production, would militate in favour of locating the production of 'dirty goods' in the backward regions of the world and the 'clean goods' in the advanced regions.

Indeed, it is possible to discover in the much discussed Dunkel Draft certain indications of the emerging international division of labour. If developed countries are to specialise in clean activities such as R and D, banking and insurance, leaving the unclean industrial activities to the NICs, then protection of patent rights and removal of barriers to trade in services are its essential pre-condition. Hence the Draft's thrust for the establishment of the intellectual property rights and free international mobility of services.

Colonial history has on record the enormous environmental costs that today's developed countries inflicted over centuries on their former colonies. The problems such as barrenness of land, soil erosion and recurring drought that haunts these regions today can to a large extent be traced back to the unrestrained and ruthless depredation of the natural resources by the colonisers for commercial interest. But while pointing an accusing finger to the past rulers of the colonies, one should not lose sight of a more important fact: even in the presence of independent nation states, location of production activities determined by the 'objective and impartial' forces of the market may entail the same type of economic order which will pollute one part of the global space to keep the other part clean. The law of supply and demand can indeed achieve what in the past was made possible by brute coercion.

OF GAINS AND LOSSES

It will however be totally wrong to take these arguments to mean that the claim that trade according to market based competitiveness leads to mutual gains is false. There is nothing contradictory between static gains from trade and loss in terms of development potential. Even when specialisation is based on competitiveness that is symptomatic of backwardness, rearrangement of production within the

same initial conditions does lead to an enlargement of the set of alternative consumption bundles that the country can have access to. Thus, when production of the 'dirty goods' expands, B gains in terms of real income, but what is important is that this gain may be at the cost of long-term development. If India and Bangladesh exports more carpets and garments, that will certainly generate more income, but this increase in income will be associated with an expansion of child labour and low wage-low productivity employment which precisely are features of backwardness that the development process is supposed to transform. In fact, such specialisation often produces interesting paradoxes. For example, if the hearts of the western consumers suddenly start bleeding for the children of a lesser god working in the factories of the third world, it may jeopardise the export of such commodities. Recently, campaigns in the west against products that use child labour and the attempt to force the employers to ensure the health and nutrition of the children have raised the fear that many such export industries will cease to be 'competitive'.

At this point I want to distance the line of argument I have pursued so far from the conventional radical analysis of north-south trade. The structuralist/neo-Marxist critique of free trade rests on two main arguments. One of these, associated with Prebisch, asserts that the relative price between primary and manufactured products has a tendency to move against the former in the long run.¹ As south's export consists mainly of primary products, while the north exports manufactured products, this tendency means a secular deterioration of the terms of trade for the south, leading to a loss of real income. Hence the necessity for import substitution. The other argument, first presented by Emmanuel, claims that trade between north and south involves an unequal exchange in favour of the former even when the movements of the terms of trade over time are ignored.² In the presence of international mobility of capital, the pattern of trade between the low-wage south and the high-wage north results in a divergence between prices and labour values; price of south's (north's) exports underestimates (overestimates) the embodied labour value, leading to a transfer of value from the south to the north.

Conclusive empirical evidence in support of the Prebisch-hypothesis is difficult to find; besides, the pattern of trade between the north and south today hardly conforms to what Prebisch had in mind: manufactured goods do figure prominently

in the export baskets of the less developed countries today. It is also well established now that Emmanuel's theoretical construction suffers from serious internal inconsistency.³ But apart from these criticisms, there is a more fundamental problem with these approaches. They locate the essence of the north-south trade exclusively in the domain of exchange; as a result, for both Emmanuel and Prebisch, trade means a one-way transfer of real income which they counterpose with the standard neoclassical gains from trade argument. But this emphasis on the terms of trade has completely left out of focus a far more important aspect of the north-south trade: the possibility that the market dictated patterns of specialisation and consequent international division of labour, while generating static gains, may ultimately result in extremely uneven development. There is no need to interpret the propositions that trade between unequal partners further aggravates inequality in terms of a transfer of real income; such an interpretation is theoretically unsustainable. The same proposition can be interpreted in a far more meaningful way if the focus is shifted on the possibility that trade arising from competitiveness based on the initial condition may reinforce backwardness.

The problem I have addressed here is not totally alien to mainstream economics. Within the conventional trade theory, there is a large literature that deals with the problem of distortion. If there are distortions in the economy, prices do not reflect the true social costs. In textbook language, the price line then is not tangent to the production possibility frontier. As a result, prices provide wrong signals and international specialisation on the basis of these prices may lead to misallocation of resources, resulting in a loss of real income. Direct government intervention is then required to restore optimality.

Now consider a country that has comparative advantage in one good. Suppose that there is a wage differential and the sector with comparative advantage has to pay a relatively higher wage rate compared to other sectors. If the wage differential is sufficiently pronounced, then it may outweigh the comparative advantage and the cost of production of that good may turn out to be higher than what it is in the other country. Trade according to market-based calculations then will lead to the wrong kind of specialisation.

It is possible to interpret the cases I have discussed as cases of distortions, calling for appropriate intervention. But the problem is that the analysis of distortion in the mainstream literature has been done

mainly in a static context. Once it is placed in the context of development, the true social cost of an activity has to be calculated after taking into account its relation to the development process. In other words, the social cost of an activity must reflect its evaluation with respect to the developmental goals before the society.

LONG-TERM COMPETITIVENESS

Long-term competitiveness depends on productivity and nothing else. Contrary to popular perception, it is independent of such macro-economic variables as the exchange rates, budget deficits or interest rates. Germany and Switzerland have enjoyed steadily growing competitiveness, and hence rising standard of living, in the face of appreciating currencies. Japan, Italy and South Korea have all had large budget deficits, Italy and Korea have had high interest rates as well, yet their competitiveness has not suffered. In fact, one can move a step ahead and claim that competitiveness is not reflected in the share of exports either. There are examples of countries which have enjoyed rising standard of living as a result of competitiveness while their share of exports in the national income have remained unchanged or even declined. If the export basket consists of both dynamic high-productivity industries and backward low productivity industries, restructuring export in favour of the former may lead to higher standard of living even if it means a fall in the share of exports as a whole. Conversely, the export basket may change in favour of the static, low productivity sectors along with a rise in the overall share of exports. In such cases, the prospects of acquiring long-term competitiveness and a higher standard of living is adversely affected despite an apparently impressive performance on the export front. The point is that it is not export as such but truly competitive export that matters. Thus, a less developed country may enjoy an increase in export but the increase may be at the cost of its more dynamic sectors.

It is important to understand the relationship between the exchange rate and competitiveness in this context. Depreciation of currency does provide a competitive edge to the exporters but it is only a very short-term gain. Since it is not backed by an increase in productivity, it cannot be sustained over time. Besides, the gain is essentially of a zero sum nature; it is obtained at the expense of other countries selling the same product in the international market. If they in turn depreciate their currencies, the edge eventually vanishes. But on the other hand, since it

provides across-the-board incentive to all exporters, depreciation has a strong tendency to encourage the low productivity sectors based on perverse competitiveness. While there may be many good reasons behind a country's decision to let the currency depreciate, long-term competitiveness is certainly not one of them.

Import substitution is criticised on the ground that protection of import competing sectors inevitably leads to protection of inefficient industries which are unable to stand up to foreign competition, resulting in wastage of the economy's scarce resources. There is no criterion, the argument goes, on the basis of which the state can distinguish between industries that deserve assistance (in the sense that they can make use of the assistance and become competitive) from those which do not. The state certainly can make mistakes, more often than not it does, but what needs to be stressed at the same time, especially in the context of the less developed economy, is that the possibility of such wrong selection is not ruled out when things are left entirely to the judgment of the market. State control may not be inimical to the perpetuation of low productivity activities, but then nor is market.

If it is productivity that determines long-term competitiveness, it is innovation and technical progress that determine productivity. What then are the factors that combine to generate a dynamic process of innovation and technical progress that produces the competitiveness of a nation in certain areas of production? This is the theme of a recent book by Michael Porter of the Harvard Business School.⁴ Porter is no radical; an economic advisor to the Reagan administration and a number of well known multinationals, he is an economist of conservative persuasion. Yet, on the basis of an enormous amount of empirical work, he has warned against the wrong kind of globalisation that the less developed countries may get into if they put all their faith in the market-based ranking of the industries. The most important finding that Porter reports is that whenever genuine competitiveness has been achieved by a country, it has been achieved by overcoming the initial conditions in which the country found itself in the beginning. South Korea started its journey in the 1950s as a capital poor country, yet in less than 30 years, it has emerged as an efficient producer of such capital-intensive goods as steel and automobiles. The case of the cut-flower industry in Holland is also an interesting example. A cold and grey country, Holland does not seem to be a particularly suitable place for growing flowers. However, pro-

...in response to the inauspicious climate, Holland has developed over a century extremely sophisticated glass house growing techniques that have created a sustainable competitive advantage in that industry.

In the process of acquiring long-term competitiveness, according to Porter, a nation passes through a number of stages. The initial stage is characterised by factor cost-based competitiveness that arises out of the basic factors that a nation finds itself endowed with. Extremely fragile in nature, such competitiveness, he argues, makes the nation dependent on low productivity activities and thereby delimits the standard of living. The second stage is associated with investment-based competitiveness in which human and non-human capital leads to competitiveness in areas that were unattainable in the first stage. Being backed by higher productivity resulting from investment, competitiveness in this stage can support a rising standard of living. To sustain and further improve it, a country has to move to a third stage in which competitiveness arises out of the ability to innovate and introduce new products and product designs. (South Korea, according to Porter, has exhausted the possibilities of the second stage and is about to enter the third.) In short, sustainable advantage demands that its sources be upgraded and expanded by moving up the hierarchy of stages, i.e. moving from less to more sustainable types of sources. Among the factors that contribute to this movement, Porter isolates investment in infrastructure and education, domestic rivalry among firms, a large home market and a national commitment to success.

Porter's analysis militates in favour of approaching the question of globalisation of a less developed country with much caution. He does not deal with such sources of competitiveness as child labour or absence of environmental concern, but all these factors are likely to work as determinants of competitiveness of a less developed country in what he calls the first stage. Globalisation on the basis of the existing structure of competitiveness endorsed by the market, unless accompanied by an ongoing process of investment-driven restructuring of the economy, will then have a strong tendency to perpetuate a structure of fragile, fleeting competitiveness. In fact, the international division of labour that globalisation will entail may actually thwart any dynamic process leading the economy to the second stage. For globalisation may favour those industries which are essentially static and primitive, pushing the relatively more dynamic industries to the background because they may be at this point unable to stand the test of the market. And this will be the globalisation of underdevelopment—the integration of underdevelopment itself to the global economic order.

CONCLUDING REMARKS

Behind the cost of production of every commodity, there is a story. It may be a story of innovation, technical progress and modern labour process, or it may be one of sweated labour, primitive labour process and pollution. By putting a price sticker on all commodities, the market suppresses these stories, and thus hides more than it reveals. It is like one of those dark nights in which all horses appear grey.

No country today can live behind closed doors as China did till the middle of the 70s or Albania till yesterday. Third world countries therefore must globalise. But while attuning the economy to the needs of the global market, it should be kept in mind that globalisation does not generate the process of development, it is the latter that leads to, and in turn is reinforced by, suc-

cessful globalisation. Unless the process of development—which is basically a highly localised process—is successfully triggered off, globalisation may lead to the ossification of the structure of underdevelopment, instead of causing its dissolution.

DISCUSSION

Discourse and Practice

Niranjan Phukan

ANDRE BETEILLE's review of Amartya Sen's *Inequality Reexamined* (EPW, April 17) betrays ideological prejudices against the very ideal of equality in the name of scrupulous academic rigour. In a country like India where democratic values have not yet struck deep roots—indeed have been systematically subverted—such views among the higher academic echelons have disturbing implications. Indeed, while Beteille promotes the notion that liberty is not incompatible with equality, he has failed to read in contemporary events the clear lesson that here in India today the pursuit of equality is a condition of liberty. The line of thinking advanced by Beteille, if left unchallenged, may have an impact on the formulation of vital social policy, and put a brake on the growth of democracy in the country.

It is interesting that Beteille divides discussions on equality into two general trends—the prescriptive and the descriptive. The prescriptive school deals with what ought to be, and the descriptive school with what actually prevails in the world. While Beteille cavils at Sen's discussion for not telling us "what we can do to bring the preferred social arrangement into being", he himself makes the mistake of treating equality as an abstraction and not as a programme of social action conditioned by history and developing through ceaseless struggle.

I have not read Sen's book and am therefore in no position to question if Sen also handles a reified abstraction detached from history. Even so, he at least seems to conceive of it as a grand ideal motivating programmes of social reform through-

out history. If this ideal is abandoned as utopian, the very idea of affirmative action by the state will have to be dismissed as pointless. In view of the fact that even the Constitution of India takes a few preliminary steps in that direction, Beteille's perspective must be characterised as profoundly reactionary.

As a libertarian he applauds Sen for affirming that liberty is not opposed to equality, as even libertarians are supposed to desire equal liberty for all. This statement may be formally correct enough, but in substance it has rather different implications. This 'equal liberty' is delimited in practice by the relative share of the parties in wealth and power. A poor labourer cannot expect to get justice from the court because he cannot afford the expenses of legal action in capitalist society. Thus equal liberty is invoked to camouflage the actual fact of unequal claims to justice. If one turns Beteille's proposition upside down, one has the much less debatable notion that equal resources make for equal scope for liberty.

Of course, right from the origin of modern democracy approximations to the ideal of equality have only been gradual and conditional. It is instructive to recall that even the inalienable right to vote (one man, one vote, etc) had initially been restricted to property-owners. The levellers had denied it to 'servants', i.e. wage-earners. Equality therefore has depended on the stage of social growth. At the present moment in India it need not prescribe a utopian equality between university professors and teachers of primary schools (though of course ministers and drug

man have much more in common today than 30 years ago), but only equal availability of drinking-water, medicine, educational opportunities and certain elements of social justice.

But Beteille draws from Sen's discussion of "the pervasive diversities that affect the relations between the different spaces" the further conclusion that we cannot have equality in every space, and very little is to be gained by repeating such catch-phrases as 'all men are created equal'. Hidden in this politic and polite bow towards diversity there may well be a special pleading for the *status quo*. No one in his senses would advocate equality of status for parents and children, doctors and patients, teachers and students. But it is also a fact that in recent decades there has been a great erosion of patriarchal mores in these relations and dialogue is more and more replacing command in those spheres of human interaction. The folly of equating diversity with inequality is revealed when gender-difference is used to support unequal status. Equality after all is a juridical concept, while diversity is factual. The great mistake lies in twisting the factual to yield a juridical statement. Equality in India at this moment prescribes equality of opportunity and treatment, status and right, regardless of diversity in gender, caste, religion and race. Further, individual diversities are irrelevant in this discourse of equality which does not threaten such diversities.

Beteille's reactionary bias is exposed when he argues that any social arrangement which is conceived as different from a mere aggregation of individuals may lead to inescapable inequalities. As he says, "we may equalise a great many things among the individual members of a society but still be left with an arrangement having unequal positions". The fallacies in this argument are:

- (1) There can be no conceivable social arrangement without constitutive inequality.
- (2) Such constitutive inequalities sanction the practical inequalities imposed on members of given societies by the economic, social, political and ideological structures of such societies.

Primitive social formations permit a greater degree of equality in spite of the rise of different permanent social functions. And those who criticise inequalities in present society look forward to a future where institutions will work for a decisive reduction of such inequalities.

But then it is said that inequality in 'social arrangements' is an 'unalterable fact of life'. Such an assumption will definitely reduce the urgency and momentum of social reform aiming at improvement in the lot of the dalits, women, and Muslims in this country. It also flies in the

face of historical experience. As Ambedkar has pointed out, the most authoritative brahminical statements like the *Gita* and the *Manusmriti* absolutely deny to the Shudra the right of worship. What he may at best hope for is worship on his behalf by a member of the priestly caste. The medieval Bhakti movement, on the other hand, especially in its radical versions, categorically confers on the Shudra this right to address god directly. If breakthroughs in such momentous spheres are possible, it is too faint-hearted to assume that inequalities fostered by less rigid systems and ideologies cannot be eradicated.

In this connection Beteille draws our attention to the operation of relative social esteem/evaluation on different callings as well as on different members of the same profession. Such differences do not have juridical authority and lead at most to gradations of deference, prejudice and prestige. They have something to do with degrees of skill and personal achievement, which do not amount to discrimination or oppression, and sometimes these rest on something as ephemeral as snobbery. (Consider the prejudice against veterinary surgeons derisively called vets until recently!)

Beteille's authoritarian bias naturally picks out the university as an institution that enshrines the norm of inequality. The ranks among teachers do not, according to him, represent discrimination, repression or injustice, but hierarchies of excellence and merit. But if one takes a closer look, one is not so certain. For one thing, it may be difficult to evaluate and grade different factors like originality, sound scholarship, communicative skill,

dynamism, initiative, experience and prudence. And does the professor necessarily have a quicker mind, greater insight, wider erudition than the lowly lecturer? Even if we cross these hurdles, how justified are we in accepting for professors more than advisory authority in major academic decisions? Is not the university primarily a co-operative community devoted to pursuit of scholarship and research? If that is so, academic excellence may be seen less as a private property than as an incidental and socially useful product of such co-operation. That it has degenerated into a mechanical hierarchical institution in the service of the state and capitalism in recent times is no secret. The inequalities it enshrines these days are not always identical with degrees of excellence or achievement. In fact excellence is more often travestied than embodied in them.

These examples then pose the question of the effort to eliminate inequality and promote equality. Beteille raises the question of the use of power to realise egalitarian values. But "the libertarian fears that the power that is used in the cause of equality contains within itself the seeds of new, unknown, and perhaps more sinister forms of inequality". To be sure that happened in the now-defunct Soviet Union. But should that be invoked as a bogey to stall state action or militant movement to realise ever greater degrees of equality? After all, there is no logical connection between use of power and growth of sinister power elites. In any case, now that we are warned we may also contemplate action to minimise the dangers. But it will not do to rule out equality as a viable ideal and compromise with a demonstrably rotten actuality.

Understanding Capitalism

Ajit Roy

THIS refers to certain concepts, categories and statements in Arun Ghosh's 'Random Reflections' based on C T Kurien's *The Economy: An Introspective Analysis* (EPW, January 2-9), irrespective of the fact whether the concepts, etc, are Ghosh's own or they are attributed to Kurien.

The concepts, etc, in question are sometimes explicitly and sometimes implicitly claimed to be 'simplified' or 'lucid' restatements of basic ideas of Marx's political economy. According to the present writer, however, simplified, sometimes indeed over-simplified, these statements mark clear departures from the essential Marxist positions and are misleading for a proper understanding of the capitalist economy and, therefore, also for the struggle for the abolition of the

capitalist order. What follows is a selective discussion of some of these points of departure.

First, while Marx concedes that all sorts of generalisation are logically (rationally in Marx's word) permissible, such exercises may sometimes blur the essential character of a historically specific phenomenon. One such instance is the definition of economics cited by Ghosh from Kurien. There cannot be a useful definition covering the 'provision of material needs' in all stages of social evolution. Marx says: "When we speak of production, we always have in mind production at a definite stage of social development...It might therefore seem that, in order to speak of production at all, we must either trace the historical process of development in its

various phases, or declare at the very beginning that we are dealing with one particular historical epoch, for instance with modern bourgeois production...The determinations which apply to production in general must rather be set apart in order not to allow the unity which stems from the very fact that the subject, mankind, and the object, nature, are the same—to obscure the essential difference. ...On failure to perceive this difference rests, for instance, the wisdom of modern economists who are trying to prove the eternity and harmony of the existing social relations."¹

The essentiality of this historical specificity may be clearer from the following. Under the capitalist production, "for the first time, nature becomes purely an object for men, nothing more than a matter of utility. It ceases to be acknowledged as a power for itself, and even the theoretical cognition of its autonomous laws appears merely as a stratagem for its subjection to human needs, whether as object of consumption or as means of production. It is this same tendency which makes capital drive beyond national boundaries and prejudices, and equally beyond nature worship...Capital is destructive towards, and constantly revolutionises, all this, tearing down all barriers which impede the development of the productive forces, the extension of the range of needs, the differentiation of production, and the exploitation and exchange of all natural and spiritual powers."² This dimension, most essential for understanding the role of capital, especially today, is, and has to be, conspicuous by its absence in the generalised definition of economics cited by Ghosh.

Secondly, Ghosh's account of Kurien's historical classification of the social orders is marked by a deliberate and studious omission of the feudal phase. There may be, and indeed are, differences of opinion among Marxists about the precise form of feudalism, but no one can deny the fact that *historically* speaking, capitalism developed out of the womb of feudalism in all countries where it arose indigenously, that is, wherever it was not implanted by external agencies. Marx himself is very categorical about this. "In fact", he says, "the history of landed property, demonstrating the gradual transformation of the feudal landlord into the recipient of rent, of the hereditary, half-tributary and often unfree tenant into the modern farmer, and of the serf and villein tied to the soil and subjected to labour services into the agricultural day-labourer, would be the history of the formation of modern capital..."³

Moreover, the general concept of feuda-

lism occupies an important place in the Marxist view of social evolution for a more fundamental reason. But of this, later.

Then some basic categories like market, regulation and state seem to be treated by at least Ghosh (whether he is really following Kurien or not) as abstractions which is alien to the Marxist view.

One can conceive of market for circulation of products within a system of socialised ownership. There can also be a period of coexistence of socialised and private ownership, and therefore a regulated market. In this case regulation itself may be qualitatively varied: regulation in the rational and long-term interest of private ownership, or even in its short-term unenlightened interests, or a variety of Lenin's NEP for a long or fairly long period, but with the explicit object of the ultimate elimination of private ownership in the means of production. Most essentially, the existence of a regulated market has to be juxtaposed to the question of the permissibility of a market for labour power—that is, for the extraction of surplus value, that is, for the perpetuation of capitalism.

Before we move ahead from the question of market, it should be noted that the market mediates not only between producers and consumers as Kurien holds, but also and to a large and growing extent between producers and producers for the exchange of means of production.

Along with non-specific concepts of market and regulation, Kurien takes a non-specific and abstract view of the state as well. Expenditures or regulations by a capitalist and a 'post-capitalist' state have fundamentally different imports. However welfarish in appearance, these measures by a capitalist state are intended to stabilise capitalist class rule, whereas expenditures and regulations by a 'post-capitalist' state may be directed towards the ultimate withering away of the state itself.

Then, this writer has a fundamental disagreement with Kurien's position, as stated by Ghosh, on what the latter calls the possibility of the emergence of a 'post-capitalist' state in India. By this, they mean 'socialism with a market system'. On this question, this writer feels that Kurien and Ghosh have not properly drawn the lessons from the history of socialist reconstruction during the long period since 1917. The historical experience of the USSR and eastern Europe (leaving aside the problematic position of China, Vietnam and Cuba) has shown that under certain conjunctures, working people or even a part of them may assume power in a particular country and may initiate the tran-

sition towards socialist transformation. But they cannot make real advances in this direction unless and until there is a more or less simultaneous movement in the same direction in at least a number of developed capitalist states of the world.

Indeed, this was the perspective with which Lenin had initially led the Bolsheviks into the November revolution and this also was the perspective with which he had valiantly struggled to ensure the survival of the Soviet state as long as possible. But in the very last piece of his writing ('Better Fewer But Better') in March 1923, he stated that this struggle could not really succeed till there was a new wave of revolutionary upsurge embracing the developed capitalist countries. With the immense progress of global integration, the prospect of isolated transition to a 'post capitalist' society has become even more unviable today.⁴

Hence, while progressive forces in all countries should all the time work devotedly to advance the cause of social transformation, they should do so as a part of the international struggle for a global change in this direction. It is this writer's conviction that contrary to the apparently gloomy picture, such a more or less simultaneous transition has become a more realistic possibility today than ever before.⁵

Finally, to revert to the question of the historical role of feudalism, Marx's perspective of the historical evolution of human society is based on the long-term process of the advance of humankind from the two-fold bondage to nature and social groups to freedom from both. In this historical journey, feudalism marks a middle stage when the human being (that is, the majority) is partly free and partly in bondage. The next phase, that is, capitalism, represents an advance to formal freedom accompanied by wage-slavery in real terms. From this follows the final aim of complete freedom through the abolition of wage slavery.

Indian Institute of Management

Indian Institute of Management, Lucknow invites applications for faculty positions in the following areas :

1. Economics
2. Organisational Sociology/Industrial Sociology
Organisational Behaviour/Human Resource
Management/Industrial Relations.

The candidates applying for the positions in Economics should have specialisation in International Trade and Foreign Exchange and ability to teach Econometrics will be an added qualification.

The individual should have an interest in Management Education and should be willing to work in the environment of a management Institute. The candidates should have a Ph.D degree or an equivalent qualification with a very good academic record and/or experience in Executive positions. Interested candidates may send in their bio-data with details of the educational qualification, age, experience, papers published, details of the present responsibility, salary drawn and expected. The selected candidates will be offered salary and position commensurate with their qualifications and experience.

The Institute would normally be able to provide residential accommodation to all the faculty members. The salary scales are as follows:

Assistant Professor	Rs.3700-5700
Associate Professor	Rs.4500-6300
Professor	Rs.5100-7300

Applications should be addressed to the **Director, Indian Institute of Management, Prabandh Nagar, Off Sitapur Road, Lucknow-226 013** to reach him within one month of the publication of the advertisement.

Growing... Growing... Growing... And your gift to him keeps growing too!

Give your child a gift that grows with him. Invest in Unit Trust's Children's Gift Growth Fund. When your child turns 21, the money you invest is ready to help him do what he wants. He will have the option of withdrawing the money at 18, should he need it. Unit Trust's Children's Gift Growth Fund. A little planning can ensure a prosperous future for your child. Money keeps growing... and growing with CGGF - Dividends have been growing. Current year's is 14%. - Bonus is now paid every 3 years. - Bonus, reinvested in Units, earns more dividends. Application forms will be accepted at Unit Trust branches, all banks and collection centres. For application forms-cum-brochures contact any Unit Trust branch, Chief Representative or Agent.

Irrigation in Eighth Plan

The highly adverse Morse-Berger report on the Sardar Sarovar project which is slated to add about 1.8 mha of irrigation capacity by the end of the Eighth Plan has cast a cloud on newly started but controversial dams. There is, however, no dearth of other ongoing projects for putting our investments in, while still achieving the overall target of new irrigation capacity creation in the Eighth Plan. The crucial question is one of the requisite investments forthcoming for the irrigation sector during the Plan.

A-38

Poverty and Migration

China's economic reform since the mid-1970s have reduced the number and proportion of people in poverty. However, there remain a large number of poor people concentrated in clearly identifiable regions. In the 1980s the Chinese government's main focus was on reducing poverty by aiding impoverished areas to raise their level of development. Actually, migration out of the poorer regions has a potentially large role to play in reducing poverty, though there are special institutional barriers to migration in China.

1369

The 'Muslim Problem'

The brahminical secularism of secular Hindus would wish the Muslims to adopt lock, stock and barrel the marriage between Hindu and western ideals that symbolises the life and life-style of this elite.

1345

Water Level

Official statistics of Gujarat's irrigation potential are exaggerated and misleading. A more realistic estimate will both buttress the claim for more resources for this sector and make possible the evolving of a reasonable water development strategy for the state.

A-45

There has been a steady decline in the area irrigated by tanks in Tamil Nadu. The physical and technical factors responsible for this have received much attention, but not the institutional ones.

A-53

Money Problem

The labours of many review committees and study groups notwithstanding, rural credit remains a problem, partly on account of socio-economic peculiarities and the political environment and partly because of lack of serious effort to implement the various recommendations made as a package.

1361

Downward

In a regime of convertible and floating rupee, further depreciation of the rupee is almost inevitable, while not all the benefits of such a regime will accrue to India.

1391

Assets and Environment

Compared to the JRY/NREP type of rural development interventions which are based on the principle of adding to assets and incomes, watershed management programmes are designed to augment the natural resource base and are definitely to be preferred in specific circumstances.

A-61

Political Dimension

Studies of rural co-operatives have generally emphasised evaluation, neglecting the process of interest articulation, through institutional forms and within the institutions.

1353

Indigenous Peoples

With the revival of colonial ambitions in the UN under US leadership, the attempts of indigenous peoples round the world at social transformation are in danger of being subverted by imperialist forces.

1357

National Resource

Even a conservative estimate brings out dramatically the important national resource that mother's milk represents and the economic value of breast-feeding.

1390

Bounty

The government has decided that in the interest of 'stabilisation' investment has to be cut drastically. It has, therefore, no choice but to try to lure foreign investors into the power sector on terms which are absurdly generous.

1343

LETTERS TO EDITOR

Paul Kurien

I FIRST heard of Paul Kurien from a teacher of mine in Calcutta. In the early 1970s they had been students together at the Jawaharlal Nehru University in New Delhi. Those were the halcyon days of the JNU, newly set up, with its teachers and students fiercely committed to scholarship and ideological debate, or rather, to the interpenetration of one with the other. Among the precociously gifted talents at the university were my teacher and Paul. One was a Maoist, the other a Trotskyist; both had an acute intelligence and a formidable knowledge of the scriptures. Evidently they had had some rare battles in hostel room and coffee house. My teacher invariably referred to Paul as 'Paul Marx', at once a tribute to his erudition and an indictment of his refusal to see another point of view.

When I got to know Paul Kurien—some 15 years after he had argued so heatedly with my teacher about texts and contexts—he had lost much of his dogma and certitude, though little of his love of ideas. In appearance he was everybody's idea of a JNU radical: a thin intense man with a slight stoop, a beard and shock of hair urgently in need of running repairs. When we first met, he had just read Juan Martinez Alier's magisterial history of ecological economics, and could talk of nothing else. The book was not available in India. Paul himself had read it in Europe, and was determined that it should be known and discussed here. He was especially persuaded of the work's larger methodological claim, that energy flows rather than money more accurately captured the performance and sustainability of an economy. Immediately he set to work at organising (in Bangalore, where he was then based) a conference on energy, environment and development. With meticulous care he planned the meeting, pairing topics with persons. He even persuaded Martinez Alier (whom he had not then met) to come.

Sadly, a week before the meeting Paul had a recurrence of the depression that plagued him for the last few years of his life. Always a high-strung man, in this mood he was prone to violence. Here was a meeting he had worked untiringly and almost single-handedly to put up; and now it was threatened by an illness that he had no control over. Fortunately, prompt treatment (administered, as it had to be, without his knowledge) stabilised his condition somewhat, and he was able to attend the meeting after all. Sponsored by the Institute of Cultural Research and Action, the conference attracted some of the best known environmental analysts in India, aside from the Spanish economist whose own work had sparked it off. The papers, on various aspects of the energy-economy interface (a greatly neglected area of research), were of almost uniformly high quality. Unfortunately, Paul's continuing ill-health came in the way

of the completion of the edited volume that was to be the project's fulfilment. Bringing the book to publication would be one fitting tribute to his memory.

All well-run conferences have wider ripple effects: putting into touch people who have not previously met but who might come to forge enduring relationships, for example; or setting into circulation important ideas that are then further elaborated and developed. The energy conference organised by Paul Kurien in October 1988 undoubtedly fulfilled these larger aims. Among other things, that meeting consolidated the growing interest in ecological economics within India. It also activated links across countries, between scholars and activists interested (as Paul so deeply was) in finding common ground between environmentalists and socialists, two groups who have tended to talk past rather than talk to each other.

When I knew him Paul's abiding interest was energy economics, but in his JNU days his main focus of research had been on the condition of the working class. He co-authored a long essay, published in this journal, on the Solidarity movement in Poland; and I have been told that his study of the process of mechanisation in the mines of Chattisgarh was greatly valued by the workers' union there. He retained to the last his love of ideas; being, in between bouts, as energetic and mentally alert as ever. Shortly before he died he came to Delhi; meeting an old friend who had once been a fellow student at JNU and now taught there, he told him that he wished to register for a PhD with him. As the JNU students of the 70s make their important contributions to the intellectual life of this country—in sociology, history, economics and political science—let us remember Paul Kurien, one of the most brilliant, if tragically ill-fated, of them all.

RAMACHANDRA GUHA

New Delhi

Farmers and Dunkel Draft

AS history has to be recorded on the basis of truth, a brief report about the activities of the Karnataka Rajya Ryota Sangha (Karnataka State Farmers' Association) since its inception in 1980 has become necessary in view of false information and false claims getting disseminated. The KRRS was founded in October 1980 and has been fighting against the political, economic and cultural damages the green revolution technology has done to the village life in India and to Indian agriculture.

Since its inception, the KRRS has been agitating against the colonisation of the seed through the myth of the 'miracle seeds' destruction of genetic diversity and ecological stability through green revolution monocultures, soil toxicity and soil disease due to heavy fertiliser use and high-yielding

varieties, apart from other environmental issues like the indiscriminate exploitation of other natural resources. The new economic policies relating to agriculture and the general policy of liberalisation of the government of India leading to the final phase of the colonisation of the seed through the introduction of Intellectual Property Rights in Agriculture and the consequent adverse effects were all issues which the KRRS took up much before Arthur Dunkel presented his Draft Proposals.

The KRRS stepped up its agitation against the new economic policies of the union government soon after the removal of the subsidy to fertilisers from October 1991 and resolved at a massive rally of farmers on October 2, 1991 at Bangalore to organise the agitation nationwide, and after a preliminary discussion with Vandana Shiva of the Third World Network conducted a conference on the Dunkel Draft Text on February 8, 1992 inviting eminent scientists and leaders of farmers' organisations from different states of India.

The KRRS decided at the February 8, 1992 meet to launch an agitation against MNCs entering the seed sector in India and also chose Cargill Seeds, which by then had already established its office at Bangalore, as its first target. This decision was also released to the press. The KRRS decided to organise a nationwide 'seed satyagraha' at a massive rally of farmers numbering over 5,00,000 at Hospet last October in which the national president of the Bharatiya Kisan Union Mahendra Singh Tikait, M R Sivaswamy of the Tamilnadu Farmers' Association and Vandana Shiva of the Third World Network participated. The KRRS chose December 29, 1992 as the date for the action against Cargill Seeds at Bangalore in memory of its founder general secretary who had passed away on December 21.

As decided at Hospet, the KRRS organised a national rally of farmers on March 3 in spite of the ban imposed by the union government, which to save its face, later issued a permission to KRRS, many scientists and activists extended their help and assistance to the rally. KRRS is a founder-member of the BKU which was founded in 1981 at Hyderabad. Only the Shetkari Sanghatana of Maharashtra remained out of this farmers' unity. The BKU which inherently distrusts Indian intellectuals deliberately decided to exclude the Gene Campaign from the March 3 rally of farmers as it was talking about 'minimum renegotiation' while the BKU was talking about 'total rejection' of the Dunkel Draft. The BKU even passed a resolution to the effect that farmers would be their own spokespersons, the day before the rally.

M D NANJUNDASWAMY

President,
Karnataka Rajya Ryota Sangha,
Bangalore.

Burden of Financial Reform

THE Reserve Bank of India has taken the expected step of reducing the minimum lending rate of banks for the highest credit limit slab of above Rs 2 lakh by one percentage point to 16 per cent, effective from June 24. The reduction for the middle slab of Rs 25,000 to Rs 2 lakh has been restricted to half a percentage point to 16 per cent (fixed), thus bringing on par the fixed rate for this slab and the minimum rate for the highest slab. No reduction has been made in the lowest concessional slab of credit limits up to Rs 25,000 which attracts a rate of 12 per cent per annum. Thus, within a short period of a year and a half the number of lending rate slabs has been reduced from six to three, with considerable narrowing of the spread between rates and reduction in the element of cross-subsidisation. This takes the interest rate structure closer to the reform agenda, namely, a two-slab system consisting of a minimum lending rate and a concessional rate. The deposit rate part of interest rate reform has already been implemented: since March 1992, there is only one maximum deposit rate for the entire term structure ranging from 46 days to three years and over. Thus a fixed deposit for 46 days fetches today 11 per cent per annum, while the interest rate on saving deposit accounts which was hitherto 6 per cent has now been reduced to 5 per cent.

Broadly, the entire approach to financial sector reform has been conditioned by the government's objective of pushing the banks towards globalisation. The authorities do not apparently realise the cost this effort imposes on the real economy. The banking system has to be viable, of course; but the obsession with achieving high profitability and a risk-weighted capital base following norms prescribed for international banks is proving to be disastrous. Without examining the budgetary and interest cost implications, the government and the RBI have readily accepted the 8 per cent risk-weighted capital adequacy norm as prescribed by the Basle Committee on Banking Regulations and Supervisory Practices. For decades, the world of banking has remained perfectly solvent and has grown on a capital base of less than 2 per cent. The new norms have imposed a heavy cost on banks even in the developed countries. Many international banks in Japan and even in such a financially sturdy country as Germany are finding it difficult to fulfil the BIS norms. Besides, these norms have also induced a major shift in bank lending away from traditional corporate loans and consequently from interest income to non-fund based earnings. For developing country banks, these are steps that deserve to be deferred at least by a decade. Having accepted the norms, every sector of the economy is made to pay the price in terms of higher interest cost. The short (5-year) maturity government security coupon rates have been pushed up to 13 per cent and those on the 10-year state government

securities to 13.5 per cent—that is, equal to the banks' average earnings on their lending. Because of its anxiety over the banks' profitability, the RBI has been reluctant to reduce lending rates. Except for the symbolic gesture of a lower rate on loans below Rs 25,000, the needs of small borrowers in agriculture and small industries have been sacrificed and they have all to pay high rates of interest. A small-scale unit with Rs 2 lakh credit has to pay 16 per cent plus various add-on charges, whereas a high credit-rated bank customer may be paying the same rate or a little over with the simultaneous enjoyment of many banking facilities. Small businesses suffer from a number of disabilities and the monetary authorities are showing little sensitivity to their problems. The argument that the higher rates will induce banks to lend more to small borrowers is specious and is based on an insufficient understanding of the grass roots level reality, to say the least.

In a banking system with significant social obligations, a 3.5 to 4 percentage points spread between interest earned and interest paid (along with some substantial other incomes) should be considered as satisfactory. As for the non-performing assets, the authorities obviously take the myopic view that the answers to the problem have to be found within the banking and financial system. In fact, banks and financial institutions will continue to face non-performing loans on a large scale due to the reluctance of the authorities to enforce a modicum of financial discipline upon private entrepreneurs. The structural adjustment programme under way is likely to further accentuate sickness in industry and thus add to the size of non-performing assets (which are estimated to have crossed 14.5 per cent of the total domestic loans of banks). Making sufficient provision for bad loans is no doubt important, but the excessive burden of the high capital adequacy norms on the central government budget and the borrowing units could have been avoided.

Against this background, a more realistic interest rate structure in the current milieu could have been one in which the maximum deposit rate is fixed at 10 per cent and the minimum lending rate is fixed at 15 per cent with some differentiation between maturity periods for bank deposit rates and between the size and purpose of loans for lending rates. The differentiation should be significant and not just symbolic. In the name of simplicity, the authorities have totally surrendered their option to use the interest rate instrument for supporting priorities in the structure of output and employment—say, in regard to agriculture, small businesses and small-scale industries. Apart from adequate credit, small-scale industry deserves to receive credit at a significantly lower cost than at present. There is a strong case also for some reduction in the rates on term loans charged by the term-lending institutions.

NARMADA ANDOLAN Beyond Narmada

THE current phase of the agitation spearheaded by the Narmada Bachao Andolan emphatically and uncompromisingly underlines two truths: one that the demands of the Andolan are not only an articulation of the fundamental rights of the people of the Narmada valley, but of the vast populations which are being marginalised and even wiped out in the mindless march towards development for a few; and two, that the state having rejected the participatory course of designing development projects, is finding extensive and ruthless repression useless against the forces espousing real change.

With the height of the dam rising to 61 metres, the village of Manibeli, the historic site of the Andolan's agitation since last year, will be submerged this monsoon. Since April this year it has become the site of protest and agitation for the Andolan and its growing supporters. The actions of the government in undertaking continued activity at the dam site is in clear violation of the Gujarat high court order that there should not be any temporary submergence nor any temporary removal of the oustees until rehabilitation has been completed as per the award of the Narmada Waters Disputes Tribunal which stipulated that the oustees should be rehabilitated at least 12 months before the submergence. And yet it is now a well established fact that the government has no comprehensive master plan on rehabilitation even 12 years after work on the project has begun.

In April the Andolan constituted a 'samarpit dal' in Manibeli which would refuse to move out even when submergence occurred in an attempt to force the government to stop work on the dam and begin a review of the project in participation with the dam-affected people. Undeterred, the state government began clear felling of trees in the area ostensibly to build a road to facilitate the movement of police forces. With increase in the state's presence in the villages came brutal repression of various kinds: in that month a 42-year old tribal activist was physically assaulted and raped by three policemen; a peaceful agitation protesting the rape was violently attacked allegedly by supporters of the ruling party while the police looked on. Following these came several other incidents where meetings on Narmada and on related issues were violently disrupted by mobs with what appears to have been the tacit support of the police. There have been selective attacks on individuals in an attempt to scare them away from supporting the agitation.

With the Andolan declaring Manibeli as the site for massive demonstrations and a satyagraha has come unprecedented state repression. On May 29 the Maha-

rasatras government imposed Section 144 of the Criminal Procedure Code in 36 villages in Dhule district in an effort to prevent the movement of people to Manibeli and other villages. The following day the police made an attempt to demolish the first hut in the village which would be affected by the submergence and evict its occupants but had to retreat in the face of determined resistance. Andolan activists and supporters attempting to reach Manibeli to offer legitimate protest have been harassed, arrested and assaulted.

So widespread and determined has been the police harassment and state repression that several civil liberties groups have come together to form a Human Rights Campaign on Narmada. A team sent by the campaign has detailed the types of harassment and the manner in which legitimate protest is being suppressed. Another team constituted by the Bombay high court in response to a writ petition challenging the prohibitory orders has similarly indicted the state government.

But clearly it is a sign of the times that the state has chosen to completely ignore these substantive reports of human rights violations. Its unconcern for the popular response to its actions was once again demonstrated when Medha Patkar and Dewram Bhai decided to go on an indefinite hunger strike in Bombay to press their demand for a review, a demand which is today drawing wide-ranging support from a variety of organisations. On the very second day of the fast, Patkar was arrested for attempted suicide and forcibly removed to hospital and force-fed. This showed utter contempt for a historically acknowledged legitimate form of protest. As Patkar stated in a submission to the court, "an activist who wishes to wage a non-violent peaceful war against evils in the society cannot be denied the right of continuing the agitation". Even later, as the agitation continued and the government was faced with growing pressure to consider the demands, it again arrested Patkar and forcibly put her on intravenous glucose. Not only do these acts contravene the right to protest, they go against acknowledged ethical procedures in medicine. According to the World Medical Association's Tokyo declaration of 1975, voluntary refusal to be fed is a patient's right. Moreover, as long as the patient can exercise 'unimpaired and rational judgment' (as was most certainly the case when Patkar was arrested on the second day of the hunger strike) and the conse-

quences have been explained, the decision rests with the patient. According to the WMA's more recent declaration on hunger strikes (1991), in the event the doctor faces a conflict of values as when the life of the patient is in danger (as one may presume may have occurred when Patkar was arrested the second time) and the doctor must discharge the first obligation to ensure the sanctity of life, even then the decision must rest with the doctor in consultation with the patient and a doctor or health worker is under no obligation to carry out the orders of the state or any other authority. These ethical codes become highly relevant in the context of the state's growing indifference and intolerance to all forms of protest, because they may be used by socially-conscious professionals to stall the state's actions.

The Andolan's strength comes from the fact that its larger perspective or political philosophy has derived from grassroots questions and in the course of responding to the immediate distress of the people of the valley. Thus the issue-based focus of the organisation has over the last eight years broadened to questioning of the models of development and the processes of designing and implementing of development projects and programmes based on these models. The Andolan's actions today are not merely addressing the issue of social and economic rights of just the people affected by the Sardar Sarovar project, but are striking at the political foundations of the state in India and its links with the dominant political and economic forces internationally. And this is why the state cannot afford to accommodate its demands, even in a limited way, nor even appear to give in. And this is also why the Andolan is so significant.

POLITICS

A Liability

WHILE within the Congress party, birds of a feather are flocking together behind a leader who is increasingly acquiring quite a disreputable image, outside, the opposition continues to hum and haw—uncertain about the future of the leadership of the ruling party and unwilling to face fresh elections.

Even if nothing can be done against the actual recipients of Harshad Mehta's ill-begotten largesse (as in similar financial scams in the past), in the public mind some of the mud will stick to the prime

It is regretted that because of a mechanical breakdown of our typesetting system, publication of this issue has been inordinately delayed. The size of the Review of Agriculture has had to be cut and it has not been possible to ensure uniformity of type style. The dislocation is expected to persist for two or three weeks. Readers are requested to kindly bear with us.

minister. If, as he claims, the big bull is lying, a defamation case against him would be the normal legal procedure. At least, as a public gesture, to allay misgivings in the minds of the people—and also among his own party members—he could have tendered his resignation (to be withdrawn, as customary in Congress politics, at the request of his colleagues who would have expressed their 'everlasting loyalty' to his leadership). But that ritual was also discarded. Did Rao fear that his resignation might be accepted by his colleagues who are finding him a liability, what with the unmitigated mess that he has made of the Indian polity?

But then, the moot questions for Congressmen are: how to get rid of a leader who lacks the decorum to gracefully retire? More importantly, who will succeed him? There are too many contestants. Given the almost insurmountable task of salvaging the polity, and restoring some semblance of legality to the system, along with the fear of a bad name that any incumbent would surely acquire if he/she fails to deliver the goods, one really wonders at the courage of the Arjun Singhs, Sharad Pawars and their ilk who are staking their claims—surreptitiously or otherwise—to the post of prime minister. Do they seriously hope to bring about the changes that are required to improve the situation, or do they just aspire to make good use of the opportunities that go with the office of prime minister for their personal benefit, as long as they last?

It is the lack of consensus among the party leaders on the choice of a successor to Rao that is forcing them to continue with the consensus on Rao as the prime minister. While publicly displaying their collective support and loyalty to Rao, each of the contestants is busy in horse-trading with MPs and party chief ministers and legislators in different parts of the country, in order to weigh his chances in the contest. Till a firm deal is struck leading to another 'consensus' on a new candidate, Rao will continue.

Meanwhile, pressures are mounting from both within the Congress, and from the opposition, for a replacement for Rao. Neither the Left, nor the Janata Dal, is in a position right now to win a mid-term poll and form an alternative government in Delhi. They have therefore reconciled themselves to the continuation of a Congress government at the centre—but under a more respectable prime minister. The possibility of the BJP coming to power, in the event of a mid-term poll, is a nagging fear that compels the rest of the opposition, willy-nilly, to keep the dilapidated Congress propped up in power with a few repairs now and then.

As for the Congress, it will have to salvage its sagging image before the coming assembly elections in the four

(erstwhile BJP-ruled) states, if it wants to make any dent in the BJP support-base there. Whatever little headway the Congress could make in these states during the last few months is likely to suffer a reverse following Harshad Mehta's allegations against Rao. Fighting the elections under the leadership of a man who is under a cloud is to court disaster. The Congress therefore is in desperate need of a new leader who can at least drag it out from the pit.

But the final outcome may be decided by the result of the contest between a wily and resilient prime minister who is determined to remain in power on the one hand, and the forces opposed to him (both within his party and outside) who are yet to formulate an alternative course of action, on the other. Rao is actually a beneficiary of the system introduced by Indira Gandhi in the Congress which institutionalised the power and position of the prime minister as an individual who is beyond any democratic control by the party. Rao can tomorrow strike a deal with the BJP—given his soft spot for the 'Sangh parivar'—to frustrate any no-confidence motion that might come up against him in parliament. Even though the BJP is publicly demanding his resignation and general elections, it is not without significance that its parent, the RSS, is against the removal of Narasimha Rao at this juncture, since it thinks that the time for the BJP to bid for power at the centre is not yet ripe.

Finally also, those within the Congress and the opposition who appear to be unwilling or incapable of upsetting Rao's apple cart will have to allay the suspicions generated among the public by Harshad Mehta's allegations about pay-offs to politicians of all hues, including even members of the JPC itself, who are supposed to investigate into his misdemeanours.

INDUSTRY

In Recession's Grip

A CONSPICUOUS fall-out of the government's policy of fiscal compression and tight monetary control since 1990-91 has been the severe recession in industry. For almost a decade industrial output grew at nearly 8 per cent per annum on average with significant contributions coming from capital goods and basic goods industries. All of a sudden from 1991-92 there was drastic curtailment of public expenditure in real terms which hit industrial activity dramatically. The general index of industrial production registered a fall of 0.2 per cent in 1991-92 against an increase of 8.3 per cent in 1990-91. Manufacturing output fell by 1.6 per cent, while there was a 0.6 per cent

rise in mining and quarrying and a sizeable increase of 8.6 per cent in electricity generation due to a substantial increase in thermal and nuclear power generation.

The government's *Economic Survey* for 1992-93 expected a 4 per cent industrial growth during the year. Month-to-month indices of industrial production (1980-81 = 100) suggest that except for two months (April and September), 12-month increases hovered around 1 to 3 per cent in each of the months up to December 1992; thereafter, January, February and March 1993 experienced drastic declines of 4.1 per cent, 4.3 per cent and 5.4 per cent, respectively. As a result, the average general index for 1992-93 at 215.1 shows an increase of only 1.3 per cent. While mining output has generally stagnated, manufacturing output showed a fractional increase of 0.6 per cent and electricity of 5 per cent.

A combination of supply and demand factors and also associated long-standing structural ones blighted the industrial scene in 1992-93. A glaring aspect of the industrial sluggishness relates to the energy sector. Studies have shown that the gross supply of primary sources of commercial energy rose by only 2.5 per cent in 1992-93 against an increase of 5.7 per cent in 1991-92. There was a corresponding increase in the dependence on imported sources of primary commercial energy, the result of a steep fall of 11.2 per cent in domestic production of crude oil. Though coal has an advantage as an energy option due to its relative abundance in the country, there is a rapid and distinct shift in preference in favour of hydrocarbons on the part of user industries. Investment in coal has suffered in recent years. Coal output at 238.2 million tonnes increased by 3.9 per cent in 1992-93 against increases of 8.4 per cent in 1991-92 and 5.4 per cent in 1990-91. Power generation at 301 billion units in 1992-93 registered a rise of 5 per cent essentially because of an 8 per cent increase in thermal and nuclear power, whereas hydel power, because of erratic (though sizeable) rainfall, fell by 3.9 per cent. In 1991-92 there was an increase of 11.1 per cent in thermal and nuclear power generation and of only 1.5 per cent in hydel as a result of the inadequacy of maintenance as well as lack of fresh investment in the hydel sector.

The second group of industries to suffer sluggish output growth are capital and investment goods—cement, steel and other metals, electrical and non-electrical engineering and commercial vehicles. Their production has suffered essentially because of the cut-back in public sector investment. Despite substantial capacity expansion in recent years, cement output stagnated at 54.1 million tonnes in 1992-93

BANQUE INDOSUEZ
(Incorporated in France with Limited Liability)
BOMBAY BRANCH

Schedule 17—Notes to the Accounts

I. Principal Accounting Policies.

a) General

- i) The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country.
- ii) Revenues are accounted for on an accrual basis except interest on advances classified as non-performing according to the prudential accounting norms prescribed by the Reserve Bank of India.

b) Transactions involving foreign exchange.

- i) Monetary assets and liabilities have been translated at the exchange rates prevailing at the close of the financial year except Foreign Currency Non Resident account balances which are carried at the relevant rates specified by the Reserve Bank of India.
- ii) Outstanding foreign exchange contracts are carried at the contracted rates.
- iii) Income and expenditure items are translated at the exchange rates prevailing on the date of the transaction.
- iv) Profit or loss on outstanding forward contracts is accounted for on accrual basis.

c) Investments

- i) Investments in Government securities other than treasury bills are intended to be held till maturity and are classified as 'permanent' investments in accordance with the Reserve Bank of India guidelines and are carried at 'Cost'.
- ii) All other 'quoted' investments are valued at 'lower of cost or market value' on an aggregate basis.
- iii) 'Unquoted' investments are carried at 'Cost'.

d) Advances

- i) Provision for doubtful advances is based on their classification into "performing" and "non-performing" assets in accordance with Reserve Bank of India guidelines. Provision for non-performing assets is made as under:

Sub-standard assets	— 10% of net advance.
Doubtful assets	— 100% of the unsecured portion and 20% to 50% of the net secured portion depending on the period for which the asset has remained non-performing.
Loss assets	— 100%.
- ii) Provision in respect of doubtful advances is deducted from advances.

e) Fixed Assets

- i) Premises and other fixed assets have been accounted for at their historical cost less depreciation. Premises which have been revalued are accounted for at the values determined on the basis of such revaluation by professional valuers. Surplus on revaluation has been credited to Capital Reserve.
- ii) Depreciation is provided for on the diminishing balance method at the rates specified in Schedule XIV to the Companies Act, 1956. In respect of additions during the year, depreciation is provided with effect from the half year in which the addition is made.
- iii) Depreciation in respect of revalued assets is provided for on the revalued amount and charged to the Profit and Loss Account.

f) Staff Benefits

Contribution to the approved Gratuity Fund is made as per valuation by an actuary.

g) Revenue Recognition

Income from advances is recognised on expiration of time basis except in case of non-performing advances which is recognised on realisation basis as per the income recognition norms of the Reserve Bank of India.

h) Profit and Loss Account

'Provisions and Contingencies' include:

- i) provisions for taxes on income in accordance with statutory requirements,
- ii) provision for doubtful advances,
- iii) transfers to contingency and other funds,
- iv) other usual or necessary provisions, and
- v) bad debts written off.

II. The Bank has modified its accounting policies pertaining to Investments, Provision for Doubtful Advances and Revenue Recognition in accordance with the guidelines prescribed by the Reserve Bank of India. The impact of the changes in accounting policies on the profit for the year is not significant.

III. Previous year's figures have been regrouped/rearranged wherever necessary.

BANQUE INDOSUEZ
(Incorporated in France with Limited Liability)
BOMBAY BRANCH

**Auditors' Report on the Indian Branch of Banque Indosuez
under Section 30 of the Banking Regulation Act, 1949.**

We have audited the attached Balance Sheet of the Indian branch of Banque Indosuez (incorporated in France with limited liability), as at 31 March, 1993 and the relative Profit and Loss Account of the Indian branch of the bank for the year ended on that date annexed thereto.

The Balance Sheet and Profit and Loss Account have been drawn up in accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of Section 211 of the Companies Act, 1956.

We report that:

- (1) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory.
- (2) The transactions which have come to our notice have been, in our opinion, within the powers of the Indian branch of the bank.
- (3) In our opinion, proper books of account as required by law, have been kept by the Indian branch of the bank so far as appears from our examination of these books.
- (4) The above mentioned Balance Sheet and Profit and Loss Account of the Indian branch of the bank dealt with by this report are in agreement with the books of account.
- (5) In our opinion and to the best of our information and according to the explanations given to us, the accounts together with the notes thereon, give the information required by the Companies Act, 1956 in the manner so required for banking companies and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Indian branch of the bank as at 31 March, 1993 and the Profit and Loss Account gives a true and fair view of the profit of the Indian branch of the bank for the year ended on that date.

TOTAL	243,338	186,914			

Schedule 17—Significant Accounting Policies and Notes:

1. These accounts are based on the historical cost convention and are drawn up on the 'going concern' concept.
2. Revenues are accounted for on accrual basis except the following items which are accounted for on cash basis:
 - i) interest and other income on advances classified as non-performing according to the prudential accounting norms issued by the Reserve Bank of India,
 - ii) interest and other income on non-accrual advances classified as such by the bank,
 - iii) overdue interest on bills discounted,
 - iv) guarantee commission,
 - v) commission on foreign exchange forward contracts.
3. Expenses are generally accounted for on accrual basis.
4. Foreign Currencies:
 Revenues earned and expenses incurred in foreign currencies are translated for the period ended October 31 at the rate of exchange current as at October 31 and for the period from November 1 to the Balance Sheet date at the rate of exchange current as at the Balance Sheet date. Interest paid on Foreign Currency Non-Resident Deposits is translated at the rate of exchange at which the relative deposit is translated. All other transactions during the year are translated at rate of exchange current as at the date of the transaction.
 Assets and Liabilities in foreign currencies, including unmatured foreign exchange forward contracts, acceptances, endorsements and other obligations and guarantees are translated into Indian Rupees at rates of exchange current as at the Balance Sheet date as specified by the Reserve Bank of India. Resultant gains or losses are taken to the Profit and Loss Account. As per the present practice of banks in India, the Foreign Currency Non-Resident Account balances and Post Shipment Credit denominated in Foreign Currency balances are valued as at the Balance Sheet date at the rates specified by the Reserve Bank of India at the date of the transaction and not at the currency rates current as at the Balance Sheet date.
5. Investments:
 The bank values all investments at the lower of the aggregate of the market values and the purchase costs after amortisation of premium or accretion of discount from the date of purchase to the date of maturity of the investment. Resultant gains or losses are taken to the Profit and Loss Account.
6. Fixed Assets:
 Depreciation is on a written down value method, based on the written down value arrived at on October 31 of the accounting year, being the date as at which the corporate Balance Sheet of the Bank is drawn up, at the rates specified in Schedule XIV of the Companies Act, 1956.
 As per an agreement with the joint owner of certain premises, the bank exercised the firm and absolute option to purchase the said premises from the joint owner for a consideration of Rs. 1,100 thousand together with interest upto the date of the exercise of such option by the bank. Certain disputes have been raised by the joint owner and pending resolution of these disputes by the court, no adjustments have been made in the accounts for the aforesaid amount and interest thereon.
7. Advances:
 - i) Provisions for doubtful advances have been made to the satisfaction of the auditors in respect of all advances identified as non-performing as per the norms prescribed by the Reserve Bank of India.
 - ii) Provisions have been made on a gross basis. Tax relief which will be available when the advance is written off will be accounted for in the year of write-off.
8. Net Profit:
 The net profit disclosed in the Profit and Loss Account is after:
 - i) provisions for taxes on income in accordance with statutory requirements,
 - ii) provisions for doubtful advances,
 - iii) adjustments to the value of investment in Government and Other Approved Securities in India valued on the basis stated in Note 5 above,
 - iv) other usual and necessary provisions,
 - v) reversal of provisions made in earlier years no longer required.
9. Head Office expenses of past years amounting to Rs. 5,400 thousand will be accounted for as and when the remittance is allowed by the Reserve Bank of India.
10. Previous year's figures have been regrouped and reclassified wherever, and to the extent, practicable.

Scotiabank

THE BANK OF NOVA SCOTIA
(Incorporated with Limited Liability in Canada)

Auditor's Report on the Indian Branch of The Bank of Nova Scotia under Section 30 of the Banking Regulation Act, 1949

We have audited the attached Balance Sheet of the Indian Branch of The Bank of Nova Scotia, incorporated in Canada with limited liability, as at March 31, 1993 and the relative Profit and Loss Account of the Indian Branch of the Bank for the year ended on that date annexed thereto.

The Balance Sheet and Profit and Loss Account have been drawn up in accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of Section 211 of the Companies Act, 1956.

We report that:

- (1) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory.
- (2) The transactions which have come to our notice have been, in our opinion, within the powers of the Indian Branch of the Bank.
- (3) In our opinion, proper books of account as required by law, have been kept by the Indian Branch of the Bank so far as appears from our examination of these books.
- (4) The abovementioned Balance Sheet and Profit and Loss Account of the Indian Branch of the Bank dealt with by this report are in agreement with the books of account.
- (5) In our opinion, and to the best of our information and according to the explanations given to us, the accounts together with the notes thereon, give the information required by the Companies Act, 1956, in the manner so required for banking companies, and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Indian Branch of the Bank as at March 31, 1993 and the Profit and Loss Account gives a true and fair view of the profit of the Indian Branch of the Bank for the year ended on that date.

Economic Value of Breast-feeding in India

Arun Gupta
Jon E Rohde

This article reviews the macro-economics of infant feeding and attempts to calculate the economic value of lactation in Indian mothers.

THE importance of mother milk to the health and nutrition of infants is universally recognised [1]. Breast-feeding is associated with reduction in infectious diseases, improved survival, better nutrition, reduced development of allergic illness, improved psycho-social bonding and overall better health in the infant and young child. The lactating mother enjoys immediate benefit from reduced bleeding in the post-partum period [2], a long-term reduction of cancer risk of both breast and ovary [3, 4], and the psychological benefit attendant with successful lactation. It is now recognised that exclusive and prolonged lactation provides more reduced fecundity than use of all modern methods of family planning [5]. For the individual woman, exclusive breast-feeding can provide six months or more of effective contraception, provided menses do not return before this time [6]. In lactating populations, the lowered fecundity extends for the average woman beyond a year reaching 18 months or more in Bangladesh, Indonesia and other rural populations [7]. All of these effects of lactation on health, nutrition and fertility are reason alone for individual mothers to choose breast-feeding for their child as well as for communities and societies to advocate exclusive breast-feeding for the first four to six months of life and continuation well into the second year as a desirable social norm.

In addition to these benefits, mother milk makes a substantial contribution to the economy of most developing countries. Conventional approaches to measuring national income and GNP take little account of the informal sector and especially the non-market economy. As breast milk is neither traded nor priced, its economic value is lost to economists and planners. In this paper, we calculate the milk production capacity and estimates of actual lactation by Indian mothers. We calculate the quantity and cost of animal milk which would be required if this lactation were reduced or altogether terminated. The value of animal milk or of processed infant formula is compared to various other products in the national economy, as well as to government outlays in the public sector. Additionally, we estimate the number of animals, pasturage, and other related costs associated with a switch from mother milk to animal milk for feeding Indian infants. We review the micro-economics of infant feeding as viewed from the perspective of the family, indicating the cost of artificial feeding and the full savings afforded to the individual family by a mother who breast-feeds.

Considering the substantial protection which breast-feeding provides from diarrhoea, we have calculated the estimated reduction in diarrhoeal episodes afforded by mother milk, and the cost of treating these episodes if other feeding methods were to prevail. In addition, we have calculated the economic value of the fertility reduction afforded by breast-feeding under current patterns in India.

These calculations offer a conservative estimate of the value of human milk to the Indian economy, and demonstrate dramatically in terms that can be understood by economists, planners, and other non-health professionals the important national resource which mother milk represents.

CALCULATIONS AND RESULTS

Breast milk production capacity is the estimated volume of breast milk which could be produced if all women lactated fully. Table 1 shows estimated daily volume of breast milk by age of the child from different parts of the world [8, 9]. Taking a conservative lower daily production estimate it is assumed that an Indian mother would produce about 600 ml per day during the first six months, 500 ml per day during seven to 12 months and about 400 ml per day during 13 to 24 months. Thus, over two years, production would be 346 litres per child.

Various calculations relating to annual production capacity by Indian mothers is shown in Table 2. From the production capacity by age of the child and the surviving number of children in each age group is calculated the total theoretical production capacity, roughly 8,000 million litres per year. This capacity is diminished by the small per cent of women who could not lactate, estimated in the next line, which would give an annual potential production of 6,800 litres. However, not all women who can, do lactate, and the production is further diminished by the percentage of women who actually do not breast-feed their child. Table 3 shows data from various studies in India used to estimate the percentage of infants receiving breast milk by age and rural or urban residence [10, 11, 12, 13]. The consolidated estimates of per cent lactation from Table 2 provide the basis for calculation of the 'annual realistic production' by Indian mothers. Calculated separately for rural (70 per cent of population) and urban (30 per cent of population), the total annual realistic production is 4,411 million litres. Even this production is further reduced by the simultaneous use of supplementary milk

formula or top feeds. Based on various studies [10, 12], it is found that 50 per cent of children are given additional bottle feeds during the first six months and nearly 70 per cent or more from that age onward. This is assumed to result in a loss of breast milk production as a result of decreased breast stimulation. As frequent suckling usually continues, even in these cases, we assume a reduction in breast milk production (for mothers who give milk supplements) of 25 per cent in the first six months, 50 per cent in the second-half of infancy and 75 per cent in the second year. In the absence of experimental data these estimated losses are more an educated guess by experienced observers, and could be readily modified by the curious reader. Breast milk production loss associated with unnecessary top feeds is thus estimated at nearly 1,100 million litres. Thus, we estimate the grand total of breast milk produced annually in India at 3,316 million litres per year. This contrasts to a potential production of more than twice that amount.

This magnitude of mother milk production can be appreciated by comparison with the entire national production of milk from India's extensive dairy industry. Total milk production for 1992 is estimated at 57,000 million litres of which 46 per cent is available as liquid animal milk, 26,220 million litres [14]. Thus, mothers are providing a quantity of milk some 12.6 per cent of total national milk production. Valued at the cost of fresh animal milk Rs 9 per litre, mother milk would have a market value of Rs 2,984.4 crore. Were it replaced by tinned powder milk at a cost of Rs 18 per litre, the value doubles to Rs 5,968.4 crore. Were the milk to be imported to replace mother milk, this should require over US \$ 2,300 million in foreign exchange.

No doubt, human milk does not come without cost. However, the efficiency of conversion of common foods to human milk is extremely high (Table 4). This simple calculation shows the market price for food required for a mother to produce 1 litre of milk is Rs 3.3. Thus, the food cost of mothers producing 3,300 million litres annually is some Rs 1,090 crore. Were Indian women to cease using top milk for infants

Asian countries	530-730	600	480

and produce their realistic potential of 4,400 million litres, the production cost of Rs 1,452 crore would be reduced from the equivalent value of powdered milk, Rs 7,920 crore, for a net value of human milk production of some Rs 6,500 crore each year.

Table 5 places the value of human milk, priced at the cost of powdered milk, in the overall context of the national economy. This, comparable to major central plan outlays in various development sectors, exceeds the value of important food exports such as tea or coffee by a factor of five or more and is roughly equivalent to the import of petroleum products in a single fiscal year. Mother milk production each year has an economic value similar to the combined health and family welfare sector outlays throughout the five years of the Seventh Plan. Imported milk and cream products would increase over 100-fold were Indian mothers to insist on imported formulae to replace their breast milk, a cost exceeding even imported petroleum and oil [15, 16].

The tremendous economic value of mother milk to the nation is reflected in calculations at the household level as well. Viewed from the perspective of the individual family, the costs of bottle-feeding are substantial (Table 6). Some Rs 450 is required to feed a healthy infant each month without calculating the time costs of preparing infant formula. This is equivalent to 50 per cent of the minimum wage for an urban worker and 25 per cent of the income of a class IV employee, one-third of the salary of a private company stenographer and 10 per cent of the salary of a class II officer. Thus, the substantial cost of artificially feeding an infant must be considered carefully while calculating the household economy of women in the work place. Those who opt for the difficult and undesirable method of bottle-feeding in order to seek work outside the home, may be gaining small fiscal benefit at considerable health and nutritional risk to the infant.

It is not economic costs alone but also substantial environmental pressures which

Total breast milk produced in India annually is 3316 million litres.

would result were mother milk not available. Today to produce the roughly 1,000 million litres of milk which are lost due to supplementary top feeds, roughly 15 lakh animals are required. (Taking the average two litres per day per animal yield of national estimates.) Were high-yielding animals available producing 10 kg per day still three lakh animals would be required who would need some 75,000 acres of land for adequate grazing. Daily maintenance costs and grazing fee could exceed Rs 500 crore [14].

Even today, with wide use of bottle feeds in addition to breast milk, the fuel required to boil water to feed 10 million babies on infant formula is tremendous. At 7½ kg of wood required annually to prepare the feed for one baby [17] costing Rs 110, over 100 crore worth of firewood is consumed each year, thus levelling huge forests. Bottles and nipples require a further investment of year of life with no added morbidity in older ages. Thus, the added cost in health care for diarrhoea associated with bottle-feeding may reach upward from this estimate of nearly Rs 200 crore to something exceeding Rs 1,000 crore per year or even more. Breast-feeding avoids this needless expense.

Breast-feeding is known to cause reduced fecundity for many months. While it may not be a reliable means of contraception beyond six months of exclusive lactation, reduced fecundity is seen in populations for periods ranging upwards of 12 months where lactation is extensive and widely practised [20]. Studies have calculated that breast-feeding contributes more to the length of post-partum, sub-fecundity than all methods of family planning combined. In one recent study it was estimated that breast-feeding is responsible for reducing the potential fertility by 30 per cent throughout Asia [7]. If the current duration of breast-feeding fell by one-half, it was estimated that total fertility could increase by 17 to 37 per cent in different countries of the region [7]. In India, the median duration of lactation is about 10 months with an average lactational amenorrhoea of eight months [12]. Thus, lactational

amenorrhoea provides some 16.5 million couple protection years to the family planning effort. This makes lactation amenorrhoea the top contraceptive in the country exceeding IUDs and sterilisation, each by a factor of four (Table 7). The cost of the family planning programme is some Rs 650 crore per year and the cost per couple year of protection is estimated at Rs 300. Thus, the value to the family planning programme of 16.5 million couple protection years from lactational amenorrhoea amounts to Rs 495 crore, nearly half of the family welfare budget.

There are numerous other benefits which could be monetised. Better growth, avoidance of other illnesses in the infant and mother, psychologic bonding with later development and behavioural benefits are all of immense value, but difficult to calculate in fiscal terms. But the value of mother's milk to the economy is obvious from the cost of replacing it with cow milk, from the Rs 276 crore (assuming one bottle and two nipples used per month costing Rs 20 and Rs 1.50 respectively). More than 360 million tin packs of 500 gms each are required and would be discarded as waste into the environment each year. Obviously, the cost today in fuel, environment, needless investment in feeding-bottles and unnecessary pollution are further reasons to support full breast-feeding by Indian mothers.

Breast-feeding contributes extensively to improved health of the young child. The incidence of diarrhoea may be from three to 14 times higher in bottle-fed versus breast-fed children [18]. Here we calculate the costs involved in treating only one additional episode of diarrhoea for each child, a most conservative estimate by any measure. While breast-feeding also reduces the incidence of ARI, malnutrition, cancer risks in the mother and has many more health advantages, these will not be calculated but are of substantial economic as well as health benefit.

Each child in India suffers an estimated 1.6 episodes of diarrhoea per year, each episode costing an average of Rs 30 for treatment sought at the village level [19]. If the child requires hospitalisation an estimate of Rs 400 per day is reasonable. While most studies show an increase of diarrhoea incidence by a factor of three to 10 or more, let us calculate the cost of adding even one episode per year to each infant, a total of 25 million additional episodes of diarrhoea. National studies have shown that more than 65 per cent of families seek treatment outside of the home for an average episode of

diarrhoea. At Rs 30 per episode some Rs 48 crore would be expended for their treatment. If 10 per cent are hospitalised for two days, i.e., 1.6 million infants, the cost of treatment is a further Rs 128 crore. The savings from reduction of one episode of diarrhoea in each infant alone exceeds the annual health allocation in the last Five-Year Plan for all programmes in child health of about Rs 144 crore. But this estimate is made only on the basis of assuming one extra episode per infant in the first environmental pressures that would result, and from the increased costs of health services and fertility control which would be required in the absence of widespread lactation in India.

DISCUSSIONS

The calculations of milk production capacity of Indian mothers in this article have been based on data from numerous studies, surveys and research projects. We have endeavoured to use the most conservative figures by which calculation, the potential production of breast milk by Indian mothers through 24 months of lactation is about 350 litres. This represents the average capacity of each mother were she to follow optimal feeding patterns including exclusive breast-feeding for the first six months, timely introduction of food supplements and continuation of regular breast-feeding until the child reached 24 months of age. Recognising that some mothers would be unwilling or unable to breast-feed, these estimates have been suitably reduced (Table 2), showing the total potential production of breast milk per year of some 6,800 million litres. This potential production level is, however, not even today being reached, as a result of lower levels of breast-feeding in both urban and rural populations. Recent studies have been reviewed from which the average current level of lactation by age of infant is shown in Table 3. Using this data, we calculate that were all Indian mothers to follow rural patterns of lactation, the total production would be some 4,575 million litres per year. Were all mothers in India to follow the urban pattern, this would be reduced to 4,030 million litres per year. Overall current production is estimated much less than either of these figures due to the already widespread current use of top milk by Indian mothers. Estimates on Table 2 indicate that more than 1,000 million litres of top milk are presently being used, much of it from animal milk, the rest processed powder milk. The value of this powder milk alone is Rs 1,800 crore, an expenditure which would be unnecessary, if mothers fully breast-fed to their capacity. Thus, current production of breast milk by Indian mothers is conservatively estimated at about 3,300 million litres. This is less than half of the potential if full breast-feeding were maintained.

The value of this milk expressed in terms of fresh animal milk (approximately Rs 3,000 crore) or in terms of powder milk (approximately Rs 6,000 crore) is tremendous. It can

TABLE 6: COST PER MONTH

Material	Cost in Rs

Sterilisations (annual)	4.1	0.98	4.0

be seen that under present practices, the value of nearly Rs 2,000 crore is being lost as a result of sub-optimal breast-feeding and use of top feeds.

The extensive contribution of mother milk to the entire national milk production is unrecognised. Women have a potential of contributing fully 26 per cent of the current liquid milk available in India. This falls to nearly 13 per cent when one projects the likely milk production presently by mothers as a result of sub-optimal feeding and the use of top milk. Considering that estimated milk requirements by the year 2000 is 73,000 million litres [14] the contribution of mother milk to this major production challenge is substantial.

The cost of human milk production should, of course, be considered. In Table 4, we calculate the raw materials in the diet and efficiency of conversion to make a litre of mother milk. Assuming these inputs to cost some Rs 3.3, the cost of production of 4,400 million litres, is Rs 1,452 crore. So the net value of human milk presently being produced is about Rs 6,500 crore. This is valuing human milk at the price of powder milk in the market, even though there is no question that human milk has many more advantages, is more nutritious and provides immune protection for the child.

Table 5 provides an interesting comparison of the economic value of milk with other services and products in the Indian economy. We see in the table that the annual value of milk production is comparable or indeed exceeds many of the central plan outlays in major sectors of the economy. It is roughly equivalent to the combined health and family welfare sectors of the Seventh Five-Year Plan. Its economic value would appear to be similar to that of petroleum imports and roughly equivalent to the total national foreign currency reserves 1990-91.

The decline in breast-feeding, often seen with urbanisation and already underway in this country, must be made good with increased production of animal milk. We have shown that with average national yields, the requirement for animals in terms of capital, land and processing cost of animal milk that would be required to replace 1,000 million litres mother milk in the national economy are: 75,000 acres of land, Rs 300 crore of capital and another Rs 500 crore in simple recurring cost.

In the economy of a single family, the individual costs for feeding-bottles, nipples, fuel and milk, consume roughly 50 per cent of the minimum wage of an urban worker. This ignores the cost to the family of increased illness and, in many cases, nutritional deterioration. The cost of not breast-feeding is a substantial burden on all but the wealthiest families.

But breast-feeding offers more than the economic value of the milk that is produced. Breast-feeding improves health and is shown to reduce diarrhoea rates anywhere from three to 14 times by comparison with bottle-fed babies. We have made calculations of the

extra money that would be required to treat diarrhoea, not even considering the worse outcome and increased number of deaths that would be associated if mother milk is all replaced by bottle-feeding. Not only the Rs 176 crore of additional public expenditure on treating these cases but the obvious increase in morbidity, malnutrition and eventual death show the dramatic value of breast milk to the health system.

Finally it is been pointed out by many observers that throughout much of world, fertility reduction associated with lactation contributes more to reduced fecundity than all the modern contraceptives put together. Calculations in Table 7 show the importance of lactational amenorrhoea to overall couple protection in India. Again the effectiveness of breast-feeding in providing nearly 17 million couple protection years is comparable to the entire investment in family planning methods in India in 1990. The cost of this protection at current rates would be nearly Rs 500 crore.

Replacing breast milk with any other feeding method for infants and young children results in high costs to the individual families, to the society, and to the overall economy. Replacement feeding methods place stress on the environment, contribute to environmental pollution, and directly exacerbate population pressures through increased fecundity in the young child-bearing population. A move away from mother's milk entails extensive health costs, even for those who do survive. This national resource is currently severely threatened by trends in modernisation and urbanisation towards bottle-feeding. These are not only physiologically undesirable and place our youngest citizens at high risk of illness and death but they cost the economy substantially. All efforts to preserve, promote and encourage breast-feeding should be taken and every measure necessary to reduce the regrettable trend towards bottle-feeding in our country is in order [21]. Appropriate legislation should be enacted immediately to protect the public from the onslaught of commercial interests attempting to replace mother milk with expensive, less nutritious, and more dangerous substitutes. Mother milk is indeed a major national resource of India.

Exchange Rate Dynamics

Case of Dollar

Ranjit Sau

We have derived a first-order non-linear difference equation for exchange rate. In theory it generates a very complex dynamics. The equation is estimated with quarterly data of US dollar relative to the SDR, 1974-1991. It is utilised to forecast the value of dollar up to the first quarter of 1995. The dollar, it appears, will be in the upswing in the near future. It will remain all through at a higher level than presently. Hence, the Indian rupee, if made fully convertible, would depreciate relative to dollar.

THE Indian economy is being opened up for greater integration with the outside world. The finance minister has announced India's intention to make the rupee fully convertible as soon as the conditions permit. Exchange rate is a link that binds different parts of the world economy. The currency crisis that had gripped Europe on the eve of the French referendum on the Maastricht treaty has raised many a question once again. Is the exchange market stable? Does it ensure efficiency in some sense? What are the laws that govern the course of a currency? Is the post-1973 experience of floating exchange rates disappointing? Answer to these questions is very relevant for us today as India awaits full convertibility of rupee.

Elsewhere [Sau 1992] we have derived a first-order non-linear difference equation for the exchange rate. The basic model has certain Keynesian and Ricardian features: Keynesian, for it is the saving-investment imbalance that drives the system; Ricardian, for investment responds to the rate of profit as distinct from the rate of interest. The motion of exchange rate is found, in theory, to be highly complicated, necessarily on the verge of being what is called 'chaotic' [Devaney 1989]. This paper puts that model into empirical test with the quarterly data of the US dollar. Statistical results seem to be promising.

Section I gives the fundamental equation for exchange rate, and enumerates its properties. Section II shows the statistical results with data from the first quarter of 1974 to the fourth quarter of 1991, that is, 72 observations in all. We have also made forecast of the value of Special Drawing Rights (SDR) in terms of the US dollar up to the first quarter of 1995. Section III has a few concluding remarks.

I

'Near-Chaos'

Consider a Keynesian short period, say, one 'year'. Let that one year be divided into a number of 'days', indexed by t ($t = 0, 1, 2, \dots, T$). Saving is internationalised [McCulloch 1983:10] in that it is invested in various parts of the world every day such that the marginal rate of profit

is equalised across national economies [Whitman 1981]. The exchange rate, defined as the price of foreign money in terms of domestic money, is assumed to change in step with the outflow of domestic savings for investment abroad.

Under such circumstances, we [Sau 1992] have shown that the movement of exchange rate is given by

(1) $e(t) = a.e(t-1) - b.e^2(t-1)$, $a, b > 0$ where e is the exchange rate. For the moment we shall assume that e is non-negative; later we shall consider only the positive values of the exchange rate. This quadratic mapping is the celebrated logistic equation. It can generate a wide variety of orbits depending upon the parameters and the initial value of the variable.

Obviously (1) is a parabola in $(e(t-1), e(t))$ -space. Origin $(0,0)$ is a point on it; it is a trivial solution. The axis of the parabola is vertical; and the vertex occurs at $(a/2b, a^2/4b)$. In other words,

(2) $\max e(t) = a^2/4b$

Furthermore, we note that where $\max e(t-1)$ occurs we have $e(t) = 0$. Hence, from (1) it follows that

(3) $\max e(t-1) = a/b$

We know that $e(t)$ and $e(t-1)$ belong to the same set, say, E . Evidently, set E is bounded from above; it has a unique supremum. Thus

(4) $\max e(t) = \max e(t-1)$

From (2), (3), and (4) we get

(5) $a = 4b$

That parameter a is necessarily equal to 4 has a very profound implication—it takes the system to the brink of chaos as we shall see in a moment.

Create a new variable $x(t)$ as follows.

(6) $x(t) = b.e(t)/a$

(1) and (6) yield

(7) $x(t) = a.x(t-1) \{1 - x(t-1)\}$

In view of (3), (4) and (6) we conclude that

(8) $x(t) = e(t)/\max e(t)$

So $x(t)$ lies in the closed interval $[0,1]$, given that $e(t)$ is non-negative.

We consider only those cases where $e(t)$ is strictly positive, never zero. Then $x(t)$ belongs to the open interval $(0,1)$. We put it in symbols.

(9) $0 < x(t) < 1$

It is a standard theorem in non-linear dynamics that (7), subject to (9), can

generate a diverse menu of trajectories. If parameter a is between 1 and 2, the path of x , hence, of e , is smoothly converging to a stable value. If a is between 2 and 3, the path is still converging, but oscillatory. As a crosses 3 the movement becomes increasingly complicated; and when it exceeds 4 we get chaos [Devaney 1989].¹ By (5) we know that in our model a is precisely equal to 4; hence we get not necessarily chaos, but the system is just on the verge of it. We call it 'near-chaos'. This points to a very strong result: All such quadratic mappings that are used in economic models necessarily display 'near-chaos'.²

II

Path of Dollar

The above model relates to 'days' within one Keynesian short period. All prices are fixed in domestic currency and kept constant. Thus the purchasing power parity (PPP) theory is held at bay. The interest rate also is given. Even then the exchange rate varies in our model in response to saving-investment imbalance from day to day. We have applied this simple model to a relatively long period of as many as 72 eventful quarters which had in fact witnessed some of the most dramatic price changes and record-breaking variations in the rate of interest. In reading the results

TABLE I. PROJECTION OF EXCHANGE RATE

(US Dollars per unit of SDR)

Year-Quarter	
Observed 1991-IV	1.43043
Projected:	
1992 -I	1.40368
-II	1.38394
-III	1.36891
-IV	1.35721
1993 -I	1.34793
-II	1.34047
-III	1.33441
-IV	1.32946
1994 -I	1.32537
-II	1.32198
-III	1.31915
-IV	1.31679
1995 -I	1.31481

Equation (10) has been used for projection

of our statistical exercises this background has to be kept in view.

With data from *The International Financial Statistics* published by the International Monetary Fund, we have estimated (1) by the ordinary least squares method as follows:

$$(10) e(t) = -0.6761 + 2.1839 e(t-1) \\ (2.537) \\ -0.5103 e^2(t-1) \\ (-1.422)$$

$$S.E.E. = 0.0399, R^2 = 0.88, F = 246.977$$

where $e(t)$ is the end-of-period price of the SDR in terms of the US dollar, and the numbers in parentheses are the t -values of coefficients. There is a constant term (-0.6761) in (10), but not in (1). What does it signify? The fundamental equation (1) is derived under the assumption of constant prices and interest rates. But over the long period 1974-1991 covered by (10), in fact, prices and interest rates had changed, and the parabola evidently had drifted to the right. What (10) captures is actually a set of points on a series of parabolas, each point being the position of the economy on a particular date. In (1) there is only one steady-state solution: $e = (a-1)/b$. But in (10) there are two steady-state solutions for the exchange rate, namely, 1.30389 and 1.01612.

In (10) the estimated value of parameter a is 2.1839, while in theory it is supposed to be precisely 4; see (5). In any case, our estimated value of a is statistically significant, having a very high t -value.¹ If this estimate of parameter a is acceptable, despite all the limitations including those mentioned above, we infer that a being greater than 2 but less than 3 the motion of the exchange rate of SDR in terms of dollar is converging but oscillatory. That is to say, dollar will fluctuate even if prices and interest rates are held constant in the world market. Using (10) we have made a projection for dollar up to the first quarter of 1995. The table shows the dollar price of SDR.

In 1974 the IMF adopted a procedure whereby the price of SDR is tied to a basket of several major currencies [Chrystal 1978:18]. So in equation (10) and also in the table essentially we get an average value of dollar in terms of a number of major currencies. This process of averaging must have taken away much of the erratic movements of dollar vis-à-vis other currencies individually. We have also estimated an equation using the average (geometric)-of-the-period data with the following result.

$$(11) e(t) = -0.4062 + 1.7157 e(t-1) \\ (2.480) \\ -0.3099 e^2(t-1) \\ (-1.072)$$

$$S.E.E. = 0.0323, R^2 = 0.92, F = 383.494$$

Here parameter a has a lower value, namely, 1.7157, compared to 2.1839 in (10). We accordingly surmise that averaging of the data leads to a reduction of the numerical value of this crucial parameter. If so, it is conceivable that for some individual currencies this parameter may exceed 4 giving rise to a chaotic dynamics. It is, however, well known that discerning chaos from observed data is quite a difficult task. Even rounding-off in the course of computation may conceal a chaos that is lurking behind.

III

Concluding Remarks

A system of floating exchange rate is in vogue since 1973. Market-determined exchange rates have exhibited instability beyond the fondest nightmares of fixed-rate fanatics. Yet, international flows of trade and investment seem relatively unaffected by these erratic changes [Dunn 1983, Krugman 1989, McCulloch 1983]. There are several plausible ways of resolving this paradox. In any case, it is important for India to note in this context that perhaps of the many large risks of all types that any commercial endeavour now entails, exchange rate uncertainty may be relatively minor compared with the benefits of foreign trade and investment. Contrary to the pre-1973 conventional wisdom, floating may provide an independent incentive for foreign direct investment. Input-price uncertainty is a recognised motive for vertical integration; a regime of floating rates accordingly provides a multinational enterprise incentive for vertical integration. In short, the relative advantage of multinational firms over national enterprises outweighs any disadvantage of exchange rate uncertainty.

Even if all prices and interest rates remain as they are dollar will be on the upswing in the next few quarters, according to our calculations. If, in addition, the full effects of inflation and interest rate differentials are recognised, the exchange rate of dollar in terms of Indian rupee in all probability will be still higher. Since India does not have much by way of its own multinational enterprises, it can hardly aspire to enjoy the relative advantages of those enterprises. In a word, further depreciation of rupee is almost inevitable in a regime of convertible and floating rupee, while not all the benefits of such a regime would accrue to India.

Notes

[This paper belongs to a research project, funded in part by the Centre for Management and

Development Studies, Indian Institute of Management, Calcutta. The author thanks V N Reddy for his advice on matters of statistics and computation. The author alone is responsible for the views and errors.]

- 1 Currently two methods are available for empirically detecting chaos, namely, the Grassberger-Proccaccia method and the Brock-Dechert-Scheinkman method. See Hsieh (1991)
- 2 According to some authors, $a = 4$ is good enough to give full-scale chaos; see Boldrin 1988, Day 1983, Goodwin 1990, Hoppensteadt and Hyman 1977, Kelsey 1988.
- 3 Since the equation has lagged dependent variable, the estimates by OLS are inconsistent, see Maddala (1989:345). So the individual estimates of coefficients may not be statistically satisfactory. However, having a high correlation coefficient (10) can be a fairly reliable equation for forecasting.

The Western Illness

Brian May

THE suicide of Pierre Bérégovoy may be usefully discussed in a broader perspective than that provided in Frédéric F. Clairmont's article (*EPW*, May 22). It is proposed here to extend the background by brushing in elements not only of the French economic crisis, but of the state of western Europe as a whole, and by bringing in Toynbee's views on the decline of civilisations. We can thus transcend personalities and get somewhere near the heart of the general European malaise, of which the collapse of the French Socialist Party is merely a symptom. Also relevant to the view taken here is Rajni Kothari's illuminating idea of a 'world without alternatives' (*EPW*, May 29).

I

It is true that the French Socialist Party was torn by disgraceful, intestine battles for position. It is also true that down the years, like all similar western parties, it reduced the once pregnant term 'socialist' to a meaningless political tag, which is now on the verge of being thrown into the dustbin.

But it is contrary to all political experience to imagine that the party's leaders were dominated by an urge to satisfy and cash in on the greed of such a tiny minority as 'Big Capital'. Even if it be assumed (wrongly) that loot was their main goal, they could not get their hands on it unless they were re-elected to parliament. Their first aim was votes. Other blessings, if they wanted them, would follow.

It is too simple to attribute vacillations in the French government's economic policies to the machinations of 'Big Capital', close though its opulent tents were to some of those in power. What took place was an increasingly frantic search for solutions to economic problems, which are difficult, probably impossible, to find in the chronically unstable capitalist system. Of these the most serious, as Clairmont rightly recalls, was, and is, unemployment, which threatens not only social stability, but, some think, the very existence of the present political class, many of whom, irrespective of party, are fully aware of the danger.

There is no doubt that Bérégovoy, the self-educated working class son of a Ukrainian immigrant, was above all concerned with the plight of the unemployed. In a letter written by hand to the Canadian prime minister, Brian Mulroney, the

day before his suicide, he expressed his "deep disappointment...with this recession and the unemployment resulting from it".¹ The evolution of Bérégovoy's thinking is clear. In 1982, far from being Mitterrand's stooge, he persuaded the president to reduce working hours from 40 to 39 without loss of pay. But the following year he began to face up to the realities of the system. In December 1983 he wrote: "There is no good economic policy without social justice. There is no social justice without a competitive and dynamic economy".²

The second of these two maxims, as Bérégovoy saw it, finally preoccupied him. Appointed prime minister after the Socialist Party's defeat in the cantonal elections of 1992, he was given the impossible task, not of pleasing 'Big Capital', but of devising policies that would win sufficient public support to stave off the inevitable electoral catastrophe of 1993.

Passionate advocate of nationalisation in the 1980s, he now plunged into privatisation. Although he had become a convinced monetarist, he could not cut his soaring budget for fear of the fast approaching elections. The man who had tried the expedient of reducing working hours and lowering the retiring age to 60, finished up by hoping that encouragement of investment would create jobs. His aim, as he put it, was to "reconcile the economy with the social". The contradictions within the system ensured his failure.

The search for a solution goes on. No sooner had the new prime minister, Edouard Balladur, announced a package to create jobs, than Philippe Seguin, president of the National Assembly, rejected it and called for a drastic transformation of "values and fundamental choices". Both are members, along with Jacques Chirac, of the so-called Gaullist Rassemblement pour la France (RPR); in fact, Balladur helped to engineer Seguin's election as president of the assembly. Seguin denounced the 'simplistic catechism', under which either an upturn in the trade cycle or a kick-start of the economy was supposed to bring down unemployment.

Speaking as if from the left of centre, and to some extent negating his image as a man of the right, Seguin said that employment had been wrongly subordinated to other issues: a strong franc as against a floating franc, the reduction of the budgetary deficit, productivity and free trade. Taunting his liberal opponents on the right, he declared that social

protection was not inimical to employment and that the public sector, rather than being a handicap to competitiveness, could be an important "trump in the struggle against unemployment".

While he was clear on what should not be done, he was much less so on how various measures that he proposed would substantially reduce unemployment. It is enough to say here that his 45-page speech demonstrated the gravity and the difficulty of the problem that confronted Bérégovoy. Failure to solve it, he said, with a refreshing irony more to be found in Paris than in Westminster, would "prove Marx right".

Balladur was quick to reply. His entire economic initiative, he said, was devised to restart employment. It was to that end that the government had decided to put public finance in order, to lighten charges on firms and to stimulate the economy by raising to that end a 40 billion franc (\$ 7 billion) loan that would be repaid from the proceeds of privatisation—a highly original measure, the adequacy of which was doubted by *The Economist*.

Doubtless ideological exegesis would discover in the differences between Balladur and Seguin evidence of some clash of interest within the ruling class. But the plain fact is that western Europe is stuck with unemployment and that nobody on right, left or centre knows what to do about it. According to the EEC, 17.5 million, or 10.4 per cent of workers, are without jobs in the 12 member countries—more than 3 million in each of France, Britain and Italy.

An EC summit in Copenhagen on June 21-22 got no farther than to ask the European Commission to produce a white paper on "the strategy of durable and non-inflationary growth, respecting the environment". The impotence of the EC leaders is at once evident. For if it is possible to devise such a formula, it should have been done much earlier in the crisis. The commission is unlikely to succeed. If it does, it will qualify for the Nobel Prize in economics.

Getting back to Clairmont's article, how would the left lead Europe out of its predicament? Does Chevenement offer any hope? There is no sign of that. I agree with Clairmont that he is a man of integrity. This was demonstrated when he resigned as defence minister in protest against the Gulf war (I resigned from the British Labour Party for the same reason).³ But, alas, he has no solution to the unemployment problem. I listened to all the speeches at the rally of his Citizens' Movement in Paris on May 1 and 2 this year. But Chevenement had nothing to add to his

previous assertion that "the key to everything" was a "reduction of about three points in interest rates". Lower interest rates help. But they are not the key to everything; and unemployment in Britain, which has slashed its interest rates until they are the lowest in Europe, is expected to remain high for a long time.

Some speakers urged a Keynesian policy. But the impossibility of this became apparent when it was revealed after Beregovoy's death that France already had a hyper-Keynesian deficit. Does the Communist Party offer any hope? Not at the moment, at any rate.

II

To broaden further this picture of the environment in which Beregovoy killed himself, we may turn from Clairmont's polemic to Rajni Kothari's essay on a 'world without alternatives'. It seems consistent with his view to say that not only is no clear alternative to capitalism on the horizon, but that also within the system itself there are no alternatives, other than those that have already failed.

Further, the "yawning vacuum" he describes, with its erosion of the state, moral decline and lack of vision, evokes Toynbee's account of the symptoms of a disintegrating civilisation. Toynbee, it will be recalled, found that when a civilisation is creative, an "imitative majority" follows a "creative minority". The civilisation declines when the ruling minority ceases to be creative and loses its capacity to produce new ideas needed to cope with its environment. The majority no longer imitates, everyone goes his own way and the civilisation collapses.

The process of disintegration takes hundreds of years. Toynbee thought that in western Europe it might possibly have begun with the religious wars of the 16th century, which cracked the foundations of western Christendom. The present phase, characterised by the "cultural onslaught of the market",⁴ has been under way for a considerable time. It was at the beginning of the 19th century that Wordsworth, fearful of the future, protested that "getting and spending we lay waste our powers".

The trend rapidly accelerated and at the beginning of this century the predominance of morally destructive consumerism provoked Max Weber's scathing denunciation. Having attributed the foundation of modern capitalism to Calvinists, whose dedication to work and thrift, he said, had provided the necessary capital, Weber wrote:⁵ "Since asceticism undertook to remodel the world and to work out its ideals in the world, material goods have gained an increasing and finally an inexorable power over the lives of men as at no previous period in history...In the United States the pursuit of wealth, stripped of its religious and ethical meaning,

tends to become associated with purely mundane passions, which often actually give it the character of sport". Victorious capitalism, now on mechanical foundations, no longer needed the asceticism that made it possible, Weber said. The outcome was a social "nullity", which, with its "specialists without spirit", imagined that it had "attained a level of civilisation never before achieved".

Today, 100 years later, even Weber might be surprised at the grotesque behaviour of capitalist society. We are mostly used to it now, all of us, and are virtually mindless about the consequences for the human race. In another context John Stuart Mill wrote that there had been no western system of values since feudalism (a term often misused). All in all, it is not surprising that the west has reached a stage in which its only effective value is consumerism.

Two other symptoms of disintegration identified by Toynbee—archaism and futurism—are relevant here. Examples of archaism, which seeks a solution of the crisis in the inapplicable values of the past, are fascism and similar national salvation movements. Futurism expects salvation in a wild leap into an imagined paradise. Its ugliest and most futile manifestation is seen in organisations like the Red Brigade, who appear to believe they can remedy the ills of society by murdering people at the top. (Clairmont, relishing, as he does, "the magnum's suicide bullet that pulverised the brains of Pierre Beregovoy", seems to have a certain psychological affinity with that school.)

That the symptoms described by Toynbee are present in western Europe and its offshoot on the other side of the Atlantic can scarcely be doubted.⁶ Other civilisations are, of course, embraced in Rajni Kothari's thinking. But just as the west has exported its economic and political models, though with no great success, so it is spreading its moral contagion.

Is there really no alternative? Possibly one is available, although capitalism will have to suffer a series of economic crises, far more disastrous than any yet experienced, before society accepts it. This is none other than the unpopular East German model, which failed, not because of intrinsic economic defects, but because of the repressiveness, mind-destroying dogmatism, incompetence and widespread corruption of its rulers.

Unlike the French socialist leaders (as described by Clairmont), Honnecker was not "rooted in the most opportunistic strata of the *petite bourgeoisie*", but was a son of the working class. Yet he comes second to none as a betrayer of the practice and ideals of socialism. Compared with the historic consequences of his misrule, the failings, including moral failings, of the French Socialist Party, are mere peccadillos.

At the end of 1981 Lester C. Thurow, professor of economics and management at the Massachusetts Institute of Technology, said:⁷ "Last year East Germany passed them [the British] in per capita GNP. The Germans can make communism work better than the British can make capitalism work". While Thurow was wrong, his statement was not as far out as the limited variety of goods and cars in east Berlin would have suggested. For a large slice of the GNP was going into education, sport, culture and the best infant care in the world.

Certainly, East Germany was heavily supported by West Germany; and living standards would have been lower if the government had diverted some of the GNP to preventing pollution, which it scandalously neglected, and to badly needed investment. But the people were reasonably well off, even by western standards, and secure jobs compensated to some extent for what they lacked in affluence.

With officials and doctors demanding bribes, workers stealing and fiddling and a high suicide rate, Christa Wolf, the East German novelist, called for a "new morality". At the same time many people, including Lutherans, were mortified when the East Germany model was liquidated. They felt that the world had lost a possible alternative to capitalism and that a democratically governed, morally improved, socialist East Germany might eventually have inspired imitation.

Toynbee did not rule out the revival of a disintegrating civilisation, but said that a lot of hard thinking had to be done first. A mere model, whether it be an improved East German or any other, is not sufficient in itself to light the way forward. For, as Toynbee said, the cause of disintegration lies not in the collective experience, but in "schism of the soul", in the "personal crises of behaviour and feeling and life which are the true essence and origin of the visible manifestations of social collapse".⁸

The western illness, having worsened exponentially during the past couple of hundred years, is symbolised today by the suicide of a political leader. The question is whether or not it is terminal.

Aid and Development Policy

An Aid-Worker

ARJUN SEN GUPTA ('Aid and Development Policy in the 1990s', *EPW*, March 13) argues "that the reason for resistance to foreign aid in the richer countries may be related not just to the design of the aid programme but to the confidence of the aid givers about the ability of the receiving countries to use that aid efficiently". But he contradicts himself when he further adds "that a micro-level effectiveness related to the ability at the ground level to execute the programme is not a sufficient condition for the full and efficient utilisation of aid". If micro-level Indian experience in aid utilisation is any guide, then efficient and effective use of foreign aid leaves much to be desired. The recently concluded Joint Consultative Group on Policy (JCGP) of the five UN agencies—UNICEF, UNDP, WFP, UNFPA and IFAD—says that "the financial flow from JCGP agencies is around \$ 200 million annually mostly in the form of grants, and is modest compared to the needs of India as is the total amount of external assistance of \$ 7.2 billion pledged to India". [1] The JCGP also admits "that the problem of absorptive capacity in the administration of funds is acute. In some cases the entire amount of funds allocated for the programmes do not get spent. In other cases funds get diverted and do not reach the project on time because of various administrative bottlenecks. There are also delays in project clearance and release of funds that affect project implementation."

Why India is not able to use the external aid efficiently and effectively? Why aid is not trickling down? Is there an aid fatigue or aid attrition? If India is to push its aid and development policy in the 1990s what reforms are needed for better absorption, utilisation and disengagement? There are at least five main areas which need to be tackled for better aid use: (a) centre-state relations in respect of aid request and subsequent flow, (b) state district and block level infrastructure for better absorption and utilisation, (c) capacity of public bureaucracy for effective management of aid, (d) maintenance budget and improved operational mechanisms, and (e) effective monitoring, evaluation feedback and an exit policy.

UN and bilateral agencies deal with several central ministries and the decision on which agency should deal with which ministry is not always clear. Whether aid is needed at all and which state should get what aid have all become political issues.

UNICEF deals with five ministries whereas WHO deals with one, health ministry. Every ministry clamours to have as many aid agencies as possible to establish its 'presence' and that makes interministerial co-ordination difficult. Aid dialogues are held only with centre; and states are just passive recipients. Sometimes there are no aid takers in states and aid is just forced, without knowing the absorptive capacity of the states. Under our federal polity states are not empowered to 'negotiate' with foreign agencies. Aid utilisation is effective in a climate of decentralisation and how do we ensure this?

State, district and block level infrastructure affects aid utilisation. UNICEF is assisting, for more than a decade a programme called Development of Women and Children (DWCRA) through the ministry of rural development and is a sub-scheme of IRDP. Under this scheme Rs 15,000 is provided as a revolving fund for women groups in the villages and is equitably shared between UNICEF, government of India and states. When the DWCRA is sanctioned Rs 15,000 is released to DRDAs, which in turn is supposed to release this amount to women groups. States with serious financial ways and means position have not released this small amount to women groups and at present in some states lakhs of rupees have been locked up in ingenious deposit accounts of DRDAs. External aid is not to be substituted for state resources, which are additionalities. Here is a classic case of aid not trickling down.

Many of the present externally aided programmes in the field of health, nutrition, water supply and sanitation, social forestry and education are highly decentralised programmes and in the absence of a strong district and block level infrastructure and managerial capacity, there would be aid attrition than proper use. In the now well-grounded Universal Immunisation Programme assisted by UNICEF, there are still many problems like lack of maintenance budget for repair and upkeep of cold chain equipment, mis-use of programme vehicles, staff vacancies, as revealed by recent report of the Comptroller and Auditor General of India. External aid agencies can give drum sterilisers for sterilising needles/syringes, even a stove, but the state must provide the funds for kerosene and consumables. In some states medical officers/health workers do not have funds for kerosene!

Manpower issues affect aid utilisation.

The DWCRA does not have in many states women assistant project officers, despite the salary bill being borne by UNICEF. Reason is the non-availability of qualified women for filling the posts. In states with low educational levels women problems are further compounded. Externally aided projects have a tendency to become 'grandiose' if they are not merged/dissolved with the 'ongoing' programmes of the state and this is where the 'exit' policy or 'disengagement' becomes important.

When should disengagement take place? Is there any cut-off period? UNICEF is assisting India's prestigious Integrated Child Development Services (ICDS) programme for more than 15 years and its share constitutes not even 10 per cent of the total investment on ICDS. Why should UNICEF be putting its pie into such already well sustained programme and why should government of India keep this little pie of a UN agency? This is a fit case for disengagement. However, the multi-donor evaluation report on UNICEF aid policy [2] has suggested UNICEF to be concentrating in three areas: (a) strengthening service delivery in a given country, (b) concentrate on capacity building of aid-receivers and users, and (c) promote empowerment particularly of women. This means that UNICEF should continue to be involved in child care services irrespective of the needs of India in this area. Aid should help self-reliance and not perpetuate dependence.

For evolving exit policy, aid givers and receivers should evolve proper monitoring and feedback systems. At present both the giver and receiver of aid are shy of evaluation of external aid. Receiver wants aid to flow, whatever the quantum, because that gives the department officials prestige and entry into the aid agency for foreign jaunts and post-retirement employment prospects. The aid giver wants to impress their country constituents about the glory of their aid to a developing country and how their aid has made a dent into the poverty of the aid receiving country. There is no aid fatigue but more of aid attrition. Sen Gupta could have analysed more micro-level realities of external aid of a few countries, which would have helped to evolve an effective aid and development policy in 1990s particularly for a country like India.

On Viability of Rural Branches

C L Dadhich

THE piece 'Myth of Non-viability of Rural Branches' (EPW, May 1) is an interesting study of one of the public sector banks, based on the actual data for the accounting year 1991-92 drawn from balance sheet and profit and loss statement of the branches of the bank. One needs some clarifications on some of the points raised in the piece, since they are not in line with the general perceptions about the working of the banking system, in particular of rural banking.

One of the most startling findings of the study is about the higher rate of interest earned on advances by rural branches at 12.77 per cent, closely followed by metro branches (12.35 per cent) and urban branches (11.90 per cent). The lowest interest earned at 11.74 per cent was noticed in respect of advances of semi-urban branches. In all, the bank under study earned 12.21 per cent average return on its advances as against the average return of about 14.3 per cent for the banking sector.¹ Notwithstanding the observation that the selected bank is not representative of the banking industry due to higher level of per branch deposits and advances of the bank in rural areas as compared to those of all public sector banks, it is important to note that rural branches of the selected bank did well as compared with other branches.

The paper listed two main reasons for the highest interest earning ratio of the rural branches: (1) low non-performing advances in rural areas; and (2) relatively low year-end figures of advances of rural branches. These reasons require to be closely examined.

The highest interest earning rate on rural advances could no doubt be on account of low non-performing advances of branches in rural areas rather than higher interest rates on rural advances. But there are no detailed and reliable data regarding the quality of loans given in rural areas. In the absence of such data, this can only be a conjecture.

Low year-end figures of advances will give a favourable tilt to interest earning ratio of rural branches. But this is not a special feature of only 1991-92, and is generally regarded as a permanent factor, since low year-end figures of advances reflect the seasonal nature of advances extended by banks in rural areas. Short-term loans in rural areas, generally disbursed in late June or early July, are mostly

recovered by end-March. Even for term-loans, recovery coincides with the harvesting of major crops that takes place before the end of March.

It is necessary to caution that 1991-92 is not a good year to choose for drawing a conclusion that rural branches give high interest earnings. For, the implementation of Agricultural and Rural Debt Relief Scheme 1990 in 1991-92 had resulted in substantial reduction in the level of outstanding advances by the end of March 1992. The amount involved as debt relief was as much as Rs 2,962 crore.

We need to factor in the seasonality aspect and the rural debt relief, and calculate the interest earnings on advances by rural branches. In which case one is likely to get a figure much lower than the one that has been suggested in the paper. It is therefore necessary to be cautious in coming to any conclusions about the high interest earned on advances by rural branches. In fact, one needs to reckon such factors as inadequate managerial competence at the level of rural branches, the higher cost of deposits (low proportion of current deposits in the composition of total deposits), the higher burden ratio (on account of higher transaction cost of servicing of large number of small-sized loan accounts and inadequate non-interest income) and the low level of interest income as a result of financing of small-sized loans (at subsidised rates of interest) of rural branches as compared to their counterparts in semi-urban, urban and metro areas. The poor profitability of rural branches, one might be tempted to argue, is inherent in the system rather than being an indicator of malfunctioning.

The paper indicated non-interest cost ratio of 2.19 per cent for rural branches, 1.85 per cent for urban and 1.76 per cent for semi-urban branches. The average non-interest cost ratio worked out to 1.67 per cent for the bank as against that of

3.7 per cent for the nationalised banks.² A noticeably low non-interest cost ratio of the selected bank might be again on account of different accounting standards followed by the analyst. It is not very clear whether other expenses such as provisioning, depreciation, etc. were taken into account by the analyst while calculating non-interest cost.

The paper worked out the adjusted profitability ratio for the bank at 2.52 per cent but the figures published by the Indian Banks' Association reveal that not a single public sector bank earned more than 0.95 per cent profit during 1991-92.³ It is not clear how such a high profitability ratio has been reported by the paper.

Rural banking is in general a losing proposition and it is for this reason the Narasimham Committee recommended the usefulness of banks segregating the operations of their rural branches through the formation of one or more subsidiaries.⁴ However, this may not provide any solution to the problem of in-built non-viability of rural branches, at any rate till agriculture and allied activities become profitable.

There is probably no viable alternative to continuing with the existing system in which losses of rural lending are absorbed through the earnings from other branches. Cross-subsidisation, endorsed by the Khusro Committee⁵ cannot be avoided at this stage, since that is the only way the rural activities could be promoted and the banking system as a whole would find it viable to operate.

AUDITORS' REPORT

THE BANK OF TOKYO, LTD.
(Incorporated in Japan Liability of Members Limited)

Schedule 17—Accounting policies and notes forming part of the accounts for the year ended 31st March 1993

I. Principal Accounting Policies

(1) General

The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country.

(2) Transactions involving Foreign Exchange

Monetary assets and liabilities as well as outstanding Forward Exchange Contracts are translated half yearly at rates prescribed by FEDAI and the resulting profit/loss is accounted for. Guarantees, Letter of Credits and Acceptances are translated at T.T. (Middle) rates.

(3) Investments

Investments are valued at the lower of cost or market value. Where recent market quotations are not available, the investments are taken at book value.

(4) Advances

(a) Provisions for doubtful advances have been made to the satisfaction of the auditors in respect of identified advances, based on a periodic review of advances and after taking into account the realisable value of securities, the portion of advance guaranteed by the Deposit Insurance and Credit Guarantee Corporation, the Export Credit & Guarantee Corporation, similar statutory bodies and prudential accounting norms laid down by RBI for the asset classification and provisioning requirements thereof.

(b) Provisions in respect of doubtful advances have been deducted from advances.

(c) Provisions have been made on gross basis.

(5) Fixed Assets

(a) Premises and other fixed assets have been accounted for at their historical cost.

(b) Depreciation has been provided for on the diminishing balance method at the rates specified in the Income Tax Act, 1961.

(6) Staff Benefits

Provision for gratuity/pension benefits to staff has been made on an accrual basis. Separate fund for pension has been created.

(7) Net Profit

(a) The net profit disclosed in the Profit and Loss Account is after considering

(i) Provision for taxes on income.

(ii) Provision for doubtful advances.

(iii) Provision for depreciation in the value of specific investments which are valued at lower of cost or market value; but

(b) Without considering interest income in respect of non-performing assets taking into account the prudential norms laid down by RBI.

II. Notes on the Accounts

(1) Head Office administrative expenses have not been charged in the accounts and provision for taxes has been computed without deduction of such expense.

(2) Provisions and contingencies include Rs. 3185 lacs (including prior year 110 lacs) being provision for Income Tax and Rs. 180 lacs towards Interest Tax.

(3) Inter-office balance is net of Rs. 345.73 lacs being amount received from Head Office for the acquisition of residential premises for Bank's officers.

(4) Previous year's figures have been regrouped/rearranged wherever necessary to conform with the amendments made to the Third Schedule of the Banking Regulation Act, 1949.

Auditors' Report on the Indian Branch of The Bank of Tokyo, Ltd.

We have audited the attached Balance Sheet of the Indian Branch of The Bank of Tokyo, Ltd, as at 31st March 1993 and also the annexed Profit and Loss Account of the Indian Branch of the Bank for the year ended on that date, in which are incorporated the returns from Calcutta and New Delhi branches, audited under Section 228 of the Companies Act, 1956 by other auditors.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and the Profit and Loss Account, are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are therefore drawn up in conformity with Forms 'A' and 'B' of the Third Schedule to the Banking Regulation Act, 1949.

We report that in accordance with sub-section (3) of Section 30 of the Banking Regulation Act, 1949:

a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them to be satisfactory.

b) The transactions which have come to our notice have been, in our opinion, within the powers of the Indian Branch of the Bank.

c) In our opinion, proper books of account as required by law have been kept by the Indian Branch so far as appears from our examination of those books.

d) The report on the accounts of Calcutta and New Delhi Branches of the Bank, audited by the respective Branch Auditors, were received and properly dealt with by us, while preparing our report.

e) The Balance Sheet and the Profit and Loss Account of the Indian Branch of the Bank dealt with by this report are in agreement with the books of account and the returns.

Rouble Debt

Since mid-1990 India is living under the shadow of a large external debt in hard currency that has transformed the country's economic scenario beyond recognition. Our debt to the erstwhile USSR was initially tucked away from the public view; however, negotiations on the size and modalities of repayment of this debt had been going on with the USSR and later Russia. When an agreement was finally reached in January 1993 the general view in India was that our government had conceded everything. An assessment of the controversy against a broader canvas.

1443

Empty Boxes

While the goals set out in general terms in the finance ministry's discussion paper on economic reform are as unexceptionable as motherhood and 'dal-roti', the document throws little light on the country's medium-term economic prospects. The obvious inference is that this is all part of an arranged set of rites and ceremonies to be carried out before the government goes again to the IMF and the World Bank for the next dose of 'exceptional financing'.

1417

The Roots

It is essential to take stringent action against those guilty of fraud and corruption, but it is the economic reform programme of the government which needs to be questioned squarely in the light of the stock market scam and its impact on the economy and polity.

1418

Exploited

The expansion of the beedi industry has provided employment opportunities for women, but the women workers are exposed to economic and sexual exploitation and severe health hazards. Female workers are under constant pressure from both the employers and their parents/husbands.

1461

Investment and Growth

What will be the impact of the decline in the share of investment goods in investment as a result of the new economic policy on the long-term growth of the economy? What order of increases in the efficiency of domestic resource-use and in the inflow of investment goods from abroad will be required to sustain the growth rate?

1453

Nationalism

The debate on nationalism needs to be relocated in the politics of the present, juxtaposing nationalism to the so-called non-nationalistic realities, marking their tensions, appropriations and approximations.

1433

Defiled!

What happened when the activists of the People's Art and Literary Association sought a place for the dalits and the sudras in 'bhoologa vaikundam', the Sri Ranganathaswami temple in Thiruvaramangalam, Tamil Nadu.

1422

More Power?

The Eighth Plan envisages a net addition of 38,000 MW to the national power grid. This seems to be accepted by all and the argument is about how much of the additional capacity should be in the private sector and how much in the public. But do we need 38,000 MW of additional power at all?

1420

Vote-Gathering

In UP, in an attempt to go beyond the traditional backward class-Muslim-dalit appeal, Mulayam Singh Yadav has supported Chandraswamy's so-called Som Yagya and is adopting a line on the mandir-masjid issue calculated to appeal to conservative Hindu sentiment.

1421

Mistaken Identity

What is state terrorism: the US missile attack on Baghdad, indiscriminately killing men, women and children, or the alleged involvement, far from proven yet, of the Saddam regime in a plot to assassinate George Bush?

1423

Fatal Flaw

Poor P C Mahalanobis. The Professor, whose centenary is currently being celebrated with much demureness, had lost his way. He read his people wrong and constructed an autarkic model which made no reference to the foreign sector. It was therefore bound to come a cropper. It duly did. There was for some subsequent time much confusion, but all is well that ends well, we now belong, inalienably, to an international economic system. How does it matter if we are one hundred thirty-fourth in a class of one hundred seventy-three?

1415

LETTERS TO EDITOR

Indonesia, Sangh Parivar and Muslims

LALKRISHNA Advani and Sangh parivar friends never tire of reminding Muslims in India about Muslim culture in Indonesia where the Ramayan and Mahabharat stories are a part of their folklore. Sangh parivar advocates may wish to refer to the news item in *The Times of India* of July 1, 1993 where the experience of a Nagpur community on Muharram in 1924 is cited: "For the first time in the history of Nagpur, Kerbala, the tenth day of Muharram passed off without Hindus participating in it, in accordance with the wishes of the Hindu Sabha. It was almost a revolutionary step. For years past it was the Hindus who played the predominating part and made Muharram what it was in Nagpur." This receptivity of our culture may be noted.

As social scientist and a worker in the field in Indonesia for nearly four years, I can say that such a break as happened in Nagpur in 1924 would not happen in Indonesia. They are a very gentle, sensitive and receptive people there. In my three years in Yogyakarta (former capital), I did not come across a single skirmish on the road. On first day of my return here, an autorickshaw driver and a motorcyclist were at each other—a not uncommon sight in Bombay. At the political level, as a part of the campaign for national unity Batiasa Indonesia was adopted as the national language, even though 70 per cent of the people in Indonesia speak Javanese and all their presidents since independence have been Javanese. Contrast this with India, where, by a casting vote Hindi was imposed as our national language and that in spite of Gandhiji's preference for a pluralistic Hindustani.

Indonesians are a very musical people and sing Indian songs in perfect tune and the right pronunciation. They also sing Arabic songs. Such receptivity is second nature to them, because they have a strong Indonesian identity and feel it cannot be corrupted by outside influences. They feel deeply Indonesian without any outward show of nationalism or of their religions.

Both Hindus and Muslims in India have a lot to learn from the Indonesian people. The jarring aggressiveness of 1924, noted above, is a good example how to do things if an internal integration is to be achieved in this nation. One cannot hit people on the head and say 'integrate', it can only bring the wrong results as any understanding of elementary psychology will indicate. However, one wonders—who is an Indian? Around here one is either a Hindu or a

Muslim or a Christian, a Maharashtrian, a Punjabi, a UP-ite or what have you. Where is the commitment to this land of ours?

AZIZ PABONEY

US Attack on Iraq

WHILE some academic practitioners in the field of international relations are engaged in writing scenarios based on the incipient multipolarity of the present-day world, Bill Clinton's two strikes against Iraq have rudely drawn attention to the incontestable reality of the continuing unipolarity of effective power at the moment—so much so that the Star and Stripes could this time dispense with the fig-leaf of the UN flag for carrying out the terror strikes against an unsuspecting country.

China apart, in the wide world there has not been even a murmur of unequivocal protest by any government against this blatant defiance of civilised norms of international co-existence so laboriously evolved over the centuries and so elaborately codified in international law and UN regulations. America's former super-power rival, or rather its relic in the form of Russia today, has only revealed its split political personality as the Russian foreign ministry officially backed its patrons in the White House while the country's vice-president, Rutskoi, and one of the two houses of parliament denounced the US strike against Iraq as well as Kremlin's subservience to the great White Chief. In balance and on the whole it was hardly

anything to bother the bullies in Washington. In an ambiguous mumbling which juxtaposed concern for the national sovereignty of vulnerable nations and acts of international terrorism, India failed to indict the US for its insolent exercise of state terror. This vociferous champion of third world interests of yester-year has this time in effect chosen to condone the US conduct in Iraq, as it has failed to nail down the US missile attacks as an act of state terror.

While the UK has followed its traditional courtier's role by echoing the US voice, the potential recalcitrants among the G-7 powers, i.e., Germany, France and Japan, have done little more than refraining from applauding the US bully.

This being the real correlation of world powers today, the US president had no problem in pursuing his aim in this case, which, was to inflict punishment upon Saddam Hussein in order to serve notice on all third world countries. No less important probably were his expectations of bonus in his home politics. The subsequent polls have indeed confirmed that the Iraq strikes have led to a rise in Clinton's rating at home.

The multipolarity scenarists also may not be entirely mistaken. Whatever the situation today, the critical elements in Russia and the stated and unstated reservations reflected in the positions taken by Germany, France, Japan and even India, someday combined with the outspoken opposition of China may lead to a clearer definition of diverse political stances among the dominant G-7 coalition of today.

The Pressure Mounts

WITH the political vacuum in the governance of the country and in the absence of effective opposition from political parties and the affected sections of the people, the bureaucracy is making plans to aggressively push ahead with the structural adjustment of the economy, unmindful of the social consequences. A number of recent developments have brought this out clearly. First, there was the Aid-India Consortium meeting in Paris in the third week of June which became, more so than in earlier years, an occasion for the multilateral organisations and the aid-givers to demand, and the government of India to promise, redoubling of efforts towards structural reform of the Indian economy. Second, the government has announced that it will begin later this month negotiations with the IMF for a three-year borrowing arrangement under the extended fund facility (EFF) involving substantially stiffer conditions than the standby arrangement just drawing to a close. Simultaneously, negotiations are also being pursued with the World Bank and the Asian Development Bank on financial sector reform as well as sectoral adjustment programmes affecting the power, hydrocarbon, transport and telecommunications sectors. As the country gets deeper in debt to the international organisations, closer co-ordination among them, the IMF and the World Bank in particular, in prescribing tighter policy and performance conditionalities is only to be expected. The government, however, keeping up the pretence that the economic reforms are all a matter of its own volition, has come up with a 'discussion paper' on 'Economic Reforms: Two Years After and the Task Ahead'. Finally, the country's earlier negotiating stance seeking modification of the Dunkel draft, particularly on intellectual property rights, has been abandoned and the concerned officials have gone public advocating wholesale acceptance of the Dunkel proposals.

The finance secretary assured the Aid-India Consortium members in Paris that the government was determined "to push ahead and put economic reforms firmly on the agenda". The government, he informed the aid-givers, expected an export growth of 14 per cent this year and a current account deficit of \$ 4.5 billion (1.7 per cent of GDP) compared to \$ 5.2 billion last year. The deficit would be further reduced in the next two years. Taking into account all capital flows, there would be an 'exceptional financing' gap of \$ 1.8 billion in 1993-94, which would be lower than that last year (\$ 2.5 billion), and of \$ 2.2 billion in 1994-95. The consortium countries have this year pledged \$ 7.4 billion in loans compared to the commitment of \$ 7.2 billion last year. Over the next five years India would require an average of about \$ 6 billion annually for repayment of medium- and long-term debt, including the IMF credit but not NRI deposits, defence loans and rouble debt. It is further projected that the country would need about \$ 8 billion in gross capital inflows in 1993-94 and \$ 10-12 billion in each of the following four years. Hence the necessity of the EFF loan, to provide a cushion against balance of payments shocks.

While organising the Aid-India Consortium commitments, the World Bank has sought to press upon the Indian government a six-point programme for urgent action covering (i) tax reform and expenditure rationalisation and reallocation; (ii) more foreign trade reform in the form of further cuts in tariff rates

and "decisive action to liberalise consumer goods imports and agricultural exports by 1994"; (iii) accelerated financial sector reform with the accent on promoting greater private sector participation; (iv) restructuring of public sector undertakings; (v) reform of agriculture and energy; and (vi) substantial improvement of aid utilisation. At their press briefing on their return from Paris, the Indian officials dutifully announced that "financial sector reforms and fiscal correction together are on top of the government's policy agenda in the coming year". Recapitalisation of banks linked to their operational efficiency and overhauling of the rural credit structure, including of institutions such as NABARD with the emphasis on timely and adequate credit rather than subsidised lending are high on the financial reform agenda. To minimise the burden on the budget, the State Bank and a few other banks would be allowed to raise equity funds from the market. Existing private banks would be allowed to expand and some new ones to be set up. The proportion of funds pre-empted through the SLR and CRR would be lowered further. The ceiling on bank deposit rates and the floor under lending rates would be phased out, except for a single concessional lending rate set some 3 percentage points below the rate charged to prime borrowers. As for fiscal consolidation, the government would concentrate on reduction and redirection of subsidies, raising administered prices, further cuts in budgetary allocations to PSUs and completion of tax reform. The central government's budget deficit, which had overshoot the target of 5 per cent of GDP by about 0.7 percentage point in 1992-93, would be brought down to 4.7 per cent in 1993-94 and eventually to 3 per cent in 1996-97.

With this goal of a further sharp reduction in the fiscal deficit, public expenditure would have to be significantly curtailed in real terms, leading to reduced demand for industrial products and recession and worsening of unemployment. The way the public sector is being sought to be restructured will also make its own contribution to the growth of unemployment. As it is, because of growing capital and import intensities labour absorption in industry suffered significantly in the 1980s. Fiscal consolidation will also mean slower growth of allocation for the social sectors, such as education and health, which have already suffered a setback in the first phase of structural adjustment. The squeeze on state finances will further hurt these sectors. There is nothing in the reform strategy to help enlarge the purchasing power of the poorer households for whom additional employment alone can be the source of economic betterment. With the size of the domestic market thus confined, the spread effects of growth will necessarily be minimal. At the same time, the resources generously left untouched in the hands of the better-off sections and the rich as also the abundant liquidity with the financial system—as a result of reduced absorption by the public sector and the softened pressures on banks to meet the credit needs of small industry and other small borrowers—are likely to be dissipated in unproductive uses, thus failing to make up for the reduced investment by the public sector. The persistence of the recession in industry is an ominous portent in this respect, though government spokespersons would rather pretend not to notice it.

HUMAN RIGHTS False Promises

WHEN the Amnesty International team visited India last year and was assured by home ministry officials that the government would put an end to custodial torture and deaths, the team took the officials at their word and announced that there was a perceptible change in New Delhi's attitude towards human rights violation. Indian human rights activists had advised the team at that time not to rush to give the government a clean chit. Being old hands in the business of dealing with the duplicity of the home ministry, they warned that the latter's rhetoric about respecting human rights was for international consumption, while inside India people would continue to suffer in police custody.

As was expected, Amnesty International is now regretting its earlier decision to welcome New Delhi's assurances. It has brought out a report listing the deaths of three men in the custody of the Delhi police between January 1 and April 11 this year. Commenting on the incidents, Amnesty says: "...the organisation is gravely concerned about the [Indian] government's lack of determination to translate into practice the commitment to protect human rights it says it has made. It has failed to take the concrete measures—such as strengthening legal safeguards for detainees in custody—that it told Amnesty International it would take during meetings in New Delhi in November 1992."

What needs to be understood is that the government is merely changing tacks—under pressures from abroad. Unable any longer to conceal incidents of custodial deaths and dismiss them as fabrications by India's enemies (as it did before), North Block is now acknowledging them, but passing them off as aberrations. In its response to Amnesty's earlier submission of 455 cases of custodial deaths, it has admitted that in more than a third of the cases there was prima facie evidence that further action was needed against the police personnel allegedly responsible for torturing and killing suspects in police custody. Further action however remains a far cry. According to the government's own response to Amnesty's allegations, only a few of the perpetrators of custodial crimes have been brought to justice, and among their victims even less have been granted compensation.

In spite of international exposure and pressures (which are necessary), custodial torture and deaths in India will continue for a number of reasons. First, the system of pre-trial judicial confession encourages the police to extort confessions from the accused by short-cut third degree methods in order to build up the case against the accused. Petty criminals—and in a large number of cases, innocent poor people—become victims of this system. Secondly, the type of people who are recruited at the

lower levels of the police force reinforces the brutalisation of the force. Brawn rather than brain is the main criterion for their recruitment. In the major metropolises of India, one hardly finds any difference between the mentality and behaviour of the police personnel and the mafia dons and criminals. In fact, some among the police move in and out from the underworld. Cases of policemen in mufti indulging in crimes are quite common. Given this composition of the police force, is it any wonder that station house officers and their subordinates in charge of local 'thanas' would indulge in sadistic torture of people who are unfortunate enough to land up in their custody?

Since it is almost impossible to change the behaviour pattern of these people—who are either congenital brutes or are trained to become brutes—as long as they man the police stations, custodial torture and deaths will remain a part of our social existence. And they will continue to be the backbone of the Indian police force since the Indian state needs them to terrorise the citizens into submission, and suppress any resistance that they might put up against the state's oppressive policies. What Amnesty International describes as the "government's lack of determination" (to protect human rights) is actually a firm determination to continue with the present state of affairs and reinforce the brutalisation of the police force.

IMF CREDIT FOR RUSSIA Reward for Reform

THE announcement of the IMF's approval of its credit of \$ 1.5 billion to Russia is significant not so much for the amount involved as for its timing. The credit is meant to support the Russian economic reform programme. The announcement came on the eve of the G-7 meeting in Tokyo to which president Yeltsin had been specially invited and within a week of the disclosure that of the \$ 4 billion credit promised Russia earlier in the year by western governments, hardly \$ 500 million had been put together.

The pressure on the IMF to loosen up with respect to its assistance to Russia has been growing over the recent weeks and days and that too particularly from the US. Possibly, the way the western governments themselves had reneged on their promises of financial support had something to do with the pressure on the IMF. But perhaps no less important have been the considerations of international politics. On no account is Russia to be given grounds for drifting away from the western embrace. Significantly, the Russian government was among the first few to voice unqualified support for the US missile attack on Baghdad on the basis of what has still to be established—namely, the Iraqi intelligence's hand in an alleged conspiracy to assassinate George Bush

while he was visiting Kuwait. Interestingly, even Mikhail Gorbachev has gone public in condemning the US action and the Russian government's support for it.

It is also significant that out of the \$ 3 billion facility recently created in the IMF to support countries effecting economic reforms, as much as half has been promised to Russia. So the rest of the member countries implementing programmes of economic reform will have to do with only the balance of \$ 1.5 billion. Of course, the manner in which this particular facility has been conceived and its timing make it abundantly clear that the facility is meant to support only the east European countries. Third world countries had more or less been excluded from the very beginning, though the fact that the Fund has been charged with this additional responsibility would certainly mean a reduction in the share of Fund assistance to its other clients.

WEST BENGAL Open Congress-BJP Alliance

Ajit Roy writes:

THERE are some elements of ambiguity in the outcome of the state-wide panchayat polls along with the elections to 16 urban municipalities held in West Bengal on May 30. The victory of the CPI(M) and its Left Front allies is decisive, but this is accompanied by some evil features with grave portents.

Out of some 61,000 gram panchayats which went to polls, the Left Front annexed about two-thirds, the CPI(M) alone accounting for nearly 60 per cent. Their successes at the higher levels of panchayat samitis and zilla parishads were even more dazzling. Indeed, all the 16 zilla parishads were captured by the Front—more precisely, the CPI(M). This was the fourth round of panchayat general elections in a row which returned the CPI(M) and the Left Front so convincingly to office.

Of the 15 urban municipalities, that went to polls on the same day, the Left Front got a majority in eight. The CPI(M) also won the by-election for one of the wards of the Calcutta Municipal Corporation held simultaneously.

The Front's successes in the rural areas are not a fluke or a freak occurrence or even the result of massive rigging as some opposition parties have vociferously alleged. Even an openly unfriendly voice like the mass circulation *Ananda Bazar Patrika* editorially conceded that since the Left Front came to office in West Bengal in 1977, "it has effected the mobilisation of a wide segment of the rural people in its favour through operation barga, distribution of land vested with the government, increase in wage rates, grant of loans through the gamin (rural) banks at nominal interest, and implementation of

various development projects. Thereafter, in successive elections, rural Bengal has been providing the necessary support to the Leftists" (June 1, 1993, translated from the original in Bengali).

Brilliant though the success is, the Left Front and the CPI(M) suffered some significant setbacks too. The opposition Congress(I) increased its tally in terms of both seats and share of votes. More, the BJP for the first time opened its account in local elections by bagging over 2,000 gram panchayat seats and securing a majority in one of the municipalities in the suburbs of Calcutta.

The movement of the basic masses in political terms behind the distribution of seats given above becomes clearer in the shift of votes. The share of left votes declined by nine percentage points from 72 per cent in the last round of elections held in 1988 to 63 per cent this time; the CPI(M)'s share dropped by eight percentage points from 66 per cent to 58 per cent. The CPI(M) and the Left Front have never in the past suffered a negative shift of votes of this dimension.

Further, it was for the first time in West Bengal that the Congress(I) and the BJP joined hands in an electoral battle openly and without a smokescreen, as they did in some localities. One of the BJP national leaders, S S Bhandari, publicly exposed this liaison (deliberately, it seems, in order to embarrass the Congress(I) elsewhere) and the fact was later corroborated by some Congress(I) leaders. This joining of forces of the Congress(I) and the BJP has an ominous significance beyond the immediate electoral calculus. Through this open, even if limited linkage, the BJP, in the supposedly left-oriented state of West Bengal, has been able to overcome the inhibition of a segment of liberal nationalists to align openly with 'Hindu nationalists', forgetful of its overall impact on national interests in general. It has, to say the least, made the BJP somewhat respectable in some circles beyond its direct ideological reach.

This new turn was carried forward when the Congress and the BJP objectively acted together in organising a statewide bandh, a week after the polls, on June 7 to register their protest against CPI(M) violence during and after the polls. That the bandh was a success was confirmed by the secretary of the CPI(M)'s West Bengal state committee who is also the chairman of the Left Front.

Then, the Left Front partners not only fought electoral battles against one another with much less inhibition this time in some areas, where they failed to arrive at an agreement over seat distribution, but the incidence of violent clashes between the CPI(M) on the one hand and the three other major left parties, namely, CPI, FB and RSP on the other, was higher this time than ever before. Though the number of CPI(M) victims of other parties' violence may really be as large as

is claimed by it, the fact that the CPI(M)'s own violence took its toll from a wide spectrum, stretching from the Indian People's Front to the Congress(I) and the BJP, has its own negative impact on the CPI(M)'s image.

All this, further compounded by the arrogance of some of its accredited spokespersons in their public comments, has not enhanced the CPI(M)'s credibility and acceptability as the central fulcrum of an alternative left and democratic mobilisation against the visibly bankrupt Congress(I).

PSU DISINVESTMENT Narrow Perspective

THE government has taken about a month to release even a summary of the recommendations of the high-level official committee on disinvestment of equity of public sector undertakings (PSUs) under the chairmanship of C Rangarajan. At some stage the finance minister and the prime minister's office were said to be considering initiating a debate on the committee's report before the policy on disinvestment for the current year was finalised. However, meaningful debate is hardly possible without disclosure of the rationale and context of the committee's recommendations.

Going by the summary put out by the government, the committee's report seems to be an accountant's exercise without any economic philosophy guiding it. Revitalising the operations of public sector undertakings calls for significant multidisciplinary inputs. It cannot be treated as a mere fiscal question of generating more revenue for the central budget. Unfortunately, this narrow perspective alone seems to have guided the committee's deliberations.

In one respect, the committee's recommendations are far-reaching. The committee has suggested a ceiling of 49 per cent for disinvestment in respect of PSUs in industries reserved for the public sector and of 74 per cent for other PSUs. (At this stage, it is necessary to point out that as per the July 1991 industrial policy revision, the list of industries reserved for the public sector was pruned to just eight including defence equipment, atomic energy, mining of various types and railway transport.) While the extent of government ownership in the reserved category should be 51 per cent to enable control over management, the committee was not averse to 26 per cent public ownership in exceptional cases. Under a scheme of preferential offer of shares, 5 per cent of equity may be reserved for workers and employees. In the case of PSUs engaged in certain non-manufacturing and skill-based sectors like consultancy services, this ceiling could be raised from 5 per cent to 20 per cent. The committee has also approved of selling of equity to

foreign investors and non-resident Indians (NRIs), apart from mutual funds, employees of the companies and the general public (with merchant bankers and stock brokers being treated as intermediaries and not as target clientele for disinvestment). The ceiling on foreign investors' holdings and those of NRIs would be the same as applicable to their holdings in private sector companies in India. The committee has recommended that 10 per cent of the proceeds of disinvestment might be set apart for concessional lending to PSUs for their rationalisation and expansion needs. A part of the proceeds may be used in social sectors like literacy, health and employment creation in rural areas. The committee has suggested, in the light of international experience, that a standing committee on PSU disinvestment with full-time and part-time members be created. As for the method of valuation of PSU equity, the committee has felt that the choice of the method used needs to take into account the special circumstances affecting PSU operations. According to the committee, in cases of PSUs making the first sale of equity, sale through auction would be advantageous. Once a reasonable market price has been established, the fixed price method would be appropriate. In other cases, the auction method with wide participation may be adopted. The committee is apparently critical of pressure being brought to bear on the government to speed up disinvestment to fit into rigid time-tables.

It is a pity that such a serious subject as PSU reform should be dealt with thus in a narrow perspective of satisfying budgetary needs. In the first place, the objective of disinvestment should be clear. It can be only to reform the public sector, in which case the central issue is not of finance or ownership. It is essentially one of setting professional standards and procedures for appointments of chief executive, operational freedom for the PSUs, more flexible pricing arrangements, and also freeing the PSUs from the debilitating control of the bureaucracy. Given changes in these respects, there are any number of instances of PSUs, even in the developed capitalist economies, showing commendable results in competition with private enterprises.

The committee has also failed to appreciate that the disinvestment of government shares proposed will erode the resource base of the PSUs. The PSUs would find it difficult to go to the market again to raise fresh capital in competition with the government unloading its own holdings. At the same time, if the government chooses PSU equity as a source of funding for its social sector expenditure instead of mobilising resources through taxation, the overall development expenditure is bound to suffer.

Even with regard to the disinvestment process, the committee side-steps the findings of the Comptroller and Auditor

General who has pointed out that (as in the case of IPCL and SAIL) instead of the government diluting its equity holdings directly, the PSUs could issue fresh equity shares to the public, which would have the effect of diluting the government's holdings but would augment the capital base of the units.

On the whole, the report lacks a strategy of development for a situation marked by scarcity of forward-looking entrepreneurship and capital. The PSUs have played a major role in filling the gap and they should be enabled to continue to play this role if the country is not to face a very real prospect of de-industrialisation.

SRI LANKA

Uneasy Gains

THE results of the provincial council elections in Sri Lanka have provided the much-needed impetus for the new president D B Wijetunga to set in motion several changes, most importantly in the area of constitutional reform and in the manner of functioning of the government. But it is hardly likely that these measures intended to make for a more 'open' government and reassert the powers of parliament which had been greatly eroded during R Premadasa's term, will balance out the growing social and economic distress caused by the government's ongoing structural adjustment programmes.

In the May 19 elections to seven provincial councils, which were created in 1988 in the face of much criticism from the opposition, the United National Party (UNP) gained a majority of seats in four. In the western province the People's Alliance, of which the Sri Lanka Freedom Party (SLFP) is the major component and an odd mixture of left parties form the rest, won 45 seats against 41 won by the UNP. By virtue of this, SLFP leader Sirimao Bandaranaike's daughter was sworn in as chief minister. In the southern and north-western provinces, however, while the UNP was the largest single party, the combined opposition of the People's Alliance and the Democratic United National Front won more seats. The governors of the two provinces, following what the UNP decided were constitutional requirements, invited the UNP to nominate the chief ministers. The People's Alliance has since gone to court to challenge the governors' decisions in the two provinces.

Not surprisingly, the People's Alliance has won support in those provinces which

contain 90 per cent of the Sinhala working class and the appeal here has been for a vote against the determined economic reforms introduced by Premadasa which have already begun to result in increasing unemployment and cuts in welfare. Premadasa's 'peoplist' programme, which began in 1991, has seen 20 state enterprises being transferred to private hands. According to a recent report in the *Far Eastern Economic Review*, majority holdings in the PSUs, ranging from 51 to 90 per cent, have been offered for sale. The two biggest banks, the Bank of Ceylon and the People's Bank, however still remain in the public sector as does the Ceylon Petroleum Corporation which alone reportedly accounts for 65 per cent of government business activity. These measures together with the increasing cut-backs in social services have resulted in a deterioration of living standards of the poor, whose number is increasing with growing unemployment.

The success of the People's Alliance is partly a reflection of the loss of faith in the UNP programmes. Equally, the areas under the influence of the Janatha Vimukti Perumana (JVP), which is in serious disarray because of Premadasa's all-out effort to squash it, have registered this distress by abstaining from exercising their franchise or by deliberately invalidating their votes. Part of the reason for this action is of course JVP's stand that the provincial councils are a sop to the minorities. Given all this it is not surprising that the UNP's newly-introduced monthly allowance of Rs 260 for pensioners failed to convince people of the UNP's pro-people stand.

In the rural areas, however, the UNP has done well. Partly this is explained as being a defensive response to the repressive measures that the government has taken—people are too afraid to vote against the UNP—and partly it may have something to do with Premadasa's well-advertised efforts to take employment to the villages, such as the export-oriented garment units scheme. In the plantations the UNP has always had a base which has continued to support it in spite of the fact that only last year 356 tea estates, covering 42 per cent of the tea acreage in the country, were privatised. But this has however been accompanied by government pronouncements on the stringent obligations being forced on employers in regard to their employees. It is against this background that Wijetunga has to push forward his constitutional reforms and, even more importantly, seek a political solution to the Tamil issue in the north-east.

TWENTY YEARS AGO

EPW, July 7, 1973

the Planning Commission has apparently just concluded a round of discussions with the various central ministries. There is no official indication yet of how much pruning is to be done and where. But some reports have appeared indicating broadly where the axe may fall. The Fifth Plan's steel programme, it has been suggested, may be confined to the expansion of Bhilai, Bokaro and Tata Steel. The two new integrated steel plants at Vijayanagar and Visakhapatnam, whose foundation stones were laid by the prime minister herself some years ago, and the special steel plant at Salem, will, it appears, have to wait beyond the Fifth Plan to be taken up. The plan's power programme is evidently in for the same treatment. In this case, the outcome of the Planning Commission's discussions with the irrigation and power ministry is said to be a scaling down of the target of additional power generation from 21.8 mn KW to 18.28 mn KW. Similarly, in fertilisers—one of the sectors which earlier seemed to have been marked out for a major effort in the Fifth Plan—the number of new plants to be set up is proposed to be slashed from 12 to 5. So also, the proposal to set up a new petroleum refinery at Goa is reportedly being dropped. And so on and so forth.

The most striking thing about this catalogue is that these are the very sectors which had been affected the most by the plan holiday which began at the end of the Third Plan. The resultant lack of expansion of capacity in them has taken a heavy toll in terms of shortages and larger imports. The government is in jitters over the present and potential size of the import bill for steel, fertilisers and oil and oil products. And the impact on industrial production of the power shortage in many parts of the country recently is well known. If, despite this all-too-recent experience, the Planning Commission is being driven to prune Fifth Plan programmes in these very vital sectors it would be natural to presume that the resources position must be grim indeed.

But is it, really? For, while the government is cutting back public sector investment in the core sector, ostensibly on grounds of lack of resources, it has also been frantically trying to push up private sector investment, mainly through a series of relaxations of the controls on production and investment. This has inevitably meant virtual abandonment of any idea of priorities in regard to industrial investment by the private sector. Thus even as the steel programme is starved of investment, Maruti Enterprises marches towards the goal of producing 50,000 cars a year by 1975-76 and alcohol and beer manufacturing units are licensed here, there and everywhere. The paucity of resources does not evidently touch them.

These developments may appear paradoxical, but there is a logical connection among them. The uncontrollable growth of deficit spending and of non-developmental expenditure, the price spiral, the failure to push through investment programmes in heavy and basic industries, the abandonment of priorities with respect to private sector investment and the consequent concentration of such investment in the making of non-essential consumption items—all these describe a situation where the government is obviously unable to enforce controls on investment, production and consumption in the economy. Yet such capability, after all, is what planning is all about. Another way of describing the same state of affairs, is, therefore, to call it a 'plan holiday'.

Keeping Pace with Rising Demand

Jairaj Kapadia

IT is not enough to say in respect of Garware-Wall Ropes that it has fared well in the year ended March 31, 1993. And the proceedings of the company's AGM on July 7 point to further progress. This is particularly thanks to the policies of liberalisation with the accent on globalisation as they have opened up for this synthetic ropes, twines and yarns manufacturing company a vast potential in the newly developing marine

food industry but also in the export markets.

There resulted during the year a significant increase in exports which recorded a rise of 64 per cent from Rs 896.61 lakh to Rs 1,474.28 lakh. The figure amounted to one-fifth of the aggregate turnover which improved with increased sales by 41 per cent from Rs 5,012.69 lakh to Rs 7,085.07 lakh while production was higher by 25 per

cent from 7,003 tonnes at 8,752 tonnes. The trends have remained encouraging in the first three months of the current financial year with chairman, R B Garware, pinning further hopes on exports, as he addressed the shareholders at the AGM. The 1992-93 enhanced working, meanwhile, has boosted profits significantly; the improvement was maintained down the line. With profits after tax showing a substantial rise from Rs 284 lakh to Rs 406 lakh, the company has also raised the dividend by 80 paise to Rs 3 per share.

The directors observe in their report that the liberalised economic policies have made the market situation highly competitive, but owing to its emphasis on manufacture of products of international standards, the company is excellently positioned in the domestic and export markets. A measure of this is seen in the management deciding to put on hold a proposed project for manufacture of terry towels, and instead opting to undertake a project for manufacture of fishnet webbings and also to expand capacities of the existing products at an aggregate cost of Rs 25.25 crore. The directors explain this is due to the demand for the company's products "increasing rapidly". The terry towels project was to serve the export markets. However, with the introduction of an import quota by EEC countries and there existing an excess capacity in terry towels, the directors have decided to hold the project in abeyance.

At the AGM, Garware informed the shareholders that the programme is to result in an increase of 4,000 tonnes in the capacity of existing products. The fishnet webbings project of 1,500 tonnes capacity was under way with shipment of machinery started from foreign countries. The project is scheduled for production in this November and the expansion by next January. In the meantime, the company is expanding further its presence in international markets. It is tapping the potential in countries like Chile, Vietnam and Iran where maiden shipments are being sent. It is also planning to set up rope-making units in Vietnam and Indonesia.

NICHOLAS PIRAMAL.

Bright Prospects

Nicholas Piramal India has disclosed that in the first two months of the current financial year the turnover of the company had increased from Rs 12.40 crore in the previous year's corresponding period to Rs 16.70 crore. For the year 1992-93 gross sales have amounted to Rs 10,346 lakh against Rs 8,135 lakh for 1991-92. Net profit also has shown a corresponding rise from Rs 756 lakh to Rs 1,010 lakh. The company

has declared a higher dividend of 25 per cent against 20 per cent for the previous year on increased share capital following conversion of partly convertible debentures. Furthermore, a 1:2 bonus issue is also recommended by the directors, which is after the company issued bonus shares in the proportion of 1:1 in 1991.

The much improved 1992-93 results give the lie to the impression that pharmaceutical companies are still languishing because of the delay in the announcement of the new drugs policy. The pharma division of the company continued to perform well and registered a 28 per cent growth. The manufacturing operations at a new plant in Pithampur were stabilised during the year and this is to give a further momentum to the company's growth plans this year.

There was a 25 per cent growth in the glass division which would have been still more but for the initial teething troubles in the new soda lime plant. The products command excellent market reputation and the division is to contribute significantly to turnover and profits in this year. A new 18 tonnes per day borosilicate sodium plant is expected to commence production in the second quarter of the current financial year. Meanwhile more new projects are to be set up in the next two years, like soda lime plant of 65 tonnes per day capacity, relining and modernisation of BRS plant, doubling of the present form fill seal capacity and a bulk drugs plant.

The increased dividend and the proposed bonus issue highlight the promising prospects of the company. At the same time, on conversion of part A of the partly convertible debentures into one equity share of Rs 10 each at a premium of Rs 40 per share, the issued and paid-up share capital has gone up to Rs 810.70 lakh and the share premium account by Rs 751.93 lakh to Rs 763.36 lakh, facilitating the fresh proposal of bonus.

STEPAN CHEMICALS

Focus on Core Business

Stepan Chemicals has fared well during its last financial year ended December 31, 1992 and has declared a higher dividend of 25 per cent against 20 per cent for 1991. The company's soaps and detergents factory at Rajpura, Punjab, remains leased to Hindustan Lever. It processed 20,745 tonnes of soaps and 26,313 tonnes of detergents under the lease-cum-processing arrangement, which showed a volume increase of 22 per cent over 1991. This was the highest ever production. It earned the company lease rentals and processing charges of Rs 741 lakh. This forms part of 'Other Income' of which the total amount has declined from Rs 1,393 lakh to Rs 812 lakh in the absence of income on account of clearing, forwarding and other services which in the previous year had amounted to Rs 684.84 lakh.

But the company is dealing in synthetic detergents processed by third parties and

on account of sales of these it earned an income of Rs 18,424.42 lakh, more as compared to Rs 14,025.02 lakh in the previous year. It also deals besides in personal products, having earned Rs 41.19 lakh for the year, and in marketing of an organic manufacture and imported DAP the sales of which aggregated Rs 490.77 lakh against Rs 322.58 lakh in the previous year. However, the company has now discontinued handling and distribution of those products and decided to concentrate on its "rapidly growing core business".

This obviously is in the area of synthetic detergents for which the company has consolidated position in the rural areas and started work on a new detergent powder plant at Dharwar in Karnataka. The plant is to cost Rs 3 crore and is being financed with internal accruals. It is expected to commence production shortly.

CAMPHOR AND ALLIED PRODUCTS

Squeezed Margins

Gross sales turnover of Camphor and Allied Products for the year ended March 31, 1993 has recorded a rise of 37 per cent from Rs 5,429 lakh to Rs 7,434 lakh. This follows amalgamation with the company of the erstwhile Pine Chemicals (PCL) engaged in the manufacture of rosin and turpentine from oleo pine resin at Nandesari, Baroda, with effect from April 1, 1992. Of the three divisions now under the company, camphor division contributes Rs 6,037 lakh in sales, 25 per cent more as compared to Rs 4,815 lakh in the previous year. Of the balance Rs 658 lakh came from profeel division and Rs 739 lakh from rosin division. As against increase in turnover, gross profit has recorded a decline from Rs 866.44 lakh to Rs 820.60 lakh and net profit, after provision of Rs 192.60 lakh (Rs 182.60 lakh previously)

for depreciation, Rs 315 lakh (Rs 340 lakh) for taxation and for other allocations, has amounted less at Rs 312.10 lakh against Rs 329.49 lakh in the previous year. The directors have recommended a dividend of Rs 3 per share on enhanced share capital following the issue of shares to the shareholders of the erstwhile Pine Chemicals besides a rights issue made during the year.

The directors report that despite increased productivity and even a better price realisation, operations of the camphor division were affected by cost escalation and particularly by an increase in the price of imported turpentine following the steep devaluation of the rupee and the consequent impact on import duty. Further, user industries, viz, paint, rubber and tyre and pharmaceuticals, experienced recessionary conditions. Similarly, the profeel division suffered as a result of the severe recession in the electronic industry resulting in reduced offtake of the packaging material and also stiff competition with other manufacturers mainly on account of tax concessions enjoyed by them. Increase in raw material costs had to be partly absorbed due to recessionary trend in the market.

INDIAN RAYON AND INDUSTRIES

Growth Plans

Indian Rayon and Industries has posted excellent working results for the nine-month period ended March 31, 1993. Turnover at Rs 607 crore is higher by 22 per cent on an annualised basis. Gross profit at Rs 84.50 crore has improved by 34 per cent and net profit at Rs 43.6 crore has improved by 54 per cent on an annualised basis. Earnings per share during this period are Rs 22.85 on an annualised basis, as against Rs 14.87 last year. The directors

K P BAGCHI & COMPANY

286, B B Ganguli Street, Calcutta: 700 012
1-1698 Chittaranjan Park, New Delhi: 110 019

have recommended a dividend of 50 per cent (Rs 3.75 per share, *pro rata* for nine months) against 40 per cent (Rs 4 per share) in the previous year.

These results, the best ever, are due to improvement in production, productivity, operating efficiency, product-mix and quality of products recorded in all divisions of the company. Exports for the nine-month period were Rs 69.91 crore as against Rs 59.27 crore in the previous year, representing an increase of about 60 per cent on an annualised basis.

The company is planning to invest more than Rs 800 crore over the next three to four years in the following projects: (1) argon gas plant with a capacity to produce 3.45 million M3 argon gas, involving an outlay of Rs 48 crore, which is likely to be commissioned by September this year; (2) expansion of carbon black plant from 20,000 tonnes to 40,000 tonnes per annum at an estimated cost of Rs 72 crore, likely to be commissioned by September/October; (3) sea water magnesia plant to manufacture 50,000 tonnes per annum of high purity refractory grade magnesia at an estimated cost of Rs 240 crore, to be commissioned by early 1995; (4) a 12 MW co-generation captive power plant for the rayon division at an estimated cost of Rs 70 crore to be commissioned by the middle of 1995; (5) expansion of capacity of the cement division by about one million tonnes at the existing plant at Gulbarga at an estimated cost of Rs 300 crore; and (6) marginal expansion, replacement, modernisation and installation of balancing equipment in the existing divisions over the next two years at a cost of around Rs 80 crore.

In order to finance some of the above projects, the company has now finalised plans for issue of zero interest fully convertible debentures (FCDs) and non-convertible debentures (with detachable equity warrant) for an aggregate amount of over Rs 340 crore respectively as follows: to the existing shareholders, on rights basis, Rs 88.20 crore and Rs 155.64 crore; to the permanent employees of the company, Rs 4.41 crore and Rs 7.78 crore; and to the promoters/companies of the management group, Rs 32.40 crore and Rs 53.40 crore. The FCDs to shareholders and employees will be issued in the proportion of one FCD for every five shares held and will have a face value of Rs 170 each. Each FCD would be converted into one equity share on July 1, 1994 at a premium of Rs 160. The FCDs to be issued to the promoters and group companies will have a face value of Rs 200 each and will be converted into equity shares at a premium of Rs 190 each on July 1, 1994. Each non-convertible debenture (with a detachable warrant) will have a face value of Rs 300 and carry interest at the rate of 16.5 per cent per annum. The NCDs will be offered to existing shareholders in the ratio of one NCD for every five shares held. Each of these debentures will carry a

warrant for equity share to enable the holder to get one equity share at a premium not exceeding Rs 190. Such option will be exercisable any time between 18 months to 36 months from the date of allotment, as may be decided by the board of directors of the company. The company has made arrangements for shareholders to sell the

non-convertible debentures at a discount of Rs 25 per debenture, whilst retaining the equity warrant with them. The proposed NCDs have been rated by ICRA and have been accorded 'LAAA' (pronounced as L triple A) rating, the best rating given for NCDs. The proposed issue is scheduled to open in September.

IN THE CAPITAL MARKET

Core Organics

CORE ORGANICS, which is jointly promoted by Avtar Singh and his associates and the Punjab State Industrial Development Corporation is setting up a project for manufacture of benzaldehyde (700 tonnes per annum capacity), benzyl alcohol (200 tonnes capacity) and benzyl acetate (200 tonnes capacity) at Patiala, Punjab, with the PSIDC having a 25 per cent stake in it. The project to start this October is appraised by IDBI to cost Rs 5.60 crore, which is being met with equity of Rs 3.10 crore, term loan of Rs 2.35 crore and state capital subsidy of Rs 15 lakh. The company already has an issued and paid-up share capital of Rs 1.49 crore. It is now issuing 16.07 lakh equity shares of Rs 10 each at par and offering 15.14 lakh shares to the public. Following the public issue, the promoters' stake will stand reduced from the present 100 per cent to 51 per cent. Indbank is the lead manager of the issue which opens for subscription on July 19. IDBI has projected for 1993-94 sales of Rs 2.76 crore at 65 per cent capacity utilisation and net profit and EPS at Rs 43.49 lakh and Rs 1.40, respectively. However, the company has estimated 85 per cent capacity utilisation to yield sales of Rs 4.31 crore and net profit of Rs 93.43 lakh and EPS of Rs 3.34. Full capacity utilisation is envisaged by the year 1995-96 when sales are estimated to amount to Rs 8.71 crore, net profit to Rs 1.46 crore and EPS to Rs 4.71.

Ashapura Minechem

Ashapura Minechem, an existing company promoted by Navanilal Shah in the field of mining and processing of bentonite lumps (80,000 tonnes per annum capacity) besides powder and mined minerals like China clay, calcium carbonate and barytes in Bhuj, Gujarat, is offering to the public 6 lakh equity shares of Rs 10 each at a premium of Rs 40 per share. The issue, managed by BOI finance, opens on July 21. The company is undertaking a Rs 4 crore expansion covering production of one lakh tonnes high quality special grade RST bentonite per annum. The project is appraised by Bank of India. It is being financed with Rs 3 crore equity (including premium amount), internal accruals of Rs 85 lakh and cash subsidy of Rs 15 lakh. The premium amount of Rs 40 on public issue is explained by the company by its

1992-93 EPS of Rs 7.48 and equity's book value of Rs 20.09. But in terms of the CCI formula earlier, the premium works out to Rs 20 per share. With the expansion programme which is expected to go on stream by September, the company has projected for the years 1993-94, 1994-95 and 1995-96 sales respectively of Rs 26.26 crore, Rs 29.36 crore and Rs 33.14 crore and net profit Rs 3.33 crore, Rs 3.71 crore and Rs 4.04 crore. EPS is to correspond to Rs 11.12, Rs 12.37 and Rs 13.45 respectively for the three years.

Vamotiwala Chemical Industries

Vamotiwala Chemical Industries is establishing a project at MIDC Mahad in Raigad, Maharashtra, to manufacture 1,000 tpa of glycol ether and ethylene oxide condensate emulsifier, 600 tpa of vinyl sulphone and 3,000 tpa of ethyl acetate which have applications in oil, leather, paint, cosmetic, lubricant, dye, bulk drug, fertiliser, rubber and textile industries. The company has already commissioned the first phase of the project involving the manufacture of glycol ether and ethylene oxide condensate emulsifier and has earned cash profits of Rs 15.53 lakh on a turnover of Rs 165.52 lakh in the first six months of phase I of production. Commercial production of the other products is to commence by the last quarter of 1993. The company has signed an MOU with Schell Chemicals for exporting up to 60 per cent of the production of vinyl sulphone and ethyl acetate. Sales turnover in the next three years based on 60, 75 and 90 per cent capacity utilisation are projected at Rs 1,190 lakh, Rs 1,488 lakh and Rs 1,786 lakh. To part finance the cost of the project at Rs 639 lakh, the company is entering the capital market with a public issue of 30,00,000 equity shares of Rs 10 each for cash at par aggregating Rs 300 lakh. The remaining portion of Rs 339 lakh is being taken care of by the promoters' contribution (Rs 160 lakh), term loans from banks (Rs 79 lakh), hire purchase (Rs 75 lakh) and state subsidy (Rs 25 lakh). The issue which opens on July 27 is lead-managed by SBI Capital Markets and Bank of Baroda. Listing of the shares at Bombay, Ahmedabad and Delhi stock exchanges will be done.

Calcutta Diary

AM

Poor P C Mahalanobis. The Professor, whose centenary is currently being celebrated with much demureness, had lost his way. He read his people wrong and constructed an autarkic model which made no reference to the foreign sector. It was therefore bound to come a cropper. It duly did. There was, for some subsequent time, much confusion, but all is well that ends well, we now belong, inalienably, to an international economic system. How does it matter if we are one hundred thirty-fourth in a class of one hundred seventy-three?

AN American bank functioning here had little respect for the country's laws. A direct method was employed by it for recovering money it had advanced to customers in case the latter defaulted on due instalments; it would set private goons after the offending parties, Indian civil and criminal procedure codes be hanged. Even a few years ago, there would hardly be any defender of the manner the bank had gone about; on the contrary, had the matter been reported in the press, letters would flood newspaper offices urging revocation of the bank's licence. At least no Indian citizen would go public in defence of the bank's conduct. We however now live in a different ambience. A contribution in a daily paper had mildly criticised the bank's taking the lawless route, which, it was suggested, was a challenge to the country's sovereignty. The reaction to the published piece is flabbergasting. Several angry letters have been addressed to the paper. It is evidently *lese-majeste* to criticise a foreign bank, more so, an American bank. If it had engaged private goons to recover its money, it had done a jolly good thing, why should it be hamstrung by the lugubrious processes of Indian legality? That bank epitomises efficiency; efficiency means maintenance of a high margin of profit, which is contingent upon collecting outstanding receivables on schedule. For achieving that objective, the bank was entitled to take recourse to whatever procedure it regarded best, and let not the wretched government dare to interfere on the ground of silly legality. Would that foreign bank—one of the leading banks in the world—be expected to pattern itself after the habitually-loss-making, proverbially inefficient nationalised banks in this country? Did not the editor of a responsible newspaper have better things to do than print such crap libelling saintly foreigners? Patriotism, who does not know, is the last refuge of scoundrels.

This is of course inverted jingoism. Foreigners, right for wrong, or, rather, foreigners can never be wrong, they are by definition right. The episode illustrates a remarkable transition in the Indian middle class mind-set. Pride in the country has been substituted by a different variant of emotion, pride in the surrender of the country's dignity to foreign

carpet-baggers. A charitable interpretation of this change in attitude would be to put it down to the strides globalisation has made in recent years. The countrymen have been fully liberalised. They are liberated from past hang-ups. They are no longer interested in demarcating national barriers or entities; they choose efficiency, and do not care whether the party they have chosen carries a home or foreign trade mark. The shibboleth of political or economic sovereignty they are able to recognise, in no time, as just that. What, after all, is the basic element in sovereignty? We want to be autonomous so as to be able to exercise freely our judgment on how to reach a better base of material welfare. If globalisation helps us to reach that goal in the fastest possible manner, why bother about inessential other details? The best patriots are surely those adept at picking foreign parties who know their job truly and well and who will pass on their knowledge to us. That is the key to national prosperity, and, please, let there be no silly remarks about the East India Company syndrome. One wishes that that company had never left; we might then have by now displaced China from the third position in the International Monetary Fund roster, we would perhaps have even made the grade in the honours list of the *World Development Report*.

But one must be fair, first impressions are generally deceptive, the emergence of this mind-set is hardly the outcome of the goings-on in recent years. Its roots stretch way back, and perhaps have an unbroken continuum with the days of yore. Thirty years ago, V S Naipaul had hit the nail on the head: the craze for foreign products was not a stray aberration, it was an absorbing total civilisation. To suggest that this civilisation came alive only after the departure of the British would be to take liberties with the reality as it always has been. Even when the freedom struggle was in full throttle, and anti-British sentiment was reportedly at its height, a hint of ambivalence marked the proceedings. Most of the polemics of patriotism was of course conducted in English. This was so not merely on account of the absence of any obvious other lingua franca which could have brought together on a common platform orators and pontificators from

the different parts of the country. The national leaders had attained the coveted positions they did largely because they took to English as a duck takes to water; proficiency in the queen's language was the capital asset which underwrote their social status. They were fierce patriots, but conformed, equally fiercely, to the imperial ethos of *chota* and *bara hazari*. G D Birla nagged and nagged at Mahatma Gandhi in order to persuade him to endorse the boycott of Lancashire textiles. Gandhiji however had little illusion; the task, he knew, was hopeless, few leading Congress households would make any bones about possessing two sets of apparel—the khadi garb for swadeshi meetings, and imported finery for normal perambulations. The dichotomy was reflected once more in the on-again off-again attempts to introduce prohibition on a voluntary basis: leaders would take the teetotaler's oath, but for the sake of public relations; it did not need to be taken seriously, nor need it lower one's thirst for foreign whisky. True, exceptions like Jawaharlal Nehru thought whisky to be a barbarian drink; they chose wines instead, Rhine or Mosel.

Scholars have since unleashed the proposition that nationalism itself was an imported product, it came with the British. The ideology of nationhood had apparently not bothered Indians in the past. They knew of kings and empires; they were also conversant with the reality that kings and emperors, or their local representatives, would, from time to time, demand tributes, which have to be paid with expedition whatever the resulting strain to daily living. The occasional appearance of a royal presence nonetheless belonged to the genre of a natural law; it was taken in its stride. Otherwise Indians were accustomed to survive on a miniature scale; the village was the basic unit of social existence, even the fellows across the ditch or canal or rivulet were deemed to be foreigners. In due course, a distinction was sought to be made between run-of-the-mill foreigners and those who, arriving on horseback, demanded tribute and subjugation. This was the beginning of the identification of royalty with the exotic presence. The Hindukush was *prima facie* a range of mountains, but it also gradually came to connote an advancing army, bands of foreign intruders who imposed themselves, but not too intensely. These would-be-royal foreign parties would perhaps appoint a local tax-collector, and withdraw. The social distance led enchantment to the view. The Hindukush ceased to be a formidable barrier, it became the virtual *laissez-passer* for entry into our plains and terrains. It soon became a fixation too: Hindukush lets in the foreigners, who are kingly and handsome, who possess superior arts and superior graces, who are worthy enough to dominate us, and are therefore entitled to dominate us. Bit by bit, the humble village folk, millions of them, occupying hundreds of thousands of hamlets which comprised India, slipped into a frame of mind besotted by the craze for foreign species:

whoever arrived from across the Hindukush were divine and were to be received with open arms and gift cheques. In lieu, these visitors would teach us civilisation and efficiency.

On each occasion, those who came in constituted a new superstructure. Most of the time, they had little trouble in coping with the old superstructure. The latter perhaps disintegrated for biological reasons; sometimes some muscle power had to be deployed to make it see reason and liquidate itself. Here and there, the superstructure would assume the form of a mighty empire. It was however always a hot country, and large masses experienced difficulty in maintaining their immaculateness for any length of time. This made it easy going—or shall one say, easy coming—for every fresh bunch of foreigners. For generations on end, the inhabitants in the umpteen little village units went through a uniform experience. The foreigners came, came, ever came; they came, but they kept their distance, they did not bother to get assimilated. That helped to sustain the romantic notions the villagers cherished about foreigners. Foreigners were god, they were unreachable. It was not possible to attain godliness that distinguished the alien visitors, but there was no harm trying; our forebears therefore desperately emulated the foreigners even while the latter extracted, via agents, the taxes due to them.

Throughout history, in the eye of the native-born, foreigners retained their dazzle and glamour. A smattering amongst them inter-married with the natives, became apostates, or through other accidents lost their caste. Thank goodness, a hard core was however always there to ensure the permanence of pristine qualities that defined foreigners. Foreigners, it was held as axiomatic, were superior to you and me, they arrived, unfailingly, in order to dig us out of the quagmire we habitually sank in, they arrived to teach us civilisation, sometimes they arrived to make us aware, in the manner of, a Max Mueller, that we once had a civilisation, or in the manner of others to assure us that we had even pornography in those wondrous days of yore. This, then, is the essential point to stress: unless foreigners vetted it, we refused to take cognisance of our history. Our geography too has consistently been what foreigners decided to make of it.

Since hate is a form of love, we have been wont to experience periodical bouts of patriotism. The latter hardly ever took the form of xenophobia though: the ambience was of afternoon cricket in the village green. In any event, the nationalism which inundated the Indians in the second half of the 19th century and the first half of the 20th was an imported product too, impeccably foreign-made. Nationalism became respectable because it had foreign pedigree, the relevant concepts were lifted from the books and journals shipped every week from England. Where would we be if our dear adversaries, our masters, had not taught us about nations

and nationalities or about antagonistic and non-antagonistic relationships? It is they who made our patriotic day. We got to know from them about the Boston tea-party; we have never tired of the cliché 'no taxation without representation' ever since. We stuffed ourselves with Hobbes, Locke, Comte and Dicey. We got equally fascinated by the Irish question, what with Parnell and McSweeney and the Sinn Féin. The role models were there; we only slipped into the assigned roles, roles assigned by us for ourselves. And should we not be honest, did not our young men, while returning from their digs at Oxford or Cambridge, bring in the early shipments of Lenin and Bakunin and Lunacharsky? We were, in all seasons, the echo, never the voice.

There is little point therefore in taking umbrage at the current phase of the head-over-heels love affair with foreign products and productions. It is neither an aberration nor a temporary situation; it is celebration, in our unique, inimitable style, of our return to roots. Should a whiff of scepticism begin to assail you, please look up the Upanishads, it is all there in the learned books. From the time of the Aryans, we have stuck to our ground: the home is the universe, and vice versa. We adore foreigners, foreign ideas, foreign goods, foreign masters. Whatever its superficialities, the freedom movement was no deviation. Much can actually be said in defence of the theory that the Nehru-Gandhis were preferred as post-independence royalty

because, amongst the national leadership, they provided the appearance of being the most foreign, and were accordingly at the receiving end of the most admiration. The Nehru-Gandhis belonged, and yet did not: they were remote, superior, foreign. They proffered love for the countrymen, and yet could not be more condescending to them. That was the hallmark of pedigree; countrymen learnt to swoon at their feet.

Poor P C Mahalanobis. The Professor, whose centenary is currently being celebrated with much demureness, had lost his way. He took the leaders—and the people—of this country at their face value. Whether he had come across F'eldman before he decided to construct his four-sector growth model is hardly of any importance; what is relevant is that he read his people wrong and constructed an autarkic model. It was a closed system, growth was supposed to explode from out of it if only its severe conditionalities, including the one about continuing to produce machines which would produce other machines, were adhered to. What a scandal, the model made no reference to the foreign sector. It was therefore bound to come a cropper. It duly did. There was for some subsequent time, much confusion, but all is well that ends well, we now belong, inalienably, to an international economic system. How does it matter if we are one hundred thirty-fourth in a class of one hundred seventy-three?

DECENTRALISED PLANNING

The Karnataka Experiment

ABDUL AZIZ

The serious drawbacks of development plans drawn up by the Central or state governments have long been recognised. This awareness has been accompanied by a general acceptance that decentralised planning, properly conceived and implemented, is far better equipped to achieve equitable growth by being more responsive to local problems and needs.

The central purpose of this timely study is to develop a general theoretical perspective based on a review of the actual experience of decentralised planning in the state of Karnataka, one of the first to implement this strategy.

'The Task Ahead': More Empty Boxes

K S Krishnaswamy

The finance ministry's discussion paper on economic reform is a document of the mandarins who are confident that no matter what happens to other people or elsewhere in the country, they are firmly established in the seats of power and therefore can call the shots, regardless of who or which party constitutes the elected government.

A PRIMARY feature of Narasimha Rao's government is the announcement of major policy decisions, or of important views on the government's position, in the interregnum between parliament sessions. This applies to the finance ministry much more than to the others, though all of them are tending to do so more or less regularly. Consequently the release of the government's discussion paper on 'Economic Reform: Two Years After and the Task Ahead' (by Montek Singh Ahluwalia?) some days back entirely conforms to current practice. Apart from other things it also indicates the dominance gained by the bureaucracy in matters of policy formulation.

The discussion paper contains no surprises of any kind, nor does it throw any clearer light on the country's medium-term prospects. Like all government statements the goals it sets out in general terms are as unexceptionable as motherhood and 'dal-roti'. But what follows bears little relationship to the profound statement that "the only durable solution to the cure of poverty is sustained growth of incomes and employment: in agriculture, in industry and in services". The preamble goes on to talk about additional investment in farms, in infrastructure, in manufacturing industry and "above all, in people". This has been the government's refrain for some time now, and has become somewhat louder after the *Human Development Report, 1993* demonstrated how poorly India has done in comparison with other countries in providing the essentials of life to the people. It has also been sanctified now by the urgings of the World Bank that more needs to be done in the areas of education and public health, especially by the government. For the rest the paper hardly contains anything that has not been discussed threadbare in the last two years. The obvious inference is that this is all part of an arranged set of rites and ceremonies to be carried out before the government goes again to the IMF and the World Bank for the next instalment of 'exceptional financing'.

The Reform Agenda for the next three years set down in Section III of the discussion paper exhibits the same order of priorities as before with one minor difference.

Between the top priorities of fiscal consolidation and financial sector reform, seven brief paragraphs have been interposed on the important subjects of human resource development and employment and poverty alleviation. When one turns eagerly to these paragraphs to see what these programmes mean, one is not just astonished but depressed by their inanity. We are told in all seriousness that we must spend much higher shares of the budgets for education and health, on primary education, basic health care and women and children welfare. The paper does *not* say that the shares of education and health expenditures as a proportion of total public expenditure should go up; but only that out of whatever amount is provided for these purposes in the budget, more should be spent on primary education, basic health care and women and children welfare. There is no recognition of the fact that over the years budgetary provisions for these items have been drastically reduced in real terms; and given the immensity of the tasks ahead, minor rearrangements within a scanty budget allocation seem hardly worth the name of determined effort at human resource development. There is no disputing the fact that primary education and basic health care have to be accorded a higher priority, as the discussion paper says. But to believe that with better targeting of public expenditure and no substantial increase in total resource allocation for human resource development, we can reach the goals that we ought to have reached long back is to indulge in fancy.

Even these brief statements suffer from the obsessive concern of those in charge of government to make beneficiaries pay for the services provided to them. Obviously public education and health services cannot be free for the rich and the poor alike, and there is no question but that fees should be charged to those who are palpably capable of paying. But this is side-tracking the main issue of what the overall responsibility of the government should be in this area. The section on human resource development ends with the pregnant observation that "private providers must be encouraged to supplement public provision". Again one can recognise that in both education and

health services not everything can be or need be done by the public sector. But if private enterprise is to run schools and colleges and hospitals and diagnostic centres, the state has the responsibility to ensure that private agencies do not become a means of ruthless exploitation of the needy. The ongoing dispute about capitation-fee institutions and five-star hospitals charging unconscionable amounts for diagnosis or treatment are proof enough of what the private sector is likely to do in these areas, which are typically unsuitable for market-oriented solutions.

In a similar fashion the two paragraphs on employment and poverty alleviation (paragraphs 54 and 55) are indicative of the complacency with which these serious issues are viewed in the ministry of finance. A matter that has been repeatedly brought up in discussions of development policy is the difficulty of ensuring simultaneously a rapid and sustained growth of both output and employment. Our own experience in the commodity-producing areas in India is indicative of this. Even more, the chronic problem of unemployment that the developed countries are facing underlines the extraordinary difficulty of ensuring sustained growth of employment with the lag in human resource development that we have, the problem of creating additional employment opportunities in the context of import of highly capital-intensive technologies is all the more complicated. One would have thought that this section deserved something more than a rehash of IRDP and the Jawahar Rozgar Yojana. But that is all there is; and after that we are back to 'better targeting' as the ultimate solution!

What about agriculture, which has been crying for greater attention? Once again we have the standard prescription: public investment in agriculture-related infrastructure should be increased; this can happen *only if* the huge subsidies being provided for water, electricity and fertilisers are contained. This according to the discussion paper 'is the key'. We are back to a repetition of making beneficiaries pay and cutting out the various subsidies from the budget. But the link between doing this and increasing investment in agriculture-related infrastructure is not obvious. After all is not the main purpose of reducing or removing subsidies to bring down the fiscal deficit to around 5 per cent of GDP by 1996-97? Unless one accepts the finance ministry's hope that better tax administration and greater honesty amongst tax payers will automatically enlarge tax yields in a greater measure than the growth in GDP, there is no guarantee that agricultural investment in the public sector can be stepped up merely on the strength of levying user charges in irrigation, etc.

The only other additional responsibility placed on the public sector is to upgrade the quality of research and extension support. Even here the wording of the document is such as to leave in doubt the precise role the public sector has to play. We then have the expected call for more private investment in the agricultural sector, and the changes in government policy which should be undertaken to make this possible. However, despite all the planning that we have had since independence the bulk of agricultural investment has always been private investment—by millions of medium and small farmers who have for the most part provided the necessary savings or borrowed. Despite the extension of the co-operative credit and commercial banking networks, the poorer farmers have rarely benefited from institutional credit and have depended on the local moneylenders. When the government now says that private investment in agriculture will have to be resurrected, the question naturally arises how and by whom? Like everything else agriculture is to be globalised and export opportunities opened up under the new regime. Since in all likelihood the government will also subscribe to the Dunkel proposals, one may perhaps also expect corporations which have patented their biotechnological products wanting to invest in agriculture in India. To the policy-makers in Delhi, who are fascinated by their macro-economic models, all this is fine as long as there is a net addition to agricultural investment and the introduction of new technologies to raise farm productivity. But these

will inevitably mean a sea-change in the agrarian sector, with unpredictable consequences on existing farmers. They will also mean the commercialisation of agriculture in a manner that is not necessarily conducive to greater employment in that sector.

Thus when one looks for new directions of action in vital areas affecting education, health, employment and food security of the people the discussion paper throws little light on what the government intends to do. As for other areas—namely, fiscal reform, financial sector reform, trade and foreign exchange policy and industrial policy—there is merely the statement that we continue to move along the same road. This has become so much of a worship of the market and the private sector and a denigration of the public sector that there is hardly anything new that can be said about it. In the grand style of the non-institutional and ahistoric positivists, the political and social transformations that have occurred in India as well as outside in the last two years have been blissfully ignored. One has the lurking suspicion that this is really a document of the mandarins who are confident that no matter what happens to other people or elsewhere in the country, they are firmly established in the seats of power and therefore can call the shots, regardless of who or which party constitutes the elected government. As long as this lasts, the unemployed, underprivileged and the poor have to be satisfied with such 'trickle-down' benefits as come their way in the wake of the so-called policies of liberalisation and globalisation.

kets. If, however, the stock market scam is looked upon as only the handiwork of brokers, working in collusion with some corrupt bank managers, bureaucrats and politicians in the government, the JPC will tell only half the story of the scam—its surface manifestations rather than its far more potent inner impulses.

The depositions before the JPC have been revealing of the genesis of the stock market scam, its nature and dimensions as well as the policy environment in which it flourished. The evidence of the former Reserve Bank governor R Venkataramanan, for instance, showed that the official stance that the scam was an aberration, a case of fraud by some clever and unscrupulous individuals, was totally lacking in conviction. The fact that the stock market scam erupted shortly before the presentation of the budget for 1992-93, as has been pointed out by Harshad Mehta in his statement on payment of slush money to the prime minister, was not something fortuitous. R Venkataramanan specifically told the JPC that he had informed the finance minister about the irregularities in December 1991, but he was advised not to take any action because of the impending budget. The budget, when presented, gave a big boost to speculative activity in the financial markets. The finance minister was obviously anxious not to do anything at that juncture which would give the 'wrong signals' on the economic policies of the government. The most important announcement in the budget, which acted as the catalyst for the speculative spree, was that stocks and shares would henceforth enjoy preferential fiscal treatment as productive assets in respect of wealth and capital gains taxes. The budget also launched a massive 'operation whitewash' for black money which was so designed that black money hoards, along with the genuine savings of individuals and surpluses of corporations, would flow into the stock markets to garner large profits. Side by side, commercial banks and financial institutions were pressed to adopt what was pompously called 'innovative' methods of enhancing their profitability even as they were expected to scale down the funding of productive activity, especially in the priority sectors of agriculture, small industry and so on. The nationalised banks were under pressure to somehow increase their profitability and resorted to circumventing rules and guidelines—which was not only worked at but actually encouraged by the Reserve Bank and the finance ministry.

Among the most important of such practices was the use of bankers' receipts by the brokers to raise funds for their stock market operations. This was the starting point for the collusion between banks and brokers on a gigantic scale. Significantly, the

NEW DELHI

The Scam and Economic Reform

BM

It is, of course, essential to take stringent action against those guilty of fraud and corruption, but it is the so-called economic reform programme of the Narasimha Rao government which needs to be questioned squarely in the light of the stock market scam and its impact on the economy and polity.

AS the probe into the great stock market scam by the Joint Parliamentary Committee (JPC) proceeded, its policy and political dimensions were bound to surface more and more sharply. The charge that the prime minister himself accepted tainted money from Harshad Mehta in exchange for his 'blessings' has yet to be proved. But so are the charges against Harshad Mehta for his part as the principal accused in the scam. The ramifications of the scam have still to unfold fully. Will the JPC be able to unravel the full story and reveal the whole truth behind it is yet to be seen. The pos-

tures and tactics, all too familiar, adopted by Narasimha Rao to fight 'politically' the charge levelled against him by Harshad Mehta must, however, make matters extremely intractable and complex for the JPC. In its draft report prepared before the revelations by Harshad Mehta, the JPC had confirmed financial irregularities on a large scale. It had also taken due note of the infringement of rules and regulations by various agencies and high officials and ministers of the government in order to arrange the flow of public funds for speculative trading by brokers on the stock mar-

Reserve Bank was advised by the finance ministry, as has been admitted by R Venkitaramanan before the JPC, not to take pre-emptive action against the Bank of Karad, Bank of Madura and Andhra Bank.

The point is that over a period of time 'normal business practices', as Harshad Mehta has often asserted, had developed, in response to government policies and encouragement, to use public funds for the brokers' stock market operations. The 1992-93 budget, framed to subserve the structural adjustment programme for the economy, gave a powerful stimulus to such practices. The 'guidelines' of the Reserve Bank ceased to matter. R Venkitaramanan acknowledged before the JPC that there were highly adverse reports against foreign banks, but no action could be taken because the government was dependent on them to bring in hard currency deposits to sustain import liberalisation as part of structural adjustment.

The stock market scam has, therefore, to be directly linked to the changes in economic policies. Even as the boom in stocks and shares fed the wild expectations of ordinary investors, it was financed mainly by the flow of black money and public funds into speculative trading. At the same time, the government, led by the finance minister, saw in the booming stock markets evidence of the success of the new economic policies. The stock market scam cannot, therefore, be explained in terms of a failure of the monitoring system or lack of computers in banks because of trade union opposition. The active participation in the scam of the foreign banks mocks at this reasoning.

The brokers could not have played their games on the stock markets without the massive flow of public sector funds into stock markets. These funds were made available because attractive returns were promised and expected. This was the basis of the nexus between brokers and managers of public financial institutions and commercial undertakings and, of course, the politicians at the very top. If personal gains were made by those in high places in the government, this was only to be expected. But the grand scale on which it happened could not have been possible but for the socio-economic and political environment created by the so-called economic reform programme launched by the government as soon as it had been formed in June 1991.

Those who have a vested interest in the economic reform programme are a worried lot these days. They have visibly lost their assurance and élan. Things have not worked as smoothly as they had hoped. They are harassed by the spectre of political instability even as the much applauded reform measures, handed down by the foreign

creditors, are becoming more and more difficult for the government to implement. A concerted effort is being mounted to salvage the reform programme from the debris of the scam, even as senior managers of banks and public sector undertakings, bureaucrats and even a few ministers are sought to be held to account. As part of this strategy, Narasimha Rao would have to throw out a number of senior ministers as well as top bureaucrats, but has neither the power nor the inclination to undertake this job even as his own position in office has become uncertain.

It is, of course, necessary to take stringent action against individuals guilty of fraud, corruption and misappropriation of public money, though in the prevailing social and political environment one may be sure that many of the offenders will escape punishment. But it is the policy prescriptions of the government which have to be questioned squarely in the light of the stock market scam and its impact on the economy and polity. It is not only in respect of the financial sector that the adventurous course adopted by the government in June 1991 has shown such ugly results so quickly. The failure is stark all along the line for the economy. The left parties and their allies must respond to this challenge adequately. They must not allow themselves to be befuddled by the antics of the Rao camp. It is amusing that the prime minister, who had remained smugly unmoved by the com-

munal threat after the demolition of the Babri masjid and had even assumed responsibility for building the Ram temple at the disputed site, is now calling for an all-out fight against the BJP.

THE FIRST GLOBAL REVOLUTION

A Report by the Council of the Club of Rome

Alexander King and Bertrand Schneider

What we are witnessing today is the emergence of the post-industrial society, and the tumultuous changes around us are elements of this transitional phase. Poised on the brink of a social revolution ushered in by modern information technology, the world has two choices:

- to continue pursuing material goals and selfish aims, and thereby cause the slow but sure decline of all world systems;
- to unite and work towards building an improved life for future generations.

This book offers an overall perspective of the complex and interactive global problems, and discusses means of solving them comprehensively.

Who Needs 10,000 MW of Private Power?

Nirmalya Roy

The premise that an addition of 38,000 MW is required during the Eighth Plan on which both the advocates and opponents of privatisation base their respective cases is faulty because the shortage of power is mainly because the performance of the power sector has not received due attention.

THE Eighth Plan envisages a net addition to the Indian grid of 38,000 MW. This is accepted by all. The debate is about the mode of financing. The government's plea is clear and simple: it has money only to install 28,000 MW, the remaining 10,000 MW have to be financed from private (domestic and foreign) sources. Opponents think this move will cripple our power sector.

But do we need 38,000 MW at all? How much will be the peak load (PL) at the end of the Eighth Plan? (This note talks only about 'power' to make it simple, and also because power shortage (approximately 17 per cent) is nearly double the energy shortage (9 per cent)). Table 1 shows peak load forecasting at different times, by different groups. Since the demand forecasts vary rather widely which one is to be followed? For a realistic forecast, let us look at the actual demand at present. In 1989-90, the end of the Seventh Plan that is, the peak load served was 33,850 MW. Considering a peak shortage of nearly 17 per cent, the unrestricted peak demand was around 40,500 MW. In 1990-91, the unrestricted peak demand was only 44,000 MW.

We can now see from Table 1 that the low scenario of National Power Plan (NPP) forecast almost matches the actual demand. According to this forecast, our peak load demand in 1994-95 (the end of the earlier Eighth Plan) will be 60,790 MW. So, making allowance for two more years, the peak demand at the end of the new Eighth Plan would be around 65,000 MW only. How much installed capacity (IC) do we need to serve a peak load of 65,000 MW? Let us look at the performance of some other countries (Table 2). In 1982, the CEGB, UK was able to fully meet the peak demand of 42,000 MW with an installed capacity of 56,700 MW. But in 1989-90, in India we could not fully meet a demand of 40,500 MW with an IC of 60,500 MW. Also, the demand in England slowly increased 1982 onwards but no extra generating units were added. It met the additional demand partly by improving the peak availability of the generating units and partly by imports. Its peak/capacity ratio increased from 0.75 to 0.9. But even with

our low peak/capacity ratio of 0.64 we could not meet the peak load and left a shortage of 16.7 per cent in 1989-90. So, the shortage of power and energy is not due to lack of adequate generating capacity, but due to poor performance of our power sector. Surprisingly, it is never boldly accepted and our planners try to bridge the demand-supply gap by installing more generating units.

Let us come back to how much IC is

needed to meet the peak demand of 65,000 MW in 1996-97. Even if we take the lower peak/capacity ratio of CEGB, i.e., 0.75, we need an IC of 86,600 MW at the end of 1996-97. Our IC at the end of March 1992 was 69,350 MW. So, the required addition during the Eighth Plan comes to around 17,500 MW, not the whopping 38,000 MW. Actually, if we can improve the performance of our power sector, there should be surplus funds with the ministry of power.

Some may raise objections to my assumption of 65,000 MW peak load. This estimate is based on NPP 1983 and should therefore be deemed as realistic. Take the latest official assumption. In its latest report the CEA accepts the 14th Power Survey Forecast, according to which, the PL in 1996-97 will be 73,650 MW (Table 1). Considering a peak/capacity ratio of 0.75 the IC should be 98,200 MW. Then we need to add only 28,850 MW. So, in this case also, the 10,000 MW of private power is not at all necessary.

From where then, does this figure of 38,000 MW—28,000 public and 10,000

TABLE 1: PEAK LOAD (MW)

Agency	1989-90	1994-95*	1996-97	2004-05	2006-07
National Power Plan (1983) (High scenario, 7 per cent GR)	46976	69216	-	-	-
National Power Plan (1983) (Low scenario 5 per cent GR)	42765	60790	-	-	-
12th Power Survey	49278	78438	-	-	-
13th Power Survey	-	-	86437	-	-
14th Power Survey	-	-	73656	-	-
Working Group on Power	-	83537	-	-	-

* 1994-95 was originally scheduled to be in the end of Eighth Plan, but due to political instability at centre it has shifted to 1996-97

TABLE 2: CEGB, UK

	1982	1983	1984	1985	1986
Demand (thousand MW)	42.6	42.7	43.6	46.2	45.1
Demand met (thousand MW)	42.6	42.1	42.2	44.1	45.1
Installed capacity (thousand MW)	56.7	55.2	54.75	51.0	51.1
Peak/capacity	0.75	0.77	0.8	0.9	0.88

Note: Figures rounded off.

Gap between demand and supply was made by importing power from Scotland and France. Though the data is about a decade old, it is still relevant as there was no major change in demand and supply position

FIGURE: ALL INDIA GROSS HOURLY GENERATION FOR JULY 1991

private—come into the picture? Actually it was the projection of the Working Group on Power for Eighth Plan, constituted by the Planning Commission, which forecast an abnormally high PL of 83,540 MW in 1994-95. The forecast was later rejected by the CEA. The peak/capacity ratio based on the Working Group report comes to 0.827, quite high by Indian standard. If we adopt this standard for our generating units, even with a 73,660 MW peak load considered by the CEA (which, I feel, is on the higher side) the total required IC in 1996-97 should be 89,060 MW. In that case, too, we need to add 19,700 MW only. That too would leave a surplus fund with the ministry, leave alone the need for inviting private parties.

In estimating the power requirement above, various other options available for

reducing peak load and energy have not been considered. Our load profile (see the Figure) and consumption trend (Table 3) shows ample scope for 'peak flattening'. In addition, various energy conservation measures can also bring down the peak load by a considerable quantity. Together, it is feasible to bring down the peak load by 10 per cent during the Eighth Plan. Capacity addition, in that case, can be reduced by 8,000 MW.

Our planners had always tried to bridge the gap between demand and supply of power and energy by putting up more generating units. The productivity of generating units (peak availability, kwh/kw installed, heat rate, etc) never received much importance. Now also, the debate is about the 'colour of the cat', i.e., who is the financier, and not about the number of 'cats' required.

UTTAR PRADESH

Mulayam Singh's New Tune

Amaresh Misra

In an attempt to go beyond a traditional backward class-Muslim-dalit appeal, Mulayam Singh Yadav supported Chandraswamy's so-called Som Yagya and is adopting a line on the mandir-masjid controversy calculated to appeal to conservative Hindu sentiment.

THE Harshad Mehta saga may have yet fallen short of upsetting the national equilibrium, but it has had its impact on the fortunes of the UP Congress. A further erosion in the party's dwindling support base seems unavoidable.

After the Chandraswamy episode, which ended in a call by the so-called sadhu to begin the temple construction from the 'garbagriha' of the disputed site, the Muslims are incensed twice over. At the same time, the Congress's attempt to surreptitiously win over Hindu votes through the Som Yagya failed miserably.

The vacuum created by the erosion of sup-

port for the Congress is, however, not being filled by the BJP alone. A different type of claimant in the form of Mulayam Singh Yadav is also on the scene. The former chief minister is not only winning new support among the backwards and Muslims, but also gaining the confidence of certain sections within the upper reaches of village society. In some pockets of western UP, where the BJP had been successful in penetrating the backward ranks, a drift back towards Mulayam's party is evident. Such instances have involved members of the backward but dominant Lodh community. Recruitment of a number of upper caste power-brokers,

mafia forces, etc, is also going on. These forces are also responding to the lack of sufficient space in either of the dominant parties. And in some cases the appeal of Hindutva is finding it difficult to transcend the real life contradictions of caste and other interests.

In accordance with this shift, Mulayam is also changing his political rhetoric. In an apparent bid to go beyond a traditional backward-Muslim-dalit appeal, he supported the Som Yagya. This was accompanied by an overt enlistment of 'sadhu' support, which saw god-men of particularly the Etawah belt issuing statements in Mulayam Singh's favour. Of late Mulayam Singh has also dropped all references to a masjid being built at Ayodhya. Instead the spot where the Babri masjid once stood is now referred to as a disputed site. Chandraswamy's VHP-type statements on the mandir issue have not been condemned and in other utterances too Mulayam Singh is trying to mix his general political appeal with an appeal to conservative Hindu sentiments. A soft line towards the Congress is also evident, especially in the efforts to sideline the issue of the prime minister's resignation over the Harshad Mehta disclosures.

Armed with this strategy the SP-BSP combine is forging ahead of V P Singh's Janata Dal. The Janata Dal, despite some continuing appeal among liberals and the more conscious sections of the backward caste and Muslim intelligentsia, has yet to break any significant new ground. The party's Mandal Rath is not drawing the expected crowds. Even Laloo Yadav's charisma is creating no more than a minor flutter and V P Singh has not been able to draw to himself the aggressive, vocal type of forces (from within the same target social base) as Mulayam Singh has been.

But a Mulayam Singh-BJP polarisation is not the only political possibility in the state. The allegations of corruption involving the prime minister have once again lifted the morale of forces aspiring for a democratic mobilisation. Recently the IPF gave a renewed call for all non-Mulayam Singh, anti-Congress, anti-BJP forces to get together on a movemental plank. The initial response from parties like the Janata Dal is encouraging, though something concrete has yet to materialise. The Left parties still appear wary of criticising Mulayam Singh. They deplored the Som Yagya without, however, mentioning Mulayam Singh's role. But the IPF has launched an ideological campaign on the issue. Besides questioning the relevance of such moves for any genuine secular plank, it has also criticised the BSP for being a dalit party and yet capitulating to brahminical rhetoric on many issues. The IPF is also focusing on the inherent fragility of any move towards a Congress style revival with Mulayam as its centre.

Besides the political activities at the top, a number of grass roots issues too are now coming to the fore. A case of police firing on peasants at Bithauli on the Lucknow-Sitapur road has once again highlighted

side. Last year's similar incident at Ramkola (EPW, October 3, 1992) had triggered off political unrest. This time the peasants were organising a peaceful 'rasta roko' to protest against the high-handedness of the Lucknow Development Authority (LDA). The LDA is buying land from the peasants at 24-30 paise per square feet and selling it at Rs 95. This is being done with the active connivance of the state government and has been accompanied by a severe clamp-down on any protest. The Janata Dal and the IPF have picked up the issue and Mahendra Singh Tikait is contemplating his own action. The IPF, through its student wing, AISA, is also currently preparing for the proposed autumn march of students on the issue of 'right to work' in Lucknow, which will precede the November 25 parliament gherao on the same issue.

The IPF is also trying to reorganise the peasant movement of the Lakhimpur Kheri-Pilibhit belt which has large tracts of forest land controlled by a nexus of forest mafia, officials, government contractors and landlords. The area came into limelight recently following a spate of terrorist-related killings at Maigalganj which were projected in the media as another instance of a burgeoning

ing ~~movement~~ were the result of simmering local contradictions in which the terrorists were allegedly acting at the behest of a small Sikh farmer who had been previously attacked, looted and beaten up by some anti-socials. The latter were ostensibly linked with the aforementioned nexus which is actively involved in illegally appropriating and selling vast tracts of the forest reserve. As a result, a parallel lumpen economy has come up with the covert backing of the police and the administration. IPF activists recently caught some police personnel sneaking out illegally felled trees. In other instances the police is known to take regular sums of money from some big Sikh farmers supporting terrorist gangs in the area.

In the case referred to above, the pleas of the affected farmer were ignored by the police. The Sikh farmer then went to the local gurudwara to demand redress. Though some of his kin were earlier involved in the terrorist movement, he was not known to have any links with them. Subsequently two rifle-wielding terrorists descended on the village of the assailants and many innocent persons were killed in the indiscriminate firing.

equates to protect Ranganathar. As Rama Gopalan, the leader of the Hindu Munnani, descended on Thrichirapalli in the first week of April. His was indeed a difficult job. Unfortunately, it was not even a month since Govindachariya, the general secretary of the BJP, displayed his magnanimity in public and claimed the worship of sudra/dalit deities such as Ayyanar and Mariamman to be part of the catch-all Hindutva tradition; and what the infidels wanted to do in Thiruvaramangam was what they always did to Ayyanar and Mariamman. In the course of his public address, Rama Gopalan did not mess around with troublesome caste and hierarchies of gods and goddesses, but merely simplified it all for his camp followers: the godless communists would loot the temple on May 1.

Enthused by Rama Gopalan's presence, the Hindu Munnani/VHP cadres, though not many in number, launched their counter-campaign. "Protect the temple", their posters incited. Then, posters were only part of their agenda; they were more interested in defacing the wall writings of their tormentors. In the dead of the night, they roamed the streets of Thrichirapalli with white-wash and brush, only to be stopped in places by the vigilant DMK and DK cadres. Every devotee of Ranganathar should break a coconut for him on May 1, the Hindu Munnani announced. It was an affordable protest. Coconut prices have crashed in the district for quite some time.

A tense Thiruvaramangam as well as Thrichirapalli were brought under 144 CrPC on April 30 itself. Policemen in large numbers were mobilised to protect Ranganathar in his state of brahminical purity. On May 1, the devotees on their way to the temple were 'security-checked' at Gayatri Mandapam, Vinaya Nazhi Kottam and the temple office with metal detectors. None asked whether metal detectors were agamic; such doubts are banal in the yuga of Green Card Brahminism. They worshipped a distant, but unpolluted, Ranganathar from Gayatri Mandapam as they were not allowed to go beyond.

As announced, the assembly of the infidels, carrying banners and flags, assembled in Melapuddur in Thrichirapalli junction. Before they could proceed to Ranganathar's sacred abode and carry out the insidious plot of sacrilege, they all were arrested by the waiting policemen. Another procession of about 200, including women and children, began at Thrichirapalli bus stand. They too were stopped on their way and taken into custody. Similar processions meeting similar fate continued throughout the day. In total, 700 of them, including 100 women, were arrested and charged with non-bailable offences. The following morning, the unofficial organ of the BJP, the *Indian Express*, heaved a deep sigh of relief and announced to the world, 'Temple Stir Fizzles Out'.

It was not the first time that the temple

The Defilers

M S S Pandian

What happened when the activists of the People's Art and Literary Association sought a share in 'bhoologa vaikundam', the Sri Ranganathaswami temple in Thiruvaramangam, for the dalits and the sudras.

LYING five kms north of Thrichirapalli, located on the island of Thiruvaramangam, Sri Ranganathaswami temple means different things to different people. For the Hindu orthodoxy, it is the most sacred of the 108 'divyadesams' of the Vaishnavites and no less than *bhoologa vaikundam*, 'vaikundam' itself on earth. For those who are not spiritually inclined, the temple with its 21 towers, multiple 'praharams' and centuries of history is simply a sign of monumental non-brahmin labour, usurped and turned against them. After all, it was their ceaseless labour which, as recently as the 1980s, converted 116 lakhs of bricks and 3,000 tonnes of cement into the tallest temple tower in south Asia, the Raja Gopuram of the Thiruvaramangam temple. In between these absolutes, there are shades and shades of other meanings which an ambivalent Ranganathar offers with ease.

All this contending flow of meanings did not trouble Ranganathar much. Life went on as usual, surrounded by tonsured and untunsured devotees, cheerless brahmin priests and repetitive pujas carried out with a Pavlovian ring. The monotony ended abruptly in the second week of March when the Makkal Kalai Illakiya Kazhagam, People's Art and Literary Association (PALA), a CPI (M-L) front organisation,

sought a share in the vaikundam for the dalits and the sudras. Outstepping their karmic privileges, they claimed it to be their right to enter that last territory of brahmin monopoly in the temple, the garbhagraham, and perform pujas in the language of the Asuras, the Tamil.

Wall writings surfaced in Thrichirapalli, Thiruvaramangam and elsewhere in the state. "We shall lay siege on Thiruvaramangam", one of them proclaimed unabashedly. Handbills in thousands were distributed. They read, "There are several places which the poor cannot enter. There are [several] places which the uneducated cannot enter. But, there is one place which one cannot enter for reasons of birth; and that exists only in our country, and only in Hinduism. That is the garbhagraham of the temple." Scores of public meetings were organised, attended by, among others, the enthusiastic cadres of the Dravidar Kazhagam, the Dravida Munnetra Kazhagam, and a number of dalit organisations including the Dalit Panthers. The ever-elusive sudra-dalit unity looked real for once. A date too was announced for the close encounter with Ranganathar. It was May 1.

As the campaign of the infidels got off the ground, the series of rectangular enclosures around the temple, formed by mas-

least once earlier: that was in the early 1970s. The DMK, which was in power then, dreamt no longer of assaulting Thiruvaramangal Ranganathar and Chidambaram Natarajar with cannons; that was all a dead dream by then. But the old agenda was not fully lost. Braving the intense Vaishnavite offensive, the DMK government under M Karunanidhi got the Hindu Religious and Charitable Endowments Act amended in 1972 so that any qualified person, irrespective of caste, could become a priest in the 10,040 government managed temples. The intention of the move was loud and clear. As the advocate-general of Tamil Nadu claimed, the amendment was meant "to abolish brahmin monopoly in religious affairs..."

The swiftness with which the amendment was challenged by the brahmins was indeed a testimony to their celebrated efficiency. Sixty-six brahmins filed 12 writ petitions in the Supreme Court. Nani Palkivala, in contrast to his spirited defence of *laissez-faire* during the anti-Mandal agitation, argued then for the protection of brahmin privilege. The highest court of the country ruled that Articles 25 and 26 of the Constitution, which deal with the freedom to practise one's religion, are "not limited to matters of doctrine...[but] extends also... for rituals and observances, ceremonies and modes of worship which are an integral part of religion". Using all its judicial wisdom, it specified further: "the ritual in a temple could not be performed except by a person belonging to a specified denomination; otherwise the purpose of worship would be defeated." How could it allow the purpose of worship to be defeated? The plea of the brahmins was upheld and garbhagraham continued to remain as their exclusive preserve.

What had fizzled out earlier need not always fizzle out. Ranganathar was blissfully unaware that May 24 would turn out to be an eventful day in his career. The cadres of the PALA, determined as they were, purchased on that special day special tickets and mingled with the queue. As the queue slowly moved ahead, Muthu, the Thiruchi district secretary of the association, suddenly crossed the silver steps in front of the garbhagraham and entered it. Following a slogan-chanting Muthu, few of his other comrades too did the same. The red banner was unfurled and Ranganathar found himself flanked by the portraits of unwelcome intruders—E V Ramasami and Ambedkar.

In the scuffle that ensued, the north Indian devotees, numbering around 300, abetted by the priests in Hindi, intervened on behalf of a helpless Ranganathar and thrashed the southern defilers of Vishnu. The PALA cadres knew, the punishment for such irreligious acts was not always executed in the after-life; it could be here and now. Few on both sides were injured,

including five women and two who were arrested. Perhaps for the first time in their political career, the arrested PALA activists found to their utter surprise the policemen to be sympathetic to their cause. With their exit, the temple doors were shut. 'Somprokshanam' was performed in Moolavar Sannadhi (garbhagraham), Thayaar Sannadhi and for the vimanas of the temple. Somprokshanam not merely returned Ranganathar to his inhuman state of purity, but also affirmed the rightful place of the sudras and the dalits in the casteless universe of the anti-Mandalists and Hindutva.

If gods themselves cannot be safe, how can Hindutva be? An angered BJP condemned the 'atrocities' and called for severe

1. Though most of the non-brahmin press, including the DMK's *Murasoli*, was almost euphoric in its support to the PALA, what mattered to the government of Jayalalitha, the divine incarnate for her ever proliferating toe-touchers, was the worries of the BJP. The government quickly condemned the event and instructed the police to take severe action against the tormentors of Ranganathar. The four temple staff who sustained injuries in the scuffle were paid Rs 5,000 each and an iron enclosure was erected around the garbhagraham. It was all expected; none was too surprised. After all, Jayalalitha was merely upholding the Constitution and could anyone complain, be a dalit, be a sudra?

US State Terrorism: Another Criminal Act

Frederic F Clairmont

One more crime of US state terrorism against yet another third world country is a grim reminder that indignation is not enough. It must be matched by organised campaigns to ensure that the words of the UN Charter become a binding reality.

I

EVEN before the last of the 22 cruise tomahawk missiles—each costing over a million dollars—smashed into Baghdad, indiscriminately slaughtering men, women and children, a jubilantly apoplectic Clinton sputtered: "I feel good, and I'm sure the American people feel as I do."

In that barefaced utterance, Clinton revealed not only the utter depravity of a ramshackle administration, but the extent to which he had shrunk to dwarfish proportions. The man that opposed the Vietnam carnage by seeking refuge at Oxford University, to his greatest honour, has sunk into the sewer of US militarism.

More glaringly, the massacre highlighted the momentarily unstoppable thrust of US imperialism even in its debilitated state. To naive spirits who believed that Clinton was a politico different, or differentiable, from his Reaganbush predecessors, the Baghdad bombing smashed that delusion; the frantic striving at any cost to destabilise Iraq, the daily threats against North Korea, the perennial embargoes against Cuba and Vietnam unveils once again the rapacity of the US global system.

These acts of aggression stem from the crisis of the internal workings of US capitalism which Clinton promised to modify, but cannot deliver on his promises. The major motive behind them is to secure the

political support of the right and boost his sagging political ratings.

II

Clinton's economic problems on the home front have become unmanageable; the spectre of unemployment just would not go away; a mild recovery of sorts has been aborted; his budget, social and energy reform policies have been shaved and compromised beyond recognition; a mere skeleton of a once grandiose electoral programme trumpeted with such fanfare.

Inexorably, the US ruling oligarchy simply tells all the upstarts that have thrown their hats into the political ring that rosy election promises are one thing, but if anyone gets out of line and begins to tamper with the workings of the system, even at the fringes, one is in trouble. For the ruling class there is only one constant: its class and propertied interests are not to be trifled with.

This is an unalterable law of class dynamics that the palaverings of the Clinton clique cannot change. Hence the frantic back-peddalling of a febrile administration hell bent on displaying its anaemic muscle to the forces of Corporate Capital. The crime committed against Iraq was thus an attempt by a desperate politico striving to recoup his wilted fortunes on the domestic front.

For the time being he basks in his ephemeral glory. "He acted quickly, properly and in the interests of the United States", writes Rosenthal in *The New York Times*, still one of the dominant ideologists of the political right, and apologist of international Zionism. Likewise, Jeanne Kirkpatrick, propagandist extraordinary of the Reagan administration, adds her homage that Clinton's murderous assault "was a demonstration of political will and an important one at that". The corporate media, obviously, took the cue.

Such fulsome hosannas by the weighty political right on the domestic front were not, however, matched on the international front, with one wretched exception: that of Douglas Hurd, foreign secretary in a Tory government riddled with graft, corruption and sheer incompetence. It was the obsequious and solitary voice of the traditional and unwavering English bootlicker.

He told parliament that "it was a justified and proportionate exercise of the right of self-defence, and a necessary warning to Iraq that state terrorism cannot and will not be tolerated". On what basis was the accusation of state terrorism advanced? And on what evidence? Collected by whom? And serving what objectives? The quest for justice?

III

According to the American charge-sheet, punitive measures were galvanised on the grounds that in April, the Kuwaiti government (*sic*) had uncovered what "they suspected was a car-bomb plot" to bump off former president George Bush. (See official statement in *The New York Times*, June 28.) Suspicion is never proof. What was always a cubious suspicion was immediately switched into an incontrovertible fact.

This threadbare fabrication had its comic undertones. The CIA and the FBI, both US Federal agencies, acting in complicity with the Kuwaiti Intelligence Service 'claimed' to have uncovered the plot. In this sordid sham the Kuwaiti stooges, as trivialised sidekicks, were simply shoved aside. From the onset this was a CIA/FBI showbiz stunt.

Kuwait is a medieval police state in which even the rudiments of an impartial judicial system are obliterated. The Emir is the supreme judge and jury, and in his person he embodies the highest court of appeal. Did the Bush gang raise any human rights objections when over 200,000 Palestinians, most Kuwaiti-born, were expelled and their property confiscated, with thousands summarily executed?

Indeed they applauded this crime as a means of cleansing the Emirate of a com-

mon enemy that had always been judged inimical to US interests. At present there are more than 25,000 'political' prisoners many of them adolescents; executions and disappearances are daily phenomena. But this is precisely one of the greatest allies of the US as Bush reminded the Emir when he was awarded its highest national award. The mutual backscratching is desirable; Bush and Baker are major shareholders in the Kuwait Investment Organisation (KIO). Baker's law firm is the KIO's major international legal representative. These were not substantive matters that were raised at the Human Rights jamboree in Vienna.

IV

If there was an attempt to liquidate Bush why is the evidence of 'guilt' suppressed to foreign jurists? Why has the CIA/FBI opposed presenting 'the evidence' on the grounds that it would be detrimental to the national interests of the US?

Such basic procedural questions are irrelevant to the power games of US state terrorism. The crime against Iraq was committed in the name of 'self-defence'. Article 51 of the United Nations Charter provided the fig-leaf. It is utterly irrelevant as far as the US conspiracy was concerned that the Security Council was not consulted.

There is nothing in Article 51, or indeed, in the Charter, that suggests that 'the self-defence argument' can be invoked in response to an assassination attempt against an individual or head of state, particularly in the case where there was no assassination, and where the so-called assassination attempt was foiled.

This was not the first time that imperialism sought to deploy Article 51 as a legal rationalisation for colonial genocide. In 1956, during the Suez invasion, France, the UK and Israel sought to justify their pounce on Nasser by invoking Article 51. They were rebuffed by the General Assembly. True, it was a different UN system then.

Likewise, US imperialism failed in its attempt to use Article 51 to bless its invasion of Panama and the abduction of general Manuel Noriega. Tom Pickering, then US ambassador to the UN gloated "that self-defence under Article 51 permits the US to use armed force anywhere to defend our national interests".

Article 51 in conjunction with other legal provisions of the Charter were intended to cover armed attack against nation states and not individuals. When pressed, even the US ambassador in London was compelled to admit that the missile attacks did not fall "within the conventional meaning of Article 51".

This raises the question: Why did not Clinton and his cronies wait for the outcome of the court findings, even if the trial was phoney from beginning to end, and then bring their case to the UN? No, that would not have worked because it would have been rejected by the Security Council, and hence would not have served his political stratagem.

The Guardian in its critique of the Tory government spoke justly for a far wider community: "Mr Major should never have supported this reckless adventure outside international law in the first place." To its credit, China explicitly condemned the crime, as did Cuba.

No Mr Clinton, there is a universal sense of revulsion in your deployment of state terrorism; the American people, unlike yourself, cannot be 'made to feel good' for a crime unredeemed by any trace of legality in international law; aggression in reprisal for an alleged act committed several months ago in a foreign country (a fabrication, to be sure) cannot be justified.

VI

Clinton's crime must be seen in the wider perspective of US global policy. When the International Court of Justice condemned US state terrorism for blowing up a Nicaraguan port, a minor Reagan hack angrily retorted that the court should mind its own damned business and added for good measure that it should study the Monroe Doctrine—Nicaragua was not merely the US backyard, but US real estate.

The world is not amnesiac: it was US terrorists with the complicity of the Thatcher covey that bombed Tripoli in an aborted attempt to kill colonel Gaddafi. It was US terrorists under the command of general Schwarzkopf—the presumed hero of Desert Storm—that liquidated the legitimate government of Grenada, a member of the UN.

One more crime of US state terrorism against yet another third world country is a grim reminder that anger and indignation is not enough. It must be matched by organised campaigns to ensure that the words of the Charter become a binding reality.

The muscle deployed by you, Mr Clinton, will not enhance your credibility. The Neanderthal fascists will applaud you, but the test of any honest politician is to face up to the challenge of his time. That, Clinton, you have abysmally failed to do, both domestically and internationally.

Common Property, Collective Action and Ecology

Subir Sinha
Ronald Herring

Much modern discourse on environmental degradation takes place under the shadow of the 'tragedy of the commons'. The logic of that metaphor has been used by states for seizing control of local commons on grounds of conservation. Report on a conference which sought to highlight research on common property systems that do function, the limits to local solutions to ecological dilemmas and the problems with state-directed environmental protection

AN international conference on 'Common Property, Collective Action and Ecology' was held in August of last year at the Centre for Ecological Sciences of the Indian Institute of Science in Bangalore with additional support from the Social Science Research Council (New York), the Smithsonian Institution (Washington) and the Ford Foundation (New Delhi). Papers presented at the conference will be described and then cumulatively discussed in the concluding section.

Contested themes at the conference included (1) whether or not the tragedy of the commons is a real tendency of universal human maximising behaviour or a product of either Euro-centric academic praxis or states and markets reducing the political space and institutional capacity of local people, (2) the reality and accuracy of an emergent 'standard environmental narrative' (dubbed SEN) or romanticised account of 'eco system people' which posits pre-colonial harmony between people and a benign 'nature' in the sub-continent, (3) whether or not such a narrative threatens a reversed orientalism in conceptualising 'eastern' and 'western' modes of practice and belief, (4) the tensions among 'deep ecology', defensive reactions and 'social ecology' as frames for understanding environmental politics and policy in India, and (5) internationally, whether an elitist construction of a 'global commons' and common ecological crisis threatens the economic interests of the south to remedy the sins of the north.

Much modern discourse on environmental degradation takes place under the shadow of the 'tragedy of the commons', a simple and influential model that explained why maximisation of individual interests in using any commons could result in catastrophe. The logic of that metaphor has been used by states as legitimation for seizing control of local commons on grounds of conservation. Leviathan may not be popular, but it putatively acts in the general interest when individuals cannot generate the collective action necessary to provide public goods. This construction has been used as a reason for

opposing common property institutions generally 'that which is everyone's concern is in fact no one's concern'. The conference sought to highlight research on common property systems that do function, the limits to local solutions to ecological dilemmas, and the problems with state directed environmental protection.

LOCAL INSTITUTIONAL SOLUTIONS TO THE 'TRAGEDY OF THE COMMONS'

The first session opened with Madhav Gadgil's paper 'Changing Patterns of CPR (Common Property Resources) Usage in Uttara Kannada District in Southern India', co-authored with S Rao. While the particulars of the paper deal with Uttara Kannada, broader theoretical points can be discerned. According to Gadgil and Rao, how much of which resource is demanded and extracted in any historical period is a function of the interests of 'elites' who use 'regimes' as instruments for their particular ends. This argument is based on a reading of India's transition from 'pre-British' to British to independent rule. This historical evolution had a parallel trajectory of technological progress which required large quantities and more varieties of natural resources. In the process, local communities lost control over resources, resulting in their net degradation. Gadgil and Rao focus on three resources: forests, irrigation tanks and estuarine lands.

In pre British India, when elites appropriated primarily agricultural surplus, control over irrigation tanks and forests remained with local communities since agricultural production was crucial to elites. Use of human and animal power for agriculture's energy needs, a 'strong caste based social control', as well as religious beliefs and customary practices regulated resource use. The autonomy of local institutions was also a result of the limited coercive capacity of pre-British regimes. With considerably more coercive power, the intervention of the colonial state in rural economy and society was more radical. Uttara Kannada came under

Sultan's defeat in 1799. Since state power was then in the employ of a more far-reaching, surplus-appropriating enterprise, open access forests, in which local populations had tax-free usufruct rights, were taken over as reserved forests. Since irrigation tanks were crucial for generating agricultural surplus, they were left to local control. Although landlords exploited estuarine land more than previously, pre-colonial organisations survived. Though the British conceded some space to van (forest) panchayats, the general pattern of peasant behaviour seems to be one of relative quiescence.

After 1947, a new elite—the 'politician-bureaucracy-business combine'—made rapid industrialisation a higher priority than collection of land revenue. As a result, local communities lost control of local resources. The van panchayats were derecognised in 1976. Simultaneously, modernisation eroded, through a variety of mechanisms, the rigid social controls which had underpinned local resource management systems. Indigenous irrigation tanks languished with the introduction of alternatives such as pump-sets. However, the Karnataka forest department has recently introduced pro-peasant policies such as eliciting popular participation and has supported autonomous systems of resource management, leading the authors to conclude that there has been a shift in the balance of power in favour of the peasantry.

In contrast to the narrative of continuous decline, Anil Gupta's 'Household Survival through Commons Performance in an Uncertain World' suggests theoretical reasons for the survival of the commons. Firstly, the commons situations should be studied from the perspective of survival strategies of households. Some of these strategies may be dependent on community and common property, others are not. Hence concentrating on only one property regime will mean losing sight of how strategies of survival, rooted in different 'portfolio choices of a household', might in turn affect the commons.

Since households are involved in multiple resource markets and multiple institutions, Gupta argues for a multiple level of analysis where eco-sociological relations have to be identified at each level with corresponding forms of 'rationality', which he introduces with a theory of 'playful portfolios'. One portfolio represents the familiar 'survival ethic', consisting of choices meant to minimise the risk of failure. He confronts the orthodox argument that environmental risk and uncertainty will impel all users to over-exploit the commons, observing instead that people's behaviour will depend upon the place the commons has in each household's survival portfolio, their attitudes and expectations. Co-operative behaviour is a function of the distribution of risk and diversified resource use by households. Here, culturally-embedded notions of redundancy and randomisation come into play. The

'free-rider' problem of orthodox theory is offset by patterns of ongoing reciprocity and shared values

Interactions concerning the commons, as in other arenas of rural life, Gupta argues, are more like assurance games: the critical question is generating belief that restraint in using the commons will be reciprocated. This assurance is reinforced in local communities through rituals and myth as well as popular conceptions of what is 'moral' and 'just'. Moreover, punishments and rewards are easier to mete out in small face-to-face communities, as long recognised in the conventional theory of collective action.

Indeed, much of the CPR discourse is rooted in the historical experience and behavioural logic of western societies, in his paper entitled 'The Legal Economies of Natural Resource Management and Sustainable Development', Chhatrapati Singh argues that this discourse ill serves India. Contrary to the 'western' notion that equates private property with privacy (and is thus incompatible with common access), Singh cites examples from India of individually owned wells, tanks, temples, etc., which are made for the common good to earn individual merit ('punya'). Uncomfortable with the theoretical baggage carried by the term 'common property', Singh advocates seeking solutions within the 'Indian ethos'.

Singh argues that the two disciplines which have most contributed to the development of the CPR discourse, namely, economics and political science, are rooted in the western experience. While they are preoccupied with individual interests and the realm of the optimal, Singh suggests more emphasis on identification of existing operational possibilities, which would take us in to the realm of the legal sciences dealing with the socially actual. Examining the legal status of resources is crucial to a solution that leads to sustainable development. The rules of acquisition, utilisation and regeneration, constitute the actual arena of possibilities. Indeed, these rules have changed, but invariably to give control over resources to a centralised state. According to Singh, that trend needs to be reversed. Policies that have created a fractured consumption pattern should likewise be reversed, flattening inequalities in consumption across the population.

Whereas much commons discourse operates at the level of very small communities or centralised state solutions and causes, there is a crucial intermediate level. Minoti Chakravorty Kaul's paper, 'Self Organising Communities: The Institutional Roots of Colonial Rural Punjab' investigates how people organised the management of regional commons: how interdependent groups of pastoralists, nomads and agriculturalists used vast stretches of the Punjab without degrading it.

Interdependence based on reciprocity and complementarity in demand characterised the contacts of the inhabitants of each geographical zone of the Punjab eco-system.

Kaul notes that the physical boundary of the village cannot be seen as the sole determinant of the village community, similar preferences, values and cultural norms which enabled consensus on matters of regulating a particular way of life are as important on a broader scale. Since such a consensus existed in the area, there was a shared perception of an ecological niche: village communities functioned as organising units with institutions for sanctioning and monitoring. Common property resources were the social peg of these communities.

External forces in the 19th century weakened communal control over common property. Human and cattle populations increased, and the increase in the value of land as property led first to free riding and then to privatisation. Expanded market forces thus eroded the customary networks of dependence, simultaneously, penetration of a new state apparatus replaced communal authority, leading to differentiation of rights of exclusion both between and within communities.

The impact of state and market interventions on community level co-operation was likewise central to the paper presented by Ravi Chopra, 'Guhls—A Traditional Irrigation System in Garhwal' (co-authored with Rajesh Kumar and Debashish Sen). The paper presents preliminary results of studies of two villages in Tehri Garhwal district, and two in Chamoli.

In the villages in the Chandrabhaga watershed in Tehri-Garhwal, there is a fair amount of caste homogeneity, caste hierarchies are in any event loosely maintained. Each family has small and scattered plots, and in villages with more than one channel, families draw their irrigation from each guhl. There is a gender division of labour similar across each caste. There is also a not too-distant memory of these guhls constructed by collective village labour for the common good. Common labour is also used at every stage of agricultural production on an everyday basis. Risk is also shared by changing the sequence of receiving water from the guhl. Collective vigilance discourages misuse by individuals, and common effort repairs the guhl. Each family produces grain for subsistence, just as each produces onions for commercial exchange. There was a high degree of 'community spirit'.

State interventions began in 1955, with an offer to local inhabitants to get free lime to line the networks. The state subsequently took them over in 1987, since then, the guhls have acquired a concrete lining and steel sluices. Chopra et al. argue that this was done to augment the production of onions. One result of this market-led state intervention was the weakening of community level institutions.

The villages in the Shorghad watershed in Chamoli are recent settlements. One village has absolute caste homogeneity, in the other, sharp caste distinctions between thakurs and harijans exist, but they do not come in the way of collective management of the guhls.

Production here is strictly for subsistence, since markets are not proximate. The water goes first to those who have tilled their fields first. As in Chandrabhaga, there is both collective and individual responsibility for maintaining the guhls.

From these comparative cases, the authors draw two conclusions: state intervention was market-led and was deleterious to local resource-management institutions. The authors locate the different degrees of success in retaining control over the guhls in the two areas in variable strength of local traditions of CPR management.

Amid the gloom of decaying institutions and tragedies came Amulya Reddy's paper, 'The Blessing of the Commons, or How Pura Village Dealt with the Tragedy of the Commons'. Describing the establishment of a biogas plant system in Pura village, a project in which Reddy is himself intimately involved, he argued that the tragedy can be avoided if the costs to individual agents of not preserving the commons far outweigh the benefits of maintaining it. In this village, there is a confluence of individual self-interest and collective interest in such a way that the latter is furthered automatically in pursuing the former. One prerequisite was that the supply, in this case of electricity, from the local resource must be more efficient and reliable than those provided by private or state agencies. On the issue of social obstacles to co-operation, Reddy reported that villagers employed a useful metaphor, just as we leave our chappals outside when we enter the temple, we leave our differences behind when we enter the development committee. He proposed a totally decentralised solution to commons dilemmas, with local responsibility and authority. The theoretical thrust of the paper is to reinforce the earlier line of logic which sees common property management as a source of political cohesion which extends beyond the resource in question.

Rita Brara's agenda in her 'Crazing Lands: Negotiating Custom and Law' is to investigate the 'commonness' of grazing resources, and the rules that govern inclusion and exclusion in Lachhmangarh tehsil of Rajasthan. The paper identifies two distinct classificatory modes: property as lived experience, and property as legally constituted, each is investigated in the context of changing techno-environmental limits to stock rearing and legal as well as socio-political changes influencing settled and transhumance lives. Brara finds that the ideology of rights in common was a response to the imperative of ecologically sound animal and crop husbandry.

Economic limitations of pasturage and water scarcities gave rise to transhumance, which was based on a web of social relations and local conventions with affines having reciprocal grazing rights in each other's villages. However, with more area coming under the plough, transhumance on the village commons became costlier, and villages not connected by kinship ties started

demanding grazing fees. Rich johada lands (a run-off pond and its catchment area), perceived as sacred tracts of khejn trees, were used for grazing, but not cultivated. Owing to scarcities in the 1920s, when the local jagirdars and yaredars started claiming more of the commons and levied taxes on grazing lands, peasants protested successfully. Under such hostile circumstances, only the adaptability of conventions made transhumance viable.

Since 1947, village level committees of mukhias have regulated use of the commons and sanctioned misuse. (A mukhia is one 'whose word is heeded', typically the head of a family with influence in village affairs, criteria having to do with shared perceptions of local power.) The rational bureaucratic apparatus of the post 1947 state established parallel gram panchayats as a channel for development schemes and electoral promises, but these bodies encompassed several villages. On questions regarding the commons, real authority lay with the 'parde ke peechhe' (behind the curtain) panchayat, the informal village level committee of mukhias.

These panchayats auctioned produce from the commons and used the proceeds for the betterment of that village alone. Informal authority has also not consistently protected the interests of women and lower castes, as the parde ke peechhe panchayats are jat dominated. Brara concludes that a one village, one panchayat model should be considered by policy makers. There would then be gains in efficacy of local institutions, but not necessarily in social justice.

LOCAL RESISTANCE AND CONTESTATION

The second session, focused on 'Local Resistance and Contestation in the context of state and market encroachment on local resources', started with Pramode Parajuli's paper, 'Cultural Politics of Ecology: Resistance for Space and Spaces of Resistance in Jharkhand, India'. His agenda is two fold: one, to see how ecological crises, ethnicity and the developmentalist state are linked with power and knowledge; and two, the identification of the ways in which the Jharkhand movement reflects a conflict between different 'spatial worldviews'. These worldviews are analysed as hegemonic constructions within discursive formations.

Parajuli sees ecology as one constituent of the Jharkhandi's notion of space along with the collective memory of recent struggles in the context of a common history of exploitation by *dikus* (outsiders). He agrees with Marxist explanations of exploitation of the region, but dissents from the conclusion that it has destroyed ties of ethnicity and community. To the contrary, the Jharkhand movement is sharpening and politicising such identities by the revival of both the Sarna Dharma and of traditional systems of managing natural resources. He argues that in this context, class is an overdetermined category, and thus an inadequate analytical

tool. Enumerating the other dimensions of conflict, Parajuli sees the significant participation by women in grassroots movements as indicative of 'women's counter space' in Indian society, ecology, agriculture and political culture. Parajuli also sees the struggle between local knowledge and the state perpetrated system of modern science as a dynamically conflictual relation between the Jharkhandis and the state, where the ecological interests and perceptions of each are at odds with the other's. The distance between the Jharkhandis' modes of struggle and discourse of statist politics is such that spaces of resistance open up which sustain the movement despite periodic setbacks.

David Hardiman's paper 'The Forest Economy of the Dangs in the Early 19th Century' examines the impact of British rule on these forest tracts in western India: the growing penetration of the colonial forest department, the establishment of administrative structures and popular resistance to these forces. Additionally, he wants to study how tribal peoples relate to ecology, to each other and to market forces.

Hardiman mounts a powerful critique of the elevation of an 'Indian ethos' to the status of an explanatory tool in current accounts of ecology, its management and struggles around it, typified by the works of Vandana Shiva (1990) and Seabrook and Pereira (1990). The picture usually painted of a stable state of consciousness and social organisation, unset only with the advent of outsiders, is ahistorical. Seeing the indigenous rooted in ancient Indian wisdom of conservation, in contrast to a western idea of deforestation, is an inverted essentialising, orientalism, which cannot explain significant deforestation in pre-colonial India, nor the emergence of the modern environmentalist movement in the west. It is also a failure to call the pre-colonial forest dwellers 'conservationists' as certain authors have done, since that concept was the product of a specific historical conjuncture, namely the ecological havoc wreaked by the industrial revolution. Conservation implies scarcity, giving rise to the need to conserve; that notion was absent in the Dangs. Representing human behaviour as a mechanical adjustment to the environment is symptomatic of 'ecological functionalism' which addresses neither the logic of cultures nor relationships of power. The wider socio-political context in which forest-dwellers are operating is also left unexplained in the romanticised environmental narrative.

As an alternative, Hardiman attempts a history of local practice to find out how and why forest dwellers related to the forests in the way they did. He finds complex power relationships in the Dangs in the early 19th century. There was a hierarchy among Bhils and between Bhils and the Gavit peasantry; there was gender based exploitation; and forest dwellers as a whole were exploited by sahumars (moneylenders). Hence, concludes Hardiman, it would be wrong to characterise

Dangi society as either egalitarian or naturally affluent, as part of the literature has done. He states also that no 'conservationist ethic' prevailed in the Dangs, the Bhils in particular were rapacious users of the forests. Indeed, the forests were seen as eternal, with no consciousness that human beings could destroy them. Nevertheless, the Dangs were selective in their use of nature, guided by a conscious affinity with natural processes.

THE CULTURALIST MATERIALIST PROBLEMATIC

The session on 'The Culturalist Materialist Problematic in Explanation' opened with Bina Agarwal's paper, 'The Gender and Environmental Debate: Lessons from India'. Agarwal criticises the eco-feminism of the west on the grounds that it draws a biodeological link between gender and environmental values. She offers an alternative explanatory framework, labelled 'feminist environmentalism' which provides a material basis for this link among particular females in particular situations.

Degradation in the quality and quantity of natural resources and their privatisation, Agarwal argues, are the two primary factors underlying the class-gender effects of environmental change. Erosion of community resource management systems, population growth and technological changes are other intermediary factors which interact with each other. Women, on whom the household responsibility for securing subsistence lies, have limited private property rights and hence, along with other subordinate groups, depend disproportionately upon the village commons. Environmental degradation means that women have to spend more time securing fuel, fodder, water and subsistence. Degradation reduces the ability of the village commons to provide crucial supplemental income to women and in areas where women are primary cultivators, it affects crop cultivation time, causing reduced net production. Women's health and nutrition are also endangered, as are crucial social support networks when people are relocated, as from dam sites for example. Simultaneously, the material basis of women's indigenous knowledge is eroded. In response, women have taken the responsibility of guarding and replanting forests in various contexts. Since women are most affected by environmental degradation, they are most active in grassroots movements, sometimes in co-operation with menfolk, but also in defiance of them.

Paul Greenough's paper, 'Naturae Ferae: Managing Wildness in Colonial and Post-Colonial South Asia' detects a 'vegetal bias' in the standard environmental narrative (SEN) on south Asia, in which the natural world of the pre-colonial past is consistently represented without animals, and thus without some of the more dangerous elements which exercised villagers and influenced their construction of the forest. If the aim of the

standard environmental narrative is to recover all culturally marked elements in this natural world. Greenough suggests that forests should be seen not only as a source of fuel and fodder, but also as a habitat sheltering fauna.

Greenough sketches the kinds of interactions between humans and wild beasts that existed in south Asia, and how these relations were mediated. Although romanticised accounts of hunting abound, a far more frequent entry into local records concerns the destruction of crops, houses and human life by wild animals. Indeed, presence or absence of wild beasts is a good indicator of the state of the village economy, whose villages and towns were abandoned when animals could not be controlled. Although people in general and women being the principal victims—in particular were relieved when 'man-eaters' were killed, there was a lack of co-operation from local villagers who said they feared divine retribution for their involvement. Greenough notes that the relations between certain animals and humans are no less permeated by spiritual exchange and moral casuistry than that between humans and flora.

Some of the villagers' responses to wild beasts were individual, others were collective, and still others depended upon the intercession of the landlord or the colonial state. These responses included vigil, beating drums, abandoning settlements, making wooden barriers and offering *pūja* to placate marauders. Indigenous hunters or *bagh maras* enjoyed royal favour with the Mughals, tribal or low caste hunters were also crucial to the success of peasant agriculture. The British introduced a system of bounties, paying cash for the remains of designated animals. These rates reflected the anxiety of both local inhabitants and officials. The much-maligned Forest Act of 1878 introduced the practice of closed hunting seasons, bag limits and permits. The colonial state also established wildlife preserves in Kaziranga in 1926, and the Hailey (now Corbett) National Park in 1936, but such public efforts at conservation did not preclude the private pleasures of hunting enjoyed by princes, aristocrats and VIPs. It was in the post 1947 period, however, that the ratio between domestic and wild animals was reversed, India's wild fauna were decimated. Preservation of habitats of declining populations of wild animals may well conflict with the interests of human beings sharing the same natural space.

An examination of 'an environment that participates in human affairs' is the core of Ann Grodzin Gold's paper 'Cultural Constructions of the Natural Environment in and beyond Rajasthan'. Gold analyses folklore, collective rituals and mythology of Rajasthani villages, and emphasises the continuities between human beings and their non-human surroundings. To her, meanings attached to the environment are linked with aspects of social organisation and economic production, economic and symbolic domains

of knowledge are mutually constructed. The story of the Jangli Rani reveals an identity between humans and the wilderness.

After having discussed the political, moral and psychological implications of consumption from both private and common lands, Gold explores the images of the environment in Rajasthani folklore and finds "an immediate cause-effect connection between a person's condition and the natural environment". Nature, as an actor in folklore, does more than merely reflect the human condition, it often intervenes to change it. Divine sanctions exist against human interference with given environments. Indeed the power and authority of gods is predicated on their successful protection of natural surroundings, such as tanks and groves. The responsibility of maintaining a balance between human settlements and the wilderness is part of the moral economy that legitimises the rule of kings, as Gold points out from one of king Bharthari's tales. Significant also is the disapproval of excess consumption that is a *leitmotif* running through these tales.

Gold next turns to collective rituals aimed at controlling the environment. The ritual of cow worship, performed in the months of harvesting certain *kharif* crops, has as much to do with the 'human manipulation of geophysical conditions' as it does with celebrating 'the non-violent regenerative powers of women.' Gold discerns here an eco-feminist parable having to do with the collective management of community prosperity. Similarly, 'village outside cooking' celebrates the health of cattle, which Gold sees as a form of common property, and strengthens village solidarity. These collective rituals respond to a need to overcome fissiparous tendencies for the sake of moral well-being on which depend geophysical and physical well-being.

On the basis of her analysis, Gold rejects Wade's [1988] dichotomies between moral and calculative reasoning, and between efficacy and ceremony, arguing instead that ritual enactments of community spill over into the management of common property as well. She agrees with Vandana Shiva that the culturally constructed notions of consumption in rural Rajasthan are sensitive to the 'systemic interplay between nature and people, in contrast to 'western' constructions.

COMMUNITY AUTHORITY AND THE STATE

Harry Blair's presentation on 'Democracy, Equity and Common Property Resource Management in the Indian Subcontinent' has two central theoretical concerns: first, can democracy support environmental integrity, especially through common property resource management? Secondly, what will be the impact of democracy on distributional equity? He argues that local democracy instituted by the modern state would not seem especially hospitable to CPRM or to equity to the poor.

Blair analyses forests as an example, since they represent a kind of mid-point on a CPR spectrum stretching from 'clean' to 'messy'. Democracy is compatible with two of Hardin's suggestions to avoid the 'tragedy of the commons', namely, centralisation and privatisation. Its compatibility with the third option, local control, is more uncertain. Of these solutions, privatisation has been implicated in generating power dynamics adverse to the worst-off. However, the effectiveness of a Leviathan in averting the tragedy cannot be guaranteed. Although decentralisation is often suggested as a counter to centralised power, Blair points out studies that conclude that such plans become little more than formulae from above in the hands of local elites. He is more hopeful for areas like West Bengal where long durations of communist rule have given the poor access to local government, thereby making its authority more legitimate. Local government along syndicalist lines likewise offers some promise.

Blair's solution to this dilemma of more state or less is to introduce the concept of 'user groups', members of which are linked by a direct common material interest rather than geographical jurisdiction. Ideally these groups should be small—or very large—and culturally homogeneous. When these conditions are met, CPR scarcity seems to motivate the right incentives for co-operation. But concern with economic growth often overwhelms preservation, Blair thus entertains the controversial alternative of a donor Leviathan which attaches ecological conditionalities to aid packages as a solution to the global tragedy of the commons.

On the question of deep ecology, Blair argues that while a democratic polity gives access to groups with such interests, the 'ideational shift' (elaborated in Herring's paper) required to make them successful in electoral politics is a long time coming.

In 'Property, Authority Systems and the Artful State', Daniel Bromley argues that each resource management system is an authority system, the stability of which rests the security of a property regime, which in turn depends upon perceptions of what is scarce and valuable and which, as instruments of social policy, have specific ends as priorities. He starts with the essential fact that collectivities can design the institutions of their society and economy in a number of ways. These institutions he defines as 'a set of rights and obligations in force' which shape the choice of individual economic agents, and thereby reduce transaction costs. They can be classified as conventions, rules and entitlements. The state, as a guarantor of rights, must take an interest in what transactions it will and will not sanction.

Paradoxically, however, the 'artful state' is the most significant obstacle to the existence of meaningful enforceable authority systems. The role of the state is to create internal and external legitimacy for given property regimes and to apply coercion to enforce rights and duties. A failure to confer

such legitimacy, Bromley argues, in the case of third world countries, leads to the breakdown of local management systems through inner tensions or through increasingly tenuous links with the larger polity and economy. Aggressive enforcement of norms and conventions is thus needed for a successful CPR regime. The two major factors that weaken CPR regimes, according to Bromley, have been the lack of alternative opportunities, and privatisation in the immediate area. The failure of recently decolonised nation-states to maintain indigenous property rights structures, to create economic growth and development, and to create rules that guide individual actions towards social betterment are the real dimensions of the tragedy of the commons. He describes how various colonial states destroyed the village as an autonomous decision-making body, and how subsequent national governments have taken over vast tracts of natural resources without the capacity to manage them.

The binary opposition of state and society was challenged by Mark Poffenberger's paper on 'Fibre Grass from Forest Lands: A Case from North India', co-written with Madhu Sarin. The paper was based on experiences in villages of Ambala district in the Haryana Shivaliks, and concerns state intervention in a pre-existing triangular relationship between the fibre grass, the paper industry and local communities. His presentation ranged much wider, describing new forms of local society—state joint management throughout India.

In village Surajpur, a heterogeneous community which had alternative employment opportunities at a cement factory nearby, 40 of the worst-off members of the community, who depended most on the fodder grass, successfully petitioned the Haryana forest department (HFD) for the formation of a Hill Resource Management Society (HRMS). In Kahinwalla, which has caste homogeneity and where rope-making is the major income generating activity, villagers waited for the HFD's initiative. Seventeen HRMSs were created in the vicinity. The reactions of the paper industry, which had previously enjoyed privileged access to fodder grass, was one of alarm, and contractors tried to sabotage some of the HRMSs.

The position of state officials in this process was ambivalent. They ruled against the fodder grass leases given to the mills on grounds of public interest and in favour of the poor's access to subsistence. At the same time they were caught in a contradiction: on the one hand, they had to help villagers manage their resources, but at the same time, they had to either ensure lease recovery. Moreover, while they showed concern for the poor's subsistence, the terms set for the villagers for access to fodder grass were much tougher than the terms offered to mill-owners.

Poffenberger's oral presentation discussed joint management schemes in south-east Gujarat, south-west Bengal, Orissa, Haryana,

eastern Maharashtra and south Bihar, covering thousands of villages. Schemes for regeneration of degraded land were of special interest. Labour from those in the village who had the lowest opportunity costs were producing real results in regenerating eco-systems which were of immediate economic benefit. The problematic concerned whether or not collective will would prove fragile when replanted trees reached a size of marketable value, at which point tensions over individual ownership could arise. These schemes required a fundamental change in the self-perceptions of forestry officials concerning their authority, local capacity for commons management and the balance between regulation and facilitation of local initiatives. Preliminary success seemed to be independent of any of the usual variables one might suspect—caste composition, culturally embedded reverence for forests, extensive local politicisation and mobilisation, etc—but in all cases, there were real material benefits to local participants. The independent contributions of culture and organisation remain unclear.

In 'Politics of Nature: Interests, Commons Dilemmas and the State', Ronald Herring interrogates the notion of 'interest' mediated by culture and structure, as the primary force dominating human behaviour as assumed in various literatures. Herring sees the 'tragedy of the commons' as an ideological construct employed by the state to justify its intervention in and appropriation of nature. 'Tragedy' is only part of the story of the commons, and one which is neither the exclusive nor even the primary outcome of commons situations, which may well facilitate the emergence of defensive as well as progressive responses, as in Wade's (1988) villages. Yet, tragedy is a more likely outcome in a second-order, often latent, conflict in which collective action fails to preserve nature independent of its human-attributed use values. Nature valued for human use underlies the 'social ecology' perspective; nature 'for itself' reflects the 'deep ecology' positions in the current environmental debate.

Herring next looks at the viability of the three solutions to the tragedy. In some cases, local institutions have successfully protected their environment, but they have no mechanisms for determining the 'tipping points' of their larger ecosystem, nor do they have the means to influence extralocal causes of degradation. If the Silent Valley episode is offered in support of state-centric solutions, there is no guarantee for the state's ecological sensitivity, since 'Leviathan must be fed'. The Silent Valley case itself reflects tensions within various levels of the state; mobilised local democracy in Kerala supported the dam in the legislative assembly, not the preservation of a unique forest ecosystem. The property rights solution, too, is dubious, since market rationality will only coincidentally coincide with ecological rationality. Moreover, privatisation excludes whole classes of society, and thus has unacceptable human costs. For all the warts of a contem-

porary centralised state, some 'broader collective authority' will be required to maintain boundaries, prevent externalities and mediate disputes among overlapping commons situations.

Since the tragedy of the commons implicitly assumes use-value for nature, it has no solutions to offer to deep ecologists, whose politics must be rooted in values of aesthetics, ethics and risk in support of unappropriated nature. Since perceptions of nature are also in conflict, Herring argues for a political economy of nature sensitive to its phenomenology. While there has clearly been some shift in perceptions of nature's value—as in the historical changes in evaluations of the Sundarbans (from useless and dangerous swamp to valuable wetlands ecosystem)—there are constant growth pressures from the domestic and international political economy and political systems. Local democracy and decentralisation tend to support a social ecology agenda rather than deep ecology. Herring's ideal solution in the south Asian context is a state that resists despoliation for short-term gains, while at the same time ameliorating generalised destitution. For deep ecologists, Herring's solution is to appeal to a 'global commons' in which common interests imply both common sacrifices and shared power. While this brings up the conflict between sovereignty and collective rationality, it may also give new leverage to the south in dealing with the north.

DISCUSSION

The Standard Environmental Narrative: East and West

Paul Greenough's claim about the emergence of romanticised 'standard environmental narrative' (SEN) was also directly tackled in Hardiman's paper on the Dangs and raised in Herring's treatment of 'defensive reactions'. It generated considerable discussion. One issue concerns the reality and explanatory importance of an 'Indian ethos' regarding nature, as presented by Singh. In extreme form, the argument implicitly posits an ageless, thus ahistorical, harmony between people and 'nature' in the pre-colonial period, extending to the present.

The SEN is transnational and threatens reinvention of the us-them dichotomy of modernisation theory and orientalism via modern noble savages. It assumes that 'ecosystem people' in effect have a consumption ceiling and will be perpetually happy with a life most intellectual ecologists would find unacceptable. Parts of the SEN assess blame and relate to the history of colonialism and its nationalist rendering. Other elements make assumptions about materialism as a basic human motivation, the reality of organic interest-cohesive communities, and the extent of pre-ecological-science understandings of ecology.

Positing an essentialised 'east' with its conservationist ethic in contrast to an essentialised 'west' with its ecological profligacy

comes dangerously close to an inverted orientalism. Though Hardiman identifies Seabrook and Pereira and Vandana Shiva as among the main practitioners of this paradigm, that sees history set in motion only on the arrival of the colonialists, elements of the theme were apparent in some of the papers presented at the conference.

Anil Gupta best captured the tension of this contested discourse of natural resources by simultaneously positing an 'eastern world-view' (characterised by deference to others and moral sanctions as causes, among other things) and the concepts of game-theoretic work which privilege the methodological individualism characteristic of mainstream economics. Ann Gold's paper agreed with Vandana Shiva on the conservationist ethic in rural Rajasthan, and stressed, like Gupta, the moral dimensions of consumption and co-operation. Collective rituals may indeed contribute to a sense of community which overcomes 'fissionary tendencies', but they may do the opposite as well. The difficult question concerns cultural practice at odds with powerful interests, under what conditions will symbolic enactment of a community interest (a) dominate or submerge private interests, and (b) be ecologically friendly?

A fruitful approach to part of the problem of how culture drives behaviour was suggested by Ann Gold: cultural perceptions about sanctions (the gods really are punitive). These sanctions have behavioural consequences whether or not there is good empirical evidence for their validity, just as some people believe that the state cannot effectively punish petty tax evasion or disregarding traffic rules, whereas others do believe that the sanctions are real. These opposed beliefs are separate from a norm that one ought to pay taxes or obey traffic rules even if there are no enforceable sanctions. Bina Agarwal's paper explicitly rejected the essentialism of special environmental concern on the part of either Indians or women or even Indian women, such conservationist norms as exist are located in specific groups which have survival interests in nature—e.g., poor women in hill terrain. The male/female splits in Chipko are of course indicative of this line of argument.

An essentialism, similar to that critiqued by Agarwal, is implicit in Singh's rejection of the CPR discourse as tainted by its origins in the historical experience of the west. (But if western origin is damning, his recourse to 'legal science' as an alternative becomes problematic for the same reasons.) Singh might well be right in pointing out that Indian notions of 'property' are distinct from those of the west, but it needs remembering, that in the same private resources with common access that Singh mentions—e.g., temples—collective or 'public' access was exclusionary: subordinate groups were not automatically granted access, were humiliated on the issue and had to fight for their share of public goods 'privately' provided (from social surplus).

Collectively, a number of papers emphasised the importance of centring local knowledge systems to understand the ways in which such generalised, democratic and accessible knowledge systems have informed resource use and survival strategies. But this focus on community and integrative practices is in tension with narratives of power, of conflict, and of disequilibria, often expressed in modes derived from dissonant popular culture, most forcefully expressed by Parajuli. For example, the reluctance of Greenough's peasants to co-operate with colonial authorities, while located in a system of belief, might well be seen as a political act of resistance, situated in a conflict between local ways of perceiving the problem and the rational bureaucratic solutions of the colonial state.

What remained problematic, as it is generally in the literature, is relating norms legitimated by culture to behavioural consequences. Joan Robinson raised a parallel in attacking the concept of surplus value: you can kill sheep with incantations so long as you simultaneously use arsenic. For example, Bina Agarwal's paper powerfully argued for a political economy framework for understanding gender issues and the resultant distribution of environmental values, rendering culture epiphenomenal. Yet it is difficult to understand the division of labour which differentiates interests between males and females without some context of cultural practice. How much of culture is composed of routines legitimating interests—i.e., incantations rather than causes—as James Scott argues generally in *Weapons of the Weak*? Clearly this is a rich and significantly understudied aspect of understanding natural system/social system interactions. It remains difficult to sort out counter-interested effects of norms, and the local mooring of norms such as the value of biodiversity, which are taken for granted in a transnational elite environmental narrative.

Culture and Rationality: Norms and Interests

The problematic of an 'Indian ethos' is of course part of the much wider and older dispute between culturalist and economic explanations. Behavioural social scientists are primarily interested in behavioural consequences of norms, whatever their origin. Clearly a force for degradation throughout the world is that material interests running counter to cultural norms of preservation are so powerful. Destitution aggravates these pressures. There is a real need for humanist behaviourist dialogue on this issue of cultural systems and environmental behaviour. There remains an incredibly rich set of questions about the origins and integration of environmental beliefs and values into cultural practice generally and the power of those practices in the face of countervailing interest.

The conference had its fair share of contributions from each approach, plus some

attempts at a reconciliation, such as Gupta's. Nevertheless, strategic behaviour and a moral/cultural ethic make uneasy bedfellows in Gupta's analysis (as in everyday life). Different portfolios presumably represent responses to different caste, class or gender positions. An alternative to much of the communitarian thrust of the SEN would be to analyse the entire ensemble of morals, local knowledge, myth, rituals, and popular conceptions of justice, as segmented aspects either of hegemonic formations or of subalternity, and therefore as areas of contestation rather than as given and attuned to a common good.

A similarly unresolved tension exists in Kaul's paper on pre-colonial Punjab, straddling intellectual traditions: perceptions of ecological niches and communitarian conceptions of survival strategies on the one hand, and a universal behavioural tendency to free-ride on the other. While Chopra attributes the different rates of success in retaining control over the guhl across the villages his team has studied to 'local traditions of CPR management', the absence of such a tradition in Chandrabhaga's homogeneous villages and its decisive presence in the caste-ridden villages of Shorghad (which are also more recently settled) remain a mystery. Where 'traditions' come from, how they are maintained and where they go when discarded are all questions of special relevance to the CPR debate; the papers collectively presented no easy answers.

Parajuli's notion of 'space' rests on a political construction of 'tradition' as well as a collective memory of oppression and resistance to it, supported by aspects of popular culture that remain autonomous of state appropriation. But it remains difficult to explain the richer/coaster path of the movement and the salience of ecological consciousness in it. The notion of a larger Jarkhandi counterspace does not account for tensions within it.

Agarwal's critique of eco-feminism for creating a bio-ideological link between women and nature, for essentialising both 'women' and 'Indian' as explanatory categories at the expense of differentiated specification and for remaining at a symbolic rather than at the material level throws a theoretical challenge to the richer and messier world of culture. If the ideology of 'feminist environmentalism' has a material basis, it is worth asking whether this 'memory' allows any autonomy to the cultural from the material. In terms of Agarwal's framework, Ann Gold's rich dissection of folk customs is typical of essentialising along both gender and civilisational lines. Nevertheless, along with Gupta, Gold's paper argues forcefully that nature and its uses might well be the basis for the co-operative integration of the community. This point is reinforced by Brara's detailed study of the micro-political and social dynamics of the villages she studied. However, the processes of persuasion and coercion that local elites must have used to compensate for the

under-representation of subordinate groups in decision making bodies is not without costs, nor is it clear how durable such solutions to the dilemma of authority may be.

The issue of norms also underlay the concern in Bromley's paper with political legitimacy, property systems cannot function without authoritative norms, an issue of particular importance to common property systems. Rita Brara argued that traditional authority structures at the village level fared better than did state mandated ones. Nevertheless, informal authority proved to be exclusionary and not particularly beneficial to the weakest groups in the village.

Since much of the literature on common property and collective action, from Hardin to Olson to analytical Marxists such as Lister, is based on the assumption of self-interested individuals, we now look at the role assigned to individual interests and 'rationality' in the papers, especially as they relate to the question of co-operative behaviour. Whereas much of the literature on these subjects is formal, deductive and ahistorical, Herring's paper argues that the powerful concept of 'interest', often taken unproblematically, necessitates analysis of structure and culture—and thus history—even in terms of simple theoretical coherence. Historically grounded culture forms the context within which 'interests' and action gain meaning.

Whereas Gadgil and Rao see 'elite' interests served by the state in relation to nature and scope of resource extraction, the formation and articulation of these interests at the level of the state is problematic. The triumvirate of politician, bureaucrat and businessman can hardly be said to have a unitary interest, inter-elite conflicts and their impact on resource use remains an important arena of investigation. The tendency to assume unity of interests from what may well be a vector sum of conflicting interests leads to difficulty in explaining change, the paper of Gadgil et al. demonstrates just such reversal in official positions vis-à-vis peasant participation and power.

Gupta accepts Mancur Olson's theories of strategic behaviour among individuals with clear interests, and also his suggestion that collective action is less problematic in small groups (since sanctions and rewards can be meted out more easily). It seems evident, however, that Gupta's 'survival portfolios' are also competing portfolios. In his recourse to culture in the last instance as a mechanism for providing 'assurance' in uncertain interactions, Gupta assumes a more stable and homogeneous culture than is often the case.

Similarly, Kaul gives credence to the 'human urge to free ride', yet documents co-operation among disparate and far flung peoples. In her work, it is the onslaught of state and market forces that leads to the breakdown of the regional community. Certainly, for market forces, often for state forces, dynamics depend on the self-interested behaviour of individual agents: there must be defectors and collaborators. It may

be as Karl Polanyi suggested: individuating pressures that result from the 'great transformation' become powerful social forces regardless of the strength of opposition by integrated communities.

One line of reasoning holds that existing forms of community solidarity organised around commons management are transferable to other forms of collective action, such as defensive reactions. Yet in Kaul's account of the Punjab, shared perception of an ecological niche that was one of the components of the regional community and other rituals of solidarity were not mobilised by the peasants to resist these forces. Echoing Gadgil and Rao and Gupta, Chopra et al. make two interesting suggestions: one, that co-operation is part of a subsistence ethic, and the other, that it is structured by the very nature of certain resources. The first point suggests that scarcity breeds a co-operative ethos rather than a conflictual one. The second point is ambiguous in Chopra's paper: transfer of effective control over the resource from the locality to the state seems to have been decisive in undermining co-operation, although the resource in question remained the same. As in Brara's account, state interference with actually functioning institutions may be either instructive or destructive.

Blair's user groups are constituted primarily by a direct 'common material interest' recognised but not necessarily created by the state. Manageable group size, resource scarcity and cultural homogeneity are held to be facilitating factors in success. Real decentralisation of resource management depends upon the assumptions that these groups already exist as coherent, legitimate entities. Brara's paper demonstrates how difficult it is for states to establish novel institutions with real authority.

What the papers did not analyse systematically is the sources or origins of communitarian regimes of co-operation. The 'all round tradition of CPR management' for example, is treated as given by Chopra et al., its formation and institutionalisation in relatively recently settled communities is left to be explained. Gold likewise treats gender, community rituals and the conservationist ethics of consumption as pre-constituted and thus unproblematic. Much of the literature in general uses a functionalist explanation in place of an intentional one: institutions arise because they serve specific functions, such as providing some common good. If it were that easy, the world would be a better place.

State and Market

A common theme at the conference was the role of the state and markets in destroying local commons and local environments, whatever the local configuration of culture and interests. It may well be that this effect is both structural and cultural: states reduce the political space within which local communities can work institutional solutions to perceived problems just as the 'great trans-

formation' produces intense pressures for the commoditisation of everything and the individuation of interests. Nevertheless, neither state nor market is unproblematic in composition, dynamics or effect.

The theme that expansion of state and market forces leads to a breakdown of the authority of local institutions and therefore to resource degradation runs through the papers of Kaul and Chopra et al. What is puzzling in Kaul's paper is the fact that the same regional community that had managed its risks effectively through co-operation over so vast a canvas crumbled before the forces of the state and the market. Why did the political capacity engendered by large-scale co-operation and management not provide tools of resistance? In Chopra's villages, how do we explain the phenomenon, apparent elsewhere, of state intervention proving to be the kiss of death for local initiatives despite strong local traditions of CPR management?

Brara's paper brings out well how, despite the expansion of the apparatus of the developmentalist state, the village community retains its autonomous space and institutions, the 'parde ke peechhe' panchayat retains real authority. However, the conclusion that what is needed at the level of policy formulation is to think in terms of 'one village, one panchayat' becomes problematic because of Blair's paradox: women and lower castes do not have much say in the autonomous institutions. This has a bearing on the decentralisation debate: the extent, scope and nature of the state's intervention in the rural economy in terms of its impact on distributive justice and empowerment.

In arguing that 'elite interests' mediated by the state have historically led to resource degradation, Gadgil and Rao make the familiar uneasy equation between 'elites', 'regimes' and 'states'. The cases discussed at the conference indicate that these boxes need disaggregation. While Singh is right in pointing out that the legal rules of the game have so far been used for centralising state control over resources, the suggestion that these rules be changed again for the common good assumes both leverage to move the state and state capacity to enforce rules. Though hostile to 'western' dominance of the discourse, Singh's perspective is not borne out by environmental practice in the United States: Courts there have themselves opened a countervailing space and consequently played a larger role than anticipated and belied the claims of radicals that the legal system is an elite arena not worth contending.

In contrast to the treatment of rural people as passive reflections of tradition and received culture, buffeted about by state and market forces, Poffenberger and Sarin describe peasants as active participants in their own lives. They take the initiative to create societies to control and manage local resources, even in instances in which such societies are created at the initiative of the state, the peasants are able to organise col-

solutions to common problems. In doing so, a fourth solution to Hardin's tragedy is advanced, that being state-initiated constitution of user-groups with joint management of the commons

The crucial question in this story concerns the necessary and facilitating social networks within and between communities and political conditions that enabled joint solutions to common problems. Material rewards to individual families seem to be the common denominator in Poffenberger's cases (which varied along other dimensions). Yet one wonders what caused the Haryana forestry department's sudden concern for the subsistence of the indigent, and how the paper lobby which had so far had privileged access to the state had its position reversed. Poffenberger's presentation suggested new relationships in India between state and local society organised not around conflict over rights to nature, but around mutual interests in environmental regeneration. Again, we find states with less autonomy and clearly defined interests than any static or deductive analysis would indicate.

Parajuli's paper imparted dynamics to this problematic repeated confrontation between the state and the Jharkhandis created a 'counterspace' for resistance. However, the Jharkhandis have been part of parliamentary politics for years. The specifically environmental trajectory of the movement remains cloudy, would concessions for autonomous development achieved in electoral bargaining with a developmentalist state produce political quiescence and ecological disaster? What is to prevent the counterspace from elaborating its own demands for destructive developmentalism?

The argument for a strong and legitimate state to enforce common property norms, as developed in Bromley's paper, poses the crucial question of whose interests Leviathan will serve. If it is the state that guarantees the legitimacy of resource management systems, the question of its own legitimacy must first be asked. Changing notions of the legitimacy of given property regimes come from conflict and co-operation in civil society. In a hierarchical world economic system, legitimacy may well be perceived in terms of precisely that form of development which has devastated so much of the global commons.

States are nested, just as commons are; concentric circles of ecological and political arenas stretch from the very local to the international. Powerful pressures on the state emanate from its position in the international system. Blair's notion of 'donor Leviathans' raises serious questions of sovereignty and thus of global democracy and yet it is not clear that conservationist international pressures might not provide useful assistance to local struggles against destructive and repressive states, as has clearly been the case in human rights on a global scale. Yet this logic assumes power asymmetries which are politically unacceptable to states in the south, as well as to the intelligentsia, as Madhav Gadgil and

Ramachandra Guha argued forcefully in discussion.

International pressures have contradictory implications for local power to preserve local commons and environmental integrity. Herring argued that the biodiversity agenda of deep ecologists in the north implicitly recognises a 'global commons' in which common interests imply both common sacrifices and shared power, while this dynamic underlies the conflict between sovereignty and collective rationality, its realisation necessitates new political relationships between south and north. The caveat is that both actors are internally differentiated. Indira Gandhi moved to save endangered species in Silent Valley, George Bush is no friend of the spotted owl.

Understanding the state's interest in nature remains a major theoretical and practical puzzle. The state has claimed a special role and authority in part from legitimations rooted in the 'tragedy of the commons' logic. Local populations are seen as incompetent or worse, game-theoretic (particularly in the prisoner's dilemma mode) work provided justification for the view that even good intentions would not produce effective co-operation. The late 20th century has witnessed a sea-change in the valence attached to state intervention by mass publics and intellectuals. States are increasingly seen as more a part of the problem (any problem) than of the solution. Yet the character of natural systems seems to make a strong case for larger than local authority, even though the state's role to date frequently has been destructive. It was centralised authority which halted encroachment on the Sundarbans and protected 'Silent Valley' from a state legislature bent on development, but the Indian state has also pressed for destruction in other cases, as in the Narmada valley.

We still poorly understand the state's interest in environmental protection, its vertical and horizontal contradictions on environmental policy, and its new relationship to society in a field which increasingly touches all citizens, not just isolated forest dwellers. The state is also increasingly subject to international pressure, bribes and censure. The most disturbing normative implication is that all good things may not come in bundles, there may well be trade-offs among values of democracy, social justice, development and environmental preservation.

Research agendas of the participants will almost certainly be altered by the conference. Bina Agarwal's concern that we often conflate mentioning women with gender analysis and *de facto* ignore the pervasive ways in which environmental issues in the subcontinent are engendered was profoundly instructive. Madhav Gadgil's, Anil Gupta's and Ram Guha's explicit concern that the north's conceptualisation of environmental issues amounted to an elitist 'sacred groves for the rich' strategy resonates with the major international political issue in environmental protection [Guha 1989]. The necessity of coming to terms with local practices, know-

ledge and culture, just as the theoretical difficulty of doing so was highlighted.

Finally, for all its distortions, the much (and justly) maligned tragedy-of-the-commons metaphor is useful in directing attention to the reality of common interests in natural systems—all local commons are finally embedded in larger commons, though not in a common community or system of authority. This is sensitive turf because environmental politics of the north on a global scale clearly employ double standards and imply unequal and unfair burdens on the south. Nevertheless, the consequences of a global tragedy of the commons are in many ways similar to other international tragedies: the consequences will be born most heavily by those least able to adjust. Creating political institutions commensurate with threats is not easy, but recognition of common dilemmas is a precondition for more representative, just and effective politics.

[Though a draft of this report was circulated to participants, the views in this report remain those of the authors.]

Problematising Nationalism

A Raghurama Raju

The problem of nationalism in India needs to be approached not from the perspective of derivation/autonomy but from that of incorporation/assimilation. It is also necessary to relocate the debate on nationalism in the politics of the present, juxtaposing nationalism to the so-called non-nationalistic realities, marking their tensions, appropriations and approximations.

IT would not be an exaggeration to assert the significance of nationalism for the making and unmaking of cultures and societies in the modern world. Partha Chatterjee's work, *Nationalist Thought and the Colonial World: A Derivative Discourse?*, offers a convenient ground for analysing this significance and of contending with some aspect of its emergence and its variety.

Following a brief exposition of some important perspectives on the idea of nationalism, this article presents Chatterjee's appraisal and reformulation of them. While explicating one of the underlying assumptions of Chatterjee's formulation, namely, the construction of the monolithic west, an attempt is made to revoke the relation between the idea of nationalism and western societies and try to show its discontinuity. In this context presented here is another form of Indian nationalism, namely, the ideology of Hindutva as reflected in the writings of V D Savarkar, amplifying in this course the support it seems to lend to Chatterjee's thesis. We conclude with a series of questions voicing the seriously delimiting character of Chatterjee's analytic framework, as routed through the formulation, 'thematic' and 'problematic'.

This would entail opening up the contours of Chatterjee's discussion, going beyond its frame—the politics of the idea of nationalism in its transplanted context—and to pose afresh the question of the politics of this idea in its original context. This would, I think, facilitate not only clarification of certain basic nations surrounding nationalism, western and Indian, but also provide for a reformulation of Chatterjee's thesis. In this paper I am interested in raising certain broad issues concerning Chatterjee's work and would not attend to its other empirical references such as, his interpretation of Gandhi, Nehru, etc.

I

The idea of nationalism in its original context has been viewed by liberal-rationalists John Plamenatz (1976), Hans Kohn (1967), Ernest Gellner (1983) and Marxists H B Davis (1978), B Anderson (1983). The nationalist project for the liberal-rationalist is an enabling agency for the realisation of the 'universal urge for liberty and progress'. In those instances where this project became the ideology of 'racial hatred' and generated 'irrational revival movements' and 'oppressive political regimes', this has been explained away by its proponents as owing to the prevalence of 'conditions unproportion to freedom'. Thus they establish a necessary relation between nationalism and the ideals of 'liberty' and 'progress'. Accomplishing the ideals of the idea of nationalism involves, for Gellner, a

general imposition of a high culture on society, where previously low cultures had taken up the lives of majority, and in some cases of the totality, of the population, ... It is the establishment of an anonymous, impersonal society, with mutually substitutable atomised individuals, held together above all by a shared culture of this kind, in place of a previous complex structure of local groups, sustained by folk cultures reproduced locally and idiosyncratically by the micro-groups themselves. That is what *really* happens (1983:57).

This nationalist project, it may be noted, is not philosophically defended but explained sociologically as a 'requirement of industrial society' and its 'cultural homogeneity', to which mankind is said to have been irreversibly committed. This paradigm of universal history, when confronted by the arguments of cross-cultural relativism, instead of answering the objections of the latter, explains them away by a sociologism according to which, the agrarian plural society 'somehow or other' manage to overcome their particularities. Gellner, who, while confronted by the

argument of relativism evades them by declaring that,

The question concerning just *how* we manage to transcend relativism is interesting and difficult, and certainly will not be solved here.

And asserts, that,

What is relevant, however, is that we somehow or other do manage to overcome it, that we are not helplessly imprisoned within a set of cultural cocoons and their norms, and that for some very obvious reasons (...) we may expect fully industrial man to be even less enslaved to his local culture than was his agrarian predecessor (1983:120).

For, B Anderson, nation is 'an imagined political community', and is 'thought-out' and 'created'. This imagined political community of nation supersedes the preceding 'cultural systems' of religious community and dynastic realm, in the process generating "a fundamental change ... in modes of apprehending the world, which more than anything else, made it possible to 'think' the nation". The factors responsible for this change is "a half-fortuitous, but explosive, interaction between a system of production and productive relations (capitalism), a technology of communications (print) and the fatality of human linguistic diversity". Thus making the 'innumerable and varied idiolects of pre-print Europe ... now "assembled, within definite limits, into print-languages far fewer in number"' (Anderson cited in Chatterjee 1986:19).

Chatterjee explicates and criticises the 'sociologism' explicit in both Gellner and Anderson (belonging to liberal-rationalist and Marxists schools respectively). He argues that there are no substantial differences between Gellner and Anderson, and lists three substantive issues on which both concur. (a) In their recognition of the fundamental change in ways of perceiving the social world preceding nationalism. While 'Gellner relates this change to the requirements of industrial society, Anderson more ingeniously, to the dynamics of 'print-capitalism'. (b) "Both describe the characteristics of the new cultural homogeneity which is sought to be imposed on the emerging nation: for Gellner this is an imposition of a common high culture on the variegated complex of local folk cultures, for Anderson the process involves the formation of a 'print-language', and importantly for Chatterjee. (c) "Both see in the third-world nationalisms a profoundly 'modular' character ... outlined by given historical models which are objective, inescapable imperatives"

[Chatterjee 1986:21]. From this Chatterjee concludes that both liberal-rationalists and Marxists have resorted to

Sociologism, i.e., fitting nationalism to certain universal and inescapable sociological constraints of the modern age, or alternatively, reducing the two contending trends within nationalism, one traditional and conservative and the other rational and progressive, to their sociological determinants, or invoking a *functionalism*, i.e., taking up an appropriate attitude towards a specific nationalism by reference to its consequences for universal history (1986:22).

In reducing the problems of nationalism into the paradigm of sociologism, Chatterjee points out that the problem of nationalism has not been formulated as a problem either 'for epistemology or political philosophy'. Away from these received formulations Chatterjee takes the very system of knowledge representing the idea of nationalism to task, locating nationalism as a problem in the history of ideas and formulating it along a knowledge/power axis that sees 'thought' itself as one "which can dominate and subjugate".¹

By locating nationalism as the problem in the history of political ideas, Chatterjee complicates the relation between western nationalism and Indian nationalism, showing the latter as a derivative of the former. In doing this he comes to take western nationalism as a monolithic, obliterating the distinction between the idea of nationalism as a form of Enlightenment, and the western society. He sees the idea of nationalism as a western idea, having its genesis in the Enlightenment, and goes along with Plamenatz in identifying France and Britain as the pace-makers of this idea, as those who set the standards for other societies. Such other western societies as Italy and Germany, though in a disadvantageous position in keeping pace with these standards, had nevertheless possessed the "necessary linguistic, educational and professional skills that were deemed necessary for a 'consciously progressive civilisation'" [Chatterjee 1986:1]. It is obvious that for Chatterjee the idea of nationalism does not pose any significant questions to western societies themselves. We must ask: what is the relation of the Enlightenment to the societies of the west? Indeed, it can be shown that the relation between the idea of nationalism as a product of the Enlightenment, and western societies themselves is not a smooth one but consists of stresses and strains. The fact of Italy and Germany possessing the necessary requirements for becoming nations does not by itself make this process, of becoming a nation, a smooth affair. Western social realities preceding the idea of nationalism seem to

have been put to more or less the same ordeals as eastern societies. In short, Chatterjee's position undermines the western critique of western nationalism.

In order to understand the relation between the Enlightenment and western societies would presuppose having a sense of the former. The conception of rationality underlying the nationalist discourse is derived from the Enlightenment presuppositions of man and society: the concept of pre-social man, what I term as 'hypothetical man'. This concept of man as postulated by the contract theorists has no reference to the natural man ('is'),² nor is it a concept of man when he realises his teleology ('ought'); rather, it is a postulation divorced from reality.³ Further, this conception of man has been shown by the contract theorists to be fashioning a social state; a state which I characterise as 'artificial society', whose sovereignty expresses and is an expression of the general will, specific contents of this will coincide with the idea of nationalism. Indeed, the general will can be viewed as forming the ideological basis of the idea of nationalism and the contract theorists, particularly Rousseau as the protagonists of totalitarianism. [J W Chapman 1956; J L Talman 1966; W Kendell 1941]. A more detailed working of these themes cannot be undertaken here and must await another occasion.⁴

These presuppositions of the Enlightenment thought in their encounter with the social realities surrounding them introduce basic discontinuity; in particular they transform these realities in the self-image of the Enlightenment. Specific fragments of this transformation find expression in the work of Gellner, in his analytic characterisation of the transition from 'wild' to 'high' cultures. The former, i.e., the 'wild' culture, refers to the traditional agrarian societies which according to Gellner, like the savage plants are produced and reproduced 'spontaneously' without a 'conscious design' surviving in a 'nature given atmosphere'. The 'high' cultures on the other hand, refers to nation which "possess a complexity and richness, most usually sustained by literacy and by specialised personnel ...", and nurtured "in a new, specially blended and artificially sustained air or medium". These processes are created and maintained by the state, on whom the people of the nation are made to depend. Gellner contrasts this dependency on the state, necessitated by the 'high' culture against that obtaining in the 'wild' culture, where men are not solely dependent on the state for support [Gellner 1983: 50-51].

The transformation referred to above is not smooth, neither governed by sympathy nor understanding of what is being

transformed. As Gellner writes, this transformation is not an "awake(ning) ... (of) an old, latent, dominant force", ... (but) a period of turbulent readjustment, in which either political boundaries, or cultural ones, or both, were being modified, so as to satisfy the new nationalist imperative which now, for the first time, was making itself felt ... (and) this period of transition was bound to be violent and conflict ridden (1983:40).

This transformation of the agrarian societies into national cultures marks a discontinuity between them, making the discourse of nationalism a discontinuous discourse. The material for recognising the relation between the Enlightenment and the western societies, though easily available in Gellner, has not been noted and problematised by Chatterjee.⁵ He confines his discussion to expose the political domination of the nationalist thought in the colonial world, charging Gellner instead with ignoring "the problem of incommensurability and intercultural relativism which the new nationalist culture must overcome" [Chatterjee 1986:8]. This charge is levelled by Chatterjee in the context of the pluralist character of the third-world societies. But what of nationalism itself and its relation to the western societies? Chatterjee does not query this. Indeed, this relation itself is rendered insignificant given his construction of the west as a monolithic whole, a construction uninformed by the histories of the western societies and their variations.

Establishing this relation between the Enlightenment and the western agrarian societies and showing it to be discontinuous, in my view, facilitates a better reading of the relation between western nationalism and Indian nationalism, than the one available to Chatterjee. Laying bare this distinction would also facilitate the location of a critique of nationalism not in an amorphous space called west, or western nationalism, but pointedly to a particular instance of the west, namely, the Enlightenment. The preceding discussion facilitates the claim that not only is Indian nationalism derivative, but the idea from which it is derived is discontinuous with its own society. That is, the idea of nationalism is not only oppressive/dominating in its application to the third-world but it also seems to be inherently so.

II

It is this idea of nationalism which the Indian nationalists comes to inhabit. Chatterjee traces the nature of this relation which is neither smooth nor linear but complicated, and hence to be approached 'in terms of stages'. Indian nationalism is both opposed to and imitative

of the idea which is western. That is, it challenges the colonial rule making "certain claims regarding the practical forms through which these possibilities could be realised" [Chatterjee 1986:40]. This, is seen to constitute the problematic of Indian nationalist thought, which, being active and participating, Chatterjee affirms to be different from the problematic of 'orientalism',⁶ being non-passive and participating. The subject of the nationalist thought is viewed as possessing a 'subjectivity' which is "active, autonomous and sovereign". Chatterjee shows these claims of the problematic of the Indian nationalist thought to be "justified by appeal to logical, epistemological, and ethical principles" drawn from the rational knowledge systems of the Enlightenment age, what for Chatterjee constitutes the thematic of the nationalist discourse. He writes, the thematic "refers to an epistemological as well as ethical systems which provides a framework of elements and rules of establishing relations between elements" (1986:38).

The relation between the concerns of Indian nationalism (problematic) and the idea of nationalism (thematic) for Chatterjee "is not a simple relation of correspondence, even of derivation", but is complex, its route very serpentine and hence to be explained in terms of 'theory of stages'. He advances two reasons for the complexity of this relation: (1) Indian nationalist thought is selective—deliberately and necessarily—about what it takes from the western nationalist thought. Even when it adopts from western thought, the adoption is not wholesome, for that would not constitute itself as a nationalist discourse. (2) The Indian nationalist thought (problematic) and the idea of western nationalism (thematic) are prone to various changes. To quote Chatterjee,

The thematic will tend to apply a closure on the range of possibilities, and many possibilities will be ignored and some not even recognised. At the same time, this process of mutual influence between the thematic and problematic of nationalist discourse—the periodic dissociation and coming together—could even produce at critical junctures a thoroughgoing critique of the thematic itself, points at which nationalist thought will seem to be on the verge of transcending itself (1986:43).

Given this revised formulation of problematic and the thematic, Chatterjee points out a crucial contradiction in the character of Indian nationalist thought, in that it repudiates the very structures it imitates. This repudiation involves rejection,

in fact two rejections, both of them ambivalent: rejection of the alien intruder and dominator who is nevertheless to be

imitated and surpassed by his own standards, and rejection of ancestral ways which are seen as obstacles to progress and yet also cherished as marks of identity. This contradictory process is therefore deeply disturbing as well. Eastern nationalism is disturbed and ambivalent as the nationalism of Herder and Mazzini were not [Plamenatz (1976) quoted and paraphrased by Chatterjee in 1986:2].⁷

Indian nationalism, confronted with this contradiction, strives to overcome it by resorting to a process of imitating the west, accepting the latter's superiority with regard to material progress, while affirming itself as being spiritually superior, even in a position to export its spirituality to the west, and thus drawing a claim for autonomy on this basis.⁸

Chatterjee goes on to chart the nationalist process of 're-equipping' India under three broad moments: the 'moment of departure', Bankim Chandra Chattopadhyaya; the 'moment of manoeuvre', Gandhi; and the 'moment of arrival', Nehru.

The contents of Chatterjee's discussion seems to be broadly limited to the Indian nationalism based on liberal-rationalist ideology, primarily the nationalism of the Indian National Congress. This is only one form of Indian nationalism, may be the dominant form; and hence one cannot hastily conclude that Indian nationalism is derivative. Rather, it must be stated that the nationalism of the Indian National Congress is derivative. In other words, the Indian National Congress, in articulating its concerns within the knowledge systems which are western is productive of a derivative discourse.

What would happen to this derivative-ness if one were to consider another instance of Indian nationalism? It is in this context I shall discuss the ideology of Hindutva as stated in the writings of V D Savarkar. The question may arise why this particular instance and not some other? The choice is governed by some of the significant developments in the contemporary Indian politics. The rise in the popularity of Bharatiya Janata Party (BJP), Shiv Sena, Vishwa Hindu Parishad (VHP), etc, characterised as the rightist parties/organisations, and the corresponding decline in the popularity of the Congress, labelled as the centrist party, marks a significant development in the politics of the contemporary India. Both these parties have been contestants for power before and after independence. However, it has been the Congress which succeeded in capturing power till 1975 and after a brief break again between 1977-1989, conceding only little success here and there, particularly at the local levels to the 'rightist' parties. The scene however seems

to have been changing with the rise in the popularity of BJP, Shiv Sena, VHP etc, a view which is contested by Gail Omvedt (1990). Particularly, BJP by claiming to be a national party safeguarding the unity of India—a claim marked by an ambivalence in shedding and embracing its erstwhile Jan Sangh type of fundamentalistic predilections—has been working towards larger appropriations. This change necessitates along with other things, a discussion of the ideology of these parties.

One of the central themes running through the various invocations of Savarkar is political unity. It is around this notion that he weaves his other concerns: (a) The formulation of Hindutva as "not (just) a word but a history" (1964:2), consisting of one language (Hindi), one name (Hindu), a common culture and law, what for Savarkar, are pre-British and pre-Islamic (1964:46). (b) His plea for developing western science, technology, industry and knowledge systems, in India, to be used for both achieving material prosperity as well as for making bombs, weapons, in order to 'militarise Hindudom'. Militancy for him is not an end in itself but is at the service of 'unity of India', making the concept of unity, not militancy, central to his discourse. In an interview, Savarkar is reported to have said:

It is sin to follow the path of violence where it is possible to make progress in a peaceful way. Such were my views when we (referring to Gokhale) worked in the revolutionary camp [in Keer 1966:129]. It is through this forced militancy and not by having a common constitution that India could regain its nationhood and remain united. It is interesting to note that both liberals as well as militant nationalists accepted science, technology, industry, etc, which are the products of western knowledge system, although the latter intend to use them to establish unity through militancy.

Further, it is this notion of unity which decides Savarkar's friends and enemies. These relationships in him are not exclusively religious but 'political'. In *The Indian War of Independence 1857*, he attacks Sikhs for not joining hands with Hindus and Mughals to fight against the British. He observes:

The Sikh princes and people, did not wish well to the Revolutionaries even at heart; nor did they remain neutral; nay more, they did not hesitate to aid openly with the English and shed the blood of their own countrymen on the field of the battle. On the contrary,

The Hindus as well as the Mohemmedan communities thoroughly sympathised at heart with the revolutionaries and were full of hatred towards the British⁹ (1947:496).

INSTITUTE FOR SOCIAL AND ECONOMIC CHANGE

Nagarabhavi PO — Bangalore 560 072

Advertisement No. 264/6-7-1993

Applications are invited for the following posts (temporary for a project for a period of two years upto September 1995 or till the end of the project, whichever is earlier).

Senior Research Officer — 2 Posts

(equivalent to Associate Professor in the Institute)

Essential Qualifications a) Master's Degree in Sociology/Social Anthropology with a minimum of 50% marks in the aggregate; b) Ph.D or published work of equivalent standard in the subject; c) 5 years teaching and/or research experience in the subject; d) Publications in the subject

Desirable Qualifications a) Knowledge and experience of working in a large project of applied social sciences involving data collection, Qualitative research analysis; b) Demonstrated ability of draft reports and make independent representation in various fora; c) Knowledge of regional languages namely, Kannada, Tamil and Telugu

General: a) The Research involves intensive and independent field work in rural areas of Karnataka. The candidates are expected to be familiar with PRA techniques; b) The candidates are expected to spend 3 months in the Department of Sociology, Glasgow University as visiting Research Fellows for Project work; c) Persons employed in teaching and/or Research Institutions are encouraged to apply for the post on a deputation basis, d) Applications should be accompanied by a copy of at least Three Publications.

The Selection Committee may relax qualification in exceptional cases and can also consider suitable candidates from outside the list of applicants. Higher start may be given in deserving cases according to ISEC Rules.

Age Limit: Normally below 40 years; relaxable upto five years for SC/ST Candidates and without any limit for employees of the Institute.

Scale of Pay: Rs 3700-125-4700-150-5300 (Gross at the minimum of the scale Rs. 7142.00)

A copy of the Advertisement and application form can be had on request from the REGISTRAR by sending a Postal Order/DD for Rs. 20/- with a self addressed stamped (Rs. 2/-) envelope (28×11 Cms) Application fee is not required for SC/ST Candidates, but they should send their requisition with an attested copy of the Caste Certificate alongwith a self-addressed stamped envelope (Rs. 2/-). Completed applications with copies of all documents/certificates/publications in support of the entries made therein should reach the REGISTRAR on or before **24th August 1993**.

REGISTRAR

Incidentally, in this book Savarkar does not criticise 'Mohammedans' instead he goes out of his way to praise them, addressing them as 'brethren!'. His later antagonism to Muslims, particularly the Muslim League, is in the context of the threat to this unity—which he romantically upholds—with the demand for Pakistan. Likewise, his explanation for the causes of the fall of Buddhism in India, is again political. For him, it is due to "Buddhist forces...(making) China the basis of operation...reinforced by contingents from many Buddhistic nations..." (1964:16). The concerns of Savarkar, it is evident are clearly political, his tone often propagandistic, being based not on argued facts but managed through the sheer power of rhetoric and emotions.

The concept of Hindutva is an idea embodying this principle of unity. Hindutva, for Savarkar, needs to be distinguished from Hinduism. A Hindu need not necessarily accept the authority of Vedas, as "a man can be truly Hindu as any without believing even in the vedas, as an important religious authority". Hinduism is identified with vedanta philosophy, and is not central to Hindu rather, it is for Savarkar a "derivative, a fraction, a part of Hindutva" (1964:2). Hinduism is not to be the main concern for Hindus, and maintains that we Indians "are at present all Shudras and cannot claim access to the vedas and vedanta". We, says Savarkar, "as a nation, are unfit for these sublime thoughts,...Let us study, history, political science, science, economy; live worthily in this world, fulfil the householders' duties and then the philosophic dawn might come" [Keer 1966:137]. The overtly religious nature of Hinduism comes to be charged with the political intent what for Savarkar culminates into Hindutva. The Hindu of Hindutva is defined by him as one for whom *सिंधु-स्थान* ("S/Hindustan) is not only *अपितृभूमि* (fatherland) but also *पुण्यभूमि* (holyland)" (1964:74). The primary concern of Hindutva is political unity, material prosperity and military strength. The failure on the part of the Indian society not to become a strong nation, in yielding to the foreign rule, is for Savarkar a political failure—a failure in not seeking military means to establish the unity. Hence the need to 'Hinduise all politics' and 'militarise Hinduism'.

This ideology of Hindutva though threatening to provide a discourse different from the nationalism of Indian National Congress nevertheless comes to replicate the same paradoxes of the latter, Savarkar berates the constitutionalism of the Congress, as insufficient to safeguard the national unity, and affirms militancy as a means to upholding this unity. The affirmation finds justification in the experience of the west, particularly the at-

tempt at fusing the sacred and the profane through religion and science. Savarkar attributes the success of western nationalism to their having a single unified religion and their use of religion as a means to "wordly strength and social solidarity". By way of contrast, he confronts the diversity of Indian society, maintaining that Hindu never looked upon religion as a means of strength and solidarity. This, according to him, "is their fundamental blunder from the point of view of nationalist strength and solidarity" [Keer 1966:142].

Thus, we must ask: Is Savarkar's militant nationalism also not privy to the process, that though opposed to the mainstream nationalist discourse, it upholds the model of 'universal modernisation' inscribed in the latter? Also, what of the echoes within Savarkar that reminds one of Mazzini? (incidentally, Savarkar translated the autobiography of Mazzini into Marathi and often adulates Mazzini in his writings). Indeed, Savarkar's obsession with unity, to be supported by militancy, his preoccupation with history, politics, modern science, and his endorsement of such 'orientalist' categories as 'Indian spiritualism' and 'western materialism' comes to bolster the 're-equipping' thesis intrinsic to the Indian liberal-rationalist nationalism. The obsession with unity, with 'nation-building' seems to concretise the concerns that have animated the post-independent Indian state. What Savarkar's avowed militancy hides is the search for alternative conducts for modernity. Most strikingly, perhaps, is not just the emphasis on politics, on establishing lines of political authority, but the coincidence of political intent, Savarkar's preoccupation with 'Hinduising all politics' and 'militarising Hinduism' and modernising India/Hindustan, to reinforce as it were, a sovereign nation state. A resolution in modern times, incorporating, our contemporary instances of violence.

III

There may well be other instances of nationalism, separate from that of the Indian National Congress and Hindutva, that may, or may not reflect this contradictoriness of nationalism in its transplanted context. Assuming that they do, are we then to conclude emphatically that the pluralities of nationalisms in India embody within themselves the same contradictions that underwrite the mainstream nationalist effort of the Indian National Congress, what has been presented by Chatterjee? To reply in the affirmative would be relatively a simple option. Rather, I would argue, that it is within the framework of this question that one begins to think through the inherent limits

of Chatterjee's focus. Sustaining the analytical frames, employed in Chatterjee, thematic and problematic one could argue that the varieties of nationalisms have all shared in a singular thematic, while their problematics may have been distinctive. What does one have if this suggestion were to be carried through? One perhaps finds the militant nationalism embodied in the Hindutva concept replicating the same paradoxes of the mainstream nationalist effort, marked by a divergence between the 'thematic' and the 'problematic'. More, importantly, however, a perspective from the militant nationalism embodied in Savarkar could, in relation to mainstream nationalist discourse, suggest a convergence of their 'thematic' but with opposing 'problematics'. The militancy dimension of Savarkar's discourse suggests something more than just a question of means, of the instruments realising nationhood. Also, what seems to be equally significant, from the point of view of the nationalisms, in the west, one could posit the same convergence of 'thematic' but divergence of 'problematics'.

Surely, Chatterjee's mode of posing the problem of nationalism renders a history of nationalism(s) unintelligible, even impossible. Where, for instance, does the nationalism of the Herder and Mazzini type figure in relation to the liberal-rationalist nationalism of the Enlightenment? And, to deflect from these questions we have just formulated, what of those nationalisms in Europe which succeeded in challenging and destroying the "liberal constitutionalism in the (Europe) of the eighteenth century", adopting later, some of its outward forms to the "services of an expanding and modernised (Europe)"¹⁰ [Kohn 1967:357]. Importantly, is one to talk of nationalism in the singular or in the plural, a problem which, I assert, would have to be formulated both in the context of nationalism's originating context (west) and its transplanted manifestation (non-west)? These questions, I should think embody significant histories which in the context of Chatterjee's analytic presentation in terms of 'thematic' and 'problematic' are obscured into a singular dominant history. The framework assumes a dominant configuration, and consequently, the activity that Chatterjee concedes for the 'problematic' of the nationalist thought, is rendered innocuous, under the sway of the 'thematic'. What if one were to take the realities connected by the 'problematic' as active, and the relation between the 'thematic' and the 'problematic' dialectical or dialogical. This would necessitate approaching the problem of nationalism not from the perspective of derivation/autonomy but from the perspective of incorporation/assimilation. In other words, Chatterjee's perspective

of his analysis. It may also be noted that the framework employed by Chatterjee is not intrinsic to the discourse which he analyses, rather, he thrusts it upon his material.

To conclude, given this restriction imposed by Chatterjee's form, how do we begin to pose afresh the question of nationalism in India? A necessary starting point would be to relocate it in the politics of the present, juxtaposing nationalism against the so-called non-nationalistic realities of India, marking their tensions, appropriations, approximations. The Bharat-India interface (posed by, say Sharad Joshi), the question of Nation vs 'Dharma' (presented by Badrinath Chaturvedi), and such other phenomena as Tikait in western UP, the Bahujan Samaj party of Kanshi Ram, etc., suggest possibilities quite other than the contentions of mainstream political analysis.¹¹ But exploring them would constitute the substance of another paper.

Notes

[I thank Sashee Hegde for helping me formulate the concerns that animate and clearly go beyond this text.]

The earlier draft of this paper was presented at the seminar on 'Political Thought in Western India: 19th and 20th Century' organised by department of political science, Goa University in collaboration with ICSSR, Bombay during January 15-16, 1990. To Aditi Doctor, Y S Prahalad and Navjyoti Singh among many others, I am thankful for their encouragement and comments.]

1 In this context Chatterjee raises the following issues: thought as a vehicle of change, the relation of thought to existing cultures of society, imposition of cultural categories and frameworks of thought produced in alien cultural context, i.e. is the positive knowledge contained in these frameworks neutral to the cultural contexts? in cases where there are two cultures, one dominating the other (as in colonialism) how thought comes to be received in the subordinate culture? etc. (1986: 26-28).

2 One of the failures in the discussions of thought controversy in the western philosophy is its failure to distinguish between the empirical and postulated.

3 This marked polarisation between the assumptions of the Enlightenment and the western social realities generated a wide gap between thought and reality. In this theories come to fall apart from realities, a second fall! This gap in the period following Enlightenment comes to be mediated where both theory and reality comes to appropriate each other. The theory modelling the Enlightenment appropriates the reality in certain ways: by creating realities, an enterprise assisted by modern science and technology, by transforming realities through social change—in these the realities are brought nearer to the theory. And the theory comes to be revised in order to represent/appropriate the reality better. The contributions of Hegel, Nietzsche, Darwin, Freud, Marx can be contextualised in this

way, where the sense of history, irrationality, evolution, unconscious, concreteness respectively, come to be resurrected to the Enlightenment abstract assumptions stated above. Thus bringing the theory nearer to the reality. These two appropriations are not, however, to be taken as exclusives but mutually interacting with each other.

4 However, some of these issues have been discussed in my *Man and Society: A critique of the presuppositions of Modern Political Philosophy* unpublished doctoral dissertation submitted to IIT Kanpur in 1985.

5 It may be noted here that Gellner, though recognised the relation between the Enlightenment and the western agrarian societies, does not question the Enlightenment presuppositions of man and society. He seems to concur with his predecessors about the self-evident truth of these assumptions. Further, citing arguments from Gellner to work a case for discontinuousness of the nationalist discourse within the west should not however be taken as a wholesome adoption of his thesis, particularly, not the sociologism associated with it. While it is true that Gellner's sociologism militates against the conception of thought as an instrument of social change, what is central to Chatterjee, we should also guard against embracing this contrasting position. To subscribe to either of these strands is a convenient device of a theorist. But this could not enable us to capture the constant interaction between thought and social process, to formulate a metaphysics of dialectically related theory and reality.

6 The problematic of the Orientalism is defined as an 'object of study, stamped with an otherness—as all that is different, whether it be 'subject' or 'object'—but of a constitutive otherness, of an essentialist character. This 'object' of study will be, as is customary, passive non-participating, endowed with 'historical' subjectivity, above all non-active, non-autonomous, non-sovereign with regard to itself, the only Orient or Oriental or 'subject' which could be admitted, at the extreme limit, is the alienated being, philosophically, that is other than itself in relation to itself: posed, understood, defined—and acted—by others [Anouar Abdel-Malek in Chatterjee 1986: 36].

7 While I agree with Plamenatz and Chatterjee with regard to the disturbance that nationalist discourse evoked in the Indian nationalists, as already discussed the process of nation making is also disturbing both to the traditional European and traditional eastern societies more painfully for the former as the success of nationalism is more pronounced in them.

8 Underlying this mode of analysis is the construction of the west as a monolithic embodying materialism, underplaying the notion of spirituality and religion within the west. Consequently by following the same argument India comes to be identified with 'spiritualism', underplaying the material aspect of its culture.

9 The Sikh's reluctance to join the 1857 uprising as also their active participation in suppressing it are to be seen in the light of the

background of Sikhism. On the first case there was a continuous struggle for religious freedom against the Mughals with the proclamation of Bahadur Shah Jaffer as the Empire by the revolutionaries. The Sikh feared a renewed religious intolerance. This point has been totally ignored by Savarkar. Further, Savarkar does not take into account that just eight years before the 1857, the upper caste Hindu and Muslim soldiers of East India Company had deprived the Sikhs of their freedom although the Sikhs were fighting a war to protect dharma.

10 We may note that Hans Kohn has in mind here the challenges posed by Bismark to the Prussian state.

11 Elaborations on these and other themes can be had from Sahasrabudhey, Sunil (1986). The lines of analysis suggested by Mitra, Chandan and Chaturvedi, Badrinath (1990) on the pages of *The Times of India* are also worth pursuing.

Social Causes of Hunger

Porus Olpadwala

An End to Hunger? The Social Origins of Food Strategies: A Report prepared for the United Nations Research Institute for Social Development and for the South Commission based on UNRISD research on food systems and society by Solon L. Barraclough; Zed Books, London, 1991; pp 284.

I

IT is a sad reality that people regularly go hungry in our day and age. That they do so in overwhelming numbers in a world of agricultural abundance is shameful as well. The problem persists despite the close attention called to it by world politician and entertainer alike, and more importantly, despite the concerted efforts over three decades and more of countless highly knowledgeable, well trained, reasonably well financed, and exceedingly dedicated professionals of great goodwill from all over the world. Indeed, the Institute on Hunger and Development (Bread for the World) estimates in its *State of World Hunger* report for 1992 that "there are more hungry people in the world than ever before". Even if, as some argue, this represents a somewhat smaller proportion of humanity than earlier, that is scant comfort for the millions who still suffer and are at risk, and should not be of any greater consolation to the rest of us.

Who amongst us has not wondered about the reasons for such a calamity? And yet, genuinely satisfactory explanations are hard to find. Human destruction of such immense proportions necessarily has many causes. They stem partly from societal arrangements, partly from the natural world. They relate to a whole host of scientific disciplines. They occur singly and jointly. They arise within the boundaries of the societies concerned, and are imposed or influenced from outside. They vary with geography and have changed over history. They are often closely tied to politics, and thus prone to ideological interpretation and obfuscation. Sorting them out is a complicated task, even in the best of circumstances. In the normal run of things, or in incompetent or unscrupulous hands, the results are almost always wanting.

An End to Hunger? is a long overdue exception. We have here the intellectual culmination of a lifetime of sterling work in the area of food and development. What Barraclough modestly terms his 'biases' in the Preface are in reality the impressive credentials of an agriculturist, ac-

tivist, international civil servant, scholar, and above all, humanist. His words carry great authority.

Barraclough is a quintessential practitioner-scholar. A country youth from New Hampshire (he still owns farmland there), he served with the US Occupation Forces in Japan after World War II, an experience that he credits in the book with sparking his interest in development issues. After an economics doctorate from Harvard—financial courtesy the GI Bill—he began professional life working with sharecroppers in the Mississippi Delta. There he first became acquainted with extreme social and economic inequities, and the brutal power of landed interests, that later were to form one of the focal interests of his life and work. As a US agricultural officer in west Asia, and then as a senior official with the UN Food and Agriculture Organisation (FAO) in Latin America in the 1960s and early 70s, Barraclough became renowned as an authority on land tenure and agrarian reform. He wrote at length, lectured, and taught in many third and first world universities. (Cornell was lucky to snare him as a tenured professor of agricultural economics in the late 60s, but after a short time he returned to the field.) His scholarship led him to the directorship in 1977, of the UN Research Institute for Social Development (UNRISD). Even as an international civil servant and researcher, Barraclough never forgot his grass roots activism, for which pains he paid the all too common price. His family was forced to depart Chile in danger after the 1973 military coup, and later, at the start of the Reagan years, he was prematurely eased out of the UNRISD directorship by state department pressure because of his assistance to revolutionary Nicaragua.

II

Although he never states it quite so directly, Barraclough argues that the problem of world hunger has two roots. One is the failure of public policy; the other, the destructive effect of regressive social structures. These twin shortcomings are present in both the third world and in the

industrialised countries. Detrimental policy and stifling social structures are not confined to agriculture and rural areas only, but extend to all parts of the national economy, including the urban-industrial sector, and international trade.

This deadly mixture of failed policies and biased social structure ensures the food insecurity of billions of people. Investments are diverted to non-priority and luxury needs, in the countryside and in the cities (p 34). Agricultural production is shunted to cash and export crops, instead of food crops (pp 31-33, 239). Food crops, when grown, are given over to animal feed and other non-human consumption. Business and public benefits are cornered and co-opted by the privileged classes (pp 30, 70). The rural poor are physically and psychologically brutalised. If they choose to resist, even if by "peaceful democratic means, they are likely to be forcibly repressed with loss of liberty, livelihood and sometimes life... [by] devastating reprisals from landlords, employers and the police" (pp 177, 245).

The most important way to reduce hunger and food insecurity is to enlarge the numbers of people who are in control of their own economic destiny. This requires raising the levels of genuine participation in society, particularly amongst the least privileged. The main barriers to this are found in social structure rather than in faulty policy. Eliminating or reducing structural roadblocks almost always involves some measure of agrarian reform and changes in land tenure, although it may not be limited to that. Where land has been distributed more equitably, improvements have followed in food security and general physical well-being. If the changes were also accompanied by some sort of transition to collectivised or communal agricultural production, the results have been even better and longer lasting. On the other hand, land reform by itself is no panacea, or guarantor of improved food security. Societies are very complicated. So is history. It is imprudent to try to generalise too much about these issues. "Each situation is special" (p 236).

This is a complex argument, with many intricate weaves. Barraclough uses repeti-

is conveyed three times, in three successive sections of the book, each time with more information, detail and insight. Part One looks at food security issues through the lens of different types of agricultural production systems (which helpfully turn out to be geographically discrete as well). There is a chapter each on bi-modal agrarian structures (mainly Latin America), on communal land tenure systems (mostly Africa), on small-cultivator agrarian structures (Asia, mainly the Indian sub-continent), and on China. Part Two has five chapters on national food strategy, such as policies for increasing production, improving distribution, and providing food security for all. Part Three is a consideration of the international dimensions of the problem. Chapter 10 tries to divine how useful is mutual co-operation among the less-developed countries in tackling this problem. Chapter 11 scrutinises the so-called north-south relationships. The final chapter is a distillation of Barraclough's thoughts on some general principles and dilemmas regarding the achievement of food security for all.

III

Any effort to understand the world food situation must start with an appraisal of the physical capacity of the earth to nourish its inhabitants. Is there, and can there be, enough food for all? The book makes it very clear that this is no longer an issue, let alone a key one. There is no physical shortage of food today. Barraclough quotes several studies, including those of such establishment sources as the World Bank, to show that "the world has ample food" (p 2). Even at the height of the last great World Food Crisis in 1972, the "shortfall in production of the five Sahelian countries most affected... was less than 0.5 per cent of world cereal trade, and 0.25 per cent of the grain fed to livestock in the industrialised countries" (p 221). Indeed, and surprising as it may sound to lay people, in the last 20 years the overall world food dilemma has had a component that was related to 'persistent' and 'endemic' food surpluses, in addition to the much better known concern with deficits!

Taken as a single entity, therefore, the planet has little excuse for widespread hunger, particularly in the face of recent communications and transportation advances. But that is not all. For an overwhelmingly large proportion of the sufferers, the surpluses actually exist right in their own vicinity. The largest absolute numbers of severely malnourished people in the world are on the Indian subconti-

continent have made dramatic advances in food production in the last 20 years (p 93). India particularly has been self-sufficient in foodgrains since the mid-70s, holds food reserve stocks of 20 million tons and more, and is a net cereal exporter. And yet these same two countries account for the lion's share of the 40,000 children of one year of age or less that UNICEF estimates die daily on the planet from causes that are entirely and only hunger-related!

Even if there is enough now, what of the future? Will the growth of human populations eventually outstrip what may be for the present an adequate food supply? Neo-Malthusians stress that unless the problem of population is dealt with "there is not much use in doing anything else... [because it will be] cancelled out by growing hordes of people". Barraclough contends, on the contrary, that "world food supplies could be increased to meet the needs of practically any conceivable growth in population" (p 211). This of course assumes that appropriate structural changes can be made in the industrialised countries too, in addition to the poorer nations. At the moment the industrialised world puts an immeasurably greater strain on resources, including on those for food, than do the developing nations. The *The State of the World, 1991* charges that the "world's one billion meat eaters, car drivers, and throwaway consumers are responsible for the lion's share of the damage humans have caused to common global resources". For example, presently a "Dutch person's consumption of food, fuel, natural fibres, and other products of the soil involves *exploitation of five times as much land outside the country as inside—much of it in the Third World*" (Alan Durning, 'How Much Is Enough?', emphasis added). Estimates of increased carrying capacity are predicated, therefore, on a less wasteful way of life.

Barraclough concedes that population increases hamper the situation nevertheless, and need to be countered. The best way is through "expanding human capabilities and raising the quality of life" through deep and genuine social reforms, in addition to the indubitably needed family planning programmes. "A population programme without popular-based development is like trying to mop up the floor with the water turned on" (p 212). By making it clear that the solution to the problem of hunger does not have to wait upon driving down rates of population growth, Barraclough forces us to grapple with the much more contentious social dimensions of the issue.

If social factors are the principle cause of world hunger, what are they and how do they operate? If conspiracy is rejected as an explanation—and it mostly is, no matter the politics of the commentators—then the task becomes how to identify and wrestle into some order and priority the numerous other forces and decisions that combine to create this situation. This is the point at which many treatments begin to unravel, but Barraclough does not stumble.

The problem may be caused by faulty economic and social policies, including sheer neglect. This certainly has been the case in the past. For instance, less-developed countries often have hurt food production by giving preference to investment in industry over that in agriculture. Or they have kept prices of basic agricultural commodities artificially low to favour their more concentrated and politically volatile city populations. The book contains masterful accounts of national and international policies concerning investment, trade, marketing, the pricing of inputs, exchange rates, population, social services, and aid and international co-operation (part two mainly, Chapters 5 through 9 on the 'Dynamics of National Food Strategies', though happily for us they appear elsewhere throughout the book too). Each treatment is both an excellent primer and a handy reference for important topics.

Barraclough's approach to food and development policy is informed, practical, sober and pithy. It is also refreshingly open-minded and honest. Aspects of political economy permeate the discussion. For example, how would one evaluate policies to create a multi-million dollar investment project in Senegal and Mali for dams and associated infrastructure which "turned out to be uneconomic... [but from which] many foreign contractors and consultants reaped handsome profits" (pp 190-91)? Or how does the west's insistence on free-trade and open-markets jive with its own long history of subsidisation and protection of agriculture (p 74)? What are the consequences for developing countries of the strangling presence of oligopoly in agricultural commodity trade, where "transnational corporations controlled two-thirds of world trade... in the early 1980s" (p 200), or of the "unstable world monetary system", which keeps the third world at a handicap no matter how good their foreign exchange technicians (p 200)? There are additional telling passages on the retrogressive effects on policy of such factors as the 'deliberate' sabotage of public food distribution sys-

terms by the wealthy in Chile (p 66), the capture of the benefits of technological change by large landowners in Bangladesh (p 46), and the uses and misuses of international food aid (more on the last topic later).

If improper policy were all that was at fault, the tragedy would be neither so large nor so persistent. Sooner or later most policy-makers would be redeemed into the correct way of seeing and doing things. Unfortunately, policies are dependent upon, and subject to, the workings of deeper structural forces, substantially related to skewed asset and income distributions. For example, India has more than 70 per cent of its population in the countryside, and half of it is landless. Needless to say, these lives are extremely tenuous. Further, even many of the people who own land are not much better off because it is not adequate in size and quality. The book refers to a survey of 50,000 households in eastern India that found that "nearly half the families in West Bengal and one-third in Orissa did not produce enough food to feed their families for even one month in the year" (p 41, emphasis in original). In Latin America, the 'bimodal' distribution divides rural areas into "two clearly distinct strata in respect of the size of farms, their market orientation, and the socio-political position of the cultivators", with "essentially exploitative" links attaching them to each other (p 12). Large cultivators, domestic and foreign, indulge in the "rapacious exploitation of soil, water and forest resources for short-term profits" that end up further marginalising peasants (p 24). On the other hand, where land is more equitably held, the food situation is shown to be markedly better (Chapter 2 on 'Communal Land Tenure Systems'). Unfortunately, with trends moving clearly towards privatisation (p 26), and concentration in landholdings (pp 40 and 73), almost everywhere, the prospects for improvement based upon structural adjustment can only be viewed as grim.

Those who do not own land, or enough of it, depend upon others to provide work. These jobs may be on farms, or in off-farm activities located in the country, or in cities. Here too the future is foreboding. Agricultural modernisation tends to displace hired labour on farms, either through mechanisation, or through its replacement by family members. Where jobs do exist, real wages are often stagnant or falling (p 44). Likewise, the record of rural off-farm employment in the third world has not been very great. Migration to towns and cities is a massively chosen option, but it too falls far short of need. International migration—a key if severely underacknowledged factor in the development of the industrialised countries in

their own day—is effectively absent (p 228).

A few countries have managed to break their structural constraints through agrarian reform. This is one of Barraclough's professional specialisations, and Chapter 4 ('The Role of Agrarian Reform') is an excellent survey of land reform in approximately three dozen countries in Latin America, Africa and Asia. Not all were equally successful. Indeed, Barraclough singles out only six as being particularly effective in increasing the food security of the rural poor (China, North and South Korea, Taiwan, Cuba and Nicaragua). The Mexican and Bolivian reforms were effective "for a few decades" only, some of the others for even shorter periods (p 250). Some movements changed the distribution of land only (Mexico, Bolivia), while others tried also to change property relations (mainly China and Cuba). The relative success of all depended upon the seriousness with which they were pursued, and the "national and global processes of which [they were] only a small part" (p 133). The important role of foreign intervention in the 'global processes', particularly that of the United States in Latin America, is recorded on page 115.

Barraclough spares no one in this searching analysis of policy and structure. 'Soft' do-gooders of whatever ideological variant are forced to confront the harsh and disciplining presence of economic laws, including the unavoidable necessity for economic growth. Establishment economists are upbraided and up-ended repeatedly in a series of crisp rebuttals of their favourite shibboleths (e.g., the popular doctrine of 'getting prices right' on page 80, and the various development

'dilemmas' on pages 246 through 254). Uncritical proselytisers of the developmental methods of the currently industrialised countries are reminded at every turn of the vast differences between them and the third world, in particular the unique and unreplicable advantages of many of the former. Analysts of more radical persuasion are brought to earth by practical accounts of miserable failures in attempts at food security even after revolutionary struggle and structural change. The short-term mentality, greed, and corruption of the private sector are exposed. So are the ineptitude, sluggishness and corruption of the public sector. National and international bureaucracies are critiqued. Nothing is sacrosanct. (Only academe has been spared; not so much, it seems, because Barraclough is impressed by its worthiness, as because he overlooks it in its unimportance.)

V

Why cannot more be done to stem the hunger on a purely humanitarian basis, even as we sort out its complex roots? We know the places where people are at risk. The food exists, and is often available nearby. We have the means to convey it. What holds back the effort to cut drastically the numbers of hungry people worldwide?

Barraclough offers political and technological reasons. Much of the purpose of food aid has been and continues to be "strictly political" (p 217). This fact is now so well established that it brooks no argument, even from the aid-givers. Probably the most recent example is a speech given

Principles and Practices of VALUE ADDED TAX: LESSONS FOR DEVELOPING COUNTRIES

235 + XII pages* Rs 250, US \$ 30*

Cloth Bound* 1993

In the light of the experiences of more than 60 countries all over the world, this book by Prof. Mahesh C. Purohit of the National Institute of Public Finance and Policy, New Delhi 110 067 presents lessons to be derived for commodity tax structure of India as well as for the other developing countries. It provides an intensive study of the system of value added tax in various countries, especially in France—the pioneer of VAT. The coverage includes an in-depth analysis of the rates, bases, exemptions, taxation of services and harmonisation of tax rates among EEC countries. It also includes an extensive discussion of the administrative organisational and operational problems encountered in different countries with special reference to the forfait system of France in dealing with the small dealers.

The book has been greatly appreciated by Indian as well as foreign fiscal experts and is highly recommended for students, teachers, researchers, policy makers and tax administrators in developing countries in general and in India in particular.

Gayatri Publications, ISBN 81-85930-00-7

Post Box No 8495, Asnok Vihar, Delhi 110 052

at the UN on September 21 this year by president Bush in which he categorised his own Agency for International Development as "a weapon in the Cold War" (For partisan and historical balance, here is a quote from—then soon to be president—John F Kennedy "I would like to cut out foreign aid, it is unpopular. But this is a method by which the United States maintains a position of influence and control around the world." (NY *Herald Tribune*, August 10, 1960). Politics therefore plays a crucial role in his catastrophe.

On the economic side, the food aid process is as much driven by 'supply' (the endemic surpluses that the book notes) as by demand. Since it serves the giver at least as much as the receiver, both the composition and the timing of the assistance are far from ideal. The composition is determined substantially by the donor's agricultural needs and the instructions to him. In 1958 "We should be able to promote agricultural development without avoiding encouraging agricultural exports" (pp 218-19). These goals were reiterated and apparently reinforced in AID's newsletter, *Highlights*, in its spring 1992 issue that "the largest importers of US farm goods are nations that once received large quantities of US food aid. In 1990 alone, the United States purchased \$2.6 billion in agricultural exports, more than all the other nations combined received by South Korea during the same year period." As for food aid, Barraclough maintains that it is "essentially 'counter cyclical' because it increases sharply in periods of general scarcity and high world prices, when some nations choose to sell the food on the world market. This means that food aid is most available when food is dear and most needed" (p 216).

The reasons that are given for the need by donor countries for continuing assistance to match need are "increasingly more technocratic, and tend to put the onus on the receivers. Often the food does not reach the intended beneficiaries because it is appropriated by more privileged elements, sometimes for their own use, sometimes for profit. When it does get through, the technical aspects of distribution can be mishandled resulting in depressed domestic prices and reduced production (Barraclough characteristically notes that these effects are "less a problem of aid than of world food surpluses being dumped abroad" (p 218). Food aid is also used by recipients "primarily to delay or avoid making necessary domestic reforms" (p 217).

Concerns about food aid are perfectly valid from a technical point of view. But they also serve to underscore the structural constraints that prevent even the best intentioned policy makers from achieving greater success. It seems that emergency and temporary relief measures are derailed by many of the same forces that create the need for them in the first place.

VI

Property rights are an important aspect of the food system, very much who owns the land and the productive resources. It is a central issue on which the system is based. For example, the assets of the land tend to be owned privately and deployed for personal profit and unlimited individual accumulation. The rural and agricultural sector conforms to this arrangement in the majority of places, though the concentration of food is clearly much more skewed in the industrialised countries.

Making food a commodity like any other has some anticipated consequences, both positive and negative. On the production side, a very big plus is the increased productivity and output of the sort associated with the green revolution. However, these gains come at the cost of an enormous and wasteful use of farm machinery, fertilizers, and water. On the consumption side, productivity is increased, but it is destroyed by the system, destroyed by the way it encourages consumption. The output of the system is not used in the most effective way. On the consumption side, the transformation of food into a commodity means that it is no longer a social link between an important human need and its fulfillment into a commodity one. One result has been that even the richest countries have never fully solved the problem of hunger, indeed, it is once again a serious and growing menace in many parts of the world. In the poor nations, this set of arrangement helps to keep in place the ironic situation questioned by Pierre Spitz, another UNRISD researcher, in the *International Social Science Journal* in 1978 "How is it that the men and women who sowed the seeds, harvested the crops and minded the herds have perished for lack of food? How is it that they died of hunger in those parts of the world, whereas most of the people who do not produce foodstuffs were spared?"

The book's major shortcoming is that it does not deal explicitly with such systemic influences, even though it touches upon them throughout. Indeed,

Barraclough goes to the other extreme and eschews questions of private versus public property, market forces versus central planning, and capitalism versus socialism as "grossly misleading simplifications" (p 9), relegating them to the status of "pseudo-dilemmas" (pp 255-59). Here he does the wrong thing for the right reason. It is true, as he says, that most societies are a mixture of private and public, of markets and planning, and that, as far as food security is concerned, differing combinations of all these attributes have been present in successful and unsuccessful countries. It is also true that there are very few, if any, clear variants of one or the other social system or mode of production (essentially capitalism and socialism in our day and age). And there is no doubt either that many debates formulated in these terms tend to be trite and dogmatic. But none of this is reason to warrant dismissing the distinctions themselves as spurious. If practice is complex and not so easily categorisable, our ways of thinking about it imperfect and wanting, and some of the people involved narrow-minded and obstinate, then the redress is to recognise these failings and remedy them, and not peremptorily to declare them inconsequential or invalid. Capitalist societies that rely on public planning turn out to be quite different to socialist ones that involve markets, even though both plans and markets are present in both. It matters very much what is the base and what the enlargement.

It is clear from Barraclough's treatment of the topic that the answer to the question posed in his title is a resounding no, at least for the indefinite future. It is a pity that he does not state as much clearly and unequivocally somewhere in the book. We desperately need voices of his calibre and standing to constantly point out the acute and deteriorating nature of the international food problem. Too many others are either paying no attention at all, or suggesting by omission that it will be adequately resolved, in a not too untoward length of time, by staying the course that we have currently set. This expectation is incontrovertibly wrong. Judging from this superior book, Barraclough seems to believe so. It would have been ideal to hear it in his own words.

This is a very deep, very informative, and very reflective statement by a person of enormous experience, sagacity, compassion and honesty, on arguably the most important human topic of our day. Professional and lay person will benefit enormously from a consideration of its contents. We cannot go on as usual in this area. Barraclough's analyses must be a critical element in how we decide to move in the future.

India's Rouble Debt and Depreciating Rouble

Nirmal Kumar Chandra

This paper assesses the India-Russia agreement on the size and modalities of repayment of India's rouble debt from two different angles. The first consists of examining the distribution of the gains of India's trade with the former Soviet Union. The focus is on the unit values of the commodities exchanged, particularly our arms imports financed through Soviet credits. The other aspect concerns the nature of the rouble as a currency up to 1989 and after, on which score there appears to be very widespread misconception.

SINCE mid-1990 India is living under the shadow of a large external debt in hard currency that has transformed the economic scenario beyond recognition. Our debt to the erstwhile USSR was initially tucked away from the public view; negotiations about the size and modalities of repayment were, however, going on between India and the USSR, and later Russia as the successor state, over a number of years. When the agreement was finally reached in January 1993, the general view in India was that our government had conceded everything. The critics were perplexed by the Indian government accepting the Russian position that 9.9 billion roubles (bn rb) of debt be converted into hard currency, not at the Moscow auction rate of 488 rb/\$ as of January last, but at the 'old' 'unchanging' Soviet official rate of 0.78 rb/\$ at end-1989. Outside the government, only a handful defended the agreement.

The object of the paper is to assess the controversy against a broader canvas. Between any two inconvertible currencies like the rouble and the rupee, it is extremely difficult to establish a mutually satisfactory rate except through the intermediation of some hard currency, say the US dollar. So long as the par values of the first two in terms of the dollar remain stable, it is relatively easy to continue with some initially agreed exchange rate. Difficult problems arise when the par value of one or both the currencies changes in a marked fashion. Indeed, such was the case with the rupee devaluing rapidly since the mid-1980s, and the far more dramatic depreciation of the rouble (as evidenced by the Moscow auction rate) since 1989.

Here I approach the issue from two different angles. The first consists of examining the distribution of gains in Indo-Soviet trade. The focus is on the unit-values of the commodities exchanged, particularly of our arms imports financed through Soviet credits. The other aspect concerns the nature of the rouble as a currency up to 1989 and after; unfortunately, there is very widespread miscon-

ception on this score.

The paper begins by spelling out the key terms of the January 1993 agreement between India and Russia. In the following section the analytical approach of this paper is elaborated. Section III is on the valuation of Soviet arms exports. The theme of Section IV is the nature of the rouble as a currency till 1989. Next, some of the recent studies on the purchasing power parity of the rouble is summarised. Post-1989 changes in the scenario for the rouble are described in Section VI, followed by conclusions on the Indo-Russian agreement.

I

The Agreement

According to the *Economic Survey 1992-93* (p 119), "India's debt to the erstwhile USSR stood at about 9.871 billion roubles at the end of March 1992—8.899 billion roubles incurred for defence imports and the rest for civilian imports. As per the recently concluded negotiation, this debt, to be denominated henceforth in rupees, has been valued at Rs 31,342 crore. Of this, Rs 19,660 crore is to be repaid as per the existing schedule. The remaining Rs 11,682 crore will bear no interest and is to be repaid over the next 45 years. The negotiations have resulted in a net reduction in the debt owed to the former Soviet Union according to the 1978 Protocol, by about 32 per cent."

The *Economic Times* (January 30, 1993) reported: (a) The same volume of rouble-denominated debt was valued at Rs 19.90/rb on December 31, 1989 leading to a rupee figure of Rs 19,660 crore, and at Rs 31.78/rb on March 31, 1992, enhancing the total to Rs 31,342 crore. (b) Rs 19,660 crore will be repaid in 12 years, carrying an annual interest of 2.4 per cent on the outstanding amounts, but the rupee magnitudes of debt servicing will be redesignated in units of SDR (Special Drawing Rights). (c) The balance of Rs 11,682 crore will be repaid without interest in 45 years, i.e., Rs 260 crore per year.

For the first five years the repayment will be in rupees irrespective of the exchange rate. Subsequently, the sum of Rs 260 crore will be redesignated in SDR units, if the Rs/SDR rate rises by more than 3 per cent per annum. Considering the Rs/\$ rates (the weighted average of official and market rates) published in the *Annual Reports* of the Reserve Bank of India, it is evident that India implicitly acquiesced in a \$/rb rate of 1.28 on December 31, 1989 and a more favourable 1.09 on March 31, 1992, the weighted average being 1.21.

One must now look at the 1978 protocol, the main features of which were summarised in the *Reserve Bank of India Bulletin*, February 1979 (pp 100-01). (a) The two governments changed the 'commercial' exchange rate to Rs 10/rb from November 25, 1978, against the earlier Rs 8.33/rb. Further, "the rupee-rouble rate is subject to revision from time to time". (b) In "contracts where the period of implementation is one year or less, no rouble-rupee or any other exchange variation/protection clause shall be provided and the prices shall be expressed only in Indian rupees." (c) "When the period of implementation of a contract is more than one year and where the contract price is designated in Indian rupees and also related to the exchange rate between the rouble and the rupee, the exchange variation is to be provided. Accordingly, if on the date of payment under the contract, the exchange rate between the rouble and the rupee is different from the exchange rate obtaining on the date of conclusion of the contract, the quantum of payment to be made shall be adjusted in proportion to the exchange rate between the rouble and the rupee." (d) "The two governments have also agreed that the new rouble-rupee exchange rate shall not apply to non-commercial transactions between the two countries."

In the 1978 protocol, India agreed to a rate of Rs 10/rb, when a US dollar was equivalent to Rs 8.23; implicitly she accepted a \$/rb rate of 1.22. Around that time the official Soviet exchange rate for

commercial (foreign trade) transactions averaged \$1.46/rb in 1978 or \$1.53/rb in 1979, implying a cross rate of Rs 12.02-12.50/rb [ITS 1988]. Thus in the 1978 agreement the Soviets apparently made a significant concession to the tune of about 20 per cent on the Rs/rb exchange rate; as shown later in Section VI, this is not a correct inference.

Coming to the latest agreement, the Indian government has claimed that the initial amortisation payment (in Rs crore) which should have been 3,364 ($=31342/12+31342*0.024$) in terms of the earlier protocol, has been reduced by nearly 30 per cent to 2,370 ($=19660/12+19660*0.024+11682/45$) (*The Economic Times*, January 30, 1993). This is entirely due to the longer maturity of the rescheduled part of the loan. To get an idea of the 'real' reduction, it is more appropriate to compare the net present value (NPV) of the payment obligations over the entire stretch of 45 years. The NPV, it is well known, is highly sensitive to the choice of the discount rate. The new agreement provides for a 2.4 per cent interest rate for the non-rescheduled part of the loan, which may be taken as the lower bound of the discount rate; one finds from the World Bank estimates that the average interest rate on India's external debt increased from 5.3 per cent in 1988-89 to 5.8 per cent in 1990-91 [RBI 1992: 49, 52] and hence another discount rate of 5 per cent from the Indian perspective may be reckoned with. At the lower discount rate, the NPV in rupees crore is reduced from 31,342 to 26,756 or by 14.6 per cent, while at the higher rate the corresponding reduction is from 27,081 to 21,602 or by 20.2 per cent. The claim in the *Economic Survey 1992-93* that the debt has been reduced by 32 per cent is exaggerated. At this stage a caveat is in order. The calculations just presented assume an unchanged Rs/SDR parity as on March 31, 1992. Apart from the small sum of Rs 260 crore payable annually over the first five years, the rest of the debt service obligations should go up *pari passu* with the devaluation of the rupee.

In parentheses one must point to the misleading nature of the tables on external debt in the *Economic Survey 1992-93* (p 118, S-107), as these excluded the rouble debt as well as another \$2.18 bn owed in hard currency for defence purchases. Reckoned at the weighted average of the official (40 per cent) and market (60 per cent) rates of Rs 29.09/\$ on March 31, 1992, the former amounted to \$10.77 bn. Thus India's total debt (excluding those with a maturity under six months) at end-September 1992 was not \$71.1 bn as reported, but 18 per cent higher at \$84.1 bn. Adding to it an incremental debt of at least \$2.0 bn during the latter half of 1992-93.

the year-end figure should be around \$86 billion or Rs 266,755 crore at the exchange rate of Rs 31.00/\$. If one accepts the size of 1992-93 GDP forecast by the government, the debt-GDP ratio should exceed 40 per cent on March 31, 1993 as against 27.3 per cent shown in the same document for 1991-92. India is likely to graduate within a year or two from the 'moderately indebted' to the more exalted 'severely indebted' status under the World Bank classification! But that is another story that need not detain us here.

II

The Approach

As I intend to use the analytical framework of an earlier study [Chandra 1977] on Soviet trade with the main third world partners, the earlier approach and conclusions may be recapitulated. (a) Looking at the latter's opportunity costs of exporting to, and importing from, the USSR, I accepted other scholars' findings that the third world countries gained on the price front some 5-10 per cent as against what they paid to or received in hard currency from the west. (b) In the early 1970s the Soviets gained much more. While they charged reasonably for their export of primary commodities, including fuel, and certain manufactures, they overpriced the machinery supplied. Comparison of the units values of Soviet machinery exports to three sets of countries, namely, the west, other CMEA (Council of Mutual Economic Assistance) countries and the third world, all based on official Soviet statistics, showed that the last two sets paid roughly similar prices, exceeding those realised from the west by anywhere between 36 and 68 per cent during the years 1971-74. (c) "Had the third world countries been able to obtain their imports from the USSR at prices no higher than what the latter has been realising from the western countries, the question of an appropriate rate of exchange between the rouble and the rupee or other third world currencies would have been of purely academic interest" (pp 119-20). (d) In a sense, the USSR "maintains an artificially high value of the rouble, not in relation to trade in hard currencies, but as against inconvertible third world currencies. This becomes particularly burdensome at times of aid repayments if in the meanwhile, the latter undergo devaluation under external pressure" (p 122). I cited a number of western, Soviet and east European studies, taking into account Soviet domestic and foreign trade prices; these showed that the Soviet official exchange rate of 0.9 rb/\$ was not out of alignment with the purchasing power parities (PPP). Now Kravis (1976) found that *vis-a-vis* the dol-

lar, the PPP of the Indian rupee in 1970 was 255 per cent higher than its nominal value. It followed that the PPP-based rupee-rouble rate should have been fixed at a far lower level than was agreed between the two governments. (e) My overall conclusion was that there was an unequal distribution of gains in the trade between the USSR and the third world in favour of the former. The practical alternative, I felt, was for the latter to 'try and bring down the import prices of Soviet machinery'. [Chandra 1977:111].

The keystone of the argument was the overpricing (*vis-a-vis* their world market prices) of Soviet machinery. In a subsequent 1983 study by Marrese and Vanous (cited in Dietz 1986), the percentage overvaluation in Soviet machinery export to the CMEA was put even higher at 108-143 per cent during 1970-78, on the premise that "the quality of manufactures traded between CMEA countries is lower than on the world market by 25-60 per cent". These higher estimates have, however, been questioned by several scholars, including Dietz (1986). Further, my point of reference was very different from that of Marrese and Vanous, it is unlikely that the USSR supplied machinery of different qualities—one for export to the west, and another for the domestic, CMEA or third world markets.

My hypothesis seems to have been vindicated by the actual course of development. By the late 1970s, India's import of Soviet machinery dropped to a trickle, very few new projects in the civilian sectors were undertaken with Soviet technology, and the technological gap of the USSR *vis-a-vis* the west came to be widely discussed within and outside the USSR. A few years ago in the wake of our rising surplus in rouble trade, the Indian government sent private sector delegations to the USSR in search of machinery, but they all came back empty-handed. However, civilian items account for under 10 per cent of our present rouble debt; military supplies formed the bulk of non-standard Soviet exports and of the outstanding credit to India. Hence the crucial question is to ascertain whether or not Soviet weapons were reasonably priced. This is the theme of the following section. I assume, as before, that all other trade transactions between India and the USSR took place at transparent world market prices, leaving little scope for an unequal distribution of gains.

III

Soviet Arms Exports

The annual studies by the SIPRI (Stockholm International Peace Research Institute) since the late 1960s have gained

wide recognition as 'objective', though other agencies and scholars do not necessarily endorse the findings. Indeed, some of the latter are discussed in different year-books of the SIPRI. Although I was unable to consult the sources, notably the estimates of the US Arms Control and Disarmament Agency, it may not be a major shortcoming in the present context.

The SIPRI data on arms trade comprises trade in 'major' weapons to the exclusion of small arms; the former also cover imported raw materials, components, etc, needed for the local production of major weapons (e.g. the MIG fighters in India) under licence from another country. The method of valuation is, however, quite unusual and often causes confusion among unwary readers. Unlike official trade data reflecting actual prices paid or obtained, the SIPRI's object is to measure "the trend over time both in the quantity and quality of arms traded". As a result, the SIPRI consciously departed from actual delivery prices, and devised its own method of evaluation [SIPRI 1990:310].

Back in 1968 a long list of weapons was drawn up along with the actual US dollar prices, wherever possible. Next, the actual prices were adjusted for 'weight, speed and role' of every category of weapons in order to establish a sort of 'uniform' 1968 price for each. The technical characteristics of each weapons system were assessed by experts from different wings of the Swedish armed forces. The SIPRI later shifted the constant base year price to 1973 and then to 1975, by allowing for an increase in costs measured by the 'wholesale price index'; in arriving at the overall inflation rate, the weights assigned were 60 per cent for the US index, and 20 per cent each for France and the UK, the two other major western suppliers [SIPRI 1983:354-55]. There were minor changes in the method over the next 10 years.

Before shifting the base from 1985 to 1990, a thorough revaluation of 4,500 weapons systems was undertaken in 1987. A general mark-up for 1990 costs was based on the US department of defence deflators over the years, 1985-90. The overall inflation rate during the quinquennium came to 19.1 per cent that took into account: (a) the producers' price index for machinery in the western countries that were among the largest exporters of arms; and (b) the changing exchange rates between these currencies [SIPRI 1992:354-56].

For Soviet weapons, the SIPRI establishes their technical equivalence in terms of western weapons and applies the western prices. As a result, the SIPRI valuation in US dollars of Soviet exports "tend to be higher than their quoted prices". By 'quoted prices' is meant the rouble prices converted into dollars at the Soviet offi-

cial rate of exchange.

At constant 1985 dollars, as shown in Table 1, the SIPRI estimated the Soviet exports during 1986-90 to all countries at \$60.8 bn; since there was a 19.1 per cent inflation, the value at constant 1990 dollars comes to \$72.4 bn. This may be compared to the Soviet official statement, perhaps for the first time, in early January 1991 that the USSR had exported to all countries during the 'past five years' (presumably, 1986-90), arms worth 56.7 bn rb, including a gift of 8.5 bn rb (E S Belousov, deputy chairman, USSR council of ministers, cited in SIPRI 1991, p 212). As there is little evidence of inflation in the prices of Soviet weapons, the aggregate value of export should have been the same at the current 1990 prices. Combining the Soviet and SIPRI figures, one arrives at the 'SIPRI exchange rate' of \$1.28/rb for arms export. For Soviet exports to India, I have the SIPRI estimate for 1986-90, but none from the Soviet side; the figure of 8,899 mn rb refers to the outstanding credit, but not to the arms flow which may have been larger. Hence I shall presume that the same SIPRI rate of \$1.28/rb applies to India as well, which equals the rate recently agreed between India and Russia for end-1989.

How reliable are the SIPRI values in dollars or the Soviet rouble figures? Indeed, for Soviet military expenditure as a whole, there has long been a vast discrepancy between the budget figures and western estimates. In 1989 Gorbachev himself disclosed the 'true' figure of 77 bn rb against 20.9 bn rb earlier reported in the Soviet budget; the SIPRI's *ex ante* (in December 1988) estimate for 1989 was 88-96 bn rb, which was enhanced *ex post* to 100-105 bn rb or \$ 263-276 bn at the SIPRI's 'military PPP' of \$ 2.5/rb; western intelligence sources put the Soviet outlays even higher at 120 bn rb. The SIPRI was, however, critical of the inflated dollar estimates of Soviet defence outlays by the Central Intelligence Agency

(CIA), as the latter "considers the dollar cost of replicating the Soviet armed forces in US, i.e. equivalent US wage costs. This would also raise the defence burden [i.e. defence outlays as a ratio of the GNP] for France and Germany" [SIPRI 1990:162-64; SIPRI 1991:145]. On the other hand, it has been argued by Steinberg (1992) that the CIA underestimated the rouble costs of the defence sector insofar as "there exists secret wage subsidies in defence industry, not included in the official defence expenditure".

Notwithstanding the controversy on the rouble costs of the overall Soviet outlays on defence, none of the contending scholars or agencies, to my knowledge, have suggested that there was an upward or downward bias in the official (rouble) valuation of arms exported. It is possible that the CIA or the NATO or the individual scholars never addressed themselves to this question. One cannot rule out altogether the possibility that the Soviet authorities may have underpriced their weapons in roubles either because they blindly followed the norms for domestic costing or because they wanted to expand their market share. On the other hand, since many of the buyers were 'captive' clients, the Soviets might have got away with a premium over costs.

If the Soviets had, indeed, underpriced their arms supplies in terms of roubles, one can in the present context ignore it so long as the Russians do not ask for an upward revision in the rouble value of the debt. What needs to be investigated is whether the USSR had overcharged, affecting the SIPRI valuation of Soviet arms export. Actually, the SIPRI estimates of Soviet arms export to the third world are significantly lower than the CIA's. For the overlapping years for which the two sets of figures are available (Table 1), the latter exceeds the former by 120 per cent in 1984, 48 per cent in 1986, and 120 per cent in 1988; the fact that the CIA esti-

mates are in current dollars, while those of the SIPRI are at constant 1985 dollars, would call for only a small correction of these percentages. The SIPRI believes that the CIA estimates are biased upwards, and that its \$/rb exchange rate is inappropriate [SIPRI 1991:186-87]. It thus follows that the SIPRI's dollar figures on Soviet arms export to the third world are not artificially high.

In recent years the SIPRI has provided comparative cost figures for particular weapons (a) At a joint press conference in June 1989 with the US Admiral W J Crowe, the Soviet General Moiseyev claimed that their freight aircraft SU-25 costs only 5-8 mn rb against \$28 mn for an F-16. At the SIPRI 'military PPP' rate of \$2.5/rb, the former works out to a little over 50 per cent of the latter. The SIPRI attributed the huge difference to 'goldplating' (incorporating inessential but high-cost features in F-16), corruption, cost-plus pricing, and excessive profit rates prevalent in the US defence industry. Alternatively, the Soviet fighter might have been underpriced [SIPRI 1990:165]. (b) It was gathered from the Polish defence ministry that: (i) the Soviet fighter aircraft MIG-29 cost \$18-25 mn each as against \$21-25 mn for an F-16, and \$26-70 mn for the French Mirage 2000; (ii) the Soviet tank T-72 cost \$0.4 mn against \$2.6 mn for the German Leopard-2, and \$3.7 mn for the American Abrams; (iii) the Czech armoured vehicle BWP-2 cost \$0.5 mn against \$1.2 mn for the American M-2 Bradley. (c) An American study showed that as against a 1975 cost of \$15 mn for an F-16, a MIG-23 produced in the US would have cost no more than \$5 mn. (d) The SIPRI surmised that the Soviets may not have covered cost for many weapons; a study by the RAND Corporation, USA, supported this conjecture for naval ships and helicopters, but not for tanks and tactical aircraft [SIPRI 1992:209-12].

The preceding discussion may be summarised as follows:

1. On the dollar valuation of Soviet arms exports to the third world, the estimates by the SIPRI are the lowest among the western agencies, and also the least unreliable.
2. For 1986-90, the SIPRI estimated the parity rate for Soviet arms export to all countries at \$1.28/rb, which is close to the implicit \$/rb rate under the 1993 Indo-Russian agreement.
3. The actual prices for individual weapons quoted by the Soviets for their exports were often lower than the 'uniform' or notional prices of the SIPRI.
4. On the whole, there is no evidence of Russians having overcharged for their arms supplies to India.

IV Rouble till 1989

The Soviet rouble (along with the currencies of other centrally planned economies) is quite unlike others, convertible or inconvertible. It is best brought out by contrasting the rouble as it was till 1989, and our rupee. Both were primarily used as legal tender for transactions within the country; legally, neither currency could be taken out of, or brought into, the country; the exchange rate *vis-a-vis* the dollar (or other hard currencies) was fixed by the respective government; an ordinary citizen going abroad was allowed to buy only a small quantity of dollars; capital transfers were banned. There was also a black market in currency in both countries; about the Soviet black market more will be said later. Here the similarities end.

Till 1990, the USSR had a highly centralised planning system. All domestic prices (barring those on the kolkhoz market) were set arbitrarily by the government, and insulated from domestic supply-demand imbalances or world prices thanks to the complete state monopoly of foreign trade. The foreign trade agencies bought exportables from domestic firms at local prices, and also sold imported wares at domestic prices; individual enterprises had hardly any incentive to export or save on import, but were encouraged to fulfil, if not exceed, the output and delivery targets as laid down in the plan. Thus the external value of the rouble had no impact on the bonuses offered to the enterprise personnel; nor did it affect the planning of foreign trade by central organs. By contrast, although India maintained a system of elaborate controls by the state over foreign trade, the actual decision to import or export remained with individual firms, public or private, that were profit-oriented. Prices in India were only partially protected against trends in international markets. Variations in the exchange rate of the rupee may or may not have affected the aggregate levels of export (import), but these certainly had a major impact on the profit rates earned by exporters (importers) unless there was a countervailing tax on export (import). In other words, India was much more of a market than a centrally planned economy; and the exchange rate of the rupee played a very significant role in many sectors.

A couple of examples may bring the differences between the rupee and the rouble into sharper focus. Since Indian shrimps found an export outlet since the 1970s, domestic prices shot up; a similar development in the USSR would mean just longer queues for the consumers without a rise in price. In tea, although the

government has kept the export volume under control, domestic prices flared up in sympathy with movements in international prices in the late 1980s. On many occasions, the Indian government imported large quantities of wheat as a means to stabilise domestic prices of wheat and other cereals. No parallels could be found in the USSR, as the state maintained fixed prices for most goods and services over the decades. Large-scale import of wheat into the USSR since 1972 was designed to supplement the domestic availability of milk, meat, etc. Lastly, smuggling into India augmented the annual domestic supply of a number of goods like gold, synthetic textiles, consumer electronics, etc, which directly or indirectly affected local prices; but smuggling of goods into or out of the USSR was rather insignificant till the last couple of years.

In 1961 Khrushchev introduced the 'new' rouble with a notional gold content of 0.987 gramme, since the US had pegged the gold price at \$35 per ounce, offering to sell any amount of gold at that price, the exchange value of the rouble was fixed at \$1.11 by the Soviets. Once the dollar lost its gold moorings in late 1971, the Soviet government announced from time to time the exchange rate between the rouble and the dollar or other hard currencies, although the \$/rb rate generally moved in sympathy with the dollar value of one SDR, the rouble was not tied either to the SDR or to the fluctuating price of gold in the international market. In practice, the official conversion rate for Soviet trade flows in \$/rb varied from 1.11 in 1970, to 1.33 in 1975, 1.52 in 1980, 1.30 in 1985, 1.63 in 1988 and 1.58 in 1989 [ITS 1988; UNESCO 1991].

Given the sharp differences between the domestic and foreign prices, the unique rate of exchange hardly helped the central planners to maximise the benefits from foreign trade. In Poland the exchange rate of the zloty was fixed just as arbitrarily as the Soviet rouble at 25 zl/\$ in the late 1950s. The Polish central planners, notably M Kalecki (and his team) working on the Perspective Plan, 1960-75, employed 'efficiency' norms for foreign trade differentiated by branches; it was observed that in order to earn one dollar through export, the domestic outlays (net of subsidies and taxes) ranged from 30 zl for machinery to as much as 80-90 zl for food products [Chandra 1967]. More elaborate calculation of such branchwise norms or conversion coefficients between 'internal' and 'foreign exchange' (dewizowy) zlotys followed. There is a strong family resemblance between these conversion coefficients, and the western economists' 'domestic resource costs' (DRC) or its earlier version, 'effective rate of protec-

tion' (ERP). It seems that the ERP was first operationalised around 1963 (Bhagwati and Desai 1970: 356), or several years after Kalecki and his team. The differences between the Polish norms and the western ERP are substantial. The latter aimed at removing the distortionary effects of differential tariffs and quantitative restrictions on the import of various goods, in order to measure the efficiency of domestic manufacturing *vis-a-vis* international producers; in DRC the calculation is similar except that the imperfections of the domestic market for non-traded goods and services (including labour and capital costs) are eliminated by utilising 'shadow' prices for the latter. In centrally planned economies there was no need for import tariffs or quantitative restrictions; if one assumes that the domestic price structure reflects the planners' preference, which may not always be true, then the conversion coefficient is close to the DRC for an industry.

The Soviet planners took up the Polish-type exercise with a considerable time lag. Their practical usefulness was severely circumscribed by the rigidities of a command economy; hardly less important was the systematic political discrimination by the NATO powers against import of manufactures from the eastern bloc which was keen to export much larger quantities of these goods for a variety of reasons. (i) The domestic costs being low, the suppliers were willing to sell the products (from machines to cars, textiles, etc), even at a discount against the prevailing western prices. (ii) Fair competition in the world market would have enabled the exporters to improve upon their quality, thereby reducing the technology gap. The west in its turn, was determined to prevent the last on military, political as well as economic grounds. Had the global market been anywhere as free as liberal theology makes one believe, there was a distinct possibility that the eastern bloc could emerge as a much stronger manufacturing power, challenging the domination of the west. Furthermore, since the USSR et al were compelled to restrict themselves to primary commodities in their export to the west, the former were competing in effect with the third world in western markets, strengthening the forces leading to a secular decline in the global terms of trade between primary commodities and manufactures.

In the wake of the perestroika a post-1968 Hungarian-type reform was attempted from 1987, and individual firms were encouraged to export on their own, utilising the conversion coefficients between the 'internal rouble' (IR) and the 'foreign exchange' ('valyutnaya') rouble (VR) established by the central authori-

ties. Exporters could retain a part of the VR in order to meet their import requirements; but the ratio varied according to the nature and/or purpose of the import. Thus, against an earning of one VR, a tractor exporter could import western equipment worth 0.46 VR, while an exporter of tourist automobiles could import goods worth as much as 1.92 VR. Up to 4,000 such conversion co-efficients were in vogue between 1987 and 1989, ranging widely from 0.2 to 6.6 IR per VR; actually, the ratios of domestic wholesale to international prices were even wider from 0.03 to 50.0 IR/VR for different products of the mechanical engineering industry in 1988. The post-1987 conversion coefficients were also changed frequently, up to three times a year, causing a great deal of confusion all round. The new system made little headway, contributing only about 10 per cent of total export at the end of 1989. Moreover, the existing system was causing a drain on the state budget; an earlier 1985 study by the Gosplan covering the whole of foreign trade estimated the overall IR/VR ratio at 1.4 (Ricoeur 1991: 53). In 1988 it was found that although the USSR had trade surplus of 2.1 bn VR, the centralized trade agencies incurred a staggering deficit of 50 bn IR (Lushin 1991: 7).

Hence the government decided in 1989 to move over to a more manageable system in the near term. While the official rate remained unchanged at 0.62 rb/\$, a 'commercial' rate with 100 per cent premium, i.e. 1.24 rb/\$ would be established, the effective rb/\$ rates, however, would be 0.6 for raw materials and basic goods, and 3.0 manufactures. Two other decisions were implemented immediately (i) A 'non-commercial' rate for foreign tourists and residents was introduced for the first time at 6.26 rb/\$. (ii) The Moscow Interbank Currency Exchange was set up to hold regular auctions at which dollars were to be bought and sold against IR. In the western media, the introduction of the commercial rate was interpreted as 50 per cent devaluation, the tourist rate as 90 per cent devaluation, and so on. Few noted that for raw materials, etc, there was no 'devaluation' at all. What really happened was that a system of multiple exchange rates was formalised, more freedom to dispose of dollars was given to exporting firms, and foreign tourists got an attractive conversion rate to wean them away from the black market. Further, the auctions were in no way free, these "are only open to certain enterprises, and hence the price of hard currency is indirectly restricted by administrative fiat and would hardly be allowed to rise too high. It is, therefore, a small and distorted market" (Aslund 1991 a: 19). At the first auction

in November 1989, the actual rate was 9.57 rb/\$ though the Auction Committee data showed that many firms were prepared to pay up to 17.0 rb/\$; the volume transacted was a mere \$ 0.88 mn (Ricoeur 1991: 56).

For many decades now there is a parallel or black market in dollars. Back in 1970, this rate was reported at 5.92 rb/\$ (Kidron 1972: 31), or almost 6.5 times the official rate. I myself observed in mid-1981 that in Moscow it was still around 6 rb, whereas in Warsaw one could sell a dollar for 300 zl, and buy a rouble for 20 zl, yielding a cross rate of 15 rb/\$. In general, scholars do not consider this rate as a meaningful exchange rate for evaluating the Soviet trade flows or national income or consumption, etc. As Nove (1986, p 288) put it succinctly, such dollars were bought by Soviet citizens either to acquire foreign consumer goods like whisky, jeans, consumer electronics, etc, available only at special hard currency shops, or to supplement the meagre amounts released by the Gosbank for those travelling abroad. One may add that the black market supply of dollars came mainly from foreign residents with a dollar income (e.g. embassy officials, students or scholars receiving allowances in hard currency), or from foreign tourists who might change a few dollars to buy food from the kolkhoz market or restaurants. Given the extremely small number of foreigners and their equally limited need for roubles, there was an excess demand for dollars leading to its high price. Aslund (1991, p 184) came to the same conclusion; he also noted that the black market rate stood still for a long time at 5 rb. After perestroika, there was a greater influx of foreigners, but the excess liquidity with Soviet citizens rose much faster. As a result, the rate shot up to 10 rb in 1989 before the currency auctions started (Ricoeur 1991: 57).

Purchasing Power Parities till 1989

How much is a rouble 'really' worth in terms of dollars? There is no unique answer. As the Soviets since the 1920s were keen to catch up with the west, there is by now a vast literature comparing the levels of output, consumption, military expenditure, etc, in the USSR with those in the west, particularly the US. Generally, but not always, the official Soviet estimates at current prices are considered reliable. But scholars differ widely on how to translate rouble prices into dollars, taking into account the quality, availability and so on. Here I shall confine myself to several post-1980 studies.

Undoubtedly the most elaborate effort so far is that of the American CIA. To this end it collected a large volume of sample data in 1982, and many Soviet products ranging from packaged foods to all kinds of manufactures, including consumer durables, were specially flown into the US for an on-the-spot examination by American experts. The CIA found that in 1989, at rouble prices (US quantity weights) the Soviet GNP came to 39 per cent of the US level, while at dollar prices (Soviet quantity weights) the figure was 66 per cent; the PPP from the GNP comparison, i.e., the geometric mean between the two PPPs using respectively the American and the Soviet quantity weights, came to 0.24 rouble per dollar (cited in Rosefielde 1991). For those who believed that the Soviets always falsified their data, the outcome was disappointing. Indeed, the Central Statistical Administration (TsSU) had estimated, presumably at dollar prices, the Soviet net material product at 67 per cent of the US's, both in 1980 and 1983 [Narkhoz 1983: 58].

On per capita personal consumption, the CIA estimated the 1976 Soviet level at 34.4 per cent of the US magnitude, and the PPP came to 0.60 rouble for dollar. Birman, a noted Soviet economist who emigrated to the US in the Brezhnev era, was quite unhappy, his main complaint being that the CIA took inadequate account of the very poor quality of Soviet goods. Birman's estimates of Soviet consumption ranged from 22.4 per cent to 28.4 per cent of the American figure, the implicit PPP for the dollar being in the range, 0.73-0.92 rb [Birman 1989: 26-27, 155, 174]. The widely respected Harvard scholar, Bergson (1991, p 31), whose earlier work provided the benchmark for the CIA estimates of Soviet national income since the 70s, conceded that the 1976 PPP rate of the CIA did not "allow fully for proverbial qualitative deficiencies in Soviet products". Yet he made no more than a 10 per cent upward adjustment in the rate, based on a subsequent, but unpublished, study by a CIA economist. The modified Soviet index of per capita consumption (with US=100) was 31 for 1976, and came down to 29 in 1985. Bergson also referred to the estimate given in a report by international agencies [IMF et al 1990: 51] that in 1989 the Soviet per capita GNP amounted to \$ 1,780, or a mere 8.5 per cent of the US level. "Apparently, this astonishing figure was derived by a foreign exchange rate conversion at a rate reflecting a fresh two-thirds devaluation, which testifies more to the vagaries of such a calculation for an inconvertible currency country than to the level of output itself. The cited study makes no claim for its GDP figure from the latter standpoint" [Bergson 1991].

Rosefielde (1991) has examined several other estimates presented by Soviet scholars at a well-publicised Washington conference in April, 1990. (a) Allowing for quality adjustment and hidden inflation (owing to prices being often raised significantly for trivial improvements in quality or qualities being lowered without a fall in price) in the USSR, M Shukhgal' ter put the PPP value of dollar in respect of 'all fixed capital assets' at 1.0-1.2 rb. (b) Another scholar, L. Novchekina, put the 'adjusted PPP' for 'capital investment' at 0.45-0.70 rb per dollar. Considering further expert judgment on quality, and forced substitution (due to non-availability of the desired good), she raised the same PPP for dollar to 0.89-1.38 rb.

From all this I conclude that: (a) The PPP rates vary greatly as between different baskets of goods and services, e.g., GNP, consumption, investment, capital stock, etc. No single PPP rate irrespective of the basket can be obtained. (b) The rates estimated by different scholars for the same basket in a particular year also diverge greatly. As Bergson (1991, p 41) put it: "The last word on the CIA estimates of Soviet output remains to be said." Nevertheless, the range indicated in the preceding paragraphs, 0.24-1.38 rb per dollar should provide the upper and lower bounds. (c) The exchange rate officially fixed by the Soviets is well within this range, and the black market rates, not to speak of those at Moscow auctions, lie far beyond; the latter are hardly of any use in determining the dollar equivalent of a rouble either for large and sustained trade transactions or for international comparisons.

VI Rouble after 1989

Tumultuous changes are taking place since 1989. Eastern Europe rejected the Communist parties towards the end of that year, and has moved towards a market economy. And the same direction has been taken by Russia after the disintegration of the USSR in late 1991. The major macro-economic and social changes affecting the rouble since 1989 may be briefly enumerated:

- (a) There has been a sharp fall in national income, industrial production, and many other sectors of the economy.
- (b) The old system of centralised planning has been dismantled, but an orderly market economy is yet to take shape. Enterprises, regional authorities, and ministries, all have roles, sometimes conflicting, in decision-making.
- (c) Although privatisation has been on the agenda, most big enterprises remain state-owned. In petroleum and certain other

sectors, however, there are already many joint ventures (JV) between the state and private foreign capital.

(d) Tariffs have been introduced on both exports and imports. Quite a large number of exportable items are on the banned list. Subject to these restrictions, firms are free to trade.

(e) A part of the export earnings has to be surrendered to the government; the remainder can be utilised to import goods or kept in foreign banks for future use. But the JVs that had obtained foreign capital, pledging future export of their products, are exempted from this obligation.

(f) Along with the decline in national income, etc., the Soviet foreign trade also shrank from 1990. In particular, trade with the CMEA partners plummeted in 1991, and in 1992 Russia's trade with them came down to a trickle. But illegal foreign exchange transactions have taken massive proportions.

(g) While Soviet prices were remarkably stable till 1989, there were significant increases in 1990 and 1991, since January 1992 a hyper-inflation has been raging in Russia.

Regarding the external value of the rouble, it was earlier noted that the USSR intended to introduce from 1990 differentiated (by commodity groups) 'commercial' rates around the basic one of 1.24 rb/\$, and that in the much quoted report on the USSR by the IMF et al (1990), the commercial rate was put even higher at 1.8 rb/\$. In a study of the Vienna Institute for Comparative Economic Studies, Grabisch et al (1992, pp 85-87) erroneously converted Soviet trade flows in VR into dollars using the changing commercial rates. From the official foreign trade data for 1990, in VR as well as dollars, it transpires that the overall exchange rate was still 0.59 rb/\$ [Chandra 1993]. If this was true on the aggregate plane, the reality at the ground level was at least as complicated as before when thousand of commodity-wise 'conversion' rates prevailed; what added to the confusion was the trend toward decentralised decision-making, and the introduction of the Moscow auction rate (AR) enabling firms to acquire and dispose of dollars. Not only were the AR far higher than the commercial rate, but many firms, it was also noted, were willing to pay nearly twice as much as the AR. On the other hand, the volume of transactions at the auctions remained quite small in the initial phase. For all these reasons the operational significance of the commercial rate remains for me shrouded in mystery, in any case, it cannot replace the old official exchange rate either for statistical or for economic purposes. Russia in May 1992 had a plethora of exchange rates as follows [Kireev 1992]:

(1) The auction rate (145.5 rb/\$) was determined at the periodic auctions as noted above. Some 34 authorised banks, the Central Bank (CB) and the Moscow government participated in the auctions; other domestic firms operated through the banks. No foreign companies or individuals were allowed to enter the scene. The CB did influence the auction rate. The average volume of transactions per auction amounted to \$ 6-8 mn.

(2) The market rate (100 rb/\$) was set by the CB from time to time, though linked to the AR, it was neither equal nor strictly proportional to the latter, allowing some further latitude to the CB. The market rate was used for accounting purposes; exporters compelled to surrender 10 per cent of their earnings to the Currency Stabilisation Fund were compensated in roubles at this rate.

(3) A special commercial rate (55 rb/\$) was again set by the CB as a proportion of the market rate, and used for accounting purposes; exporters obliged to part with 40 per cent of their earnings to the foreign exchange reserve, obtained roubles at this rate.

(4) The black market rate (120-130 rb/\$) was highly volatile, even during a single day. Individuals, traders, firms and even banks took recourse to it. Deals were struck even inside the premises of a bank in order to avoid payment of bank commission.

(5) The special foreign exchange rate (5.4 rb/\$) was used exclusively for 'centralised import' of food, medicines, technological raw materials, etc, paid out of the state budget, and for the release of foreign exchange to government officials visiting abroad.

This situation did not last very long. Although the former prime minister Gaidar sought to introduce a uniform rate of exchange, initially for current account transactions from July 1, 1992, and eventually for capital account as well with full convertibility from 1993, he met with partial success. The scene in early 1993 has been surveyed by Grigoryev (1993). For current account transactions, there are still more than one *de facto* rates.

(a) The basic one is the AR determined twice a week, and is declared as the official rate by the CB on the following day. The parallel auction centres in St Petersburg, Ural, Siberia, etc, have their own rates which are not identical with, but still close, to the Moscow rate. Since the Moscow auctions are confined to a limited number of participants, most individuals and firms go to authorised commercial banks or to the street/black market. While the AR stood at 572 in February 1993, the banks were buying dollars for 620-640 rb, and selling at 690-710 rb. The black market rate would be within the band established by the commercial banks.

(b) For 'centralised import', covering around one-half of Russia's total import, the government sells dollars to the designated state enterprises at highly subsidised rates varying from 5-30 per cent of the official rate. Thus when the latter was 572 rb/\$, the government charged anything from 29-172 rb/\$, depending on the commodity to be imported. According to Democh (1993), the lowest rate in March was even smaller at 20 rb/\$.

(c) For ordinary citizens, most state and private enterprises and businessmen, however, the AR occupies the centre stage. That is why two business organisations, namely, the Moscow Chamber of Commerce and the Moscow Commodity Exchange, started quoting forward rates, in early February 1993, these rates per dollar were 1,100 rb for delivery in April, and 1,300 rb for delivery in May, respectively 92 per cent and 127 per cent higher than the spot rate in February just quoted.

As the AR soared, Grigoryev continued (perhaps for the benefit of Indians), "our debtors began to convert with pleasure" their dollars into roubles, and "insistently offered us to receive the payments". The Russian Central Bank had to issue a notification for all debtors; the calculations would be based on the 'old' (pre-1991) exchange rate of the erstwhile Gosbank of the USSR, linked to a basket of six convertible currencies.

This notification, in my view, can hardly be called arbitrary or whimsical. For, the Russian government has yet to permit full convertibility of the rouble; capital flows are still legally banned, although since mid-1990 the Soviet citizens were allowed to hold dollars for 'personal' use or consumption purposes. The exchange control system may have become flabby and corrupt, but one cannot legally take an unlimited quantum of dollars out of the country. Nor is a foreigner permitted to bring in dollars, convert them through commercial banks and purchase capital assets in Russia. In that case, as Grigoryev tells us, an American could buy up a medium or large Russian enterprise for the price of a new car at home. No government could tolerate that. Thus the rouble remains an inconvertible currency for any kind of capital transaction.

Grigoryev mentioned one further complication. Outside of Russia, the rouble is still the sole legal tender in Kazakhstan, Uzbekistan, Turkmenistan, Armenia and also in non-CIS Georgia; in Belarus, Latvia and Moldova the rouble is used concurrently with the respective local currencies; and in Estonia, Lithuania, Ukraine and Azerbaijan only the local currencies are permitted. It is evident that the trade regime and the exchange control system in the first two groups of countries will have a far from negligible impact on the exter-

nal value(s) of the rouble; besides, the former do not co-ordinate their monetary policy with the Russian CB.

Nevertheless, in western as well as Russian media the AR has received wide publicity and is closely monitored as if it were the exchange rate of the rouble. It is evident, however, from the accounts of Kireev and Grigoryev that it is far-fetched to talk of a single exchange rate of the rouble.

Initially, the size of transactions at the Moscow auction was quite small. In November 1989, one may recall, it was just \$ 880,000, even in May 1992 it was no more than \$ 6-8 mn at each auction. In the second half of the year, thanks to the new policies, the volume vastly increased. In December 1992 the amount transacted was \$ 453 mn, rising to over \$ 500 mn in February 1993. For the whole of 1992 the figure was \$2.8 bn, while in the first quarter of 1993 it crossed \$1.5 bn. Currently, the transactions constitute 20 per cent of export, or 35-40 per cent of export earnings going into the authorised Russian commercial banks (*Ekonomika i zhizn'*, 1993, Nos 7 and 12; *Finansovye i vestiya*, April 10, 1993). Thus the Moscow auctions cannot any more be set aside as a marginal phenomenon.

I shall now explore the link between the AR and the consumer price index (CPI) of the Goskomstat; the data for selected months since November 1989 to March 1993 are presented in Table 2. In the first year till November 1990, the AR rose twice as fast as the CPI, and the same is true for the next 13 months till December 1991. As prices flared up owing to the 'big bang' of January 2, 1992 when the decades-old government control over prices was lifted for most commodities, there was a spectacular reversal; between December 1991 and February 1992, the AR declined by 30 per cent, while the CPI shot up 4.8 times. Indeed, during the 27 months from November 1989 till February 1992, the AR increased 7.3 times against a 12-fold rise in the CPI.

From February 1992 a new pattern seems to have emerged. If one takes a somewhat longer perspective of several months, the AR and the CPI tend to move in tandem. Thus the respective incremental ratios were 2.9 and 2.8 in February-September 1992, 2.04 and 1.95 in September-December 1992, 3.37 and 3.78 from September 1992 to March 1993, and 9.77 and 10.84 from February 1992 to March 1993. However, such a tendency cannot be observed on a month-to-month basis. The AR, for instance, fell from 160 on April 2 to 128 on May 6, 1992, (*Ekonomika i zhizn'* 1992/51). From Table 2 one finds that in January-February 1993, the AR rose by 16 per cent against 29 per cent for the CPI.

So far I have used the Goskomstat series on the CPI. Critics pointed out that during the Soviet period there was 'hidden' inflation, and some offered alternative estimates (cited in Aslund 1991, pp 184-86). For 1992, while the Goskomstat showed a 26-fold rise, another official agency, the Centre for Economic Conjuncture and Forecasting (CECOF), put it higher at 30 times (T Bolotova, *Izvestiya*, March 6, 1993). Hence I have constructed an alternative series on the CPI in column (3) of Table 2, taking the highest of the available indices for different periods, my object is simply to test for the robustness of the earlier conclusion, rather than to suggest that the alternative series is more trustworthy than that of the Goskomstat. In the absence of the CECO's monthly indices from January to November 1992, I have raised the other index for each month by a common factor of 1.14 ($=3000/2625$). The new series reinforces the conclusion that the CPI rose faster than the AR from November 1989 to February 1992, the same is true for the previous conclusion on the AR-CPI relationship since February 1992.

Here a couple of caveats are in order. I have so far established a close statistical association between the AR and the CPI since February 1992, but have no hypothesis on the causality. Did the CPI push up the AR, or vice versa? Or, was there one or more exogenous factors that led to a surge in both? Without such an investigation it is difficult to make a forecast about the future relationship between these two variables.

An examination of the AR in 'real' terms, i.e., by discounting for the inflation factor since 1989 when prices were stable throws some interesting results. At constant November 1989 consumer prices, the AR in February 1992 amounted to 5.82 or 5.12, depending on the prices series; for March 1993 the corresponding figures were 5.25 or 4.09. Prior to 1992, the 'real' AR was much higher at 35 to 40 in December 1991. This is another indication that the 'real' AR is only now moving within a rather narrow band of 4 to 6, which is surprisingly close to the 'historical' black market rate that prevailed for decades prior to the perestroika. Further, as Kireev as well as Grigoryev noted, today's street rate is generally linked to the AR.

What does the AR today signify? "The current exchange rate of the rouble expresses nothing in real terms but an irresistible urge, prompted by panic, to drop it like a hot potato, and by the absence of any serious incentives for solid foreign investors to put their money into Russia's economy." That is how Shmelyov (1993) characterised the auction rate. Indeed, an international investors' conference in March 1993 at Miami, USA, ranked

Russia as the country with the 'highest investment risk' (*Ekonomika i zhizn'*, No 13). That businessmen have been getting rid of roubles to acquire dollars was also confirmed by Garkusha (1993).

The AR, Shprygin (1993) has forcefully argued, does not reflect the relative prices in Russia and abroad. If the rate at the end of February 1993 was 600 rb/\$, the commodity-wise price parities (in rb/\$), assuming for all Russian industries an average wage of \$ 20 per month, were 70-90 for machine-building, 100-110 for oil, 150 for steel pipes, 130-140 for steel sheets, etc. In other words, at the prevailing AR, the Russian costs of these products were

just 12 to 25 per cent of the world prices. The low exchange value of the rouble encourages domestic producers to go in for exports on a large scale, sacrificing the local market. On the other hand, with low dollar realisation from export, and the high cost of import in terms of roubles, the firms can hardly afford to import equipment for modernisation, for, the additional costs cannot be recovered from domestic buyers. Writing in 1991, another Russian economist, Lushin (1991, p 7) made the same point in a picturesque manner, at an exchange rate of 1.0 rb/\$, all the primary commodities 'would run abroad'; at 3-4 rb/\$, manufacturers could

TABLE 2 AUCTION RATES AND CONSUMER PRICE INDICES, 1989-1993

	Auction rate (rb/\$) (1)	Consumer Price Indices	
		(2)	(3)

not import equipment and recoup the extra costs from domestic buyers.

The weekly, *Argumenty i fakty* reproduced comparative retail prices in early January 1993, compiled by the Goskomstat, of a few food products in several Russian cities, both in roubles and in dollars, using the then AR of 423-442 rb/\$, and also the dollar prices of the same goods in Tokyo, Paris and Rome. In Table 3 are indicated the dollar prices in Moscow, St Petersburg, Rome and Paris. The Russian prices are invariably much lower than those in west Europe, but the gap is highly uneven. The Russian parliament, one may note, has imposed price control on bread, milk, meat and vodka. The price differentials for these products are therefore much larger than for sugar, margarine, butter and boiled sausage. But why are sausages, relatively to beef, so much more expensive in Russia than in the west? I have no answer to this puzzle.

All these lead to the conclusion that the AR is out of alignment with the purchasing power parity (PPP) of the rouble vis-à-vis other currencies. But then for many important third world countries, the actual exchange rate is grossly undervalued in relation to the PPP (computed for the respective GDPs) e.g., by a factor of 6.1 for China, 5.6 for Pakistan, 3.8 for India, or 1.7 Brazil, all in 1990 [World Bank 1992, Tables 1, 2 and 30]. If the AR (at its present 'real' level) suddenly became the sole exchange rate, if all quantitative restrictions over export and import were lifted, and if tariffs were sharply reduced, then the Russian economy will go through another upheaval of a major nature. In the wake of the second big bang, it is doubtful that the 'real' AR would remain unchanged. Whether the rouble in the end will appreciate or depreciate is something that is best left to crystal gazers.

Conclusion

Many knowledgeable persons in India untainted by the virus of crude nationalism would tend to agree with the main thrust of the first editorial in *The Economic Times* (February 1) that India made a '\$ 10 bn gift to Yeltsin'. Most people have in mind the present level of the AR. At the January 1993 rate of 488 rb/\$, India's debt of 9,871 mn rb would amount to a paltry \$ 20.2 mn, and hence all that India agreed to pay was simply a gift.

Elementary common sense tells us that the Russian rouble of 1993 is by no stretch of imagination equivalent to one Soviet rouble of 1989 or earlier when the USSR had supplied military wares on credit. A more sophisticated critique of the Indo-Russian agreement would concede this point; if the new exchange rate is deflated by the official inflation factor in Russia

since 1989, it would be, as shown above, close to the historical black market rate before perestroika. Consequently, India's debt would stand reduced to \$ 1,718 mn. But I have already cited several western scholars who all rejected the earlier black market rate as a meaningful exchange value of the rouble, and also adduced fresh evidence that the current AR is no better.

On the other hand, it is very difficult to specify what the 'correct' exchange rate should be for a country in transition from a command economy with strict exchange control to a more market-oriented one with fewer restraints on foreign trade and payments. Even at the cost of repetition, I must underline that Russia is in a highly volatile state, the new economic order is yet to take shape, foreign trade has been decentralised but is badly disrupted, there is large-scale capital flight, and for many key items, most notably oil, there is a vast difference between the domestic and world prices [Chandra 1993]. For all these reasons, one cannot characterise the current AR as an 'equilibrium' rate of exchange in the textbook sense.

Once a semblance of stability returns to Russia, the authorities may well settle on a rb/\$ rate higher (allowing for the inflation factor) than the present AR. If that rate were applied retrospectively to all transactions, many trade partners of the USSR might ask for a refund owing to overpayment (underpayment) on their import (export)! If none of them did so, on what logic could India ask that her own debts be scaled down? For, this debt was accumulated for military supplies up to 1989, generally at prices well below the world market prices for comparable weapons as evaluated by the SIPRI. Hence, in my view, the Indo-Russian agreement on the rouble debt was a legitimate one from a legal as well as a strictly economic point of view.

Third world countries, inclusive of India, owed to the ex-USSR approximately \$ 150 bn, and the prospect of Russia getting more than a small fraction back is rather bleak [Grabisch et al 1992: 85]. The international bankers who are lending simultaneously to Russia and to her debtor nations do care for the safety of their own loans, and hardly any at all for the sums owed to Russia. This is the reality of the new international order since the Soviet perestroika, and most visibly demonstrated by America's naked and continuing aggression against Iraq with an impotent UN acting as the rubber stamping authority.

If India reneged on the rouble debt, she might not attract any sanctions from western powers or multilateral agencies. But what would she gain beyond the savings on the debt service payments? In the post-cold war era, the west could not favour

India with greater loans, investments or market access. And since Russia could easily find alternative sources for her requirements in tea, coffee, textiles, etc., India would lose a valuable export outlet. Conversely, most of Russian exports to India consisting of 'hard goods' like oil, fertilisers, metals, etc., for which there is no dearth of external demand. Thus on items of civilians trade, India will be hurt disproportionately if her ties with Russia were snapped. Indeed, during the whole of 1992, if not earlier, India's direct export to Russia came to a virtual standstill, and many Indian firms heavily dependent on export to the rouble area faced an acute financial crisis.

Regarding the immediate to medium-term implications of the Indo-Russian agreement, I endorse in general the views expressed in the editorial of the *Economic and Political Weekly* (February 6) captioned 'Not a Sell-Out'. But the prospects of India exporting to Russia a large quantum of manufactured consumer goods may be dimmed by the rapid takeover (legal or *de facto*) of Indian firms in these sectors by the OECD transnationals thanks to our own liberalisation policy dictated by the IMF and the World Bank; I have in mind the alliances, mergers or takeovers affecting among others, Godrej and Proctor and Gamble, Tomco and Hindustan Lever, Kissan and Brooke Bond, and Bajaj Electricals and GE. The transnationals are unlikely to permit their Indian affiliates to penetrate the Russian market, preferring supplies from their own headquarters. If they also manage to control Russian importing agencies and/or producing enterprises in these sectors, the scope for Indian exports would be further curtailed.

My hunch is that the Indian government signed the agreement, not so much for these hypothetical economic gains, nor out of a moral or legal compulsion (pace its prevarications over Kashmir, Ayodhya, Bofors, the stock market scam, to name just a few), but mainly on considerations of foreign policy and defence. Russia still wields a veto at the UN Security Council. If the US supports even indirectly a new Security Council resolution reaffirming its earlier call for a plebiscite in Kashmir, only Russia can stand in the way; it is by no means certain that Russia would actually do it, but there is an outside probability that she might. Nor, it must be added, is the US keen to revive the issue, unless Indian repression and popular resistance crosses the limits of US tolerance. As for the Indian defence sector, the Soviet weapons still remain the mainstay; in the absence of the Indo-Russian accord, India's 'defence capability' would be seriously jeopardised. My feeling is that this 'defence' factor was decisive in India's sign-

ing the rouble debt agreement

Although I have little sympathy for this *raison d'etat*, I believe that a unilateral debt cancellation by India would foreclose the prospects of Indo-Russian collaboration in the long run. Given the enormous scientific and technological capabilities of both nations, there is limitless scope for co-operation between them, especially in areas of advanced technology where OECD-based transnationals have a near monopoly over the world market. But that will remain a will-o'-the-wisp so long as the governments of the two countries remain mortgaged to the global moneylenders.

PHD CHAMBER OF COMMERCE & INDUSTRY NEEDS A CHIEF ECONOMIST

This is a senior position and requires good understanding of national and international economic trends. He/She should be able to prepare comprehensive reports, undertake studies, prepare discussion papers and advise the industry on policy matters, besides strengthening the Economics Department of the Chamber.

The Chamber offers congenial atmosphere for professional growth and excellence. The salary will be upward of Rs. One lakh per annum.

Please apply in confidence with full details within 10 days to

The Manager (HRD),
PHD Chamber of Commerce and Industry,
PHD House,
Opp. Asian Games Village,
New Delhi-110 016.

Growth Perspectives of the Eighth Plan

A Two-Sector Open Economy Framework

Suman Sarkar

The two-sector model presented in this paper takes into account foreign trade which was assumed to be absent in Mahalanobis model in addition to aspects of sectoral investment allocation in the Indian economy. Keeping in view the changes that may result from the government's New Economic Policy in the shares of the consumer goods and investment goods sectors in total national investment, alternative economic growth projections have been made for a period of 20 years. Using the new model, the study makes an attempt to assess the prospects of a relatively high long-term growth rate by increasing the level of efficiency in domestic resource use and the inflow of investment goods from abroad.

DURING the last three decades planning in India was associated with several variations of short- and medium term objectives and specific steps proposed for the attainment of these objectives. But in the 1950s there had also evolved a planning strategy which no doubt may be regarded as a strategy of long term development of the Indian economy. It is a well known fact that India's second five year plan had been framed in accordance with an approach of economic and social development of which Prasanta Chandra Mahalanobis had been the chief architect and that this approach had obtained its official status as a national planning strategy as a result of the whole hearted support and active collaboration of the then prime minister Jawaharlal Nehru. However, the subsequent five year plans in India were characterised not only by varying extents of failure to implement development programmes consistent with this long term strategy but also increasing deviations from this approach itself.

I

The Nehru-Mahalanobis Strategy

Speaking generally the Nehru-Mahalanobis strategy¹ of planned development that emerged during the 1950s sought to achieve a self-sustained development of the Indian economy with an active role of the state in promoting heavy industries and infrastructure. An important aspect of the developmental philosophy underlying this strategy was demonstrated by Mahalanobis (1953) in terms of a model² which divides the economy into two sectors of which one produces investment goods and the other produces consumer goods.

With the help of this two-sector model Mahalanobis showed that two different proportions of investment allocated to the investment goods industries yield two different time paths of gross domestic product and that in the long run the curve of GDP which is associated with a higher

share of investment for investment goods industries, intersects the curve associated with a relatively lower share of investment going to investment goods industries from below and gradually rises significantly above the latter. In view of these relations between the pattern of allocation of investment and the time path of GDP, Mahalanobis concluded that from a long run point of view it may be desirable to invest more in industries producing investment goods rather than investing more in industries producing consumer goods.

The two-sector model of Mahalanobis however, has certain limitations which arise in connection with the different restrictive assumptions³ on which the model is based. The assumption of absence of foreign trade makes it impossible to consider the possibility of counteracting a fall in long-term growth rate resulting from a reduction in the share of investment going to investment goods industries, with the help of an inflow of investment goods from abroad. On the other hand the assumptions of the absence of any sector producing intermediate goods, the full utilisation of production capacities in the two sectors of the economy and the absence of any behavioural conditions relating to savings and investment decisions are limitations which no doubt to some extent reduce the operational significance of the model in the present economic context.

However, some of these restrictive assumptions may be looked upon as unavoidable under a two-sector framework involving only the physical outputs of the two types of commodities. Under such a framework, for example, intermediate goods cannot but be lumped together partly with investment goods and in part with consumer goods. Further, such a model may not have a scope for incorporating within itself any behavioural aspects of savings or investment. But a similar two sector framework may well be used for formulating a new model which may be able to dispense with the restric-

tive assumptions of absence of foreign trade and of full capacity utilisation. As a matter of fact, a two-sector model free from the two above mentioned restrictions may be able to illuminate an important area of choice regarding national policies in the present economic context.

THE NEW ECONOMIC POLICY (NEP)

The NEP declared by the government on the eve of the eighth plan has initiated a process of privatisation of industries belonging to the public sector and delicensing of many of the industries already existing in the private sector. The door is also being opened for foreign private investment in industries of different types. The government thinks that the changes mentioned above can serve to reduce India's domestic budgetary gaps and balance of payments deficits by improving industrial management and efficiency and by increasing foreign private investments.

But in the entire NEP there is no emphasis on investment in investment goods industries. On the contrary, there seems to be a ground for apprehending that this policy may in fact lead to a lowering of the share of investment going to investment goods industries. The decontrol of industries implies that investment decisions will increasingly be subject to private profit considerations and it is a widely shared impression that investors in the private sector in India are more inclined to investing in consumer goods industries of different types rather than investment goods. Production of consumer goods, speaking generally, requires relatively less capital and have shorter gestation lags as compared to production of investment goods. On the other hand, with the expansion of incomes of the middle section of income earners the demand for certain consumer goods including different luxury⁴ items has been increasing in recent years so that marketing of such commodities may be supposed to involve lesser uncertainty than does the marketing of investment goods, the demand for which

depends on a number of complex decision factors operating at different levels, public as well as private. The preference for investment in the quick return industries producing consumables may also be associated with the existing status of many of the private investors in India who do not have adequate command over capital to make possible substantial long-term investments in the relatively capital intensive investment goods industries. Under these circumstances, a reduction in the proportion of public investment in total national investment and the withering away of government control of industries in the private sector may be associated with a reduction in the share of investment goods industries in total national investment in the physical sense.

In view of the above mentioned reasons if it is assumed that as a result of the new industrial and economic policy the share of investment goods in national investment will decline by a stipulated percentage, it becomes important to have knowledge regarding the possible impact of such a change in the pattern of national investment allocation on the long-term growth path of the economy. It may also be useful to have knowledge regarding the extents to which domestic efficiency in resource use and the inflow of investment goods from abroad will have to be increased if a growth path similar to the one corresponding to a stipulated higher share of investment goods in national investment is sought to be recovered. These are the questions which the mathematical model presented in the next section has been designed to deal with.

II

Mathematical Model

The model is based on a framework which divides the economy into two sectors of which one produces investment goods and the other produces consumer goods. In accordance with the above mentioned sector classification the GDP is defined as the sum total of the outputs of investment goods and consumer goods.

The economy is defined as an open one in the sense that a part of national output is exported and the domestic supplies of the two types of goods include the quantities of these goods imported from abroad. Under this framework both national output and exports have the status of endogenous variables. On the other hand, imports are assumed to depend on current export earnings, the exact relationship between the two depending on assumptions regarding the availability of foreign exchange resources over and above current export earnings.

Time is treated discretely with an year as unit and it is assumed that there is a

uniform gestation lag of one year between investment and capacity expansion in both investment goods and consumer goods industries. It is also assumed that domestic outputs and exports are evaluated at constant prices. The GDP may then be projected with the help of equation (1)

$$Y_t = Y_0 \{ (1 + \alpha_0 \{ (1 + \lambda_1 \beta_1)^t - 1 + \lambda_1 \beta_1 \sum_{x=0}^{t-1} (1 + \lambda_1 \beta_1)^x \}) + K_1 (\lambda_1 \beta_1 + \lambda_2 \beta_2) \sum_{x=0}^{t-1} M_x (1 + \lambda_1 \beta_1)^{t-x-1} \} \quad (1)$$

where

Y_t = gross domestic product in year t

M_x = imports in year x

α_0 = rate of investment in the base year 0

λ_1 = share of investment going to investment goods industries

λ_2 = $1 - \lambda_1$ = share of investment going to consumer goods industries

K_1 = share of investment goods in total import

β_1 = incremental output capital ratio in investment goods industries

β_2 = incremental output-capital ratio in consumer goods industries

DERIVATION OF THE MODEL

Equation (1) is derived in the following manner. If the domestic capacity of production of investment goods in year t is denoted as I_t^u , the physical amount of investment in the economy in year t may be represented as

$$I_t = I_t^u + K_1 M_t \quad (2)$$

where

$$I_t^u = I_{t-1}^u + \lambda_1 \beta_1 I_{t-1} \quad (3)$$

It is easy to see that the above relations may be obtained on the basis of two assumptions. The first of these is that there is full capacity utilisation in the investment goods sector so that I_t^u can be taken to represent the domestic output of investment goods. At a later stage this assumption will be relaxed. The second

assumption is that the whole output of the investment goods sector is available for domestic investment. To fulfil the above mentioned condition it has to be assumed that investment goods are not exported. However, from the point of view of the government's NEP the last mentioned assumption which implies that only consumer goods are assumed to be exported, may be regarded as a congenial one in the following sense. On account of this assumption a relatively higher share of investment going to consumer goods industries may appear as desirable as it may be associated with a higher time path of export earnings than that corresponding to a higher share of investment going to investment goods industries. Now, if it is hypothesised that the NEP will be associated with a rise in the share of con

TABLE 2. PARAMETERS REPRESENTING ALLOCATIVE SHARES AND TRADE BALANCE

Parameter	Alternative I	Assumptions II	III
λ	0.40	0.60	0.60

TABLE 1. PARAMETERS RELATED TO PRODUCTION AND EXPORTS

Parameter	Values Assumed in View of Official Information*	Special Assumption	Assumption of 100 Per Cent Capacity Utilisation	Assumption of 80 Per Cent Capacity Utilisation	Assumption of 60 Per Cent Capacity Utilisation
	(i)	(ii)	(iii)	(iv)	(v)
β	0.154		0.154	0.1232	0.0924
β	0.125		0.125	0.10	0.075
θ	0.051	0.078603174			
θ	0.047	0.00			

Notes * Values of β_1 and β_2 assumed in view of facts presented in Technical Note on sixth five year plan and seventh five year plan. Values of θ_1 and θ_2 estimated on the basis of data presented in *Economic Surveys* 1986-87 to 1990-91.

sumer goods in domestic investment, the assumption that only consumer goods are exported may tend to increase its desirability from the point of view of growth of export earnings associated with this policy. In Section III of this paper the sensitivity of the export growth path to the assumption that investment goods are not exported will be assessed by comparing the quantitative results obtained on the basis of this assumption with those obtained by relaxing this assumption. But for the time being let us maintain the assumption that investment goods are not exported.

Substituting equation (3) in (2) above we obtain the difference equation

$$I_t = I_{t-1}^u + \lambda \beta_i I_{t-1} + K_i M_t \quad \dots (4)$$

which has the solution

$$I_t = I_0^u (1 + \lambda \beta_i)^t + \lambda \beta_i K_i \sum_{x=0}^{t-1} M_x (1 + \lambda \beta_i)^{t-x-1} + K_i M_t \quad \dots (5)$$

From equation (5) it may be seen that the domestic production capacity of investment goods in year t is given by

$$I_t^u = I_0^u (1 + \lambda \beta_i)^t + \lambda \beta_i K_i \sum_{x=0}^{t-1} M_x (1 + \lambda \beta_i)^{t-x-1} \quad \dots (6)$$

On the other hand, production of consumer goods in the economy may be represented in terms of the difference equation

$$C_t^u = C_{t-1}^u + \lambda_c \beta_c I_{t-1} \quad \dots (7)$$

which has the solution

$$C_t^u = C_0^u + \lambda_c \beta_c \left\{ I_0^u \sum_{x=0}^{t-1} (1 + \lambda \beta_i)^x + K_i \sum_{x=0}^{t-1} M_x (1 + \lambda \beta_i)^{x-1} \right\} \quad \dots (8)$$

Adding equations (6) and (8) and using the relation $C_0^u = Y_0^u - I_0^u$, we obtain

$$Y_t^u = Y_0^u + I_0^u \left\{ (1 + \lambda \beta_i)^t - 1 + \lambda \beta_c \sum_{x=0}^{t-1} (1 + \lambda \beta_i)^x \right\} + K_i \sum_{x=0}^{t-1} M_x (\lambda_c \beta_c + \lambda \beta_i) (1 + \lambda \beta_i)^{t-x-1} \quad \dots (9)$$

If it is assumed that production capacities of both investment goods and consumer goods are fully utilised, (9) may be written as

$$Y_t = Y_0 [1 + \alpha_0 \left\{ (1 + \lambda \beta_i)^t - 1 + \lambda_c \beta_c \sum_{x=0}^{t-1} (1 + \lambda \beta_i)^x \right\}] + K_i (\lambda_c \beta_c + \lambda \beta_i) \sum_{x=0}^{t-1} M_x (1 + \lambda \beta_i)^{t-x-1}$$

which is the same as our equation (1).

IMPORTS AND EXPORTS

In order to obtain a time path of GDP with the help of equation(1) above, one has to start with a given set of values of annual imports M_x for $x = 0, 1, \dots, t-1$. Under our mathematical framework if the base year value of imports M_0 is specified exogenously, all the other values of annual imports may be obtained from an export function by making a suitable assumption regarding the relation between current exports and imports. It may be assumed that

$$M_t = \phi E_t \quad \dots (10)$$

where E_t denotes exports in year x and ϕ is a parameter, the magnitude of which depends on the assumption made regarding the balance of trade. Thus $\phi = 1$ represents the assumption of balanced trade and for $\phi > 1$, M_t exceeds E_t . This last mentioned case implies that the gap between current exports and imports will have to be assumed to be met by making use of additional sources of financing imports such as foreign assistance or foreign private investment.

If it is assumed that the export bundle consists solely of consumer goods, then with a given base year value M_0 , the values of annual exports, E_x for $x = 1, 2, \dots, t$ may be obtained from the export function presented below:

$$E_t = \theta_c C_0^u + \lambda \beta_c \theta_c \left\{ I_0^u \sum_{x=0}^{t-1} (1 + \lambda \beta_i)^x + K_i \sum_{x=0}^{t-1} M_x (1 + \lambda \beta_i)^{x-1} \right\} \quad \dots (11)$$

where θ_c denotes export of consumer goods as a proportion of the value of output of consumer goods at constant domestic prices. It may be noted that to calculate the time path of exports on the basis of this export function, one has to make use of the feedback link which is assumed to exist between exports and imports as represented by equation (10) above.

RELAXATION OF ASSUMPTIONS

Let us now discuss the possibility of relaxing two restrictive assumptions made in the course of our discussion so far. The first of these is the assumption that investment goods are not exported. Relaxation of this assumption may be possible if a new parameter θ_i representing investment goods exports as a proportion of the domestic output of investment goods is introduced and the investment function is adjusted so that it can take into account the annual outflow of investment goods in the form of exports.

The second restrictive assumption is that of complete utilisation of production

capacities in the two sectors of the economy. With less than full capacity utilisation, the incremental output-capital ratios will no longer be the same as the incremental capacity-capital ratios. But if one takes the base year levels of outputs of the two sectors as data and if it is assumed that in a particular sector a definite proportion of production capacity will always be utilised, then such divergence between production capacities and output levels does not stand in the way of projecting future national output by making use of our two sector framework. The time paths of GDP and exports may be calculated under specific assumptions regarding the extent of capacity utilisation, if the values of the incremental output-capital ratios β_c and β_i are adjusted accordingly.

The two-sector model presented here can be used for obtaining the time paths

FIGURE 2: TIME PATHS OF GDP UNDER 80 PER CENT CAPACITY USE

if GDP and exports under different assumptions regarding the values of the parameters that are involved. On the basis of such variational exercises one can assess the possible effects of stipulated changes in the allocation of investment and imports or of changes in the levels of capacity utilisation and efficiency on the long term growth path of the economy

III Quantitative Results

The mathematical model presented in the last section was programmed¹ for ob-

taining quantitative results with the help of a computer. Numerous computational experiments were made with different sets of values of parameters with a view to discover the important characteristics of the time paths of GDP and exports over a time horizon of 20 years starting from 1992.

In column (i) of Table 1, the values of β_c and β_i are the estimates of incremental capacity-capital ratios, obtained from official statistics. In column (iii), the same values are also presented as incremental output capital ratios under the assumption of 100 per cent capacity utilisation

Column (iv) and (v) of the table present the values of the incremental output-capital ratios under the assumptions of 80 per cent and 60 per cent capacity utilisation levels respectively. Column (ii) of Table 1 shows the values of θ_c and θ_i under the assumption that consumer goods only are exported. It may be seen that the value of θ_c has been augmented so as to compensate for the assumed absence of export earnings from domestically produced investment goods.

The three sets of parameter values presented in Table 2 represent three alternative sets of assumptions relating to economic policy. While under alternative I, 60 per cent of investment is assumed to be allocated to investment goods industries and 40 per cent of investment to consumer goods industries, under alternative II the share of investment goods is assumed to be 40 per cent and the share of consumer goods 60 per cent. Under alternative III in addition to the assumed increase in the share of consumer goods as under II above, the share of investment goods K_i in total imports has been reduced to 64 per cent from 84 per cent as under alternatives I and II. In all the three cases it has also been assumed that the value of ϕ equals 100, implying that trade is balanced.

Table 3 presents the assumed base year values of the different constants. It may be noted that the base year rate of physical investment has been assumed in view of available facts regarding the division of national income into different parts in accordance with industries of origin. On the other hand with the assumed base year GDP level of 100, the base year level of imports is simply imports as percentage of GDP as found from recent official observations.

TIME PATHS

In figures 1, 2 and 3, three sets of curves representing the time paths of index numbers of GDP under the assumptions of 100 per cent capacity utilisation, 80 per cent capacity utilisation and 60 per cent capacity utilisation respectively, have been presented. In each of these figures three curves corresponding to the three alternative sets of assumptions regarding parameters λ_c , λ_i and K_i of Table 2 have been presented. All these three sets of curves have been obtained on the basis of the assumption that the values of the parameters θ_c and θ_i are those presented in column (ii) of Table 1 and that the values of the parameters β_c and β_i used for obtaining the time paths under the assumptions of 100 per cent, 80 per cent and 60 per cent capacity utilisation respectively, are those presented in columns (iii), (iv) and (v) respectively of the same table.

FIGURE 3: 'TIME PATHS OF GDP UNDER 60 PER CENT CAPACITY USE'

In addition in all these projections the base year values of constants presented in Table 3 have been incorporated.

Now, if one examines the relationships among the three curves presented in any one of the three figures it can be seen that a curve corresponding to assumption I of Table 2 after a short span of years starts rising much above the other two curves. On the other hand a curve corresponding to alternative assumption III remains lower than that under assumption III of Table 2.

In other words, in any one of the figures the three time paths of GDP under the three sets of assumptions regarding allocative shares represent three long-term development alternatives for the Indian economy under a specific assumption regarding the possible extent of capacity utilisation. From these curves showing the alternative time paths of GDP, it is evident that under balanced trade conditions, a stipulated 20 per cent reduction in the share of investment going to investment goods industries can result in a significant lowering of the time path of GDP. In addition, a 20 per cent lowering of the share K_1 of investment goods imports in total imports can result a further lowering of the time path, though such lowering will be much less significant than the growth retarding effect of a lowering of λ_1 .

From the figures it is also interesting to observe that the curves showing the time paths of GDP under different assumptions regarding parameter values start from almost the same level and diverge after the passage of some years. Thus in contrast to the two-sector model of Mahalanobis, in the case of the present

model there may not be an intersection of curves corresponding to alternative assumptions regarding the allocation of investment. The reason behind this is that the present model is based on the assumption of an open economy where imports of investment goods balanced by exports of consumer goods may to some extent reduce the initial gap between time paths of GDP under alternative assumptions regarding the allocation of investment between the two sectors of the economy.

Comparing all the three figures showing alternative time paths of GDP, it can also be found that each of the three curves under the assumption of 100 per cent capacity utilisation, is significantly steeper than its counterpart under the assumption of 80 per cent capacity utilisation. Each of the curves under the last mentioned assumption again, is steeper than its counterpart under the assumption of 60 per cent capacity utilisation.

The different projections of GDP, mentioned so far and the corresponding projections of exports will henceforth be identified in the terms stated below: Firstly, we shall describe all projections under the assumption of 100 per cent capacity utilisation as over-optimistic. Secondly, all projections under the assumption of 80 per cent capacity utilisation will be described as optimistic. Thirdly, the projections under the assumption of 60 per cent capacity utilisation will be termed as pessimistic. On the other hand, in accordance with the alternative assumptions of Table 2, the alternative projections of GDP or exports under any given assumption regarding capacity utilisation will be distinguished as projection I or projection II or projection III.

TABLE 6. ADDITIONAL INFLOW OF INVESTMENT GOODS* (Percentage)

Increase in Efficiency	100 Per Cent Capacity Utilisation (i)	80 Per Cent Capacity Utilisation (ii)	60 Per Cent Capacity Utilisation (iii)
2	110.72	93.28	70.40
5	84.48	68.48	44.80
10	42.88	27.52	3.84

Note * As percentage of export-balanced imports and increase in efficiency required for recovery of long-term growths rate under alternative I.

Tables 4(a), 4(b) and 4(c) present the over-optimistic, optimistic and pessimistic sets of compound average annual growth rates of GDP respectively, for four consecutive five-year periods starting from 1992 and for the 20-year period as a whole. From Table 4(a), it may be seen that the growth rate of GDP in the over-optimistic case and under assumption I, increases from 5.83 per cent per annum during the first five-year period to as much as 7.08 during the fourth five-year period, the average rate for the whole period of 20 years being 6.50 per cent per annum. The long-term growth rate under assumptions II and III are 5.77 and 5.63 respectively and in both these cases the five-year average rates decline continuously between the first five-year period to the fourth five-year period. One can also find a similar pattern of intertemporal variation of growth rate among the alternative projections I, II and III under the optimistic and the pessimistic assumptions relating to capacity utilisation. For the optimistic set of alternative growth projections, the long-term average growth rate of GDP ranges from 5.12 per cent per annum for alternative I to 4.51 per cent for alternative III and for the pessimistic set of projections it ranges from 3.75 per cent under alternative I to 3.39 per cent for alternative III.

From Tables 4(a), 4(b) and 4(c), it is clear that speaking generally, the sensitivity of the long-term growth rate of GDP to a stipulated 20 per cent variation in λ_1 , i.e., the proportion of investment going to investment goods industries, is significantly larger than its sensitivity to a 20 per cent variation in K_1 , i.e., the proportion of investment goods imports to total imports.

Beside this, keeping the value of K_1 unchanged at its 0.84 level we have also tested the sensitivity of the time path of GDP to that of imports. In our model, the parameter ϕ is a proportionality factor assumed to be holding between imports and exports. With all other things unchanged, a variation in the value of ϕ therefore will imply a corresponding variation in the time path of imports. It has been found that a stipulated 10 per cent increase in the value of ϕ results in an increase in the long-term growth rate of GDP by 0.05 approximately under our over-optimistic estimate; the magnitudes of approximate increases in the optimistic and pessimistic cases are 0.04 and 0.03 respectively. These facts show that generally speaking the time path of GDP is not significantly affected by moderate variations in the level of imports.

EXPORTS

The five-yearly average annual compound growth rates of export earnings

respond to the alternative possible growth rates of GDP as presented in Tables 4(a), 4(b) and 4(c); respectively. These alternative growth rates of export earnings have been obtained in accordance with the three alternative sets of assumptions of Table 2 and the over-optimistic, optimistic and pessimistic assumptions relating to capacity utilisation. These projections are also based on the special assumptions regarding the values of θ_c and θ_i as presented in column (ii) of Table 1.

From Tables 5(a), 5(b) and 5(c), it may be seen that like GDP growth rates, the alternative long-term growth rates of exports also vary directly in relation to the extent of capacity utilisation assumed. But the relations observed among the periodic growth rates of exports under the three alternative assumptions I, II and III are different from those observed among alternative growth paths of GDP. It is thus found that in contrast with the case of GDP growth, the highest long-term growth rate of exports is obtained under assumption II according to which 60 per cent of total investment is allocated to consumers' goods industries. The long-term growth rate of exports is slightly lower in the case of assumption III under which the share of investment goods in imports is 20 per cent lower. The lowest average long-term growth rate of exports is however obtained under assumption I according to which 60 per cent of investment is shared by investment goods industries. It can further be seen that under assumption I, the growth rate of exports is the lowest for the first period and rises gradually up till the last period. But under I and II, the rates gradually decline from a height attained during the first period. The above mentioned relations are similar under all the three assumptions regarding levels of capacity utilisation.

The difference between the pattern of relations among the alternative growth

paths among the corresponding alternative growth paths of GDP under any given assumption regarding the extent of capacity utilisation as mentioned above, is attributable to the special assumptions made regarding the values of the parameters θ_c and θ_i (column (ii) of Table 1). In a separate exercise, keeping all other things unchanged, the assumed zero value of θ_i and the augmented value of θ_c were both replaced by their observed values (column (i) of Table 1). From this exercise it was found that under any given assumption regarding capacity use the pattern of relations among the alternative growth paths of exports have a considerable degree of similarity with the pattern of relations among the corresponding alternative growth paths of GDP. A striking point to note however, is that while the above mentioned changes in the values of the two parameters concerning exports tend to increase, the average long-term growth rate of GDP under projection I and to reduce the same under projections II and III the magnitude of such changes in long term growth rates of GDP under the over-optimistic assumption regarding capacity utilisation remains within a range of ± 0.12 . The range becomes lower as one assumes lower and lower extents of capacity utilisation. Thus, the impact of the aforementioned changes in the values of θ_c and θ_i on the alternative growth rates of GDP may be considered to be insignificant.

The last mentioned point has the following significance for the growth of the Indian economy under the NEP: Even if it is assumed that investment goods will not be exported and that an augmented proportion of consumer goods output will be exported in the coming years, the resulting augmented growth of export earnings cannot suffice to restore the higher growth path associated with alternative assumption I if market forces reduce the

TABLE 7: TIME PATTERN OF GDP GROWTH RECOVERED

Notes: A₁ 5 per cent increase in efficiency; 84.48 per cent increase in capital goods inflow.
 B₁ 10 per cent increase in efficiency; 42.88 per cent increase in capital goods inflow.
 A₂ 5 per cent increase in efficiency; 68.48 per cent increase in capital goods inflow.
 B₂ 10 per cent increase in efficiency; 27.52 per cent increase in capital goods inflow.
 A₃ 5 per cent increase in efficiency; 44.8 per cent increase in capital goods inflow.
 B₃ 10 per cent increase in efficiency; 3.84 per cent increase in capital goods inflow.

Other assumptions:

$\theta_c = 0.078603174$, $\theta_i = 0.00$, $\lambda_1 = 0.40$, $\lambda_2 = 0.60$, $K_1 = 0.64$

FIGURE 4: GROWTH RECOVERY LINES

value of λ , to the level assumed under alternative II or if λ and K together are reduced to the level of alternative III.

GROWTH RECOVERY

Achieving a high rate of growth of GDP is and has always remained a declared objective of Indian planning. As a matter of fact, the declared growth target of 5.6 per cent per annum for India's Eighth Five-Year Plan (1992-97) is higher than the rate of growth projected according to our assumption I, i.e., under an assumed 80 per cent capacity utilisation (Table 4b), that has been termed by us as 'optimistic'.

If it is assumed that as a result of the NEP the values of λ and K will be reduced to the levels of assumption III and that such reduction will be irreversible during the coming years, then under any specific assumption regarding the extent of capacity utilisation, our two-sector framework shows that India's GDP may move along the lowest of the three time paths given by the three alternative projections.

In view of India's declared objective of achieving a high rate of growth, the need for finding ways and means of restoring

the potential high growth path given by projection I cannot be underestimated. Even if it is assumed that λ and K will remain at the low levels of alternative III, one may think of certain other ways of achieving a recovery of the high growth path of projection I. The possible ways include: (1) increasing the inflow of capital goods from abroad with the help of foreign aid or foreign private investment and (2) increasing the incremental output-capital ratios by increasing the level of efficiency in resource use and the extent of capacity utilisation.

As a matter of fact, the government has recently been reiterating the importance of both the above mentioned ways as an inseparable part of the NEP. But in order to assess the feasibility of restoring the high long-term growth rate of projection I in the above mentioned ways, one needs to have quantitative knowledge regarding the extents to which the inflow of capital goods from abroad and the domestic efficiency in resource use will have to be augmented.

Quantitative knowledge regarding the requirements of increasing domestic efficiency in resource use and of additional

inflow of investment goods from abroad in order to restore the high long-term growth rate of GDP as under alternative assumption I, may be obtained from variational exercises under our two-sector framework, by finding out the different combinations of the required percentage increase in the sector-specific incremental output-capital ratios and the required additional inflow of investment goods from abroad as percentage of the normal levels of imports which are assumed to be balanced every year by the current export earnings.

The percentages of additional inflow of investment goods from abroad corresponding to different stipulated percentages of efficiency increase required for achieving a recovery of the high long-term growth rates (Projection I) of GDP under different assumptions regarding the extent of capacity utilisation, have been presented in Table 6. These results show that the two different means of restoring the high growth rate have an area of substitutability between them. If the stipulated percentage increase in efficiency is higher, the requirement of additional inflow of investment goods becomes lower and vice versa.

As a matter of fact, if one plots the two sets of corresponding percentages of Table 6 in a graph, the points obtained under any specific assumption relating to capacity utilisation are found to be located on a straight line. From Figure 4, it can be seen that the lines obtained under the assumptions of 60 per cent, 80 per cent and 100 per cent capacity utilisation are higher and higher in that order.

We have termed these lines as Growth Recovery Lines in the sense that they show the ranges of substitutability between the two distinct approaches or measures which may be employed with a view to recover a targeted long-term growth rate. Under any given assumption regarding the extent of capacity utilisation, it is also possible to obtain lines, of which the higher ones correspond to higher targets of long-term growth rates. In this sense a line of this type might also be termed as an Iso Growth Line.

Table 7 presents the compound average annual growth rates of GDP for four consecutive five-year periods starting from 1992 under alternative assumptions relating to the extent of capacity utilisation and under alternative assumptions regarding parametric variations such that the long-term (1992-2012) growth rate under each assumption regarding capacity utilisation equals the long-term growth rate under projection I despite the fact that in each case the values of λ and K are the same as those assumed under projection III. The alternative packages of parametric variation used for obtaining

these recovered long-term growth rates include, (A) a 5 per cent increase in efficiency in domestic resource use together with an appropriate extent of additional inflow of capital goods from abroad expressed as percentage of imports which were assumed to be balanced every year by current export earnings and (B) a 10 per cent increase in efficiency and the corresponding percentage of additional inflow of capital goods from abroad.

From Table 7, it may be seen that under all the three different assumptions relating to capacity utilisation in case A, the growth rate reaches a height in the second five-year period and then tends to decline gradually whereas in case B, the growth rate tends to decline gradually from a peak attained during the first five-year period. But it should also be noted that these differences in the trends of growth rates cannot be regarded as significant enough.

If however, one compares the growth rates of Table 7 under any given assumption regarding the extent of capacity utilisation with the corresponding growth rates under projection I as presented in Tables 4(a), 4(b) and 4(c), a much more significant difference in the time pattern of growth may be observed. Whereas under projection I of these tables, the growth rate is the lowest during the first five-year period and rises gradually during the subsequent periods, the recovered growth rates of Table 7 for all the five-year periods remain more or less in the proximity of the recovered long-term average annual growth rates concerned.

If one makes a bold assumption that the prospects of income increase of the individual members of the country depend in a direct way upon the rate of growth of GDP and if it is further assumed that the people of the country have time preferences such that they assign a greater utility to the prospect of a growth of their incomes in the nearer future than the utility which they assign to the prospect of income increase of the same order in a more distant future, then, a recovered growth path of Table 7 may appear as preferable to the corresponding growth path under projection I, as given in Tables 4(a), 4(b) and 4(c) in the sense that the present discounted value or utility of the stream of GDP for the people may be larger in the case of growth recovered.

However, even if one does not question the assumptions on which the above proposition is based, one cannot overlook the question of feasibility of such a growth recovery from a practical point of view. The results presented in Table 6 show that significant increases of capital inflow from abroad or of domestic efficiency in resource use or a combination of both will be necessary for raising the long-term

growth rate from the low level of projection III to the high level of projection I. Such a task does not appear to be too easy on account of the following reasons.

Recovery of the high long-term average rate of growth requires that the augmented levels of efficiency in domestic resource use and inflow of capital goods from abroad be maintained over the entire time horizon of perspective planning. It has been pointed out earlier that additional inflow of capital goods from abroad, over and above imports which are balanced by the country's own export earnings may be possible either with the help of foreign aid or through increased foreign private investment.

So far as foreign aid is concerned, its availability depends on various political factors at the international level and it may not be wrong to suggest that the financing of capital goods imports from abroad by foreign aid may be associated with a considerable extent of uncertainty. As regards foreign private investment, the uncertainty involved may be even larger, because the nature and extent of foreign private investments depend on considerations relating to changing and unpredictable market conditions.

As regards domestic efficiency in resource use, it is a more or less well known fact that in India the existing incremental capital-output ratios are unduly high in many industries as compared to other developing countries so that there seems to remain a scope for improvement. Such improvement may in theory be possible if production may be rationalised by achieving a technically more efficient combination of the productive factors, by increasing managerial efficiency and by increasing the extent of utilisation of capacities where such a scope remains.

But the question which remains to be answered is, whether the steps taken as part of the NEP can suffice to achieve a tangible improvement in efficiency or not. Turning once again towards general facts concerning the Indian economy, one finds that the reasons behind the existing lack of efficiency and incomplete utilisation of capacities of production broadly include imperfections of product as well as factor markets adversely affecting the profitability or viability of productive ventures, and a general lack of consistency or inter-industrial balances in investment pattern resulting in structural and financial bottlenecks in public as well as private sectors. One can also find a host of different political and social forces which not only influence economic decisions taken at different levels but also often stand in the way of implementation of decisions that are made. We have a history of industrial sickness not only in the case of

public sector undertakings, but also to a significant extent in the private sector. Therefore, whether the NEP with its magic wand of increasing privatisation and liberalisation of industries can lead to the augmentation of domestic efficiency in resource use to an extent which may make possible a growth recovery, remains an open question.

Notes

[Ashok Rudra kindly went through a draft of this paper and suggested some improvements. But the present writer stands wholly responsible for the flaws which may still remain.]

Female Beedi Workers in a South Indian Village

A Dharmalingam

While beedi work provides a guaranteed wage, secured employment and some degree of economic independence to rural women, it exposes them to economic and sexual exploitation. This study examines the working conditions in the beedi industry and the exploitative relations of production in a southern Tamil Nadu village.

LABOUR force participation in non-agricultural sectors is a crude measure of economic well-being. India, though still largely agrarian, has experienced substantial increase in its manufacturing and service industries, particularly cottage industries. Consequently, class and caste configurations have changed. Though caste has not lost its significance in relation to 'power', class has become increasingly independent of caste. This change was due to economic and political changes in the wider society [e.g. Beteille 1965; Epstein 1973]. Beteille (1965:223) points out that the creation of large-scale non-agricultural employment has been an important factor in altering the class structure of Indian society.

This paper examines female working conditions in a non-agricultural industry, beedi-making. The issues are explored in the context of a village, Kaviyur (a pseudonym), in southern Tamil Nadu. The study shows that beedi work provides full-time employment and some degree of economic independence to women. However, it is at the cost of economic and sexual exploitation, and being exposed to several health hazards. Further, the exploitative relations of production in beedi-making has given rise to conflicts at both the familial and societal level.

THE VILLAGE

Kaviyur is situated in the southern district of Tirunelveli in Tamil Nadu, about 50 km west of the district headquarters. A survey was conducted between June and October 1987 to collect social, economic and demographic data. The total population at the time of survey was about 1,500. The majority of the village population (85 per cent) belonged to the nadar caste and about 10 per cent were Harijans. The selection of the village is largely based on my familiarity with the village population and history. I was born and grew up in the study village, so I can understand some of the complex social, cultural and demographic issues with much more clarity than would have been possible for an outsider. The past with which I compare the present is reconstructed through not only my experience as an object in the village but also through

what I have been told as a subject by the elders about their past work, gender relations and so on.

A quasi-anthropological approach in the tradition of micro-demography (*a la* Caldwell) was employed to collect quantitative and qualitative information [see Caldwell et al 1988; Caldwell 1985]. This approach complements the large-scale survey method in trying to understand the nature of a phenomenon at the micro-level [Axinn et al 1991; Smith 1989]. Following this method, data were collected from all workers through structured and unstructured questions, participant observation, and in-depth probing. Qualitative descriptions are presented with the intention to give insights into the various social processes and conflicts in a changing socio-economic reality.

HOW IS A BEEDI MADE

Beedi is a crude cigarette in which tobacco is rolled in a small beedi leaf ('tendu') and tied with a cotton thread. A beedi is smaller and less expensive than a cigarette; it is considered the poor man's cigarette, and is smoked only by men in Kaviyur and in rural Tamil Nadu in general. Beedi is made out of the materials supplied by the beedi contractor, viz, beedi leaves, tobacco, and thread. There is a predetermined amount of beedi leaves for a given amount of tobacco. The worker has to produce a fixed number of beedis for the given amount of tobacco. The contractors are flexible only in the amount of thread bundles supplied.

The four main steps involved in producing a beedi are rewinding the thread, cutting the beedi leaves, rolling the beedi, and folding the beedi-head. It may be useful to give a brief description of these four stages to understand how the different aspects of beedi-making facilitate the creation and maintenance of division of labour; to highlight the high labour-absorption capacity of this occupation, particularly important is the opportunity to employ the children and elderly in beedi-making,¹ to bring out the exploitative relationship between employers and workers, and that between the assistant workers and main workers; and to understand the health hazards resulting

from the monotonous nature of the work.

Learning beedi-making in fact starts with rewinding the thread. Rewinding the beedi thread does not require any skill. The job involves just rerolling the thread from a small bundle onto an object, usually an empty match box or a pulley-type object. It takes about 30 minutes to an hour to rewind a bundle of thread; it has to be done almost every second day. This job is usually done by the beginners, and also by other family members of the main beedi workers.

Cutting beedi leaves is the next stage. Beedi leaves are cut into small pieces to the measure of the 'aasi'. The plate is placed on the leaf which is cut with scissors; normally, an average-sized beedi leaf can be cut into four pieces. Cutting the beedi leaves requires some skill, because the maximum number of pieces cut from a beedi leaf depends partly on the acquired skill of the worker.

Rolling the beedi leaf with tobacco is the main job in the beedi-making process. Three main steps are involved in making a perfect beedi. First, tobacco is to be rolled in the leaf and tied with the thread. The pinch of tobacco rolled into a beedi must be accurate enough, failing which the beedi may be too small or too big. Such abnormal beedis will not only be rejected by the contractor but the worker will also incur loss because the big beedis consume more tobacco than the required level. In order to rectify the loss the worker has to buy extra tobacco from the market. While rolling the beedi between the thumbs and forefingers enough pressure must be applied to make the top end of the beedi appear broader than the bottom end. Half-way through the rolling, the beedi-bottom is folded in to prevent the tobacco leaking; the beedi is tied when it is fully rolled. Then the beedi-head (or top), which is wider than the bottom, is folded in to complete the making-process. The main worker can stop after rolling and tying; the folding of the beedi-top can be done by another person. Beedi assistants who are in the learning process are mainly employed in folding the top. The completed beedis are bundled, each bundle consisting of 16 beedis, which are then taken to the contractor.

PARTICIPATION IN BEEDI WORK

Almost all beedi workers in Kaviyur are females, though this is not the case elsewhere in India. However, beedi work is now attracting more males in Kaviyur as they have started realising the hardship involved in other jobs like brick-making. Of the 346 beedi workers in 1987 only five were males. It appears, however, that in the interior part of the district a significant proportion of men are said to do beedi work, mainly because there were no other employment alternatives. The popular view in Kaviyur, however, is that 'beedi work is for females not for males'. For the present analysis beedi workers are divided into two groups: main beedi workers and beedi assistants. Beedi assistants are usually members of a beedi worker's family whose main activity is not beedi-making or who are under full-time training.

There were 346 main beedi workers and 39 beedi assistants (Table 1). These beedi assistants do not include those assistants who are in school during the school time. Over 80 per cent of the main beedi workers have so far worked for less than 20 years, which indicates the emergence of the beedi industry as a main source of employment only about 20 years ago. This is also reflected in the concentration of workers in the age groups below 40 years. Moreover, when beedi work was introduced on a larger scale it seems to have attracted the younger women, about 70 per cent of the main beedi workers aged over 20 years started this before reaching 15 years of age.

Beedi-making involves skills which need to be imparted gradually. Girls are introduced to beedi-making when they are as young as four years old. Table 2 shows that about half the beedi assistants were introduced to the work when they were between five and 10 years, and the other half were introduced between 11 and 15 years of age. It takes about five years to learn the full beedi-making process. By the time a girl can undertake beedi-making on her own, she will be over 10 years. Assistance in beedi-making is only a transitional stage prior to becoming a main worker. Before being able to get a new passbook² a worker has to work in joint account with another main beedi worker; this is like the period of apprenticeship. In most cases the main worker in the joint account is the mother, sister or another relative. The main service expected from the main worker in the joint account is to supervise and advise the learner and point out the errors in her beedi work. It takes about five years, after a girl has started making beedi herself, to get a separate passbook. About 14 per cent of

main beedi workers are aged less than 16, which indicates that these girls started the job at an early age and also the significant economic contribution the young beedi workers make to the well being and survival of their families.

EMPLOYERS

Beedi work is not new, though relatively recent, it has been there in Kaviyur for about 60 years. However, only a few people did beedi work in the past. It was a source of employment for people who did not know how to do agricultural work; for women married to salary earning husbands who did not want their wives to do agricultural work; or for those whose mothers were beedi workers. In addition, beedi work was not rewarding in the past, and there was no beedi contractor in the village to supply the required raw materials. To get these it was necessary to travel two to four miles, and sometimes even 30 to 40 miles.

To make beedis in the past (or we may call them 'old beedis'), no instrument of 'measure' was used to cut the beedi leaves. The beedi worker had to cut a leaf into pieces of approximate size, the result of which was that beedis varied in thickness and length, and also the beedi leaves were not used efficiently. The tobacco supplied was not pounded into very small pieces; and coconut fibre was used to tie the rolled-beedi. The top of the rolled beedi used to be first folded in and then a special small iron stick called 'pottu kucchi' was used to shape the beedi top.

A major change occurred in the shape and content of the beedi in the early 1970s (we may call them 'new beedis'). In making the new beedi a small iron plate (approximately 7.5 cm by 4 cm, locally called aasi) is used to cut the beedi leaves with a pair of scissors. The tobacco supplied is already powdered into very small pieces; instead of the fibre, a thin coloured cotton thread is used to tie the beedi. In short, the new beedi is thinner, a little more expensive, and of better quality than the old beedi.

While there were only two beedi companies in the study area before the 1970s, with the introduction, and increased demand for production, of the new beedi, many new companies have sprung up to provide employment. Of the two old companies there is only one left now. Contractors or agents of about six beedi companies are involved in employing the available labour in Kaviyur to produce beedi. Of the six, two companies' contractors employ about 80 per cent of the beedi workers in Kaviyur.

Except for one small agent, none of the major contractors was from Kaviyur. In the 1970s beedi workers went to the neighbouring town, about 3 to 4 km to the south, to get the beedi materials because no branch was established in Kaviyur during that period. In the early 1980s, however, the number of beedi workers in Kaviyur reached a level high enough to justify opening a new branch. The main employer in the region, the George Beedi Company (a pseudonym) opened a branch in Kaviyur. Since then, other companies have followed suit, either opening a local branch or, for those with fewer workers in Kaviyur, employing agents to bring in the raw materials every day.

The contractors obtain the necessary raw materials from the employers' main office located in the district headquarters. As the contractors have more than one branch in their area, the raw materials are stored at a bigger branch and are brought

to small branches daily. For Kaviyur, the materials are brought about once a month and stored in Kaviyur itself. The contractors have to produce a fixed number of beedis for the amount of raw materials supplied and in turn they impose the same conditions of production on the beedi workers.

The contractors who supply the raw materials employ one checker, one accountant, and one or two helpers to weigh the raw materials. The number of these ancillary workers employed by the contractor depends on the number of beedi workers in a particular branch. There are about five employees, all males, in the Kaviyur branch of the George beedi. The beedi workers have no direct or indirect contact with either the contractor or the main employer. However, the contractor is approached by the village leaders if the behaviour of any company employee towards workers is unacceptable.

The beedi workers' direct contact is with the employees at the branch particularly the accountant and checker. The nature of the relationship with the checker, who can also be an accountant, is important for the beedi workers because he can reject the beedis on the grounds of poor quality. He checks, at random, one or two beedis in a couple of bundles. If that one beedi taken from a bundle is not well made then the whole bundle is destroyed; sometimes a worker may lose from one-third to three-fourths of the beedis submitted. The worker in such a situation not only loses the wage for the work done but also the raw materials used to make the beedis that were destroyed. If the worker does not make up for the rejected beedis by the end of that particular week, the cost of tobacco, beedi leaves and thread required to make the number of beedis rejected will be subtracted from the total wage earned for that week.

The next important person is the one who weighs the raw materials. If he does not like a worker, he can weigh the materials in a way that will result in a deficit. To meet the deficit the worker has to buy the raw materials in the open market at a high price which is sometimes more than the wage received for the number of beedis made out of it. The weigher can also create a deficit to the worker by supplying damaged beedi leaves which are normally at the centre of the beedi leaf bundles.³ If the worker points out the damaged leaves immediately and demands a substitution, then she succeeds only if the weigher is in a good mood or the worker's family is an influential one. If the beedi leaves supplied were so much damaged that every beedi worker gets some of them, there is no substitution at

all for anybody. This time the explanation of the employees, on the order of the contractor, is: "we cannot do anything about it because that is the way we received the leaves from the headquarters. If you do not like this then you can stop working until we get good leaves". With no alternative work the beedi worker is forced to accept whatever the beedi contractor gives.

To minimise the number of beedis rejected, the shortfall in beedi leaves and tobacco, and damaged beedi leaves, the beedi workers must maintain good relations with the employees, particularly the beedi checker and weigher. For an average beedi worker, particularly an unmarried one, the effective means to attain this result is to use her 'feminine' characteristics. Some girls smile at them and chat with them in sex related metaphors, while the checker is checking the beedi and the weigher is weighing the raw materials. Some even deliberately let their clothes slide down from the breast so as to distract the male employee's attention. Beyond this, some invite the employees to their houses for a cup of tea after working hours to chat for hours; some employees are clandestinely invited at the weekend to the lake or river which is about two kilometres south of Kaviyur. Thus the main employer and the contractor do not have any direct relationship with the beedi workers. Only the employees of the contractor and the workers are involved in the exchange of raw materials for beedis. The beedi workers, by exposing themselves even to sexual exploitation, attempt to minimise their economic exploitation at the hands of the contractor and main employer.

Though, in general beedis produced by all companies look almost the same, they are distinguished from one another mainly by the colour of the thread used to tie the rolled beedi. There is not much difference in the wage rate between them. But shortage of materials is less prevalent for some companies than for others. More frequent short-falls of beedi leaves and tobacco are experienced by the workers of beedi companies which have many employees. Another difference is that only the major beedi companies pay a bonus; the payment of bonus also depends on the nature of the contractor: if he is a big-time contractor then he cannot evade the bonus rules but a subcontractor is more likely to keep the bonus to himself.

Every year new workers are added to the existing workforce. The beedi companies are able to attract them despite the exploitation.⁴ There are several reasons for the increased participation of women in beedi making. First, compared to the 'old beedi' companies, the new ones pay good wage; they also pay a bonus, which was

unknown in the past. Some new ones even give an amount of 'holiday pay' as a proportion of total wage earned during a year. Secondly, and most importantly, there have been attractive changes in the mode of payment; the wage is nowadays paid weekly and the bonus is paid twice a year. Under the old system it was usual to go through months, and sometimes years, of delay and uncertainty before the wage was paid; now wages are paid every Saturday without fail. A guaranteed wage and secure employment, even if it is assumed to be only for a short period, have facilitated short-term planning and budgeting for some families. In the well-off families where daughters are beedi workers, their wage is saved regularly for special purposes like marriage, to buy land, temple festival expenses and so on. Thirdly, women and girls themselves are interested in beedi work because the wage they earn gives them some power that can be exercised in their own interest; they get reasonable treatment from their families for their economic contribution; they have access to money to buy cosmetic items and can also ask their parents legitimately to buy good clothes. They have some degree of control over their marriage arrangement. Finally, population growth may also have influenced the large-scale expansion of beedi work in Kaviyur and the surrounding areas.

EXTENT OF BEEDI WORK

There is no doubt that women in Kaviyur work longer hours than men. In addition to their wage earning beedi work, women also do all the household work. Despite the importance of household work, it is an irony that women's contribution in the domestic sphere is not recognised as productive by the menfolk.

The beedi companies can provide the material for six days a week; Sunday is the official rest day. The information relating to the extent of beedi work for main workers and assistants is given in Table 3. About one-third of the beedi workers and assistants worked all the six days during the reference week; in fact, one beedi worker reported having worked for seven days, with a few hours' break on the rest day. Almost one-half of the workers worked five days; another one-fifth worked for four days; and only about five per cent of the workers for less than four days.

Usually a worker starts between five and six o'clock in the morning, and continues her work until the day's beedis are submitted. If the time of submission is in the morning then she forgoes her breakfast; if in the afternoon then lunch is forgone, because if she does not submit at the time she has been allotted, her

THE INDIAN JOURNAL OF LABOUR ECONOMICS

The Journal, in print since 1958, is published quarterly as the organ of the Indian Society of Labour Economics. The chief aim of the Journal is to promote scientific studies in labour economics, industrial relations, trade unionism and related topics. It publishes research articles, notes and book reviews on these subjects, particularly in the context of India and other developing countries.

Recent articles published in the journal include

Vol. 35, No. 1, 1992: Lockouts, Closures and the Role of the State by **Ruddar Datt**; Employment Consequences of the Green Revolution: Some Emerging Trends by **D.P. beedis will not be accepted for that day, which means that she is unemployed for the next day. Failure to submit beedis every day brings, undoubtedly, the wrath of her parents or husband; so beedi workers are forced to sacrifice their meals, to accomplish their task in the interest of their family.

It is practically impossible to find a beedi worker who submits her beedis, prepared only by herself. In order to keep up to the submission time allotted, almost all beedi workers resort to borrowing beedis from those whose submission time is either very late or very early. Those who have to submit in the afternoon lend their beedis to those who submit in the morning who in turn make the beedis for the afternoon-goers. If the borrowed beedis are rejected by the contractor for poor quality, quarrelling between the workers is certain with long-term consequences. Generally, a beedi worker gets only about half-an-hour to one hour break during the day. Even this short break is possible only when the worker has returned the borrowed beedis. The relentless tasks involved in beedi making are reflected in the number of hours worked in a day. About 90 per cent of the main workers have worked on an average over 10 hours a day (Table 3); about a quarter worked more than 13 hours; and there was one worker who worked about 16 hours a day and seven days a week. The work intensity becomes more extreme when the assistants' labour is also taken into account as majority of the assistants seem to work for eight to nine hours every day.

Sometimes even the main beedi worker, beedi assistant, and co-beedi worker network fails to make it possible for a beedi worker to submit her beedis at the time allotted to her. Fear of the wrath of the parents if the number of days not-submitted is not kept at a minimum, coupled with the economic necessity forces some beedi workers to borrow beedi bundles from professional beedi lenders. Professional beedi lenders are usually old women, mostly widows, who do not know how to make beedi. They get some bundles of beedi made either by their daughters or by paying a professional beedi worker. Then they lend these beedi bundles with a fixed daily interest rate. For every ten bundles (each bundle consists of 16 beedis) lend, they get one bundle interest every day. Some workers have to go to the professional beedi lenders despite the high interest; in the process some are trapped, never able to come out.

The pressure exerted on the beedi worker from different angles sometimes leads to tragic incidents. On the one hand a worker has to submit her beedis on time because of the strict regulation of the con-

tractor, and, on the other hand, the worker cannot undertake a lesser amount of beedi work because of pressure from family or because of her own necessity. Caught between these forces a worker at times resorts to borrowing from professional beedi lenders. The actual experience of a child beedi worker is worth mentioning to illustrate this situation.

A 12-year-old girl who was a main beedi worker had been borrowing from professional beedi lenders for some time. She had to do that because it was her parents' (particularly mother's) order to submit a fixed amount of beedis every week, failing which she would be beaten. Whenever there was a short-fall she borrowed from a professional beedi lender; her debt, along with the interest, gradually increased to about 100 bundles of beedis. Realising that the girl would not pay the beedis back, the lender informed the girl's parents. Fearing that her mother would beat her, the girl went to the forest and committed suicide by eating the seeds of a wild plant. The victim's parents were not driven by poverty to enforce rigid rules on their daughter. This case highlights the conflict between various interests caused by the nature of social and economic changes in the society. There is a growing inconsistency between the aspirations and the means available to achieve them. Every family in Kaviyur wants to earn and accumulate wealth, because that is the measure of social status; gone are the days when a person's or a family's superior social status could be achieved through only good deeds and through inheriting the family status. To earn economic and social status all available resources including children are put to use; even then not all can realise their goals because of the unequal relationships in the process of

production and distribution. The victims are the weak and the beneficiaries are the exploiters. In the child suicide case mentioned above, while the girl's brother (two years elder) was in school, she had to earn money not only to give profit to the beedi company and beedi lender, but also to give prestige and status (primarily a function of wealth) to her parents. Of course, her own future depended on how much she could contribute toward her future dowry and jewellery. Despite the double exploitation a woman or a girl is exposed to, her individual earning has given her some power and status within the family which was unthinkable, particularly among the landed class, in the past when the main source of livelihood for the village was agriculture.

Given such a great demand on beedi workers, particularly on young beedi workers, for economic and social status, it is not surprising that ceaseless work is expected throughout their lifetime. A great majority of the beedi workers worked throughout the year except when there were supply constraints; 82 per cent of the beedi workers and 70 per cent of beedi assistants worked for 12 months during the reference year (Table 3). A maximum of 10 to 15 days a year were lost because of non-availability of supplies. Supply-induced work-absence occurs during the monsoon season, when there is no sunlight to dry the beedi-head, which needs to be done within a day or two from when the beedis were collected from the beedi workers.

Everyday activities of beedi workers include not only beedi making but also the household work. Most of the unmarried beedi workers fetch water from the village well or water tap every evening for about an hour; some of them do only cooking,

Note: Of the 39 beedi assistants 12 were irregular workers. The information provided in the table, therefore, is only for regular assistance

A substantial proportion of the beedi workers (56 per cent) do all household work including cleaning the house and catlashed, fetching water and cooking. If there are more than one beedi worker, household work is divided between them. After an interval in the evening of about two hours, beedi workers resume their work around 7.30 and work until 11 or 12 o'clock at night. This routine work continues for six days a week and only on Sunday do they get some time to go to the nearby river or lake, to take a bath and wash their clothes.

The only entertainment available to a beedi worker is the pleasure of occasional visits to a cinema. It is becoming common among many beedi workers to go to movie shows in the neighbouring town at least once a fortnight; some even visit once a week. They go to the cinema either on Saturday nights or on Sunday afternoons. This can be observed more among the poor women of the nadar caste and women of the scheduled castes. Among the rich and middle-class families, girls are allowed to go to movies only if they are accompanied by a male or elder family member. After the brief break during the weekend the routine work starts again on Sunday evening.

WAGE LEVELS AND WORKING CONDITIONS

In view of the nature, and the amount, of work done, the workers' wage seems to be low compared to, say, agricultural work. Even after working about 13 hours a day, an average beedi worker earns only about Rs 8, i.e., less than one rupee per hour. But a woman agricultural labourer is paid about seven rupees for eight to nine hours work. Most of the beedi workers earn between Rs 40 and Rs 60 a week. About one-quarter, who are mostly the beginners, earn a wage of less than Rs 30; about 10 per cent of the workers earn between Rs 60 and Rs 100. These extreme cases are usually assisted by one or two beedi assistants. The assistants do the cutting of the beedi leaves and cornering of the beedi-head which enables the main beedi worker to roll a greater number of beedis. Table 4 shows that 92 beedi workers had assistants (84 workers had one and eight had two assistants). Though about 90 workers received some assistance, only about 60 per cent of them felt that their assistants deserved a wage for their work. Other assistants' contribution was either infrequent or too little to entail a wage. The amount payable, according to the main workers' assessment, varied from Rs 2 to Rs 45 per week. In any case, the average wage payable to an average assistant varied between Rs 10 and Rs 20 (Table 5), which was in fact not much different from the actual wage attributed to those who were identified as beedi assistants in the survey.

An average worker can make 800 beedis a day at the piece-rate of Rs 10 per 1,000 beedis; this entails a wage of Rs 8 per day

and about Rs 50 per week (excluding the bonus). The main beedi worker's earnings, however, have to be adjusted for the expenditure in order to arrive at the amount that will eventually go to the worker. The main source of deduction is the money spent to cover the short-fall in raw materials. Theoretically, the material given by the contractor should be enough to produce a given amount of beedis; in practice, however, this does not occur. Table 5 shows that only 8 per cent of the beedi workers reported that they did not face any short-fall in the raw materials supplied by the employer. Only about 36 per cent of the workers spent less than Rs 5 per week to buy tobacco and beedi leaves in the open market; others spent between Rs 6 and Rs 20 per week; the average was Rs 7 per week. If the average wage earned was Rs 50 per week, subtraction of Rs 7 from it would give a net wage of only Rs 43. This Rs 43 was the wage for six days' work, with each day's work ranging from 10 to 14 hours.

The seriously-felt grievance among the beedi workers was the short-changing in supply of tobacco and beedi leaves. It becomes particularly deleterious for those who have spent 40 to 50 per cent of their wage to cover the loss. Some of those who suffered to that extent have confronted the contractor but only to be denied even the meagre wage. One respondent reported that she fought alone with the contractor to rectify the short-fall which resulted in her losing the job permanently.³ The beedi-contractors are aware that the short-fall in the raw materials supplied is not due to uneconomical use by the workers. The contractors do not attempt to deal with the short-fall problem because they know that if Kaviyur people refuse to accept their conditions, they can always move their industry to another village.

However, daughters, wives or sisters of powerful and rich men in the village get special treatment from the beedi agents. A woman can also receive favourable treatment if she presents herself as a sex object rather than an honest worker to the males who weigh the beedi leaves and tobacco and check the beedis. A beedi worker is more likely to face not only short-fall in raw materials but also more rejection of beedis allegedly for poor standard, if she is not either from a privileged background or possessing physical attraction but not willing to be exploited by the contractors and their agents.

Despite the expenditure involved in meeting the short-falls, an average beedi worker can earn about Rs 150 a month, or between Rs 1,500 and Rs 2,000 a year. An ordinary beedi assistant can earn as much as Rs 600 a year. This gives an incentive to commit girls to this work when they are very young. Even school-going girls are put to this work in their free time. They are lured into this work by pocket money of 50 paise to one rupee a week and promise of good clothes, bangles, etc. Children from poor families are parti-

cularly vulnerable to the economic pressures.

In addition to the wage, beedi workers are also paid a bonus and 'holiday pay'. They are paid on the basis of the total wage earned during a year: the greater the total wage earned over a year the larger the bonus. However, not all beedi companies and beedi contractors pay a bonus. Some beedi companies do pay but the bonus does not reach the workers, instead it ends in the hands of the contractor; this is more likely when the contractor has few workers, say 10 to 20. Most workers for the small contractors are either beginners or irregular workers who tend to be content with their wage and employment op-

portunities, and also tend to be unaware of the bonus provisions.

The main beedi company and their contractors in Kaviyur do give a bonus and holiday pay. The 'holiday pay' seems to cover the wage for the official non-working days (in the survey, information on holiday pay was not collected separately but was included in the bonus). About 10 per cent of the beedi workers did not get a bonus because their beedi company did not have that system, and about 12 per cent did not obtain it because they either did not have their own passbook or obtained a separate passbook recently. The average bonus obtained was around Rs 200 per year; about 10 per cent of the workers received less than Rs 100, another 10 per cent more than Rs 500, and the bonus for the rest was in the range of Rs 200-400.

The occasion of payment of bonus is a matter of joy for the beedi workers because in most cases this money goes towards savings which are usually meant to buy either saris or gold ornaments for the working girl or woman. However, owing to the nature of structural changes that have been effected by the macro-economic changes, the strategies adopted by the families to make use of the bonus vary according to their class status. The bonus is spent mainly on the working girl among the middle and rich families. Among poor families also there is a lot of pressure to spend the bonus money on their daughters who are beedi workers, to prove that they also care about their hard-working daughters; however, despite their love and intention to make their daughters equal to other girls, some parents have to succumb to other competing economic pressures, which many a times have long-term consequences on the relationship between the parents and the working daughters. Daughters stop trusting that their parents love them. Eventually individual parents become the scapegoats for the economic and social injustices in the society. Structural forces unleashed by the prevailing social relations of production are reduced to individuals' characteristics which are products of such relations.

HEALTH HAZARDS

In addition to the economic exploitation of the beedi workers, they are also exposed to occupational health hazards. The nature of the work is so monotonous that after a few years the work becomes mechanical. There is no room for creativity or innovation. As the worker gets older her fingers become numb; unlike a young worker, an old worker has to make three or four attempts to roll a beedi. The nature of beedi work is such that a worker cannot take her eyes off it even for a moment if she is to make the required number of beedis for a day. "This takes its toll of people's eyesight" as they grow older (*Economic and Political Weekly*,

1978: 1177). As the beedi worker is seated at the same place and in the same position for hours, there is no body movement involved, except the monotonous movement of the two forearms. This results in backache, legache, headache, piles and rheumatism. A more serious threat to the health of beedi workers is posed by the inhalation of tobacco fumes to which the workers are continuously exposed. Studies from other parts of India have shown a high incidence of tuberculosis, asthma, allergy and continuous cold among the beedi workers. A study conducted in Kerala showed that about 36 per cent of the workers reported suffering from one or more diseases, and 95 per cent of these believed that it was caused by tobacco fumes [Mohandas 1980]. A trade union leader, who was himself a beedi worker, from Maharashtra reported that 'more than 50 per cent of the workers eventually die of TB or asthma' (*Economic and Political Weekly* 1974: 947).

Tobacco can affect not only the health of the workers themselves but also that of others in the family because, as beedi work is carried out at home, the raw materials are kept at home in small open boxes. Sometimes the same box is used to carry rice and eatables from the grocery shop. When entering a house it is hard to avoid smelling tobacco. The tobacco pieces left on the saris of the beedi workers may fall into their eyes when the saris are hung up. Sometimes toddlers, without knowing the difference between tobacco and eatables, put their hands into the tobacco box and then into their mouths. For instance, when a 40-year old beedi worker was being interviewed, the baby in her lap started crying for no apparent reason; the mother tried to put the baby to her breast thinking that it was hungry; the baby still continued crying with no interest in breast milk. The mother beat the child to stop its crying but it did not desist. After pausing for a few moments and watching the face of the crying child, the mother realised that there must be something in the baby's mouth; she put a finger into its mouth and took out two small pieces of tobacco.

Though all the beedi companies are supposed to provide medical facilities, only the largest company, George beedi, in Kaviyur, seems to have provided such services in the nearby city, about 30 km away. The workers have access to the medical establishment the company has arranged, which is usually located in the district headquarters. No reimbursement is made if medical service was obtained from other hospitals or doctors; no paid sick leave is available.

Despite the fact that it was the duty of the beedi company to inform the workers of the availability of free medical services, they have not done so; only about 37 per cent of the beedi workers in Kaviyur have heard of such facilities. But a majority did

not know where those facilities were available. Some of those who knew the place said that it was far away from the place of work; thus it was necessary to give up a day's work to go to the company hospital but a poor worker cannot afford to forgo a day's work. It is, therefore, not surprising that only five workers so far have obtained medical services from the beedi company's hospital.

The beedi workers are exposed to economic, sexual and health exploitation. Not only is their wage low compared to the amount and intensity of work but also their life expectancy is shortened because of their proneness to the diseases which emanate from tobacco and the nature of the work. Not just the worker alone but the entire family is vulnerable to these beedi-work-related diseases and exploitation.

CONCLUSION

Under conditions of increasing population the expansion of beedi industries have provided employment opportunities for women. The process of beedi production is such that it can absorb the labour of children, adults and the elderly. They work longer hours for meagre wages. They are exposed to economic and sexual exploitation and health hazards. Female workers are under constant pressure from both the employer and their parents/husbands. Poverty and exploitation succeed in pitting daughters against parents. Eventually individual parents become the scapegoats for the economic and social injustices in the society.

There is conflict between various interests caused by the nature of social and economic changes in the society. There is a growing inconsistency between the aspirations and the means available to achieve them. Every family in Kaviyur wants to earn and accumulate wealth, because that is the measure of social status; gone are the days when a person's or a family's superior social status could be achieved through only good deeds and through inheriting the family status. To earn economic and social status all available resources including children are put to use; even then not all can realise their goals because of the unequal relationships in the process of production and distribution. The victims are the weak and the beneficiaries are the exploiters. The social relations in Kaviyur have been undergoing changes in response to changes which have occurred in the economic context of the society. The adaptation of individuals to such social changes is likely to vary depending on their family class position and gender.

Notes

[This is the revised version of a part of the author's doctoral dissertation. The author is grateful to Jack Caldwell, Geoffrey McNicoll and Gavin Jones.]

- 1 'Economic participation of children in beedi and brick industries is dealt with elsewhere See Dharmalingam 1991 Chapter 4
- 2 The passbook contains information about the amount of tobacco taken from the agent, the number of beedis submitted, the wage earned and the bonus paid. Obtaining a separate passbook signifies the recognition of the worker as the main beedi worker both by the contractor and by fellow workers. A separate passbook is issued only after the assistant has demonstrated her skill to the beedi contractor
- 3 Beedi-leaves are issued in bundles of 100 to 200 grams
- 4 For an early account of beedi work and the nature and extent of exploitation in different parts of India, see *Economic and Political Weekly*, 1974 and 1978, Avachat 1978, Mohandas 1980, Bhatti 1981, Kannan 1988 Chapter 5. See also Zaheeruddin 1985
- 5 In contrast, beedi workers in the neighbouring state of Kerala are politically and organisationally well mobilised (for details see Mohandas 1980 and Kannan 1988)

NIPFP Books

1. The Ninth Finance Commission Issues and Recommendations

A selection of papers presented at NIPFP Seminars held in February, 1988 and May, 1990

The papers presented in this volume cover a wide range of issues relating to Union-State financial relations in India. Specifically, the papers review the issues that arose from the terms of reference given to the Ninth Finance Commission (NFC) seek to develop an appropriate conceptual framework for inter-governmental transfers and analyse in that light the recommendations of the NFC. The analysis includes the relative roles of the Finance Commission and the Planning Commission, the efficacy of the NFC's recommendations in redressing the vertical and horizontal imbalances in the distribution of government revenues, and the efficiency and equity implications of the normative approach adopted by the NFC in addressing the revenue gaps facing the States in their budgets

Price Rs. 490 US \$ 70.

2. Import Substitution in the Manufacturing Sector

By Hasheem N. Saleem

The study estimates the extent of import substitution in the manufacturing sector for the period 1970-85. A modified version of the Chenery measure incorporating changes in the structure of final demand using the input-output framework has been used to estimate the extent of import substitution for the years 1973-74 and 1979-80. The impact of changes in policy for the period 1970-1985 has also been examined by relating import availability ratios to capacity utilisation rates for some selected industry groups.

Democratic Movements and Dialectics

N Ravi

"APCLC stands unique among all the democratic organisations in the country in that it has kept itself away from condemning private violence. The high prestige that it enjoys has a lot to do with this fact", said Randhir Singh in his inaugural address at the seventh conference of APCLC in April 1991. He also warned that if democratic organisations let the private violence issue creep into their agenda either under the pressure of the state or the media, then they would not be satisfied till the organisations unequivocally support the state.

In a space of two years after the seventh conference, APCLC seems to be losing that uniqueness, though not the prestige. Letting the private violence issue creep into the agenda has not dragged it into supporting state violence, but it has led it to condemn the killing of K S Vyas, one of the most notorious and brutal police officers Andhra Pradesh has ever seen ('Reflections on Koyyuru' -EPW, March 20-27).

This response first deals with the specific instance of the Koyyuru kidnapping. The second and more important one is the question about what should be the relation between radical and democratic movements and human rights movement and related questions.

I

The whole kidnap episode turned into a drama with statements of the government and also of the APCLC that Ramanna and Ranadev, whose release was sought by the People's War (PW) group were unwilling to join the movement and hence the kidnapped be released. While Ramanna has never given such a statement till date (which the APCLC mistakenly believed he has) Ranadev gave such a statement after 40 to 45 days of mental torture by the most notorious SP of Warangal district, D T Naik. Ranadev was still alive because he was arrested by the Maharashtra police in Nagpur and not by the Andhra Pradesh police. The Andhra Pradesh police sought his custody through the Nagpur court. Therefore, it was hasty on the part of APCLC to have issued the statement, without cross-checking Ranadev's intention.

The lies told by the government began

here and the All India Radio, Hyderabad was its mouthpiece broadcasting these lies. The PW squad did not believe the statements of APCLC and insisted on the release of Ranadev. After the APCLC intervened, they wanted that Ranadev's intention be verified personally or through any reliable person. The option was Kaloji. The government agreed to send Kaloji to meet Ranadev and Kaloji himself expressed his willingness. But then the collector of Warangal sent word to Kaloji that there was no hurry and he could wait for some more time. But more drama was to unfold. AIR, Hyderabad sprang a surprise on February 8, by broadcasting Ranadev's voice, in the midst of the regional news bulletin at 6.45 a.m., appealing to the PW squad to release the kidnapped as he was reluctant to rejoin the movement for personal reasons.

Almost everyone believed that this would make the PW release the kidnapped. Everyone thought that PW had made a fool of itself by demanding the release of one who did not want to rejoin its ranks. But the PW squad still insisted that either they hear from Ranadev personally or through a reliable person. A day later it became clear that it was not Ranadev's voice, and that his voice had been mimicked. Perhaps it is the first time in the history of AIR that a mimicked voice has been broadcast as the real voice in its news bulletin. The prestige of the government received a severe blow and it was compelled to allow Kaloji to contact Ranadev. Ranadev categorically expressed his willingness to join the PW. This put the government in a fix. Even then government dilly-dallied and contradictory statements were issued. Meanwhile PW set free four of the kidnapped and retained only Balaraju and Chinnam Raju. The government moved Ranadev from Warangal jail to Vizag jail and declared that now the kidnapped be set free as its demand had been met as though the demand had been for a change of jails! The PW set free Balaraju and Chinnam Raju also after a few days. Though PW did not succeed in securing the release of Ranadev, it was successful in exposing the government and raising the debate about the difference in the way it dealt with the kidnap of IAS officers and of Sudhir Kumar and

the present kidnap.

Political observers feel that the 'voice drama' in a way compelled the government to release Ranadev because the government was hitherto taking shelter behind the 'unwillingness' expressed by Ranadev. The debate that PW raised about the discrimination that the government was showing in getting Balaraju released was also an added factor.

APCLC has intervened in two kidnap incidents. The first time when IAS officers were involved and the second time when an MLA was involved. In between these two, there have been a hundred-odd kidnaps. APCLC did not intervene in these cases and at best only made appeals for their release. The government also did not approach the APCLC. In some instances PW let the kidnapped off without having their demands met and in some other cases the government acceded to their demands. In Sudhir Kumar's case the government got him released by bringing the naxals in by air. What does all this indicate? The government acted only depending on the political compulsions—whether it was in Gurthedu or now—and the intervention or non-intervention of the APCLC would have had the same result. In the present case also had the prestige and the credibility of the government not suffered, it is doubtful if it would have released Ranadev. Moreover, at times it appeared as though the APCLC was speaking on behalf of the state, in its anxiety to get the kidnapped released and end this episode peacefully. The APCLC has obviously not been able to put pressure on the state as it could on the PW. This will develop new contradictions in the functioning of civil liberties organisations.

While intervening is one aspect, during the course of intervention APCLC has raised another debatable point when it says that it is intervening in the issue because the life of a tribal leader, a good leader, was involved. Balaraju is a tribal. All right. But he is an MLA. The question is—is an MLA not responsible for repression on the people? That too a ruling party MLA? He is being made out to be a good and popular person. Popular! Maybe true. Because now-a-days it is rare to see MLAs in their constituencies more than twice or thrice in the term of five years, and when an upcoming MLA with political aspirations meets the people, that too on foot in the forests, he will definitely become popular. If he gets a few jobs for the unemployed youth or performs such acts as building one or two schools or

gets bore wells dug, etc, he is bound to become popular in present-day politics for all have forgotten that these are the duties of the people's representatives. But is that all? What about the repression on the tribal villages of the agency area or Koyyuru for that matter? If it is to be attributed to the police, then should the MLA not question it in the assembly? Does any record prove that he had done so? If MLAs, collectors and other IAS officers are not accountable for the repression then who else is? If the state is such an abstract thing then all the exploiters are also part of the system and hence people are left to fight against such an abstract thing. That is the reason why though the 'good' MLAs like Balaraju are not directly responsible for the repression, as people's representatives they must be held accountable.

II

The argument is a different one when it is argued that "kidnapping should not be a form of struggle". With the above declaration APCLC has entered into an area which it has hitherto avoided consciously. If APCLC once enters into the argument whether kidnapping should be a form of struggle or not, the logic will extend and it will be compelled to give judgment on other forms of struggle adopted by different revolutionary groups as well. For instance, one may press for giving judgment whether "annihilation of class enemies" should be a form of struggle or not? Is that form an undemocratic one or not? The burning of buses causes inconvenience to the people, especially of rural areas and hence is it not undemocratic to burn buses? Where is line to be drawn for the civil liberties groups? The above questions are not hypothetical ones and they are very much part of the ongoing debate in the revolutionary circles of Andhra Pradesh. They are bound to creep into the arguments of the civil liberties groups. The impending danger is that they have to enter into confrontation with the radical and democratic or any other such movements (which adopt violent forms), which eventually will strengthen state violence and provide a justification for it. Moreover there is no end to such an argument about such forms of struggle and hence the acceptable forms to all would eventually be the ones that the law, that is the bourgeoisie law (or is it the semi-feudal and semi-colonial law?) permits. If that is going to be the case then civil liberties activists, who hold the view that people have a right to choose any form of struggle including the violent ones, and who form the majority of the civil liberties activists cannot be accommodated in such

groups. That is going to be the crisis for the civil liberties organisations in future if they enter into arguments on the forms of struggle.

Another debatable point is the statement "we do not see any difference between a kidnap and illegal custody by the police". Here is an attempt only to raise certain questions of practical importance and leave the theoretical aspects of whether it is Marxian or unMarxian or whether it is democratic or undemocratic to the theoreticians of a better calibre.

At present, around 10,000 agricultural labourers, peasants/workers and revolutionary activists are languishing in Andhra Pradesh jails waiting for trial under TADA. This number is swelling day-by-day. It is most common to find each person booked for two to ten offences, all invariably under TADA. With the repeated rejection of bail petitions and the appellate court being out of reach of the petitioners many are incarcerated without trial for years together. In Telengana districts it is very difficult to find a lawyer to argue these cases. Narra Prabhakar Reddy was killed by the police for boldly coming forward to do this job. Even then sympathisers and lower cadre of the activists may be able to find one or other lawyer at least for monetary benefits and may be able to come out after undergoing the legal routines of repeated rejections of bails, etc, for two to three years. This is virtually impossible for the arrested leaders. (All are not Nelson Mandelas to come out on democratic protest). But then is the APCLC able to do anything to get the detained released by democratic protest? No. This is not to blame APCLC. It is only to recognise the limitations of APCLC or any other such organisation for that matter. Then what should the revolutionary movements or parties do to secure their release? If one can provide any alternative, then one can question the kidnaps. Before that as long as nobody is able to provide an alternative, equating the kidnaps and illegal custody is absolutely undemocratic to say the least.

If one fails to see this difference then that will end up not just in equating the kidnap and illegal custody, but the extension of it will end in condemning the killing of such notorious police officers as K S Vyas. Earlier in 1985, when SI Yadarigi Reddy of Kazipet police station was killed by PW, the APCLC firmly maintained that its business was not to involve itself in the matter of counterviolence. But now Vyas is described as a "fairly well known police officer" and it is also stated that "nobody

would support this act of violence". The question is—does this 'nobody' include the families of the 17 revolutionaries for whose encounter deaths Vyas was personally responsible when he was the SP of Nalgonda district? Does this 'nobody' also include the thousands of families of Telengana districts whose male and female members were killed, whose houses were razed to the ground and whose bodies have taken the blows of the butts and lathis of the police and whose grain and clothes were thrown into wells when Vyas was the chief of the 'Grey Hounds'? Does this 'nobody' include the families of more than 40 missing revolutionaries whose disappearance was perfected in the Latin American way when Vyas was the chief of the anti-naxalite squad? Vyas's notoriety and brutality were well-documented in the *EPW* by Balagopal. Though the exposure of the state violence is still the principal activity of the civil liberties organisations, if the present stand of the APCLC continues, then with the sharpening of class struggle and class war APCLC would be pushed to a position to equate the violence of both the sides and such condemning of the counterviolence drives those fighting masses away from civil liberties organisations, would it strengthen the democratic rights movement?

These contradictions between the civil liberties movements and radical movements are arising because the civil liberties organisations in their effort to shed the image being projected by the state that they are the mouthpieces of radical movements, and in their anxiety to perform the 'transforming role' and to "enlarge the field of operation of human rights work", are trying to attain an autonomous role, autonomous from the movements and not just from the radical parties. In this process they are giving the term 'state' an abstract meaning without any relation to time and space. To perform the transforming role in order to see that "in the process of attainment of egalitarian society concern for human rights is not violated", and to check the radical movements from "reproducing the brutalities practised by the exploitative order", the acts of both the state and the revolutionary masses and parties are judged without any consideration of time and space. This is definitely not the way to understand things dialectically.

Some of the 'acts' of the radical parties and the people in the specific case of Andhra Pradesh have definitely raised doubts among sympathisers of the movement and the civil liberties activists that the movement was becoming anarchic and "repro-

ducing the brutalities of the state". Here is an attempt to locate them in relation to time and space. Important among those acts are the so-called 'excesses' in the people's courts that were in full swing during 1990-91, in the occupation of the 'patta' lands, which swept the districts of Warangal, Karimnagar and Nizamabad and in the indiscriminate kidnaps, which numbered to about 100-150 during the same period. Other acts like derailment of trains, burning of Kakatiya bogie, blowing of a private jeep, etc, are not discussed here because the PW apologised for these and some of them are admitted to have been accidents. People also have come to understand these as accidents only.

In the early 1970s and 1980s when organisers used to go to villages and try to explain the true essence of 'land to the tiller' and ask the landless labourers to come forward to till even the patta land of the landlords, the feudal ideology would not permit landless labourers to even acknowledge that the lands of the landlords was also 'their' land. They would only say, "Anna! (as the naxalites are called in Telengana, meaning 'brother') this is the own land of the Dora (landlord) isn't it? It is sinful to occupy that land. We would look for some 'sarkari' land or some forest land". Twenty years of class struggle has raised their consciousness so that they realise that only tillers have the right to the land. So, immediately after the second conference of the Rytu Coolie Sangham (Peasants and Workers Association) in May 1991 at Warangal, without even a call by the party, land occupations began to take place everywhere taking even party circles by surprise. The party must have seen the enormous potential of the people, practically, for the first time. This is the most significant cause for the subsequent brutal repression that was unleashed on the masses of Andhra and continues even today. Nevertheless, the matter of significance here is that the 20 years of the movement achieved what it was striving for—making the masses realise that the land belongs to the tiller and the tiller can get it only by struggle. In the same way, in people's courts the power was realised by the masses. The seeds of 'state power' which, the revolutionaries were saying, would flow from the barrel of the gun, were sown in the masses. They have tasted it for the first time for however short period it may be.

When the masses realised their own enormous power, they also wanted their writ to run. So, whenever the village sangham leaders were arrested they would resort to all sorts of protest. They would organise dharnas, picketings, processions and also

kidnap the government officials, bank employees, mandal revenue officers, mandal praja panchayat presidents, etc, demanding the release of their comrades. Sometimes this extended to the attenders and such lower cadres of government officials also. Only in a few instances did they take away higher officials. They got their leaders released within a day or two. This kidnapping of lower officials raised much unrest among the middle class sympathisers and they started saying "gun is controlling politics", "party has lost control over its cadre", etc. But, how is one to understand all this 'anarchy'? First of all, the realising of the power by the masses must be seen in the background of the heavy repression that they experienced from 1985 to 1990. They perceived that period as 'police raj' and hence now it is 'their raj'. The sarkar harassed them all these days. Now it is their turn to harass the sarkar or at least not allow the sarkar to harass them. So, is it the seed of 'anarchism' or of 'proletarian dictatorship'? It may look far-fetched to call it proletarian dictatorship, but it is definitely one-in-the-making. Twenty-five years of struggle has been successful in bringing three foremost things into the consciousness of the people. They are the right of the tiller to the land, the concept of capturing the state power, and the realisation that the government is not 'their' government.

The last factor played an important role when even attenders, electrical linemen and all other types of lower officials were kidnapped on some occasions. It is true that all these people fall in the 'friends of revolution' category. But to the masses they are part of the establishment and especially so because most of them are corrupt and hence qualified to be kidnapped. Here, it should be borne in mind that almost all of these kidnaps were done by the militants, that is, the village youth of the mass organisations and also that none was killed in any of the incidents. They somehow saw the difference between the true enemies and these people of the establishment but yet the division seemed to be blurring. It is exactly here that the masses should be guided by the revolutionary leadership to understand and to solve the contradictions among the people and the united

front that they have to forge in order to make the revolution successful. When they understand these two things then the excesses in people's courts, the occupation of land of even some middle class peasantry on some occasions and other wrong ways of dealing with contradictions among the people will get automatically solved. But would it not take time? If it has taken 25 years to raise the consciousness to the present state, does it not take at least part of that time to make them understand the above stated things? Meanwhile if the civil liberties organisations decide to point out the faltering of the movement they can do so with the interest of furthering the democratic consciousness of the fighting masses but not with a view that the civil liberties movement and organisations are autonomous, because the latter concept is more likely to lose the dialectical understanding and the tendency will be to have a condemning tone rather than one of suggestion. When the leadership itself deals with the village-level contradictions it is likely to reduce the excesses, but when the initiative is left to the masses then such anarchy is bound to be there in an anti-feudal struggle, but their experience will leave in them a higher level of consciousness. The first option is absolutely impractical and even if it is practical, which is preferable? Trying to pull the reins from back whenever there is a potential danger of 'excess' occurring as did Gandhi after Chauri Chauri incident or just guiding the masses to correct themselves while primarily leaving the initiative to them? Which is the correct mass line? Which is 'centralising the power'? Which will "guarantee the future egalitarian society"? The initiative of the masses or superimposed directions from the leadership? In criticising the human rights violations that have occurred in the Soviet Union and other east European countries, is the primary criticism of having the initiative to the masses or of holding back people and sending directions from the centre?

When one decides on this, it should make things clear for civil liberties activists to decide on what "transforming role they have to perform" and what "relation they should have with the radical movements"

For the Attention of Subscribers and Subscription Agencies Outside India

It has come to our notice that a large number of subscriptions to the EPW from outside the country together with the subscription payments sent to supposed subscription agents in India have not been forwarded to us.

We wish to point out to subscribers and subscription agencies outside India that all foreign subscriptions, together with the appropriate remittances must be forwarded to us and not to unauthorised third parties in India.

	<u>453,410</u>	<u>307,405</u>			

Schedule 17—Notes Forming Part of the Accounts for the Year ended 31st March, 1993

1. Principal Accounting Policies

A. Transactions involving foreign exchange:

- Assets and liabilities in foreign currencies are translated at the rates ruling at the end of the year specified by the FEDAI, except for Pakistani Rupees which are translated at book rates. Outstanding forward exchange contracts, which are disclosed as contingent liabilities, at the contracted rates.
- Outstanding forward exchange contracts are revalued at the rates of exchange specified by the FEDAI as at the end of the year and the resulting profit or loss on revaluation is accounted for.

B. Investments:

The bank's investments in Government and State Bonds and other approved securities are marked to market based on quotations in the "Daily Official list of the Stock Exchange, Bombay". Investments for which quotations are not available from this source are carried at cost.

C. Advances:

- The management has classified all its loans/advances in accordance with the guidelines issued by the Reserve Bank of India, and based on its judgement sets aside specific provisions at not less than the Reserve Bank of India guidelines for each classification. This provision for doubtful advances is made to the satisfaction of the auditors.
- Advances are stated net of specific provisions in respect of doubtful debts.
- Interest income on non-performing advances is recognised on recovery and settlement.

ABN-AMRO Bank N.V.

(Incorporated in the Netherlands with Limited Liability)

D. Fixed Assets:

- Fixed assets are stated at cost less accumulated depreciation.
- Depreciation has been provided at the rates prescribed under the Income Tax Act, 1961, except in the case of vehicles which are depreciated at 25%.
- Depreciation on additions made upto 30th September has been provided for the full year irrespective of the date of additions and depreciation on additions made after 30th September has been provided at half the rates prescribed under the Income Tax Act, 1961 irrespective of the date of addition. No depreciation has been provided on assets sold/discarded during the year.
- Fixed assets include premises which have not yet been registered in the Bank's name although the Bank is in possession thereof.

E. Staff Benefits:

Provision for gratuity and pension benefits to staff (inclusive of provision for past service liability) has been made on the basis of actuarial valuation. Separate funds for gratuity and pension have been created and the contributions payable (inclusive of contribution for past service liability) have been paid to the respective funds.

F. Net Profit:

The net profit disclosed in the profit and loss account is after:

- Provision for taxes on income in accordance with the statutory requirements.
 - Provision for doubtful advances.
 - Other usual and necessary provisions.
- The bank has invested in 10,00,000 9% Indian Railway Finance Corporation (IRFC) Bonds (face value Rs. 100/-) 2010 on a client's account. The bonds have yet to be transferred into the bank's name pending settlement of disputes with other parties to the transaction and the amount has been included in Contingent Liabilities in Schedule 12 to the accounts. The bank has filed a petition with the Company Law Board against the IRFC to transfer the bonds to the bank's name and an interim order has been passed by the Board directing the IRFC to deposit the interest accrued on the bonds in a separate interest bearing account till the dispute is settled. The bank has been legally advised that it has clear title to the bonds. No provision has been made for loss, if any, that may arise as a result of this transaction.
 - The bank has changed its accounting policy for valuation of investments. Investments in Government and State Bonds (excluding treasury bills) and other approved securities are marked to market based on quotations obtained from the "Daily Official list of the Stock Exchange, Bombay" and the resulting appreciation/depreciation in value is reflected in the profit and loss account. In the previous years, these investments were valued at cost. Consequent to this change in accounting policy the profit for the year is lower by Rs. 2,239,993. The management has used the rates quoted in the "Daily Official list of the Stock Exchange, Bombay" to mark the investments to market in the absence of generally acceptable sources from which the values of such investments could be obtained as of the balance sheet date.
 - Advances are stated net of bills rediscounted for the current and the previous year. The value of bills rediscounted has been separately disclosed and not netted off against the respective classification of advances as the details of such classification with respect to bills rediscounted are not readily available.
 - The bank has classified its entire portfolio of investments as current investments.
 - Head Office reserve account:
Head Office reserve account represents amounts remitted from overseas or transferred from unremitted profit and loss account towards the cost of acquisition/deposit for residential premises
 - The previous year's figures have been regrouped/rearranged wherever necessary.

Auditors' Report

We have audited the attached Balance Sheet of the Indian branches of ABN-AMRO Bank N.V. as at 31st March, 1993 and also the Profit and Loss Account of the Indian branches of the bank for the year ended on that date.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of Sub-sections (1), (2) and (5) of Section 211 and Sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account, together with notes thereon, are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are, therefore, drawn up in conformity with Forms A and B (revised) of the Third Schedule to the Banking Regulation Act, 1949.

We report as follows:

- We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit, and have found them to be satisfactory.
- The transactions which have come to our notice have been, in our opinion, within the powers of the bank.
- In our opinion, proper books of account as required by law have been kept by the bank so far as appears from our examination of those books.
- The Balance Sheet and Profit and Loss Account of the Indian branches of the bank dealt with by this report are in agreement with the books of account.
- In our opinion, and to the best of our information and according to the explanations given to us, the said accounts read with notes thereon give the information required by the Companies Act, 1956, in the manner so required for Banking Companies, and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Indian branches of the bank as at 31st March, 1993 and the Profit and Loss Account gives a true and fair view of the profit of the Indian branches for the year ended on that date.

We help Nature keep her true colours.

As reputed manufacturers of vital chemical products, we've been in the forefront of promoting safety and environment protection.

Our commitment to preserve the environment, improve safety and enhance the health and welfare of our employees and the surrounding community manifests itself in every facet of our operations — right from our choice of technology to process selection and engineering design.

Effluent treatment plants at both our factories render liquid wastes harmless. Sophisticated pollution abatement equipment keep emissions within tolerance limits.

Our R&D wing develops products that are environment friendly,

searches for ways to recycle waste and constantly evaluates the effectiveness of our own pollution prevention and control efforts.

We've designed education programmes to inform, train and encourage our employees to actively participate in achieving safety and environmental protection goals — safety inspections and safety audits to assure continuous control, and, onsite and offsite disaster control plans to aid effective response to a wide range of emergencies.

It's all part of our integrated effort to keep our operations safe and harmless.

And to ensure that we help Nature keep her true colours.

July 17-24, 1993

Technology as Common Property Resource

In regard to innovations and their application, the issue of sharing of benefits among the different stake-holders—the inventor, the consumer, the manufacturer and the society at large—has to be rationally addressed. The theory of common property resources gives us a framework in which a balance can be struck among the interests of the different stake-holders.

1515

Nationality Formation and Capitalist Development

The dynamics that set in motion the forces of the pan-Indian national movement were also responsible for the beginning of the process of nationality formation amongst various cultural communities inhabiting different regions of the country. The backdrop was capitalism in colonial form for both these parallel processes.

1521

Backward March

The freedom to hire and fire, which was circumscribed through long and bitter working class struggles and by law, is now to be restored to employers and that, we are asked to believe by the proponents of economic reform, will increase employment.

1489

Sense on Education

The recommendations of the Education Commission appointed by the West Bengal government, while they are informed by a distinct moral commitment, are entirely pragmatic and firmly linked to the evolving situation in education at different levels.

1504

Harmful

An examination of the differences between the system of trade-related intellectual property rights proposed in the Dunkel draft and the existing patents system in India brings out clearly why adoption of the former will be detrimental to research and development and self-reliant growth.

1496

Washington Wisdom

Bangladesh's flood action plan is a good example of the kind of unrealistic and expensive schemes that agencies like the World Bank have pressed upon third world countries without a realistic appraisal of the experience within the concerned country.

1501

Panchayat Pointers

The results of the fourth panchayat elections in West Bengal show that while there are definite symptoms of a dangerous revival of right-wing politics, there are also growing prospects of a new phase of radical activism of the rural poor.

1491

Fiscal Secession

No, this time it is not the militants who want to take Punjab out of the union of India. It is the chief minister of the state himself, the Beant Singh of the famous Beant Singh-K P S Gill twosome.

1487

Clueless

Though economic reforms cannot succeed without agricultural reforms, the current reform programme has neglected agriculture.

1497

Landholding and Equity

Size of landholding is the most common basis for provision of relief measures in agriculture. But when new technologies are being introduced, this reliance on farm size may become questionable.

1533

Charmed Circles

In building a community of discourse in the social sciences in which as much importance is given to good work coming from Coimbatore as from Cambridge, the problem of egoism, though less visible, is far more threatening than that of invidious politics.

1538

Making Sense of Murky Statistics

J C SANDESARA's article 'Modern Small Industry, 1972 and 1987-88' (February 6) displays his usual deft hand at extracting what little guidance is available from the murky official statistics that are available. Three additional considerations may be in order in viewing those statistics:

(1) The value of the rupees reported, if the reported wholesale and retail price indices are to be believed, declined considerably over the 1972-1988 period. The real value of the sums cited and any increase in amounts must thus be discounted (unless somewhere that I could not find in the article it is indicated that the data have been discounted). In particular, the growth in investments in fixed assets and production are overstated, as well as the growth in labour, but not capital productivity.

(2) The closure figures while apparently alarming are not so much so in comparative perspective. Carl Liedholm in some work published by the Gemini Project reports high mortality among African small business, the rule of thumb in the US has always been that three out of four new businesses fail in fairly short order. (Carl Liedholm and Donald Mead, 'The Structure and Growth of Microenterprises in Southern and Eastern Africa: Evidence from Recent Surveys', Gemini Working Paper No 36, Washington, DC: Gemini, March 1993 is the latest piece.) John Kenneth Galbraith even has a nice essay on the services these failing businesses perform for the economy.

Of course, India is neither Africa nor the United States. Indian small units are more heavily involved in manufacturing than those in the United States, and the wastage of fixed capital assets in some cases may be greater. Neither do the procedures for 'Small Business Exit' operate with the efficiency of the US Bankruptcy Laws, so the social costs may be higher, or in any case different.

(3) Finally, as Sandesara recognises the enterprises covered in these surveys are only a part, and a somewhat arbitrarily selected one of the enterprise universe. Better figures are available from the establishments and labour-force figures in the census. I have not been able to get data from the 1991 Census here, though perhaps it is available somewhere in India. The 1989 CMIE source which I was able to find easily, with 1980 data shows more than 18 million enterprises, almost five million of which are establishments (i.e.,

have at least one employee), six million of which are in manufacturing, of which 1,00,000 were estimated to be in the factory sector. It is those figures, with which a comparison can be made from the 1991 Census figures when they are available, to have a sense of how the different segments of the enterprise universe fared during the 1980s.

'Missing' Tribals in Bhandara

THE Committee for the Protection of Democratic Rights (CPDR), Bombay, has just filed a habeas corpus writ petition at the Nagpur bench of the Bombay High Court concerning three tribal youths of Deori tehsil, Bhandara district who were arrested by the police on February 14-15 between 12 midnight and 5 a.m. Their whereabouts are not known till today. CPDR came upon this information during a one-day visit by two of our members, Suresh Rajeshwar and Bernard D'Mello, to the Deori tehsil of Bhandara district on July 12, a preliminary visit upon being informed of allegations of a step-up of police repression in the district.

Some observations of the team are as follows:

Parshuram Salame, a 36-year old Gond tribal of Khadki village was picked up by the police on February 14 at midnight. His whereabouts are unknown to relatives and fellow villagers even today. It is alleged that he was associated with the Naxalites. We spoke to some of the residents of the village. Parshuram is a poor peasant (having about two acres of land), married with four children (minors). We also came

across details of arbitrary arrests under TADA and IPC sections, mainly in the Gond tola of the village. Yadavrao Maraskole (25 years), a Gond tribal was arrested by the police at 3 a.m. on February 15 at village Koyrai at his in-laws' place. He is since 'missing' according to close relatives. It is alleged that he had close links with the Naxalites. Maraskole is also a poor peasant-labourer household. Ashok Wadve (25 years) of Salegaon was picked up by the police at 5 a.m. on February 15 and is 'missing'. His mother Jamunabai, who went to make inquiries about him with the police was arrested and is said to be lodged in Bhandara jail. Wadve is also a poor peasant-labourer.

The struggles of the rural poor for a better livelihood continue to be crushed through illegal and brutal methods by the law and order machinery of the state. Legitimate democratic rights, indeed fundamental rights guaranteed under the Constitution like the Right to Freedom of Expression and Association, life and livelihood are being denied in the name of curbing 'Naxalism'. CPDR expects the state machinery to at least implement in practice the laws that it has framed and committed itself to. We were shocked to hear from persons in the villages which we visited that about three days after the specific arrests mentioned above, three dead bodies were brought to Deori market by the police. However, people were not permitted to identify the bodies. What could be the reason for resorting to such grotesque forms of repression? Is it to instil terror in the minds of the struggling poor that will resign them to a passive acceptance of the *status quo*?

Visible Hand

THE invisible hand writes, and, having written, moves on. This statement is however true only with respect to what has eventuated in Pakistan in the course of the past week. Apropos of its bigger neighbour, the hand that wrote the script last week was very much visible. The US administration chose to put the dying-to-be-a-vassal country, India, in its place. No nonsense about being friends and not masters; there was an unambiguous assertion of the master's right to decide which slaves play what roles. The Russians did not clear in advance with the United States their decision to sell cryogenic rocket technology to the Indians; they needed to be given a dressing down. The niceties of protocol were dispensed with. A spokesperson of the US department of state informed the world that the agreement the Russians had signed with the Indians stands cancelled. The formal transmission of the unhappy tidings from Moscow to New Delhi followed after a time-lag of 36 hours.

The various spin-offs are instructive and perhaps even entertaining, and illustrate the norms of behaviour lackeys have evolved for themselves. The ministry of external affairs in New Delhi has issued a garrulous press note; it has deeply regretted the backtracking on the part of the Russians. However, there is not even a half-word of condemnation of the gross American interference. Slaves can berate other slaves; questioning the conduct or judgment of one's daily provider is out of the question. Only a junior minister in New Delhi dared to indulge in a ranting statement taking the US government to task. He was obviously talking out of turn; he would be taken aside and duly reprimanded.

In Pakistan, the Americans have played their cards with much greater subtlety. The charade of democracy can be put up with only up to a point. The protagonists were overdoing it: the president dismissing the prime minister, a substitute cabinet hurriedly installed in consultation with the leader of the opposition, with her own husband adorning it, the Supreme Court choosing to re-install the dismissed prime minister, the provincial administrations too getting involved in the goings-on, a situation of eyeball-to-eyeball confrontation between the president, the prime minister and the leader of the opposition. The resulting confusion was tailor-made for chaos, and chaos could lead to destabilisation, the nature and gravity of which it was impossible to predict. The US administration therefore decided to press the button of remote control;

instructions were issued for intermediation by Pakistan's military brass. The scenario had its bizarre aspects: the president, supposedly the supreme commander-in-chief of the nation's forces, the prime minister, supposedly possessing the democratic sanction to order the armed forces about, and the leader of the opposition, who is effectively the prime minister-in-waiting, the three of them ushered into the presence of the chief of staff of the army, like squabbling children appearing before the house master to be sternly told that enough was enough. Not departing from the script, the president, the prime minister's party and the opposition each gave in to the army's—and the US administration's—wishes. From now on, the parts would be played according to whatever cues are transmitted to them from you know where: guided democracy cannot be allowed to go off onto wrong, impetuous rails. That both Foggy Bottom and Pentagon intend to control and regulate developments in Pakistan on a strict and continuing basis is further emphasised by the naming of the World Bank nominee, Moin Quraishi, as interim prime minister; all is well that ends well.

The past week's events have brought to the fore a further fact of life: other things being equal, old cronies are to be preferred to the new ones. It never rains but pours; the fiasco of cryogenic technology apart, India was at the receiving end of two other well-directed shafts unleashed by the Americans. First, Pakistan was let off the charge of behaving like a terrorist state, the implication being that the Indian allegation about Islamabad infiltrating arms and men into Kashmir has not been accepted by the master. Second, Kashmir, the US state department has declared, remains a 'disputed territory', and its future is to be determined not by the governments of India and Pakistan alone, but, conjunctively, by the people of Kashmir themselves. In dealing with India—liberalised, globalised, USA-friendly India—the American administration could not have been any crueller. Such is life in a world system in which there is room for only one superpower: the superpower has no competition, it therefore can afford to take its devotees for granted. That such cynicism could break the heart of this or that suitor does not belong to its agenda of concerns.

But, then, there is a category of passion which is known as unrequited love. According to grammarians, the bliss attaching to such love passes understanding.

SECURITIES SCAM Sham Regulation

THE finance ministry's discussion paper on economic reform, while conceding that the securities scam revealed the weaknesses of the banking system, seems clearly to lay the blame for whatever made possible the enormous diversion of the banks' own resources and the funds of public sector undertakings through the manipulation of the securities holdings of banks on the system being "over-regulated and under-governed" and lists a number of "reform initiatives" already announced "to restore the health and long-term viability of the banking system over the next three to four years". The list includes not only the phased reduction in the SLR and the implementation of the new capital adequacy norms but also strengthening of the RBI's supervisory system with the establishment of a new board for bank supervision.

In its agenda for the next three years also the discussion paper, while reiterating its commitment to pursue the initiatives already taken and to implement an appropriate system reform "so that the security scam which came to surface in April 1992 does not occur again", adds that "subject to prudential norms, restrictive regulations which limit competition (such as the consortium approach) will need to be modified, if not eliminated, so as to increase competition in providing service to the public". The hope is expressed that as a consequence "competition from new private banks, including joint ventures with foreign banks, will in time result in new innovative public services" and that "the new prudential norms, a more competitive environment and broad-based ownership of public sector banks will help ensure that their newly reconstituted financial health is not frittered away".

The most intriguing part of the exercise that has produced the discussion paper is the total failure to focus on those aspects of the financial system which created the opportunities for manipulative use of funds kept with the banks. After all, whether the banks are required to invest 25 per cent of their deposits or more in government securities, the problems connected with inter-bank transactions in these securities will remain. If it were possible to fabricate or falsify the instruments allowed to be used for the purpose, namely, bankers' receipts (BRs) or SGLs, as the scam disclosures reveal, concrete steps will still need to be taken to prevent the abuse of these instruments. The question to be faced then should have been not to deregulate but to re-regulate the use of such instruments. The scam has been the outcome of not over-regulation but of sham regulation. To blame it on over-regulation is a charade.

The authors of the discussion paper, however, have used the scam to advance their own agenda, namely, that of creating what they choose to call "a more com-

petitive framework" with the entry of new private banks including joint ventures with foreign banks. It strains one's credulity to read references to the scam in the discussion paper without any acknowledgement that the principal perpetrators of the scam were none other than four or five foreign banks which, with the collusion of a couple of small private banks, made a mockery of the RBI's regulatory mechanism meant to monitor transactions in securities. Will the new private banks compete in observing or subverting whatever regulations or guidelines are prescribed hereafter for such transactions is the real question. It is necessary to demand the answer to this question of those who put the blame for the scam on over-regulation.

If there is one single lesson that one can draw from the disclosures in connection with the securities scam it is that the regulatory mechanism failed miserably to monitor the activities of the banks, in particular those of the foreign and private banks. Therefore, the case is for not only identifying where the regulatory mechanism needs to be reinforced but also for maximum caution in regard to allowing the foreign banks to expand their activities. Whatever else one may say on what the discussion paper puts forth as the agenda for the next three years, on financial sector reform, it attempts to preempt the Joint Parliamentary Committee on what the committee may choose to recommend on the general contours of financial sector reform but also on the role of new private banks, especially foreign banks.

POLITICS Task for the Left

Ajit Roy writes:

THE perennial problem of the Indian left has once again assumed a sharp focus as it always does at a critical turn in national politics. The problem, as is widely known, is how to confront the right without bringing grist to the ultra-right mills. With the issue of a no-confidence motion against the Narasimha Rao government looming large on the horizon, the specific question now exercising the left is how to relate on this move with the largest opposition party in the Lok Sabha, that is, the BJP. While the CPI(M) at the core of the Indian left reveals symptoms of indecision, its critics on the right as well as the left are already castigating it in anticipation, either for boosting the position of the BJP or for coming to the rescue of the Congress(I).

While the dilemma cannot be ignored, rooted as it is in the existing division of the national political spectrum between the ultra-right, Hindu fundamentalist camp, the right-centrist Congress(I) and its allies, and the rather incoherent left-centrist agglomerate, it is not really insoluble in terms of a consistent left perspec-

tive. In working out the basics of such a tactical initiative, the left leadership has but to keep in view two essential considerations.

First, that there cannot be a straightforward, direct, escape from the existing paralysing constraints, that arise from the triangular correlation of forces mentioned earlier. The fundamental criterion of choice in this case must be, and can only be, the long-term resultant of the contemplated moves. That is, whether the moves basically develop the mass mobilisation capacity of the left camp or impair it, which is the ultimate instrument of breaking the historical stalemate. It is quite possible that at different points of such a leftist tactical trajectory, the right or the far-right may seek to derive some dividends from the particular move of the left-centre forces. But such a contingency, if it is only short-lived, should not unnerve anyone. Secondly, if and when there has to be some occasional alignment, objectively speaking only, with either of the two inimical factors of the equation—the right and the ultra-right—the left democratic forces must not give any political-ideological concession to either of them, but have indeed, on the contrary, to sharpen the dimensions of differentiation with them both.

Specifically, in the present situation if they decide to press the no-confidence move which apparently pushes them closer to the BJP camp, the left democratic forces will have to concentrate their attack on the Congress(I), along with many other issues, not only for its failure to fight the BJP menace, but in fact for providing direct and indirect sustenance to it consistently. If the left moves in this way, then there will be very little opportunity for confusing this step as supportive to the BJP. On the contrary, this may contribute towards intensifying differentiations within the Congress(I) on the question of its attitude towards Hindu fundamentalist forces, that is, between the secular and the basically Hindu nationalist elements. This will also help the left to step up the offensive against the BJP immediately afterwards, that is, as a direct continuation of the no-confidence move and thus paralyse the pro-BJP forces' move towards the BJP.

The most crucial question at this moment is not to establish the secular credentials of the left. They are well established. The crucial question at this moment is, can the left afford to be soft to the Congress(I) with its all-round record? This does not certainly mean that one should equate the Congress(I) with the BJP. The point really is that only the course proposed above can help safeguard the distinction between the two.

More importantly, it should be clearly understood that secularism cannot be safeguarded as an abstract virtue or a political philosophy in isolation from the active political process; secularism can and has to be safeguarded as an essential

dimension of consistent democracy. If the present regime persists in subverting the democratic process—economically, politically and ideologically—in the many ways it has been doing, it cannot but destroy the secular character of the Indian polity as a result.

All this finally means that while the left has to pursue the aim of gathering around itself mass allies from every quarter in its struggles against the attacks on the democratic-secular character of the Indian polity, the whole question basically hinges upon its own capacity to push forward positively its own efforts to expand and strengthen the democratic structure and secular character of national politics.

EMPLOYMENT

Zone of Silence

THE finance ministry's discussion paper on the economic reforms has attracted wide attention and comment. The fact that the document has been issued as a paper for discussion and not as a statement of future policy already decided upon is to be welcomed. It leaves room for debate and argument on what the agenda for the coming three years should be and for changes in the light of such discussion, however much the tone and language of the paper give the impression that minds in the finance ministry are already made up on not only the directions of economic policy in general but also on the aspects to be accorded priority and the aspects to be overlooked or slurred over.

While due homage is paid to the need for sustained growth in not only incomes but also employment and for poverty alleviation in both the paper's assessment of the performance in the two years just gone by and in the outline of the agenda for the next three years when the gains made could well be reversed if "we are not careful to consolidate them", there is a studied silence all through on the impact of the two years of economic reforms on the rate of growth of employment and the decline, if any at all, in poverty. In the ministry's assessment of past performance there is no mention at all of how the country has fared in dealing with unemployment. And this could not be for want of indicators on the subject. Has employment in the organised sector, public and private, increased or declined? How has the wide network of employment exchanges fared in regard to placements provided for those on the exchanges' live registers? The answers are bound to have disclosed uncomfortable facts, knowing as one does that the organised sector, especially the private component thereof, has signally failed to provide increased employment in virtually the whole of the decade of the 1980s, relatively fast growth of output notwithstanding, or that the rate of growth of the numbers on the live registers of the employment exchanges has

been frighteningly high. (The latest figure of one-third of 1 per cent of placements as a proportion of the numbers on the live registers during the first half of 1992 is a telling commentary on what is happening on the employment front.)

And if employment does not expand at a reasonable rate, reasonable relative to the expansion of the labour force, it is not difficult to hazard a guess about what is happening to the size of the population below the poverty level and the condition of those actually living in poverty. Whatever else the authors of the economic reforms programme, and this includes in addition to the ministry of finance the international agencies, the IMF and the World Bank, they cannot disclaim the uncomfortable knowledge that unemployment and poverty have increased during these first two years and will most likely continue to increase given the directions of future economic policy.

CHINA

Credit Boom

REPORTS from China speak of an overheated economy with inflation running at over 20 per cent and industrial growth in the first half of the current calendar year exceeding 25 per cent. Other reports, yet to be confirmed, suggest that the governor of the Central Bank of China has been dismissed for his failure to regulate the expansion of credit and money supply. It is confirmed, however, that concerned provincial authorities have been summoned to Beijing for a conference to discuss ways and means of regulating the supply of credit within their respective jurisdictions. Evidently, the provincial authorities in China exercise some freedom in the extension of credit within their jurisdiction, though it is not clear whether (a) this freedom is exercisable within certain limits and these limits are being exceeded or the limits themselves were too liberally set, and (b) the credit thus extended has gone to finance budget deficits of the provincial authorities or commercial and industrial investments by various enterprises in the provinces. That deficit financing is one of the causes of the current overheating of the Chinese economy has been mentioned all the same. Whether the deficit financing has been resorted to largely at the provincial or the central level is not quite clear. What certainly is clear is that the overheating of the economy is being linked to government deficit financing in the sense of credit expansion, not in the IMF sense of government borrowing, though the extent to which governments in China, provincial as well as central, resort to borrowing is not quite known.

Interestingly, the reports of an overheated Chinese economy come on the heels of those about continued inflow of direct foreign investment. Recent estimates

of the annual net inflow put the figure at \$ 3.5 billion. The country's foreign reserves are conservatively estimated at \$ 50 billion. While the inflow of direct foreign investment could possibly generate demand for domestic funds to complement the investment outlays undertaken as a consequence, the accumulation of foreign reserves with the Chinese monetary authorities generates the supply of counterpart domestic funds, unless the authorities have devised specific measures to effectively sterilise the accretions to foreign reserves taking place from time to time.

Evidently, the measures now in place are not sufficiently effective in containing the growth in aggregate demand which has been outpacing aggregate supply and, in particular, the pressures which emanate from the monetary side. It is these pressures which the authorities are now wanting to restrain. Will it involve substantial budget cuts and also a slowdown in the pace of direct foreign investment or concentrate principally on domestic credit creation is a question the answer to which will be interesting to watch over the coming days.

NORTH-EAST

Growing Network

Kamaroopi writes:

THE claiming of responsibility by the Indo-Burma Revolutionary Front (IBRF) for the ambush of an Assam Rifles patrol party near Lazu in Tirap district of Arunachal Pradesh on June 18 in which four persons, including three soldiers of the Assam Rifles, were killed, indicates that a more activist phase of the outfit, going beyond mere verbose statements of intent, is in the offing.

Initial reports from Itanagar had attributed the incident to the National Socialist Council of Nagaland (NSCN) alone. However, a statement issued by the IBRF in Imphal has clarified that the ambush was a joint endeavour of the components of the IBRF. Indeed, this is the first joint action by the IBRF whose components include, apart from the Khaplang faction of the NSCN, the United National Liberation Front (UNLF) of Manipur and the United Liberation Front of Asom (ULFA). These three organisations came together in May 1990 under the banner of the IBRF. A statement dated May 22, 1990 issued under the signature of S S Khaplang, NSCN chairman, Arobindra Rajkhowa, chairman of ULFA and Sana Yaima, UNLF's general secretary, maintains that 'Indo-Burma', defined as "the region between India and Burma comprising the so-called north-eastern region of India and the present north-western Burma" is "one of the few regions in the world which remains to be liberated from colonial rule". However, "the long struggles for national independence of various ethnic groups in the region" had made lit

the headway; rather, many of these, as in Mizoram and Tripura, had "gone down the road to capitulation". The reason for these setbacks, the statement says, was the failure of these organisations challenging the Indian state to realise the "historical limitations of ethnicism which [had] made their leaders unable to see the potential strength of the region as a whole".

Following this realisation that "separate and isolated struggles" would lead nowhere, the IBRF, "a united front of all the revolutionary forces in the region" was formed as a "historical necessity". Though the IBRF has been in existence for over three years, its activities till now were confined to theoretical and ideological discussions of revolutionary strategy and tactics. On the ground, its actions as a 'front' in a collective form were hampered because of lack of co-ordination of the forces of its component units active in widely separated areas.

However, the successful staging of the ambush cannot be viewed as only a minor tactical gain on the part of the IBRF. For one thing, the ambush was staged in an area where, though it is inhabited by the Naga people, at least formally none of the component units of the IBRF is active. Further, according to a report from Imphal, the IBRF statement claiming responsibility for the ambush also said that militants of the Peoples' Liberation Army (PLA) of Manipur, the armed wing of the Revolutionary Peoples' Front (RPF) which is believed to be close to the Muivah faction of the NSCN took part in the ambush. In other words, the ambush clearly marks not merely a tactical victory on the field but also marks a strategic advance insofar as the stated political objectives of the IBRF go, leaving aside for the moment the contradictions inherent in these objectives as well as their unrealisability.

The IBRF had, in a statement issued on May 1, last year, invited "all other revolutionary forces in the region" to join hands with the IBRF and fight together for "our common goal"—that is, "liberation of the Indo-Burma region". The component units of IBRF have already established what may be described as bilateral links with other 'revolutionary forces' active in their home territories. Thus, ULFA for instance is having a working relationship with the Boro Security Force in Assam. Valley-based insurgent groups in Manipur have a working relationship with both factions of the NSCN, though serious differences (to put things mildly) divide these factions.

Given the growth of these complex networks, the active involvement of a force like the PLA, not an original member of the IBRF, in the Lazu ambush, marks an important tactical and strategic advance of the political objectives of the IBRF. If the gains made were to be consolidated, it will only mean more trouble, in a more co-ordinated form, throughout the region.

FOREIGN INVESTMENT Not Reassuring

MAKING a strong defence of the recent liberalisation of rules and procedures applicable to foreign investment, the discussion paper on the economic reforms issued by the finance ministry refers to the flow of foreign direct investment into China. According to the paper, net foreign direct investment into China is estimated at over \$5 billion in 1992 whereas "by comparison, net foreign investment flows into India during the late eighties and early 1990s were around \$100-200 million per year".

It is a little odd that the Chinese inflow for 1992 is sought to be compared with the Indian inflow for the late 1980s and early 1990s and not 1992, the calendar year for which a reasonably firm figure should have been available by now with the RBI. Could it be that this vagueness is resorted to in order to hide the fact that large approvals of foreign investment proposals notwithstanding (the paper itself gives a figure of \$3 billion for approvals accorded "since the announcement of the new policy") the actual net inflow of foreign direct investment did not exceed \$200 million even in 1992? Of course, one should add in all fairness that the discussion paper recognises that the approvals accorded so far have yet to materialise into actual inflows, though it "sees no reason to doubt that the proposals of today will fructify into actual investment over the next two to three years".

In fact, the paper goes out of its way to prepare the country for a large inflow of direct foreign investment by trying to allay "the fears sometimes expressed in some quarters that opening up to foreign investment may swamp our economic independence". In doing so, however, the authors in their enthusiasm to underplay the relative magnitude of the likely foreign direct investment inflows ignore the elementary distinction between stocks and flows. The paper first refers to the estimated total industrial investment in 1992-93 of Rs 66,000 crore which "is growing at about 8 per cent per year in real terms". Then it observes that "even if foreign investment were to reach \$1 billion in 1995-96, it would form less than 4 per cent of total industrial investment in India". Assuming that total industrial investment in 1995-96 will have reached the figure of Rs 1,00,000 crore, allowing for not only the real increase but also some inflation, the projected foreign investment in that year of \$1 billion would be equivalent to not less than 30 per cent of total fresh industrial investment in the economy. If one were to allow for the depreciation of the rupee the proportion of total investment accounted for by foreign direct investment would be correspondingly higher. Was this an innocent slip or a deliberate attempt at confounding the readers of the discussion paper?

TWENTY YEARS AGO

EPW, July 14, 1973

Priorities in scientific research have all along borne little relationship to the requirements—immediate or long term—of the economy. They have instead been largely determined by what the scientists in control of research organisations have been interested in, and by the relative political influence they have commanded. This predilection, together with the consequent lack of a viable relationship between the research organisations and the potential users of their research results, has been aggravated by the manner in which funds for scientific research are drawn.

It is possible to visualise an alternative to this system under which a large part, if not the bulk, of the funds for research are drawn from the users of the research, with the government financing research activity which, while having no immediate user to sponsor and pay for, is nevertheless nationally important...

For instance, it is known that the department of atomic energy is proposing to allocate substantial funds for cancer research by the Tata Cancer Research Institute. Now, the only link between the DAE and cancer research is perhaps the use of radiation technology in treatment of cancer. The DAE's support for cancer research is coming, ironically enough, at a time when a number of research programmes of the Indian Council of Medical Research in other areas have had to be curtailed for want of funds. Under the present system there is no way of determining the relative importance of cancer research to which large funds are being made available and the research programmes of the ICMR which are suffering for want of resources. The problem of *inter se* priorities might be more effectively sorted out if funds for cancer research and the ICMR's research programmes both came from a single source, like the ministry of health.

The absence of such a system is a major reason why unutilised capacity in sophisticated machine-building plants like those of the Heavy Engineering Corporation, Bharat Heavy Electricals and Heavy Electricals, Bhopal, co-exist with substantial imports of the type of equipment which these plants are capable of manufacturing.

However, it is one thing to make a given system of science and technology more efficient and quite another to alter the goals of science and technology in a society... The goals of science and technology, on the other hand, are set by the structure of production of goods and services which is determined by, as well as determines, the distribution of income and wealth in a society. It has taken many five-year plans to demonstrate that the structure of production and the pattern of income distribution are very little influenced by what is formally written into a plan document. The framers of the country's first plan for science and technology may be pardoned, therefore, if they start with fond hopes of being able to influence the goals of science. But nobody would be surprised if in the end they, like the economic planners, fail to achieve even such efficiency within the system as might have been within their reach.

Volvo Terry Industries

VOLVO TERRY INDUSTRIES is establishing a fully automatic state-of-the-art integrated plant for the manufacture of high quality terry towels at a capital outlay of Rs 627.01 lakh. The company proposes to install 24 Laxmi Rieter automatic looms with an installed capacity of 660 tonnes per annum. In the second year of operation, it will be adding eight looms and, as a result, the capacity will go up to 880 tpa. The project is being implemented at Sanand, Gujarat. Commercial production is expected to start by this October. The company has entered into an agreement with Lalbhai Exports—a recognised export house—for exporting its entire production for the next three years. It has also signed an MOU with Broadway Exports of Jamaica who have agreed to buy 550 tonnes of terry towels a year. Profits after tax as per appraisal done by Syndicate Bank in the next three years ending September 30 are projected at Rs 91.05 lakh, Rs 191.55 lakh and Rs 230.94 lakh on sales of Rs 550.55 lakh, Rs 888.99 lakh and Rs 1,020.07 lakh and with capacity utilisation at 70, 80 and 90 per cent. To part finance the project, the company is making a public issue of 40,00,000 equity shares of Rs 10 each at par aggregating Rs 400 lakh. The issue opens on August 3 and is lead-managed by PNB Capital Services and Gujarat Lease Financing. Listing of the shares will be done at Bombay and Ahmedabad stock exchanges.

Renco Gears

Renco Gears, whose existing plant at Chhatral, about 35 kilometres away from Ahmedabad, is manufacturing drop box clutch sets, is setting up manufacturing facilities for all types of reduction gear boxes, namely, worm gears (6,000 pieces pa), helical gears (8,000 pieces pa) and shaft mounted gears (6,000 pieces pa). The cost of this diversification project is Rs 1,144.05 lakh. Commercial production is expected to commence in August. The profitability projections as per the appraisal done by Gujarat Lease Financing are Rs 346.75 lakh in 1993-94, Rs 423.90 lakh in 1994-95 and Rs 511.48 lakh in 1995-96 on net sales of Rs 2,040.35 lakh, Rs 2,429.54 lakh and Rs 2,818.73 lakh respectively. To part finance the project, the company is entering the capital market on July 27 with a public issue of 30,00,000 equity shares of Rs 10 each at a premium of Rs 7.50 per share totalling Rs 525 lakh. The lead managers to the issue are Gujarat Lease Financing, Ahmedabad, and PNB Capital Services, Bombay. Listing of the

shares will be done at Ahmedabad and Bombay stock exchanges.

Ace Laboratories

Ace Laboratories has altered its capital issue due apparently to the present unfavourable market conditions from an original proposal of Rs 3.40 crore worth equity shares of Rs 10 each at a premium of Rs 5 per share to Rs 14.50 crore altogether in equity shares at par. The Indian public offer is of 20.35 lakh shares while 12.50 lakh shares are being offered to NRIs. The issue opens on July 26 under PNB Caps as lead manager. The company is raising funds to finance a programme of expansion and diversification. Promoted by A C Srimal and S Tewari, the company started commercial production of liquid syrup in 1985 with an installed capacity of 60,000 litres per annum. In 1987, it took up manufacture of dry syrup, tablets and capsules as it expanded the capacity of liquid syrup to 1.50 lakh litres. It now proposes to expand production capacity further and to diversify into manufacture of powder, liquid injectables and ointment and is setting up at the same time a testing laboratory with R and D facilities. The proposed plans are to cost Rs 4.50 crore as appraised by the IFCI towards which the promoters are contributing Rs 90 lakh and the balance is being raised by capital issue as above. Ace Laboratories has seen its turnover rise from Rs 34.50 lakh in 1986-87 to Rs 6.30 crore by 1992-93 and so also profit margin (gross profit to sales) from 4.30 per cent to 12.60 per cent. Book value of its equity has increased with the present share capital of Rs 40 lakh from Rs 4.30 in 1986-87 to Rs 27.34 in 1992-93. The expanded capacity is expected to go on production this November to boost sales for 1993-94 to Rs 11.28 crore and raise net profit to Rs 99.53 lakh with an expected EPS of Rs 2.03. By 1995-96, the turnover is estimated to increase to Rs 13.02 crore and net profit to Rs 1.08 crore to yield an EPS of Rs 2.21.

Khaitan Agro Industries

The **Khaitan Group** of companies, who have been in the agro business for over a century and who have diverse interests, with manufacturing, mining and marketing expertise, in areas ranging from textiles, sugar and cotton to electrical household goods, refractories and magnesite, are inviting public investment for their latest plantation project christened 'Wood Sense' initiated by Khaitan Agro

Industries. The investor is offered a choice of two schemes, namely, Classic and Connoisseur, with initial investments in either of the schemes ranging from Rs 3,000 to Rs 3,500 per unit depending upon the kind of tree one wishes to invest in. Each unit of investment provides two trees of any kind: Teak (Rs 3,000), white cedar (Rs 3,250) or rosewood/mahogany (Rs 3,500). The first scheme, Classic, has a maturity period of 15 years with expected returns at the end of Rs 1.0, Rs 1.1 and Rs 1.2 lakh respectively, while the second scheme, Connoisseur, has a maturity of 20 years with expected returns at the end of Rs 1.63, Rs 1.79 and Rs 1.95 lakh, respectively; interim annual returns will start after three years at the rate of 16 per cent for 'Connoisseur Scheme' and 15 per cent for 'Classic scheme'. A Connoisseur unit holder will be entitled, after every fifth year, to share the benefits from the sale of alternative crops to the tune of 25 per cent of the investment in the first year. The added attractions of the schemes include transferability of certificates after one year, buy-back facility after five years, a personal accident insurance coverage of Rs 1 lakh for every unit holder for the duration of the scheme, membership of the Wood Sense Club, and in addition an offer of two full-grown Casuarina or other trees, if the growth of the two trees already allotted is less than 50 cft at the end of 15 years or 60 cft after 20 years. The project is the first Indian commercial agro forestry with agrotechnological expertise in collaboration with Blooms and Cree, of Singapore, and is spread over 4,000 acres of land in five different states. The high-density plantation techniques to be availed of have been put to successful use in Malaysia where the climatic conditions match our own, and will help attain requisite growth of the trees within 15 years when a naturally growing Teak or Mahogany tree takes from 25 to 40 years to attain the requisite growth. The mixed cropping technique with cash crops will also enrich the soil and provide interim benefits to investors. The project which will enjoy tax free agricultural income has been appraised by MPCON, a consultancy jointly formed by IDBI, IFCI, ICICI and others. Added attractions of the project are, crop insurance with New India Assurance, 60 to 100 per cent stock to replenish loss if any, purchase of seedlings/saplings under the guidance of the collaborator which is a reputed plantation company in the ASEAN region, supervision by experts in the fields of forestry, agriculture, horticulture, financial management and plantation management.

—JK

Better Times Ahead

Jairaj Kapadia

SPURRED by competition and driven by survival instinct but also helped by the tax concessions announced in this year's budget, automobile manufacturers are gearing to regain their lost position in the market due to demand recession and cost escalation.

South's Standard Motors Products has however just declared again a lock-out, 16 months after it reopened last year on a take-over by A C Muthiah of the SPIC group in February 1992. But the two traditional car manufacturing companies, Hindustan Motors and Premier Automobiles, are racing to improvise production and

also to deliver a new car each in the market. In this they have felt encouraged by the 15 per cent cut in the excise duty on cars and lower import duties on components in the budget, while the removal of production curbs and the relaxation in foreign collaboration have helped the companies to tie up with world manufacturers to produce better cars for the Indian market.

Hindustan Motors' tie-up with General Motors is to result now in production of Opel Astra in the country. GM's model has engine capacity varying from 1.2 litres to 2 litres. The cars to be considered for

production in India, after a test run which was taken recently of a GM car to try out the road conditions and parameters of temperature in different parts of the country, are to be of 1.4 to 1.6 litres engine capacity. But these are to mark a major improvement from the hitherto available models.

In producing better cars HM and PAL are prodded by the success of Maruti Udyog. Making a head start with government funding and the better technology from Suzuki Motors of Japan, the public sector company has survived the slide in demand and with export-funding of expansion has also drawn up plans for production of Maruti Zen, conforming to international auto emission standards, besides introducing the Maruti 1000.

But as car companies are switching gears, how fast are accessories to get accelerated? GM in its tie-up with HM is said to feel favourably inclined in sourcing supplies from companies like Bharat Forge, TVS Lucas, Gabriel and Sona Steering. But the question begs attention, since accessories companies also suffered due to a slump in demand for cars.

The review below of three companies, MICO (Motor Industries), Firth (India) Steel and Automotive Axles throws some light in this connection.

The Week's Companies

(Rs lakh)

MICO

Expansion and Diversification

The fuel injection equipment and spark plugs company MICO, against a 28 per cent rise in sales turnover in 1992, has seen its profit after tax increase by only 14 per cent with the result that the ratio of net profit to sales has shrunk from 3.6 per cent in 1991 to 3.2 per cent in 1992. Declaring a final dividend again of Rs 8 per share, the directors have maintained the total dividend at the previous year's increased rate of Rs 16 per share. Explaining the decision to maintain the dividend (from what they say it looks they would have liked to raise it), the directors state this will further strengthen reserves which would be required by the company for future development entailing substantial capital investment. What the directors state further in this connection is also pertinent. The board of the company decided to recommend a final dividend for the year 1992 of Rs 8 per share at its meeting held on March 11, 1993. By then, as the

directors state in their report, the business development in the first quarter of this year in the automotive industry not only in India but worldwide was weak and the company was facing a situation of declining demand and as a result reduced earnings. It was with the knowledge of this background that a cautious dividend policy was followed by the board of directors.

The directors report recessionary trends in the automobile industry during 1992 affected sales to the original equipment sector. However, the tractor and single-cylinder engine sectors were satisfactory, while the company widened the customer base for hydraulic products. It also introduced besides for the automobile sector new items, such as halogen bulbs, ignition coils, horns, voltage regulators, clutch plates and clutch cover assemblies. At the same time, intensive cost reduction measures, including substitution of imports, were taken to beat the increase in the costs of inputs due to the depreciation of the rupee, the sharp increase in the prices of petroleum products and the hike in power tariff.

Meanwhile, in exports, the company achieved a substantial increase of 58 per cent as it expanded its market to cover Australia, China and the US. New markets are being identified for further development while the company is intensifying efforts towards third party exports to the plants worldwide of its German partner, Bosch. It is also exploring the potential for software exports to Bosch, deputing software engineers to Bosch for on-site assignments while they are also working from the company's software technology park facility in Bangalore.

Export sales amounted to Rs 6,090 lakh, while the company earned a total of Rs 6,210 lakh in foreign exchange against an outgo of Rs 6,870 lakh. Plans of expansion and diversification include manufacture of special purpose machines for which a technical collaboration agreement has been made with Witzig and Frank Turmatic GmbH, Germany, for the manufacture of CNC flexible electrohydraulic and mechanical machining systems, packaging machines in agreement with Bosch to cover manufacture of bag form, fill and sealing machines, and portable electric power tools, with technical know-how from Bosch.

FIRTH (INDIA) STEEL

Improved Prospects

Despite difficult market conditions faced by the alloy steel industry in the country due to demand recession in the automobile sector, Firth (India) Steel ex-

perienced during the year ended March 31, 1993 an increase in the offtake of high speed steel, which is its main product. Production of processed high speed steel increased from 499 tonnes in the previous year to 599 tonnes as offtake improved from 458 tonnes to 619 tonnes with the sales realisation increasing from Rs 922 lakh to Rs 1,175 lakh. Sales of high speed steel billets also were more at 14 tonnes against as little as 0.090 tonnes in the previous year, with the income amounting at Rs 8,64,223 against Rs 14,459 previously. With this pick-up in sales, and since the company's order book position continues to be healthy, the prospects for the current year are considered better, and with the constraint of restrictive bank credit now relaxed, there can be a definite improvement in the working of the company.

Meanwhile, the company has commenced direct exports of high speed steel and tool and die steel to Europe, helped apparently by its technical collaboration with Firth Brown, Sheffield, UK. The company was originally named Firth Steel of India as it was incorporated in 1962 in collaboration with Firth Sterling, Pittsburgh, US. It took its present name on entering into technical collaboration with Firth Brown, UK. Exports, including through merchant exporters, of the company's products during 1992-93 amounted to Rs 38.95 lakh, while further orders worth Rs 32 lakh were received from customers in the UK. In addition, orders of Rs 25 lakh have been received from domestic customers for supply of high speed steel against their export orders, and the supplies against these are to be deemed exports. Against export sales of Rs 38.95 lakh the outgo on import of raw material, components and spare parts in foreign exchange during 1992-93 was of the order of Rs 213.01 lakh.

The working during 1992-93 has resulted in a net profit of Rs 69 lakh against Rs 76 lakh in 1991-92. However, the dividend is waived again, although in the previous year the company had cleared the carried forward loss of Rs 69 lakh and carried the surplus of Rs 7,56,977 of profit to balance sheet. During 1992-93, it has capitalised Rs 8,42,900 of preference share dividend after it was written off and carried the surplus profit of Rs 61,03,149 to balance sheet. The amount so transferred, inclusive of the previous surplus brought forward, is Rs 68,60,146. This constitutes a principal amount in reserves and surplus, as other than Rs 5,82,287 in investment allowance (utilised) reserve and a sum of Rs 18,030 in capital reserve. The rest is all revaluation reserve standing at Rs 12,08,47,186.

The company's equity share capital is

small amounting to Rs 99,47,190. It is likely therefore to declare a dividend for the current year, as it has negotiated technical collaboration with a firm in Europe for upgrading the quality of its products and reduce costs besides for developing hi-tech steel of various types presently imported into the country. It has also drawn up a major programme for modernisation of facilities and expansion of production capacity to service exports and the market at home.

AUTOMOTIVE AXLES

Turning the Corner

Automotive Axles' equity share is currently quoted on the market at Rs 30, which is three times its face value and the book value of Rs 10 per share. In terms of the earnings for the year 1991-92, the price-earnings ratio amounts to as high as 57 per cent. But this position is owing to the company having come out of the purview of the Sick Industrial Companies (Special Provisions) Act, 1985 during the year ended March 31, 1992, when it succeeded in bringing down accumulated losses to Rs 410.60 lakh and the erosion of the peak net worth to less than 50 per cent. This was after for a third year running the company sought extension of relief package with the financial institutions and banks which they granted, and which helped its liquidity position.

However, according to the directors, the company faced liquidity crunch because of all-round increase in costs which it could not recover from customers by higher price realisation, particularly since the stringent economic measures taken by the government by way of credit squeeze, upward revision in banks' lending rate and import restrictions seriously affected the operations of customers in the light commercial vehicle sector in the automobile industry. Besides, the change in the rupee's exchange value increased the burden of the principal amount and interest on foreign exchange loan and investment by Rs 270 lakh for the company. The foreign exchange outgo on interest payment was Rs 10.70 lakh.

Automotive Axles, which is established in collaboration with Rockwell International Corporation, USA, was still saddled with problems as it completed the 11th year and with a large accumulated loss on hand, although, on reducing the deficit to less than 50 per cent of net worth, it had ceased from being called a sick company. The constraints above which its LCV manufacturer-customers had faced are now become a thing of the past. But it will be still a long time for the company to announce a dividend to the shareholders.

Calcutta Diary

AM

Others abide the question, the Punjab director-general of police is free. The Punjab chief minister is equally free. This freedom the chief minister has now decided to extend to the fiscal arena: Punjab, he has declared, will not pay back a penny of its accumulated debt to the centre. The Punjab chief minister is not fooling. He is speaking from a position of enormous strength.

NO, this time it is not the militants who want to take Punjab out of the Union of India. It is the chief minister of the state himself, the Beant Singh of the famous Beant Singh-K P S Gill twosome. Come what may, Punjab, he has decided, will not meet any of its outstanding debt and interest obligations, exceeding Rs 6,000 crore, to the centre. His government has made enough contributions to the nation's cause, it has saved the state from the jaws of secession, it can therefore, in the chief minister's considered judgment, expect a just recompense. The state government has decided what this compensation is going to be. From now on, it will only receive funds from New Delhi, it will not pay back one morsel of its past obligations.

Suppose the centre demurs, suppose the union government maintains that the system of federal finances developed in this country in the course of the past few decades makes it imperative for fiscal flows to be a give-and-take affair, and Punjab too will have to repay its outstanding debts in the manner of other states, however disagreeable that task might turn out to be? But the chief minister obviously has thought things through. It is inconceivable to him for the centre to have the temerity to differ from the point of view of his government. The chief minister could not be more unambiguous in his attitude: he was merely, for courtesy's sake, informing the centre, the question of the latter's approval or disapproval was not really relevant. What the Punjab government says the rest of the nation, including the stoical regime at the centre, has to accept.

The Punjab chief minister's stance, after all, is in conformity with the current *realpolitik*. There is no force in the country to contradict a proposition or a course of action once Beant Singh, or his factotum K P S Gill—or is it the other way round, Gill, or his factotum, Beant Singh?—has decided to insist upon. Gill does not bother about the prior concurrence of either the union home ministry or the administration nominally functioning in other states before he sends out his commandos to these states in search of fugitive militants, to apprehend these rascals, and shoot them down like dogs. In the process, he might be infringing the

country's civil and criminal laws, and violating the commonest human rights enunciated in the Universal Declaration of Human Rights of the United Nations that were reiterated, to the accompaniment of much passion and polemics, at the recently held international jamboree in Vienna. Others abide the question, the Punjab director-general of police is free. The Punjab chief minister is equally free. This freedom the chief minister has now decided to extend to the fiscal arena: from now on, he will only receive bounty from the centre, such bounty will go unrequited, Punjab will not pay back a penny of its accumulated central borrowings. This is not a threat, but a statement reflecting the reality of Punjab's suzerainty. That state is no longer quite a part of the Union of India.

The Punjab chief minister is not fooling. He is speaking from a position of enormous strength. Were some busybody in the ministry of finance in New Delhi to choose to make a fool of himself and suggest that Punjab's case cannot be treated as *sui generis*, it must pay back in full, and with interest, the sums it had borrowed from the centre in the past like all other state governments, Beant Singh, rest assured, has the option of a straight and simple riposte. If such were the centre's intention, very well, then he and his soulmate, Gill, would propose to withdraw from the scene, and brother militants would be welcome once more to take over. The government in New Delhi, he knows, could not afford a recrudescence of open insurgency in Punjab. It was in any case trudging through extraordinarily difficult times. It had no majority in parliament and was dependent upon the uncertain charities of stray characters like the Yuvaraj of Bagpat; that wretched stockbroker from Bombay has rendered slumberless the nights of the prime minister himself; the Joint Parliamentary Committee has unambiguously indicted one cabinet minister of malfeasance, and has even gone to the length of passing some snide comments on the finance minister's conduct in office; it has showed a perverse interest in the nexus that might be existing between the prime minister's son holding the directorship of a company and the advance of a hefty loan to it by a major participant in the famous scam. As if all this

were not enough, the rate of industrial growth continues to be obstinately sluggish, in some months it is actually negative; foreign investment refuses to come in; the government was held to high ridicule, and worse, over Kashmir at the Vienna meet. All that the government is currently capable of is to drown its sorrow in Coca Cola, which it has decided to re-welcome in the country. In the circumstances, call the Punjab chief minister's declaration an act of blackmail, call it by any other fancy name, but alienating the Beant Singh-Gill combine is simply not in order. Punjab will hence, with effect from the day its chief minister chooses, stop making repayments to the centre. Its citizenry may enjoy the highest per capita income in the country; the state may have received over the years central subsidies, under several heads, adding up to thirty or forty or fifty thousand crore of rupees; its prosperity may be eye-boggling. None of these considerations is going to matter. Those who have will be exempt from meeting their debt obligations; only the nation's meek will assume the burden of loan repayments. If only you would think a while, this is in harmony with the quintessential classical concept of natural justice. In the early state of nature, life was nasty, brutish and short, while might was right. Chaperoned by Punjab, we are about to return to that idyllic epoch of justice: might is right, Punjab will not, repeat not, repay its loans.

The habitual worriers are, in these unquiet times, likely to concentrate on Article 14 of the Constitution and the Duesenberry demonstration effect. Article 14 is full of outlandish notions; all citizens, it says, are equal before the law. Were this to be true and all citizens were to be claimed to be equal before the law, some fuddy-duddy of a constitutional expert could offer the view that all states too were equal before the law. There could be some trouble in case he could not be prevented from approaching the Supreme Court with this strange interpretation of what constitutes legality. The only saving grace would be the precedent of Ayodhya. Ayodhya has indicated in the clearest possible terms that the authorities were not particularly keen to act according to the notions of legality as laid down by the Supreme Court. Post-Ayodhya developments have revealed a yet more redeeming feature of the nation's legal system: the Supreme Court itself is not unduly disturbed if its injunctions fail to be honoured by the government. Therefore, despite Article 14, and despite any judgments that might be delivered by the nation's highest court apropos of the issue of equality before the law, the authorities might have little difficulty in continuing to treat Punjab as nonpareil among the

states, and proceed accordingly.

That is, however, only part of the problem. Some other implications inhere in the chief minister's pronouncement. Punjab, as luck would have it, would set an example once the chief minister's threat is carried out. It would set an example of fiscal insubordination. A number of other states would feel sorely tempted to get into the act. They would not even bother about hiring a constitutional lawyer, or making a representation to New Delhi. Quoting the Punjab chief minister, they too would suspend remittances to the centre. For understandable reasons, much hero-worship abounds in the neighbourhood. Given the feats performed by its chief minister and its director-general of police, the state of Punjab constitutes the role model which the other states aspire to emulate: what Punjab does today, every other state is dying to do tomorrow. How do you then convince the administration in any of these states that, as far as this matter of non-payment of the centre's dues was concerned, Punjab's example was not for emulation. However hard one might try to convince them the other states are unlikely to budge from their position: a leader, in case he is truly a leader, must be a leader worth following in all seasons.

That would give rise to a tricky situation. Never say die though. A last ditch effort to save the day—and the New Delhi-ward flow of funds from the states—might be attempted by drawing attention to the special conditions obtaining in Punjab. That state was held to ransom for years on end by hordes of wayward militants; that state has been continuously subjected to fifth-column activities engineered by the intelligence agency of an inimical neighbouring country; Punjab happened to be the granary of the country, accounting for roughly two-thirds of the total procurement of rice and wheat; it was therefore essential to treat Punjab somewhat differently from other states; it might occasionally be necessary to tickle its ego.

This tenor of argument could however prove to be hazardous in the extreme. If the centre had invested as much funds on irrigation and agriculture in other states as in Punjab, these states too, it would be retorted, would have turned up huge farm surpluses. Besides, in no part of the country is there any dearth of ingredients which go to ignite economic or social discontent. And this is on the authority of Indira Gandhi: with the possible exception of Madhya Pradesh, every other state belonging to the Union of India either flaunts a common border with a foreign country or looks out to the sea; it is therefore no problem to import some turbulence or insurgency from outside. Given

the additional stimulus which breakneck globalisation is providing, it would be easy for the resident populations of any of the other states to do a Punjab at the drop of a hat. Every state would like to fall in love with fiscal indiscipline; every state would like to start a good clean insurgency, never mind if it costs a few thousand lives each year and destabilises the system, in case that would be the ideal *deus ex machina* for commanding the centre's deference. Admiration of Punjab could also in no time turn into resentment over the seemingly unfair advantages that state had been allowed to enjoy, accompanied by hostility toward the centre which had gone along with these discriminatory arrangements.

In such an eventuality, in what condition would the polity discover itself? A politically integrated system presupposes, one dares say, moral integrity. This morality cannot quite be compartmentalised. An administration, stamped by the stigma of immoral conduct in money matters, would obviously be gravely handicapped to pretend to adopt a moral stand on issues affecting centre-states relations too. If it were to make concessions to Punjab, it would jolly well be forced to make similar concessions to other states, or otherwise face trouble. This trouble would perhaps straddle several states. Up to a point, it is relatively easy to put down rebellion in just one state; if four or five states were simultaneously on the warpath, and, in addition, they believed that morality was on their side, the centre could soon

discover that it was fighting a forlorn battle.

Should we be surprised? What we are witnessing is hardly a variant of the modish systems failure. The system is not failing, it is being destroyed. Once thievery and corner-cutting are installed as the nation's basic philosophy, about everyone becomes an active participant in the great game of taking a pot-shot at the given structure: the managing director of the country's leading bank lines his pocket, a member of the Planning Commission uses his office to take cuts on government orders, a minister ensures that his sons and sons-in-law stay very much in clover, and even the prime minister does not remain outside the orbit of suspicion. The Beant Singhs are archetypal soldiers of fortune, they want to take advantage of the logic of the situation. Sooner or later, others would, with full justification, join the game, the bell would toll, boisterously, for all.

We would have reached this fate in any case, but globalisation, there could hardly be any doubt, has accelerated the process. A crossing between our own meanest instincts and the worst of the modes and manners of predatory western capitalism has taken place. The outcome is conduct denuded of the last shred of scruples, be it in the purchase of foreign guns or foreign petroleum crude, in the administration of justice, or in the management of centre-states relations. Such a country might still survive; that would be a miracle.

HUMAN DEVELOPMENT AND FAMILY STUDIES IN INDIA

An Agenda for Research and Policy

T S SARASWATHI and BALJIT KAUR (editors)

This timely volume underscores the need to develop appropriate programs and policies for child and human development which are culturally specific. To this end, the contributors advocate the grounding of research in rigorous theory while incorporating alternative formulations which go beyond description and focus on processes. Besides identifying issues and problems, the contributors suggest a range of possible solutions. They stress the need for and outline ways of achieving an interface between research, program and policy, and the desirability of effective and coordinated efforts to disseminate knowledge for the benefit of both practitioners and policy makers

All the Answers

Bagaram Tulpule

Though the finance ministry's document is described as a 'discussion paper', it does not raise any problems or issues, but asserts the correctness of what has been done in the past two years and sets out what needs to be accomplished in the coming years. The finance ministry has all the answers and does not really need any further examination of what needs to be done and how.

"WHY do millions of our countrymen and women who migrate abroad prosper?" asks the 'discussion paper' on 'Economic Reforms: Two Years After and the Task Ahead' put out by the finance ministry of the government of India. It proceeds to give an answer to the question which is so simplistic that it would be amusing if it were not so misleading, even mischievous. The answer, according to the authors of the paper is, "because the environments they go to reward hard work, efficiency, discipline and social responsibility". Cultivate such an environment at home and 900 million Indians will enjoy the fruits of prosperity without migrating. That is the brief, simple vision of our finance ministry. One wonders what reply the authors of the document would give if asked, 'How come that in those very countries which provide such benign environments for prosperity, millions and millions of their own people fail to prosper and have to live without jobs, shelter, adequate education and health service and without hope and why are their numbers rising?'

But the authors of the document do not expect such questions to be asked. In fact although the document is described as a 'discussion paper', it does not raise any problems or issues, much less doubts, but asserts the correctness of what has been done in the past two years and sets out what needs to be accomplished in the coming years and how that will be accomplished. Judging by the tone of the paper, the ministry has all the answers and is sure of their correctness and does not really need any further examination of what needs to be done and how.

Ritual references to poverty amelioration, improving the quality of life of our people, not burdening the poor with the costs of economic restructuring, expanding employment opportunities and social services like education and health at the primary level, facilities and incentives to small and marginal farmers and to small industries and so on are strewn all over the document. But these clearly do not

constitute the meat of the document; the meat is in the claimed achievements of the policies and measures adopted so far and to be continued in future for further stabilisation, globalisation and restructuring.

The part of the document dealing with the past two years of economic reforms narrates the steps taken and gives tables and charts showing the fall in the annual rate of inflation and in the fiscal deficit of the union government, the movements of macro-economic indicators, the rates of growth of GDP and industrial growth, imports and exports, foreign currency reserves and so on. The by now familiar claim of impressive improvement in all these parameters is repeated and it is mentioned that these results have been achieved through the policies pursued by government in the form of devaluation of the rupee, fiscal discipline, liberalised industrial and trade policies, drastic reduction in controls of all kinds, in customs duties and in direct taxes. The paper expresses the view that "over time, reforms in industry, trade and payments regime would promote a pattern of industrialisation which is both sufficiently labour-intensive and also internationally competitive". While claims regarding the prospect of growth and competitiveness are not new, it is not clear how the 'sufficiently labour-intensive' character of future industrial growth is predicted, especially since the stress of the new industrial policy is on import of advanced technology and machinery and on direct foreign investment (DFI) by MNCs.

While crowing over these results, the paper makes only a passing reference to the country's external debt, without giving any figures of the steep increase in it, and to the securities scam. Nor does it give any figures about plant closures, retrenchment, amount of compensation from the so-called National Renewal Fund (NRF) during the past two years or that are likely to come in the coming years.

A particularly bold claim made in the paper without citing the slightest support-

ing evidence is, "the process of deregulation and debureaucratization of the industrial licensing system has evoked a strong positive response from both producers and consumers. Costs have declined, uncertainty has been reduced and greater attention is being paid to consumer needs, innovation and output expansion. The consumer is beginning to reap the benefits of competition in terms of better quality and reasonably priced manufactured products." Such official information as is available, far from supporting this specious claim shows that the production index for manufactured goods has moved up only sluggishly and, according to the paper's own admission, has suffered a setback during recent months allegedly due to Ayodhya and the troubled times that have followed. The wholesale prices of manufactures are also still rising, if perhaps at a somewhat slower pace than in the past. And the claim about consumers getting better quality of manufactured goods is impossible to verify.

Outlining and justifying the policy relating to DFI, the paper seeks to allay the fears about our economic independence being swamped by MNCs by pointing out that "the total investment in the industrial sector in India in 1992-93 was about Rs 66,000 crore and is growing at about 8 per cent per year in real terms. Even if foreign investment were to reach \$ 1 billion in 1995-96 it would form less than 4 per cent of total industrial investment in India. The notion that this will swamp our independence is unwarranted." If this is the relative magnitude of DFI that India hopes to get in the next few years, several questions come to mind. When the country's doors were thrown open for DFI, a figure of \$ 2 billion per year was mooted as the likely inflow. The present paper itself mentions this figure as the targeted inflow by 1996-97. Yet even \$ 1 billion by 1995-96 is deemed optimistic in the paper itself. Does this mean that the original quantum of expected DFI has turned out to be unrealistic or that the new lower figure is being mentioned merely to allay the fear of doubters?

Secondly, if DFI is going to be so measly even by 1995-96, what does one make of the high hopes held out about DFI contributing to significantly faster industrial growth and employment generation? Thirdly, if even with an annual investment in industries of the order of Rs 66,000 crore and more, total employment in that sector remains virtually stagnant, what hope is there that industrial growth under the new economic policy will create new job opportunities to any substantial extent in the near or even medium term?

The paper recognised that the new policies, especially in relation to public sector enterprises, will lead to loss of jobs. But this loss of jobs is viewed as 'temporary' and we are assured that the burden on the displaced workers will be minimised through compensation, retraining and redeployment with the use of the NRF. These assurances are clearly unconvincing. When new jobs are not seen to be coming up in the industrial sector in significant numbers, to say that retrenched workers will face only temporary unemployment, that their interests will be adequately protected through payment of compensation or that through retraining they will readily find alternative jobs is, to say the least, hardly honest. As said earlier, the paper gives no information whatever about how many workers have received compensation, retraining and new jobs through the NRF and what is projected to be the probable dimension of the task in the next few years.

Besides, the question of job losses due to the new policy is not limited to the public sector alone. In fact it is of far larger proportions in the private sector in which, for the past many years, employers have been laying off workers and closing down industrial units in total disregard of the provisions of the Industrial Disputes Act. Most large units in the private sector, especially MNC-controlled ones, have been paring down their workforce steadily for the past several years through various devices including voluntary retirement with enhanced retirement benefits.

The part of the paper dealing with the policies and programmes for the immediate future is a mix of some specific proposal and many vague and general statements of intentions. The specifics are in the nature of 'more of the same': further reduction in fiscal deficit, in customs duties on imports and in rates of income tax, further removal of controls and regulations, incentives for DFI, reduction and progressive phasing out of most subsidies, reform of the financial system and capital market, disinvestment of equity of profit-making public sector enterprises and closure of terminally sick ones, safety net of NRF to workers who lose their jobs because of the new industrial policy, and so on. The vague and general statements of intentions are in respect of small industries, public distribution system, employment generation, agriculture in general and small and marginal farmers in particular, primary education and health services and so on. Some examples: "the effectiveness of the family planning programme will need to be greatly improved..."; "village industries and crafts will need more effective systems of technical, marketing and credit support..."; "creating an environment in which banks will have

better incentives to lend more to agriculture, small industries and other priority sectors"; "...major improvements in tourism facilities and infrastructure..."; "further measures to attract foreign investment in labour-intensive sectors..."; "small industry needs help to overcome market imperfections which affect its access to credit, technology and marketing support"; "agricultural policy must also upgrade the quality of research and extension support...devote greater attention to improving rural infrastructure...developing and propagating technologies for dryland farming..."; and "land and tenancy reform, special attention to providing irrigation and other infrastructure services to small and marginal farmers and restoring the health of the rural credit system are key elements for enhancing the incomes and productivity of small farmers".

The topics of employment and poverty alleviation are disposed of in two brief paragraphs and although the question of employment recurs at several places in the paper, the whole tone of the paper clearly shows that this is only incidental to various other subjects and not one with much importance of its own. The authors are themselves not convinced by what they say about employment generation, for, they observe "nevertheless, there is a danger that the poorest segments of our society are bypassed by the virtuous cycle of growth in incomes and employment." For such people, the only hope the paper

holds out is of IRDP and the Jawahar Rozgar Yojana.

Predictably, the paper calls for a review of the present industrial relations legislation and here it is quite specific. It wants what it calls 'excessive rigidities' as well as the requirement of government approval for closures and retrenchment to be removed. This, according to the paper, will provide incentive for investment and increased employment. It is also ingeniously argued that if employers find that once they employ a person they are not necessarily stuck with him for ever, they will have less incentive to adopt labour-saving technologies. Thus, the freedom to hire and fire which was circumscribed through long and bitter trade union struggles and by law, is to be restored to employers and that, we are asked to believe, will increase employment.

The excessive rigidities cited in the paper are nothing but a myth anyway. Employers have found any number of ways of getting round the legal provisions, including disregarding them altogether. Not filling vacancies occurring due to natural separation, carrying a sufficiently large number of casual or temporary employees and such other practices are standard in most industries. Even in the public sector, the so-called rigidities are the result of management inaction and reluctance to take hard decisions and political interference rather than of the legal provisions.

New Challenges for Bengal Left Panchayat Poll Pointers

Dipankar Bhattacharya

The portents of the fourth panchayat elections in West Bengal merit close critical attention from both activists and academics. On the one hand, there are definite symptoms of a dangerous revival of right-wing politics; on the other, there are also growing prospects of a new phase of radical activism of the rural poor.

THE three-tier panchayat system of West Bengal went through another round of elections on May 30. In West Bengal, the panchayats are known as pillars of the CPI(M)'s power-base and the fourth panchayat poll under Left Front rule, held on the eve of the Left Front government's 16th anniversary, was not expected to throw up anything unsettling in Bengal's settled polity. In fact, with the Congress lying discredited and thoroughly disorganised and the BJP threatening further cuts into the thinning Congress support base, the Left Front, particularly the CPI(M), had hoped to romp home with a still larger majority.

But the results (Tables 1 and 2) showed that the top four Left parties' combined share of gram panchayat (GP) and panchayat samiti (PS) seats had declined by 8.07 per cent and 6.51 per cent, the CPI(M) alone losing 6.51 per cent and 4.80 per cent, while the Congress(I) and BJP had improved their respective positions by 3.40 per cent and 3.82 per cent at the GP level and by 4.34 per cent and 1.29 per cent at the PS level. For the BJP, it was the party's first full-scale intervention in the panchayat poll and it successfully edged out the RSP to occupy the third position at the GP level. It was only at the highest layer of the three-tier pyramid, the zilla parishads, that the Left Front could almost retain its earlier relative strength, restricting the Congress(I)'s gain to mere 1.71 per cent and preventing the BJP from making any inroad.

If the poll outcome thus contained some elements of surprise, the other feature that distinguished the fourth panchayat elections from the previous three rounds or from all major electoral exercises so far under 16 years of Left Front rule was the spate of poll-related violence which claimed more than 50 lives in different incidents in different parts of the state. The most gruesome and widely condemned incident took place in a village called Karanda under Memari police station of Bardhaman district, the strongest rural fortress of CPI(M) wherein five

agrarian labourer activists of Indian People's Front (IPF) were hacked to death and another 30 seriously injured in a brutal CPI(M)-led massacre on May 31.

Evidently, even though the new 'permanent settlement' in CPI(M)-dominated rural Bengal has not been unsettled, somewhere something has started going 'wrong'. The portents of the fourth panchayat poll of West Bengal therefore merit close critical attention from both activists and academics.

CPI(M)'S PANCHAYAT PERSPECTIVE

CPI(M) ideologues have an easy explanation for the poll outcome (and also for the killings). The main culprit, according to the state committee of the party, was an undeclared alliance between the Congress(I) and BJP which ensured that instead of BJP eating into Congress(I) votes, both gained through mutual connivance. Some CPI(M) leaders also lament that the Left Front, on the other hand, put up a divided fight in many places yielding additional advantage to the Congress-BJP combine. The party general secretary has however not stopped with this analysis. Introducing a new theoretical argument, Harkishen Singh Surjeet has said that in a three-tier panchayat poll, political trends are reflected only at the highest, zilla parishad, level where the CPI(M) has retained its strength. The voting pattern at the lower levels, especially at the lowest tier of gram panchayats, is prompted by local, non-political considerations and hence we should not read anything 'political' in the GP- and PS-level poll results.

Such arguments, however, raise more questions than they answer. If the Congress and BJP have been conniving with each other in matters of economic and foreign policies and on major domestic issues like Punjab and Kashmir, Assam and Ayodhya, there is no reason why this 'ideological proximity' should not assume practical shape in electoral politics especially vis-a-vis the Left. The point to ponder is why the Left Front model is not able

to stand up to the threat posed by Congress-BJP collusion. Moreover, it is not true that the BJP has only gained by colluding with the Congress or by winning over sections of disheartened Congress supporters; there is disturbing evidence of the BJP making inroads into the Left's own support-base. Similarly, the CPI(M) cannot evade the question of Congress(I) revival. It should be a matter of serious concern for the Left if at a time when the Congress is losing ground in the rest of the country, it is able to improve its position in Left-led West Bengal despite its discredited, demoralised, disorganised condition.

As for the allegedly non-political character of grass roots-level electoral behaviour, one wonders how the CPI(M) ideologues would have responded had the party been able to maintain or strengthen its earlier hold. It is patently contradictory to parade the panchayats as institutions of grass roots democracy and to dismiss in the same breath the panchayat poll results as statements of non-political narrow local preferences of the rural masses. Of all institutions of parliamentary democracy in India, the village panchayat is physically the closest to the electorate and as such its affairs are subjected to a relatively high degree of transparency and public scrutiny. In this sense, panchayat polls will always be informed by a strong local element and the refusal of the rural electorate to subordinate all their immediate real grievances to remote broader concerns cannot be denounced as non-political behaviour.

In fact, to attribute the dynamics of rural political life to narrow local factors is to negate the very significance of the countryside as a key arena for waging class struggle not as a modified extension of macro-level politics, but as a direct, independent phenomenon with its own agenda and ambit. Such an approach alone can weaken the inertia of traditional non-class ties and integrate the diverse local impulses of rural society into the larger flow of class-based Left politics. Negation and neglect of class struggle was a root cause of the stagnation and eventual collapse of socialism in Soviet Union. Today's West Bengal is no post-revolutionary Russia and the panchayats are no Soviets, but the CPI(M) does display the same suicidal streak in its theory and practice of panchayat raj.

This rift between the CPI(M)'s panchayat philosophy and the Marxist perspective of class struggle is however no sudden development. The rhetoric of using governmental power at state or local level for promotion of class struggle, once a high point of CPI(M) propaganda, has

long been giving way to nationalist and constitutionalist discourse. The information brochure released on the eve of the recent panchayat poll by the CPI(M)'s daily Bengali mouthpiece *Ganashakti* projected the panchayat system in West Bengal as the most sincere realisation of the nationalist leadership's dream of grass roots democracy and rural development. Beginning with the Gandhian vision of 'gram swaraj' (village self-rule) to the Nehruvian scheme of panchayati raj, the brochure mentioned all its sources of ideological-political inheritance and inspiration, but conspicuously absent were any references to the legendary 'tebhaga' and land movement of West Bengal!

BUREAUCRATIC STAGNATION

Devoid of the perspective of class struggle and radical reforms, the panchayats in West Bengal have been reduced to a mere implementing agency for routine programmes of rural governance and 'development'. Lacking imagination and initiative and neglecting the crucial element of speedy implementation of agrarian reforms through popular participation and public accountability, they have fallen prey to all the assorted maladies that go with bureaucracy. And this indictment of the panchayat system has come not from 'ultra-Left' activists or academics but from former civil servants like Debabrata Bandyopadhyay and Nirmal Mukarji, the former of whom was keenly involved in the formulation and implementation of the much-acclaimed agrarian reforms of West Bengal.

In their report to the West Bengal government (*The Statesman*, Calcutta, June 16 and 17, 1993 and *Mainstream*, June 26, 1993), a shocked Bandyopadhyay (former union secretary for rural development) and Mukarji (former union cabinet secretary) have pointed out that the panchayats have virtually excluded land

reform from their agenda. The report showed that between January 1982 and September 1992 only 94,031 acres of injunction-free vested land had been distributed out of an available stock of 3,52,799.09 acres, at which rate it would take another 30 years to complete the job of land distribution. Meanwhile, the second and third amendments to the West Bengal Land Reforms Act have not only not yielded any additional amount of surplus agricultural land, but panchayat records show a net reduction of 79,675.4 acres.

One does not know it and how Jyoti Basu's government will explain this land-scam right behind the limelight of model land reforms, but it is interesting to note that of the 8,10,947.22 acres of vested agricultural land distributed so far in West Bengal, as much as 6,20,215 acres had been distributed before January 1977, that is during the pre-Left Front, pre-panchayat phase. And to go by the claim of CPI(M) politburo member and West Bengal's land and land revenue minister since 1977, the distribution of almost 6 lakh acres had been effectively completed by March 1970 itself, that is during the short-lived tenure of the United Front governments of late 60s. In other words, 16 years of stable, uninterrupted Left Front rule has not been able to achieve even with the backing of a full-fledged elected panchayat network what the unstable short-lived United Front governments could do under the pressure of a vigorous land movement even without any

panchayati raj apparatus. Could there be a more eloquent testimony about the real nature and role of panchayati raj in CPI(M)-ruled West Bengal?

The report also notes the petering out of the Barga operation since the mid-80s. At the present pace, it would take another 15 years to complete the recording of the state's still unrecorded five lakh odd bargadars. Moreover, recording barga or allotting 'patta' is the relatively easier part of tenancy or land reform; the challenge is to enable the poor bargadar or patta-holder to grow into viable small farmers by ensuring necessary credit and infrastructural facilities. The report observes that the panchayats have as a rule not taken any interest in enforcing the 3:1 crop-sharing formula or the stipulated minimum wages. On the contrary, the authors are shocked to find an all-pervasive preoccupation with pompous central schemes like Jawahar Rozgar Yojana, funds for which are already drying up under the influence of the IMF-WB inspired new economic regime.

Contrary to the CPI(M)'s claims of effective empowerment of the rural poor through the panchayat network, the report finds that downward devolution of power stands arrested and power remains firmly entrenched in the hands of the rising middle sections of rural society. Judged by the yardstick of direct land ownership or cultivation, many members of these middle sections may appear to belong to the category of small and marginal farmers, but land is often a misleading

TABLE 2. LOSSES AND GAINS OF DIFFERENT PARTIES IN 1993 ELECTIONS

Tier	Gains in Percentage			Losses in Percentage			
	BJP	Cong(I)	Others	CPI(M)	FB	RSP	CPI

Note: Figures in brackets indicate percentages. 'Others' include a few parties of the Left Front as well as non-Front Left parties like the Kamal Guha-led Forward Bloc faction, dissident CPM groups, SUCI and IPF.

* Seats where elections have been countermanded and where results have been withheld due to court order have been excluded.

: a class which is essentially composed of village professionals ranging from teachers and shopkeepers to brokers and commission agents, a class which thrives on the burgeoning rural service sector. And when the panchayats become synonymous with an elected 'popular' bureaucracy manned primarily by a coalition of the traditional and upcoming rich and middle strata of the rural society, it is not difficult to understand how and why institutionalised loot and corruption have become an essential embellishment of the whole panchayat system.

BEHIND 'POLL VIOLENCE'

Despite growing grievances about the working of the panchayats and unmistakable challenges to the CPI(M)'s hitherto overwhelming electoral supremacy, the party still has a comfortable majority at all levels of the three-tier panchayat system. The level of violence witnessed in the panchayat poll may therefore appear quite out of proportion with the real electoral stakes, especially when we consider a case like Karanda where the IPF could hardly be treated as a serious electoral threat to the CPI(M)'s well-entrenched rural hegemony. Moreover, the carnage took place on the morrow of the polling day when it was well known that the two IPF nominees for the GP had finished a distant second, lagging by nearly 250 votes behind their victorious CPI(M) rivals.

Of course, the logic of the massacre becomes a bit more comprehensible when we look at the pre-poll build-up of 'tension' in the area. Yet, even this tension cannot be explained in sheer electoral terms. Even in this election, more than a thousand CPI(M) candidates were elected 'unopposed' from Bardhaman district, and but for the IPF's 'audacity' to field nearly 300 nominees in the district, the tally of such unchallenged CPI(M) victories would have been higher. Of the nearly 300 seats IPF contested, it could win only four and secure second position in some 120 seats. Yet in most of these 300 cases, IPF candidates and activists had to withstand constant terror, intimidation and physical attacks which ultimately culminated in the heinous carnage at Karanda.

To understand the logic behind the various incidents of poll violence, we have to look at the deeper social processes beneath the political surface. We will then understand that however much the ruling Marxists of West Bengal may try to banish class struggle from their theory and practice and promote the panchayats as platforms of class harmony to reconcile conflicting class interests and identities, in its own way the objective process of history

is reinforcing class divisions and conflicts.

Here it may not be out of place to observe that just as every incident takes on a caste appearance in Bihar, in West Bengal everything goes on in the name of parties. Almost all cases of class conflict must invariably appear here in the form of inner-party dissidence or inter-party clashes. This is so for two reasons. One, over the years the CPI(M) has grown into an omnibus political banner housing a large-scale influx of the dominant interest groups of rural society; and, secondly, in the 'over-politicised' atmosphere of West Bengal 'party politics' permeates virtually every institution down to the local clubs and puja committees. Consequently, while on the one hand every minor incident immediately acquires a political colour, major events of class antagonisms are often created as mere 'family disputes' within or among political parties. It is true that in developed societies, class struggle is ideally mediated or articulated by parties representing diverse class interests, but when hostile classes share a common party, the flow of class struggle gets so much more complicated and muted.

To return to the Karanda incident, the agrarian labourers in question were all activists and supporters of CPI(M) till a few years ago, while inside CPI(M) itself, they had started opposing the dominant local coalition of jotedars and rich peasants who control not only the co-operatives and the developmental resources but also the local panchayat and party apparatus. It may be mentioned that the CPI(M) Rajya Sabha MP Ram Narayan Goswami and his brothers who belong to the neighbouring village of Karanda play a pivotal role in the affairs of this region. Now, it was only in the process of a growing struggle against the ruling alliance of vested interests, when the sharpness and intensity of this antagonism outgrew the bonds of party allegiance, that the landless labourers of Karanda's 'purva para', the hamlet of predominantly scheduled caste agrarian labourers in the poor eastern end of the otherwise prosperous village, left CPI(M) and opted for the alternative radical Left banner of IPF. The panchayat poll to them was only an integral part of their running battle against the ruling nexus of vested interests.

It was this logic of class struggle which lent purva para its whole identity and rendered the entire para into a single object of hatred, a common class target, for the ruling babus of the area. This is why when the local CPI(M) leadership chose to teach a lesson to the rebels of Karanda, who had been emerging as a rallying centre for the landless poor of the entire area, they chose the form of a massacre

and not murder of one or two individuals. It is true that thanks to its strong party machinery and propaganda network, the local CPI(M) leadership could mislead a section of the rural poor and even utilise them as a mass cover to camouflage the actual crime and make the whole thing appear as an uncontrollable mass retaliation against the IPF's provocative activities. The press, too, initially tended to present the incident as an unfortunate clash between two sections of rural poor or as a deplorable case of mindless internecine warfare between two Left parties. But the truth could not be suppressed for long.

For a change, the police and civil administration too described the massacre as a pre-meditated one-sided affair. And in its bid to list the victims' criminal and provocative activities, the concerned zonal committee of the CPI(M) could point only to the former's insistence on enforcing a social boycott on certain corrupt co-operative functionaries who had embezzled Rs 3 lakh of co-operative funds as against the CPI(M)'s prescription of administrative action or such acts of 'anarchy' and 'disorder' as plucking a few fruits from a rich peasant's field. The discerning reader can surely find unmistakable parallels between the Karanda carnage and the November 1989 Danwar Bihta massacre in Arrah Lok Sabha constituency of Bihar when armed henchmen of an upper caste landlord had massacred a dozen persons to teach a lesson to the landless dalit supporters of IPF for daring to exercise their franchise—IPF had won the Arrah parliamentary seat in that election—or the recent killing of five labouring backward caste supporters of CPI(ML) in Chainpur village of Gopalganj district for sitting on cots in the presence of upper caste landlords.

PROSPECTS AND CHALLENGES

If Karanda is any indication, rural Bengal is set to enter a new phase of agrarian tension. Neither the CPI(M)'s omnibus party apparatus nor the broad class balance of the 'panchayat settlement' seems capable of containing the growing class antagonism in the West Bengal countryside, especially in the region that has undergone a degree of modern capitalist development, for any great length of time. Moreover, coupled with rural society's own intensifying tensions which threaten to trip the panchayat's internal balance mechanism, the system will also have to face the destabilising effect of a growing 'resource crunch' according to the very logic of the new economic regime of liberalisation and globalisation.

To cover up this crisis and pass on its burden to the panchayats themselves, the

CPI(M) has revived talk of self-reliant, self-governed panchayats. According to the latest amendment to the Panchayat Act, the panchayats are entitled and expected to raise more and more of their resources from within by imposing levy and licence fee on almost all economic activities within their jurisdiction. If the panchayats are really to raise some resources through this arrangement they will have to hit out at the dominant coalition of vested interests in the countryside. Otherwise the panchayats will degenerate into direct agencies of impoverishment and loot of the rural poor or simply lapse into financial bankruptcy. Either way, the long spell of rural peace and order under the panchayati raj dispensation seems to be drawing to a close.

Another possible source of tension is the changed caste and gender composition of the panchayats. The fourth panchayat poll has filled a third of panchayat seats with SC/ST and women representatives. This surely marks a significant change in the pattern of base-level rural representation, though it is hardly likely to affect the composition of office-bearers or the decision-making process at any level. But even if these new representatives are denied direct accommodation in or access to the core structure and a good section is co-opted into the established order, the rural poor's struggle will surely benefit from every articulation of their experience and aspiration and every assertion of their specific interests and identities.

One may perhaps also look forward to two more favourable fall-outs. In the post-green revolution phase of Indian agriculture, West Bengal has attracted very little critical study and research. The CPI(M) has never tired of trumpeting its government's reforms and developmental achievements. Operation Barga and panchayati raj have also been lauded as the pinnacle of progressive rural reforms within the limited scope of a bourgeois set-up by the US based NRI and foreign researchers. But as an object of research in political economy and related fields of social sciences, the agrarian scene in Left-ruled West Bengal has ceased to excite researchers in West Bengal and elsewhere in India, particularly since the barga and land distribution campaigns began to run out of steam in the early 80s. Hopefully, the experiences of the fourth panchayat poll would change this situation and encourage a new series of critical investigations into the emerging agrarian reality of West Bengal.

And last but not the least, the post-poll situation should trigger off a process of rethinking in all serious sections of Bengal Left. Apart from the symptoms of Con-

gress(I)'s revival and Congress-BJP collusion, the dominant CPI(M) response to the situation should be reason for additional concern for not only the non-CPI(M) Left, but even the CPI(M)'s own ranks and well-wishers. The CPI(M)'s aggressive pursuit of hegemony which now threatens to degenerate into what has come to be known as the politics of terror, something generally associated with the infamous 'Congress culture', will only corner the Left and pave the way for the backlash of a resurgent right. It is this trend of right resurgence which alone can bring even a rootless party like the BJP to the political foreground of West Bengal.

Fortunately, there are also some symptoms of a broad Left convergence against events like the Karanda carnage. On June 3, the entire district of Bardhaman

observed a total bandh at the call of the IPF. Subsequent protest activities like a march to Writers' Building on June 8, unveiling of a martyrs' column at Karanda on June 22 and conventions against the politics of terror and massacre in Calcutta and different district headquarters have also attracted widespread support not only from Left forces outside the Left Front but also from major Front partners like RSP and CPI.

The fourth panchayat poll has thus left West Bengal at the crossroads. On the one hand, there are definite symptoms of a dangerous revival of rightwing politics, on the other hand there are also growing prospects of a new phase of radical activism of the rural poor. Here we have again a juncture when perhaps we can say that much of Indian future depends on which road Bengal chooses today.

Centre for Research in Rural & Industrial Development

2-A, Sector 19-A, Madhya Marg, Chandigarh-160 019 (India)

For the past some years this Centre has been engaged in studies on Ethnic Conflicts and Violence, population dynamics, development of border areas and technological perspectives for the industrialisation of the Northern Region. These studies are multi-disciplinary and inter-disciplinary in approach and involve extensive fieldwork as well as collection and analysis of the necessary secondary data. Also included in the studies is a programme of providing training to junior research staff in research methodology and for award of M.Phil and Ph.D Degree by arrangement with the Punjab and Punjabi Universities.

In its present programme of expansion, the Centre is looking for Research Investigators, Research Fellows, Senior Research Fellows and Associate Research Coordinators (Corresponding to the position of Lecturers, Senior Lecturers and Readers) in the revised UGC Scales.

The Centre shall be happy to receive applications, recommendations and response for these posts. Candidates with specialisation in *Statistics, Economics, Population Studies, Demography, Sociology* and related social science disciplines with experience of inter-disciplinary research will be preferred.

Please apply within a fortnight from the publication of this advertisement to the Chief Research Advisor, on the above address.

Indian Patents Act and TRIPS

Suman Sahai

An examination of the differences between TRIPS and the present patents system in India brings out clearly why adoption of the former will be detrimental to research and development and self-reliant growth.

IN India under the Patents Act of 1970, a patent means the exclusive right of the inventor to use his invention for a particular period. The basic principle underlying the grant of patents is that the invention must be new and useful and capable of industrial application. The basic philosophy of the Indian Patents Act is embodied in Section 83 of the Act:

that patents are granted to encourage inventions and to secure that the inventions are worked in India on a commercial scale and to the fullest extent that is reasonably practicable without undue delay;

that they are not granted merely to enable patentees to enjoy a monopoly for the importation of a patented article.

Among other things, the discovery of scientific principles, inventions injurious to public health, a method of agriculture or horticulture or the treatment of human beings, animals or plants are not considered as inventions and therefore are not patentable.

Although not explicitly stated in the law, going by the underlying objectives of the Indian Patents Act and the fact that methods of agriculture or horticulture or the treatment of human beings, animals or plants are not patentable, it is argued that living things are not patentable. Therefore plant or animal varieties or biological processes for the production of plants or animals will not be considered to be patentable. Inventions relating to atomic energy are also not patentable.

The Indian Patents Act also makes a distinction between Product patents and Process patents. (Patents for the product itself as opposed to the patent for the process of making a product.) Only Process patents can be granted for food products, medicines and chemicals. This means that only the method of production can be patented and not the end product.

The general term of a patent is for 14 years. However, for certain Process patents used for medicine, food and drugs the term varies from five to seven years. In addition the state can impose any condition on the grant of a patent. The central government can use a patented invention in specific circumstances without the payment of royalty. A patent can also be used for experiment or research or imparting instructions to pupils.

Keeping in mind the objectives of encouraging industrial progress, and working of inventions in India on a commercial scale without undue delay, the Indian Patent Act has provisions for Compulsory Licensing and Licence of Right. As already mentioned, a patent is given for the exclusive use of an invention for a limited period of time.

If within this time this patented invention is not used, the government can force the patentee to license the invention or it can revoke the patent on the ground of Non-Working, i.e., the patented invention has not been put to use in India. In the food, medicine and chemical sectors, automatic Licence of Right is granted after the expiration of three years of patent. This means that three years after a patent has been granted in any of these sectors, any person is free to use the invention without the permission of the permit holder, although he or she has to pay royalty to the patent-holder.

The idea behind the patent system was to encourage and maintain a continuous flow of inventions. It was thought that with new processes and products created, new and better products would be manufactured, leading to the expansion of industry. Employment, wealth and higher standards of living are supposed to be then generated. The patent system was therefore created in the interest of the national economy as well as in the interest of the inventor.

If one traces the history of the international patent system, it can be seen very clearly that there is a definite correlation between the economic, technical and industrial development of a country and the patent protection granted by that country. In the early phases of industrial development, many of the industrialised countries had either no patent system at all or very weak patent systems. As they became more industrialised, they began to strengthen their patent systems. It is therefore necessary for India to build up her industrial and technological base before allowing a high degree of patent protection.

The idea behind granting only Process patents for food products, chemicals and medicines is to keep down the price of these items, as the majority of the Indian population is poor and does not have enough food and basic health care. Besides, a large majority of the population is dependent on agriculture for sustenance and livelihood.

The granting of Process patents means that the Indian agricultural, food and pharmaceutical industries have the freedom to find processes of manufacture that are cheaper and suitable to Indian conditions. And indeed as a consequence Indian medicines are among the cheapest in the world. Until the mid-60s and 70s the patent law of many industrialised nations allowed only Process patents in the chemical and pharmaceutical sectors. Italy, for example, allowed Product patents only in 1982.

STATE BANK OF BIKANER AND JAIPUR

working' under the proposed TRIPS.

(5) The proposed TRIPS prevents the grant of compulsory licences in the public interest.

(6) Under TRIPS no ceiling can be placed on royalty demanded on patents like in the Indian Patent Act.

(7) Importation will be treated as working of a patent in the proposed TRIPS, contrary to the patent philosophy in India.

(8) TRIPS also reverses the burden of proof. Under the Indian legal system, the patentee has to establish a prima facie case that his patent has been infringed. However, under TRIPS the patentee will just have to accuse a person or a company of patent infringement and the person or company will have to prove that he did not infringe the patent.

The consequences of accepting the intellectual property regime demanded in GATT will be greatly detrimental to agricultural economies. Research and development will be hampered. Today scientists have access to exchange of information, experience and raw materials from all over the world. For example, a scientist working on breeding better wheat suited for the alkaline soils of the UP terai would have access to all wheat varieties in the world. All he has to do is write to some scientist working in another country and he will get a packet of seeds free, for experimentation.

Once plant varieties are protected by the patents or the revised plant breeders rights, scientists will have to pay royalty for using

a protected variety of seeds. Even mere improvement of any variety cannot be done without the payment of royalty or a licence from the patent-holder. Similarly, the farmer will not be able to improve his seed varieties. Nor will he be allowed to produce or sell seed.

Seed multiplication except by the patent holder will not be allowed. This means that the farmers will not be able to retain their seeds for their personal use. They will have to buy fresh seed for each crop. The farmer will also not be able to develop crop variants suited to local farming conditions and systems. In addition, farmers will not be allowed to sell seed to other farmers. Today inter-farmer sales account for over 60 per cent of the seed requirements of Indian agriculture.

There will be an unprecedented hike in the price of fertilisers and medicines if Product patents are given in these sectors as alternative, cheaper and better adapted processes cannot be used. The new category of biofertilisers and biopesticides coming increasingly in use now, and based on living organisms like algae, bacteria and small plants, will also come under the purview of patents and get monopolised.

Building local technology capacity in biotechnology, the most dominant technology of today, will become very difficult if genetic resources get patented. For countries like India, entry into critical branches of production like foodstuffs, pharmaceuticals, feedstock chemicals, etc, will be seriously hampered, undermining our efforts at self-reliant growth.

without agricultural reforms. In particular, reforms in industries would be incomplete without reforms in agriculture. However, it was pointed out that while economic reforms have been mainly in industrial policy, they have also affected agriculture. Agriculture is directly affected by reduction in fertiliser subsidies. Also deregulation of processing industries is expected to stimulate their growth and affect prices that farmers receive for their produce. Reduction in industrial protection indirectly reduces the disprotection of agriculture. As industrial prices fall, the price of agriculture increases relative to that of non-agriculture. Policies originating outside the agricultural sector such as industrial policies which affect domestic terms of trade and fiscal policies which affect real exchange rate can have significant influence on the agricultural sector. For example, conclusions based on studies of a number of developing countries show that almost three-fourths of the tax on agriculture comes from policies followed outside agriculture. In particular, taxation due to industrial protection alone is very large. This is also true of India. This supports the conventional wisdom that developed countries protect while developing countries tax their agriculture.

Even though there are millions of farmers behaving as price-takers, the agricultural sector is usually not allowed to be competitive. Governments often intervene in agricultural markets. Intervention is justified due to several reasons. First, there is a time lag between sowing and harvesting and there is uncertainty regarding the realisation of agricultural output. A complete set of future markets that can provide insurance against all possible outcomes does not exist. Second, the income distribution resulting from weather fluctuations and market forces may not be satisfactory. Third, food security is believed to be important to the nation and cannot be left to the market. Fourth, non-price factors such as research and extension and technological improvement are important for agricultural growth. These are areas in which the government must play an active role, since private participation in these activities is often much less than optimal.

PRESENT POLICIES

Farmers' output or sale prices cannot be fixed by linking them to cost of production because there is no way of obtaining these figures correctly. It is not possible to collect data for inputs as, unfortunately, there is no 'representative' farm whose costs can be considered to reflect the cost of all other farms as is assumed in economic theory, e.g., by Marshall. In fact, there is a growing feeling among farmers that removing the subsidies on inputs such as water, power, fertilisers, etc, and allowing them to receive world prices would make them better off. That is, in

Economic Reforms and Agricultural Policy

Kirit Parikh

Shikha Jha

P V Srinivasan

Though economic reforms cannot succeed without agricultural reforms, the current reform programme has neglected agriculture. Report on a seminar focusing on price policy and related issues of trade, stock and distribution policies; credit policy; and institutions, research, technology and human resource development.

THE discussion at the seminar on 'Agricultural Policy in the Context of Economic Reforms' organised by the Indira Gandhi Institute for Development Research, Bombay, on January 14 and 15 led to a surprising degree of consensus on a number of issues and some expected areas of disagreement. In either case, the range of opinions expressed illuminated the issues involved. This report reflects our understanding of the issues involved in agricultural policy reforms. It is not the proceedings of the seminar and none of the other participants at the seminar is to be held accountable for what we say here.

A number of speakers expressed the view that, in general, the reform programme has neglected agriculture. Even the changes in fertiliser subsidies can be seen as a budgetary exercise of the central government and not as part of a programme of agricultural policy reforms. If anything, the economic reforms made during the last one-and-a-half years including fiscal management of the economy have affected agriculture adversely. Plan allocation to agriculture has been decreasing and very little funds are going to research and improvement in technology. Economic reforms cannot succeed

spite of giving them all the subsidies on inputs, the output prices are suppressed so much below world prices, that it amounts to a net taxation of farmers. Prices should, therefore, be fixed at market clearing levels for the output of a representative (normal weather) year or at the most one can tie these prices to normal world prices. Keeping prices artificially low does not lead to social or economic benefits in the long run. In spite of several regulations and price controls the desired objective of protecting the poor has not been achieved. Administered prices should therefore be confined to very few commodities. It is also necessary to have market-induced shifts from foodgrains to other crops which give higher returns and where production can increase more. This may create larger employment opportunities also. Shifts from staple to non-staple crops need not lead to rise in prices of the former.

Controls on agriculture have been restrictive, repressive and extractive. While concessions given to the industrial sector are called 'incentives', they are called 'subsidies' when given to agriculture. The fact that incentives to agriculture do work can be seen in the case of Punjab where the success of agriculture is mainly due to investment in irrigation and power (amounting to two-thirds of total agricultural investment). Punjab charges the lowest flat rate for electricity use and 40 per cent of its power supply goes to agriculture. As a result, most of the tubewells are run on electricity rather than on diesel.

Moreover, controls have stifled agricultural growth and diversification. Diversification of agriculture should not be prevented through controls. For example, Maharashtra has monopolised all the licences for sugar production and much of its irrigation is used (misused?) for producing sugarcane. Similarly, it is claimed that Punjab can outperform Gujarat in milk production because of its high quality of buffaloes and the good feed availability, but the centralisation of dairy development and the control on milk prices have prevented this from happening. Another example is that of molasses. Its price is fixed very low even though alcohol prices are very high. Location of sugar mills is regulated and khandan producers invite no excise on molasses which the sugar mills do.

Zoning and restrictions on movement of grains hurt farmers in surplus states and consumers in deficit states. It is even illegal for farmers to hold more than a certain amount of stocks, which forces them to sell at prices lower than what they could have otherwise realised. Agricultural trade is mostly controlled and canalised and is generally geared to meeting the objectives of domestic price policy.

Agro-processing is controlled and generally discouraged. There has been an ambivalent attitude to agro-processing. Processed foods are considered luxury goods

and invite taxation. This restricts markets for processed foods and discourages development of processing industry. It is not fully appreciated that processing benefits farmers.

Similarly the role of private traders in stabilising prices is also not fully appreciated. Traders, often called pejoratively hoarders and speculators, are often blamed for rising prices. In particular, the edible oil traders are supposed to constitute a cartel to counter which National Dairy Development Board (NDDB) carries out open market operations (and makes losses on it, according to a recent report).

EMERGING ISSUES

The rate of growth of Indian agriculture has been higher in the 1980s as compared to the 1960s and 1970s. However, there has been a regional concentration of this growth. For instance, in the 1980s West Bengal recorded a growth rate of 7 to 7.5 per cent in the gross value added in agriculture compared to national average of 3 to 4 per cent. This agricultural growth, however, is not sustainable because a plateau has almost been reached due to the earlier technological upgradation. But, plan allocation to agriculture has been declining and very little funds are going for research and improvement in technology.

Sources of agricultural growth in the 1980s include an increase in input use: the use of fertilisers increased two to three times compared to the 1960s. But, there was a reduction in both private and public sector investment (mainly in the latter) with a fair degree of complementarity between these two. Where would future growth come from?

The policy of low output price and subsidised inputs is no longer sustainable. The subsidies on food and agricultural accounts now constitute a significant part of government budget and it is not possible for them to continue to grow as they have, without causing a serious fiscal imbalance. On that account alone, relative prices would have to change. In addition, industrial liberalisation has changed, and will further change, the relative prices of various industrial goods. The terms of trade between agriculture and non-agriculture gets altered unless agricultural prices adjust. Since the bulk of our population depends on agriculture, a fall in its terms of trade can have an undesirable impact on their welfare. Thus agricultural price reforms have to be a part of the economic reform programme.

The government has begun to take some steps to reform the agricultural sector. Subsidy has already been removed from phosphatic and potassic fertilisers. Zoning restrictions on foodgrains movement have been removed. Certain prices such as those of sugarcane molasses have been decontrolled and trade restrictions on items such as processed foods, fruits

and vegetables have been removed. However, it was felt during the discussion that the government should prepare a document setting out the statement of objective and design of policy so that we do not come up with a set of policies which are inconsistent. The direction in which the government wants to move should be clear before embarking on policy reforms.

Three sets of issues in agricultural policy were discussed at the seminar concerning: (a) price policy and the associated issues of trade, stock and distribution policies, (b) credit policy, and (c) institutions, research, technology and human resource development (HRD). We report on these in turn.

I

Price, Trade and Distribution Policy

Price and trade policies are closely connected. With free trade domestic prices equal world prices. If domestic prices are to be different from world prices, an appropriate trade policy is needed. The discussion covered the following questions:

(a) Should India open up agricultural trade? Where is India's comparative advantage?

(b) Should the domestic output prices be equal to world prices? If not, what should they be?

(c) Is price stabilisation desirable? How should such stabilisation be brought about? Through public stocks?

(d) In what sequence should input subsidies be reduced (or removed)?

(e) What is the role of non-price factors in agricultural development?

(f) How effective is the public distribution system (PDS)? Does it reach the poor? How much support does it provide them?

A degree of self-sufficiency is desirable for some staple commodities: While there was a general consensus that India should move closer to the world prices, some reservations were expressed concerning the speed of adjustment. In the trade of many agricultural commodities, particularly foodgrains, India is not a small country. If India were to try to export five million tonnes of rice, it will depress global prices. On the other hand if it tries to import that much, world price will shoot up. The total world trade in rice is only about 16 million tonnes. Even in wheat, where the world trade is larger (around 80 million tonnes), India would find that its trade will affect world prices. Moreover, USA and EC both subsidise their exports. In exporting cereals, it would not be the Indian farmers who would be competing against the US farmers, but the Indian treasury against the US treasury.

Thus, even though India has a clear comparative advantage in wheat and rice production, *as long as world trade in these commodities is distorted by the rich coun-*

should aim at a degree of self-sufficiency in these commodities. Domestic prices and trade policy, moreover, have to be consistent with the targeted self-sufficiency levels.

By opening up agricultural trade India can be a major exporter of a number of agricultural products: Even though US is a major rice exporter and even though rice market is very thin, it was argued by some participants that India can export two million tonnes of rice initially, and can, over time, become a major exporter as the US withdraws from rice trade.

It was, however, generally agreed that there is a large scope for exports of fruits, vegetables, processed foods and cotton. India may even have a comparative advantage in sugar. According to some participants India does not have a comparative advantage in oilseeds production and the recent success in expanding oilseeds production has been brought about with considerable protection.

It was recognised that for reasons of containing domestic prices ceilings on some exports may be needed. While liberalising exports the fact that small country assumption may not always hold for a number of commodities should be accounted for and, if needed, export quotas may be imposed. If there is indeed a need for a ceiling on exports, it should be set once generously and not raised in small steps. Otherwise, people should be free to export. Liberalisation of agricultural imports is likely to lead to a fall in the price of sugar and edible oils while liberalisation of exports might raise the price of cotton. Imports may therefore, for domestic price reasons, be canalised.

Domestic prices should be stabilised at the market clearing levels for the modal or average weather year levels through buffer stocks and trade: Fluctuations in weather result in fluctuations in output and possibly in prices. While government price support operations are welcome by farmers in years of good rainfall, they are averse to government intervention in the market in years of poor harvest. Similarly, consumers welcome government operations that keep down prices but object to government actions that keep prices from falling in good years.

A large number of the poor are net purchasers of foodgrains. They also spend a large part of their income on food items (which have a weight of 57 per cent in consumer price index). They would be adversely affected if food prices increase more rapidly than their incomes.

That transient food insecurity is of some consequence can be seen from the year to year variability in the estimates of rural poverty in India. The poverty line in India is defined mainly with respect to the ability to buy 'adequate' food and so poverty estimates are expected to correspond closely to estimates of incidence of hunger.

food insecurity, government should try to ensure stable food prices through operations of a buffer stock or through international trade and/or provide subsidised food to the poor, the amount of which can be varied depending on the need.

It was suggested that a buffer stock of 11 million tonnes of foodgrains (excluding the stock needed to operate the PDS) may be adequate to stabilise prices.

Reliance on foreign trade is essentially equivalent to maintaining a buffer stock of foreign exchange. One may note that reliance on foreign trade does not imply free trade. This is a separate issue.

The level at which prices should be stabilised should correspond to the price at which demand will equal production for a modal or average rainfall year. One can also think of selecting a price level that corresponds to some average of world market prices.

Poor targeting makes PDS an expensive way to protect the poor; an employment guarantee scheme would be more cost-effective: Most of the supplies of the PDS go to urban areas and more so to the middle income classes. Therefore, it is debatable as to whether this system should continue in its present form in spite of its poor targeting, e.g., one might ask: why should sugar be supplied under PDS when it is being bought more by richer consumers? It was pointed out that even in a state like Maharashtra, in rural areas, less than 20 per cent of the population makes all its cereals purchases from the PDS. The implicit value of the subsidy on cereals provided through this system is less than Rs 2.5 per person per 30 days. An extra person day of employment per family would provide the income support at a much lower cost. However, since removing PDS is politically infeasible, better ways of targeting have to be found such as exclusion of people with certain attributes (e.g., income tax payees, owners of vehicles, etc).

One should also consider ways to cut the costs of operating the PDS. It was suggested that the Food Corporation of India (FCI) operations may be dismantled and states be permitted to buy foodgrains from wherever they like. If consumers are to be subsidised then these subsidies should be financed out of the budget. About 40 per cent of agricultural workers in India are labourers whose wages have low indexation and whose incomes are seasonal. They need income support. Since the PDS is poorly targeted, an employment guarantee scheme (EGS) is a better way of providing protection to these people. Thus subsidies on the PDS may be gradually reduced as the employment schemes are expanded.

Deregulation and liberalisation would provide enough incentives to farmers: It was argued that farmers do not need or want subsidised inputs, if they are given the freedom to sell anywhere in the coun-

ing the disprotection of agriculture. All restrictions on movements of agricultural commodities should be abolished. (This was subsequently announced in the budget of 1993-94.) Restrictions on traders' inventories should also be removed. (Markets should be permitted to determine prices of commodities such as cotton for which India has a comparative advantage.) Deregulation of all kinds is needed to promote diversification. This includes licensing for processing plants, restrictions on locations such as on sugar mills, price control on agricultural inputs such as molasses, and decentralisation of dairy industry. The government should not have a procurement price but a support price can be fixed at some fraction of market equilibrium price in year of normal supply. If taxing farmers is the objective then progressive land revenue is better than procurement at a low price.

Input subsidy removal will also encourage efficient use of resources: Input subsidies have to be greatly reduced as their continuation is fiscally unsustainable. If subsidies have to be removed on inputs then the output prices will have to be freed. Though power subsidy (flat rate, etc) was appropriate in the early stages of agricultural development, it should certainly be removed now for both efficiency and ecological reasons. Canal water and electricity for irrigation are not generally charged on the basis of quantity of water or energy used. As a result they become 'fixed costs' and farmers have no incentive to economise on their use. They should be charged on the basis of quantity used.

Non-price factors are important for agricultural growth: It is often argued that non-price factors are more effective than price factors in terms of increasing output or realising a better income distribution. We cannot expect the centre alone to provide all the infrastructural and other investments needed for agricultural growth. These will be much more effective if implemented at the local level.

Among these are provision of credit, creation of infrastructural facilities and institutions, research and extension and human resources development. Investment in agriculture, including private investment, has stagnated. A major reason for this is the breakdown of agricultural credit system. The loan 'melas' and give aways of the mid-1980s have severely reduced loan repayment and consequently the availability of funds for agricultural credit. Also with the low interest charged, agricultural credit is not viable. Thus to increase agricultural credit, it is not enough to strengthen credit institutions. Unless strategic constraints facing such institutions are removed, the strengthening would be pointless.

Some of these problems are discussed in greater detail in the following section.

Agricultural Credit and Investment

Out of the total credit supply to agriculture, 37 per cent is provided by co-operatives, 57 per cent by commercial banks and the rest by regional rural banks. The agricultural credit policy adopted by the government has to some extent increased agricultural investment and fertiliser use and also reduced the farmers' indebtedness to moneylenders. The rural community's dependence on private moneylenders went down from 88 per cent in 1951 to 36 per cent in 1991. However, the costs of India's credit policy have been enormous for the central and state governments as well as for financial institutions.

The problems faced by the rural credit system can be listed as follows:

- (1) There has been an erosion of credit discipline due to large-scale defaults, loan waivers, etc, and it is difficult to bring this back in a short period.
- (2) Political tampering affects bank autonomy.
- (3) Institutional constraints lead to high transaction costs. Due to the complicated operational procedures, borrowers incur high costs in obtaining formal credit and often resort to private moneylenders.
- (4) Concessional or below-market interest rates imply credit rationing which results in high transaction costs for applicants. Targeting of credit subsidy is also poor. Since (due to corruption) getting a loan involves a bribe, the effective interest rate is high. This is a case where non-price rationing is far inferior to price rationing. Credit availability is more important than the interest subsidy on loans. It is, therefore, better to cut down the interest subsidy but not the volume of credit—contrary to the recommendations of the Narasimham Committee. Reduction in the volume of credit would adversely affect private agricultural investment.
- (5) Banks have been forced to assume the role of welfare agencies which has discouraged adherence to sound banking principles.
- (6) Since they receive concessionary refinance from National Bank for Agricultural and Rural Development (NABARD), the regional rural banks and the agricultural credit co-operatives have no incentive to mobilise savings. In addition clients have little confidence in these institutions and would not like to deposit their savings with them.

Thus reforms should focus on:

- (1) Restoring credit discipline among the rural financial institutions by rigorously implementing the policy of denying new loans to defaulters.
- (2) Allowing them to charge market determined interest rates. That is, give them freedom to charge their own interest rates (for viability) instead of uniform rates.

(3) ~~Rationalising~~ welfare and credit. For example, in times of disaster, instruments such as crop insurance programme should be used rather than relying on loan forgiveness.

(4) Encouraging financial institutions to mobilise rural savings so that they can rely more on locally generated resources.

III

Institutions, Research, Technology and HRD

Among other agricultural institutions, the importance of research and extension institutions were emphasised in the seminar. The role of government in generation of new technologies and their transfer to farmers is well recognised. The research and extension system in India is facing a number of challenges:

- (1) The yields of major cereals seem to have reached plateaus and have been stagnating. Particularly, development of high yield varieties for high rainfall areas where water application is not controlled, has not seen breakthroughs.
- (2) Research in farming systems needs a much greater emphasis.
- (3) The growing concern for environmental sustainability would require development of different technologies.
- (4) Development of private research has not been adequate. While private seed companies have been active their focus has been limited to some high value crops.
- (5) Agricultural extension systems need to expand their training and visit activities, which have been found to be effective in technology transfer and adoption.

Considerable discussion focused on the performance of Indian agricultural research system. How does one measure performance? How does it compare with other countries? How does one improve its performance? What is the role of private research? Discussion also encompassed (strayed into?) the general issue of the role of research in society.

In evaluating the performance of an agricultural research system, one should distinguish between evaluation of performance of scientists/ researchers and that of management. The number of publications, citations and patents obtained provide a generally accepted, though not without reservation and controversy, yardstick for judging the performance of researchers. For judging the performance of managers of the research and extension systems, however, increases in total factor productivity growth is the ultimate measure.

Evaluations based on total factor productivity have shown that agricultural research in India in the 1970s was productive. It also showed that investment in agricultural research in India was productive. Comparable studies for the 1980s are not available.

Learned articles may be a poor indicator of the development part of R and D. China with far fewer publications has shown much better growth in yields.

While judging the Indian agricultural research system in the 1980s, one needs to account for a few things. First of all, in agriculture, research is required to stay in the same place. So research in 1980s may have been directed to not sliding back. Secondly, wastage in research and research effort is unavoidable. Thirdly, agricultural research is part of the Indian system and the wastage in it cannot be looked in isolation from the wastage in public systems in general.

Even then, it was felt that the agricultural research system in India needs much improvement. It is seen to be a talent repulsive system. It has become stale. Many of the experimental plots of research stations are no longer representative of the land outside. The various all-India co-ordinated trials distribute money and resources too thinly. And above all, it lacks client orientation, farmer involvement or commercial motives.

A number of suggestions were advanced to improve the performance of agricultural R and D.

- (1) Install a system of macro-assessment of the system's performance at different levels in the system.
- (2) Introduce client participation. Farmers should also be asked to bear a part of the cost of R and D.
- (3) Research agenda should set priorities from the development point of view.
- (4) Not just the top management, but also research scientists should be involved in R and D planning. It may be useful to ask the scientists themselves to do a cost-benefit analysis of their proposed research.
- (5) Move away from the emphasis on rice and wheat research. Much scope exists for R and D in fruits, vegetables and other crops.
- (6) Location specificity of agricultural technology requires research centres in different agro-climatic zones.
- (7) An action plan for extension should be a part of any research plan.
- (8) Human resource development should give adequate attention to extension and delivery.
- (9) Incentives should be improved for individuals who deliver results.

While research has qualities of a public good and public research must play a leading role, private research can complement it effectively, particularly in the final development and extension phase. Commercial incentives of private research institutions should be exploited. Such research has played significant roles in other countries, for example, in developing fruits and vegetable exports in Chile and Turkey and India could learn from such experiences.

Bangladesh's Flood Action Plan: A Critique

Peter Custers

Bangladesh's flood action plan of 1990 is a good example of the unrealistic and expensive schemes that agencies like the World Bank have pushed on third world countries without a realistic appraisal of experiences within the country.

IN 1987 and 1988 Bangladesh faced excessive annual floods which drew broad international attention after the floodwaters reached foreign embassies in Dhaka's Gulshan area. Bangladesh's large donors then, after many years' neglect, got alarmed to the devastations caused by the yearly floods, and sent out teams competing to find the proper, permanent 'solution' to prevent future flood damages. Thus, the French government under Mitterrand appointed a team of engineers, and others—Japan, the UNDP and the USAID—engaged their own expatriate experts to devise elaborate flood prevention/flood control schemes. The World Bank was ultimately asked to co-ordinate the various efforts. Under its auspices, an international conference was held in December 1989, and subsequently the World Bank drafted what has come to be known as the 'Flood Action Plan' or FAP (dated May 1990).

It is important to review the FAP, because, if executed, it will have far-reaching consequences for Bangladesh's economy and environment. The FAP consists of some 26 studies and pilot schemes, of which 11 are considered main components and the remaining 15 'supportive' in kind. Implementation of these projects does not seem to have gotten very far yet, with conflicts of interests appearing within the Bangladesh bureaucracy in the very first, preparatory phase, and with various delays in the finalisation of the projects' so-called 'Terms of References' (TERs) by foreign, 'expert' teams. (See Shapan Adnan's *Floods, People and the Environment*, Dhaka, July 1991.) Ultimately, however, the plan aims at the construction of tall embankments along both sides of Bangladesh's three main rivers, the Ganges, Brahmaputra and Meghna, and the costs of such construction would be huge: initial estimates put the figure at 5 to 10 billion US dollars which would make the FAP the "very biggest development project in Bangladesh history" (see 'Birth of a Megaproject: Political Economy of Flood Control in Bangladesh' by James Boyce in *Environmental Management*, Vol 14, No 4).

Now, since there is a tendency to erect a smoke-screen in order to counter the ris-

ing criticism of the FAP, it is necessary to emphasise that the construction of tall embankments is indeed the ultimate essence of the plan. This is evident both from the order of priorities within the Flood Action Plan, as drafted in 1990, as also from the 11 'guiding principles' which the Ershad regime drew up in preparation for the FAP; the principles included "safe conveyance of the large cross border flows to the Bay of Bengal" by construction of "embankments on both sides" of the major rivers. It was further re-confirmed at a seminar held at Delft University, the Netherlands, in September 1991, where the Dutch representative on the FAP, Van Ellen, insisted: "the belief that effective protection against flooding in Bangladesh is possible only by constructing a system of embankments along all the major rivers" is the very "basis of the Flood Action Plan". Van Ellen leaves no doubt about the fact that the variety of measures proposed in the FAP should lead to "the confinement of all major rivers of the country between embankments on both sides."

FLOW OF CRITICISM

A number of articles appeared criticising the plan immediately after its publication which underlines the fact that the opposition against the Flood Action Plan is not the aberration of a Leftwing intellectual alone, but is in fact shared by a broad spectrum of Bangladeshi and western economists and environmental experts, as also a major section of the international aid establishment.

The American economist James Boyce in an article entitled 'Birth of a Megaproject: Political Economy of Flood Control in Bangladesh' on *Environmental Management* has lashed out in particular at the French-proposed scheme of tall embankments availing internal, World Bank sources to back up his profound critique. An article by Laurent Zecchini in the French daily *Le Monde*, in the wake of the April cyclone, mentions that more and more experts question the wisdom of building/rehabilitating 3,350 to 4,000 km of embankment-structures of the planned size of 4.5 to 7.4 m high. The article refers

to French megalomania, expressed in Attali's comment that "Our Century has a Need to Build Cathedrales, otherwise the world will perish of boredom". The case submission regarding the FAP to the 'International Water Tribunal', drafted by the San Francisco based International Rivers Network (April 1991) lists eight major objections against the Flood Action Plan, four of which could be termed 'environmental' ones; the document concludes: "Rather than providing the protection from catastrophic flooding that the project is designed for, construction of high embankments would actually increase the risk of devastating flooding". Then, there is the extensive review, in book form, by the Bangladeshi economist, Shapan Adnan, entitled *Floods, People and the Environment*, a study financed by NORAD. Adnan, amongst others, questions the scientific validity of the World Bank's approach. The article 'The Rivers That Won't be Tamed' by the environmental journalist Fred Pearce (*The New Scientist*, April 13, 1991) extensively quotes from the USAID-sponsored 'Eastern Waters Study' which castigates plans to channel the rivers between high embankments as "engineering hubris likely to lead to massive waste of scarce resources"; according to this study, "embankments do not reduce flood water, but merely move it"—i.e., to areas closer to the sea where people are already most exposed to the risks of catastrophes. Last, but not least, mention should be made of the 'Report of the Task Force on Action Plan for Flood Control', drafted by a Commission set up under the interim government of president Shahabuddin Ahmed (February 26, 1991). The report criticises the fact that the Flood Action Plan has not been exposed to public debate, and insists that "the need of public debate is still valid"; it recommends a moratorium on all construction activities until the results of studies regarding the plan's socio-economic and environmental impact be available.

Amongst the various objections against the proposal to construct tall embankments, the first one relates to the very nature of Bangladesh's river system. First, these rivers belong to the very largest ones in the world, the width of each of them being almost unparalleled: the Ganges at some points is 5 km in width, the Brahmaputra 10 to 15 km, and the lower Meghna as much as 15 to 20 km. With these rivers all converging in a relatively small area, anybody interested in 'taming' them is forced to realise that they form an 'integrated circuit' which can hardly be compared to rivers which have been tamed elsewhere in the world. On these grounds the idea that the control of the Bangladeshi rivers can be modelled on that of the American Mississippi (as was done in

the 'Master Plan' prepared by the International Engineering Company in 1964 has been challenged: "It is an act of grave error to either underestimate or overlook the absolute difference between the processes of training a single river and the problems of subduing a system of rivers" such as Bangladesh' ('In Search of Flood Mitigation in Bangladesh' by Aminur Rahman in *Flood in Bangladesh*, Community Development Library, Dhaka, April 1989).

Secondly, the Bangladeshi river system is rather young and the rivers are still in the process of fashioning the delta. Thus, the Brahmaputra as recently as in the late 18th century followed a course towards the sea that was located well to the east of its present course. When the Teesta, a smaller river in the country's north, suddenly changed its course in the year 1787, and joined the Brahmaputra, the latter was forced to seek a new channel: the Jamuna became the river's main course towards the Bay of Bengal. This shift, however, brought the Brahmaputra into conflict with the Ganges which enters Bangladeshi territory from the west. At one point, the Brahmaputra "threatened, almost, to shut up the Ganges". And although a head-on confrontation between the two powerful rivers could be avoided at the time, "the battle between the Brahmaputra and the Ganges could not, reasonably, be supposed to have yet been fought to a decisive finish." In any case, the process of formation of the delta by the great rivers is an ongoing one.

The World Bank's 'experts' have devised elaborate schemes for flood prevention and flood control, without first questioning whether at all the basic human knowledge about the deltaic rivers has been sufficiently developed. The judgment of the interim government's Task Force is crystal clear: "Although in the Krug Mission report (1957), the emphasis was given on basic researches on our rivers, it is painful to note that the research work in the relevant fields has altogether been neglected. The formulation of the flood plan should benefit from result of researches rather than being based on presupposition."

When the discussions about the proper method of flood control in the then East Pakistan started in the 1950s, there was no unanimity of view amongst experts as to what would be the proper approach. As the Krug Mission Report noted in 1957, "Opinions are divided on the merits of flood embankments..." (see Aminur Rahman's article quoted earlier). Nevertheless, in accordance with the proposals contained in the 'Master Plan', prepared by the International Engineering Company (1964), a governmental body was formed, baptised the 'WAPDA', whose chief task became the construction and

maintenance of dykes. WAPDA is not very popular among peasants in the Bengali countryside, because the construction of embankments has frequently borne negative consequences—at times even the very opposite effect of control of annual flooding.

Publications by economists and by organisations belonging to the Bangladeshi peasant movement indicate that the construction of dykes has variously led to artificial flooding. First, given the enormous quantity of silt being carried by the major rivers—the total amount is an estimated 2.4 billion ton per year—, embankments often have only a temporarily mitigating effect. Silt that can no longer be deposited in the vast floodplains is accumulated on the river beds, unless large-scale (and costly!) dredging operations are carried out. In the course of time flood levels in the rivers rise, leading to renewed overtopping of the embankments—with potentially more disastrous effects than was the case previous to the construction of embankments. Moreover, embankments have a 'replacement affect', as was justly stated in the Eastern Waters Study: "Embankments do not reduce floodwater, but merely move it; excess water that is confined in the stream bed higher on the river will increase the volume and velocity, and perhaps the depth, of the flow that has to be managed in the districts closer to the sea" (quoted by Fred Pearce in 'The Rivers That Won't be Tamed', *The New Scientist*, April 13, 1991).

In designing the 'Flood Action Plan' the problem of artificial flooding was simply ignored by the World Bank. The American economist James Boyce quotes from an internal audit regarding a World Bank-financed floodcontrol project which points at the "extraordinary absence of formal evaluations of floodcontrol investments in Bangladesh after 26 years of experience". The unit which itself is not responsible for execution of World Bank schemes, recognises there is a "continuing pressure for large-scale capital-intensive 'solutions' to the flood control problem when all available evidence indicates that such schemes have not been cost-effective in the past and are unlikely to be in the future". One may cite the instance of the right bank of the Brahmaputra, stretches of which have been 'protected' with an embankment to stop floodwaters from spilling across north-western Bangladesh. The Brahmaputra river has as Pearce puts it, "taken little notice of this impediment".

ENVIRONMENTAL CONCERNS

A third, and perhaps decisive objection against the World Bank's proposed scheme relates to the environment. Here, we need to take account of the potential

disruption of the fertilisation process which is yearly promoted by the river floods, i.e., the deposition of silt and the algae growth. But besides we need to look at the major consequences for fisheries. The independent American investigator, Steve Minkin, has justly pointed out that "perhaps more than people in any country, Bangladesh citizens depend on natural wild fisheries resources for their food and livelihood". Approximately 80 per cent of animal protein in the Bangladeshi diet comes from fish. Moreover, for many poor peasant families, fish capture is a crucial, secondary source of income.

Furthermore, the floodplains are a relatively important source of fresh water fish captures. Steve Minkin's data bring it all out in clear terms: whereas roughly a quarter of the yearly fish capture is gathered in the open sea, the remaining three-fourth hails from inland fresh water resources. Here, floodplains are as important as rivers, taking up as much as 50 per cent of the inland fresh water captures. Such data in fact form a major indictment of the World Bank's proposed scheme for flood prevention. For in case embankments of 4 to 7 m high would be constructed, such would constitute a direct assault on the existence of millions of landless families who as said are dependent for their survival on fisheries and who even without being deprived of income from fish captures are regularly facing the threat of starvation death.

The World Bank's Flood Action Plan, of course, proposes to investigate the environmental implications of new embankment and compartmentalisation schemes. Yet the purpose is not, it seems, to assess whether the given schemes should be implemented. Rather, the 'environmental study' will focus on how to limit environmental damages!

Bangladeshi scholars have noted that the traditional diversity of Bangladesh's aquaculture resources has already been drastically reduced by embankments, and that past projects have "left scores of fishing villages in decay". Similar kinds of observations have been made by the Dutch environmental expert Van Vierssen who covered the theme of 'Ecology and the Bangladesh Disaster' for the Delft seminar. He has stressed that "many young fish feed in the very productive floodplains during their earliest life stage", and insists that flood control, draining and irrigation schemes (FCDI) tend to inhibit the "migration, breeding and feeding of fish". Not just embankments aimed at flood prevention, but even so-called 'submergible embankments' tend to have negative consequences, since they disturb the timing of spawning. Clearly, without a careful assessment of both the benefits and the drawbacks of annual floods, and of all the negative, environmental effects

of past flood control schemes, it would be foolhardy to initiate any major new, 'structural' schemes.

Certain western European governments have consciously refused to participate in the World Bank's scheme (the Norwegian and the Belgian governments in particular). The Dutch however have thrown their weight behind the plan. As a letter by the Dutch minister for development co-operation to the Dutch parliament (June 13, 1991) proudly states, the Netherlands contributes to the FAP both by supplying 'expertise', and by co-financing, along with Germany, the 20th component of the Flood Action Plan, entitled 'Compartmentalisation Project'. Even if the concept underlying this project is not flood prevention, but controlled flooding, it is no exaggeration to state, as the minister does, that FAP-20 which purports to create polders along the left and right banks of the Brahmaputra river constitutes a cornerstone of the plan, as it helps to ideologically justify the whole. A significant amount of 10 million Dutch guilders (roughly one-tenth of the total amount for 'aid' to Bangladesh in the 1990-1991 annual budget) has been allocated for this 'pilot project'.

Though various aspects of the 'compartmentalisation' scheme remain to be clarified, Bangladeshi sources have already raised major objections against 'controlled flooding' in general, and against FAP-20 in particular. One is the fact that earlier schemes for controlled flooding have led to 'manmade ecological disasters', as is true for instance for 'Beel Dhakatia', a polder scheme in Khulna/Jessore in the western part of Bangladesh, designed by foreign 'experts' in the 1960s. As reported in the NORAD-financed study 'Floods, People and the Environment', the natural vegetation in this original 'beel'-area has suffered and the growth of fisheries has been retarded as a consequence of the non-functioning of the polder's sluice-gates and of the discharge-canal. Thus, for the last eight years, the area has suffered from serious waterlogging. Finally, a Beel Dhakatia Action Committee was formed last year and in September massive numbers of people decided to breach the polder's embankments. Clearly, landless and land-poor peasants have experienced this controlled-flooding scheme as disastrous to themselves and the natural environment.

Secondly, it is far from clear in what respect the FAP-20 Compartmentalisation 'pilot' project differs from earlier experiments in controlled flooding in Bangladesh. In fact, the non-governmental organisation 'Bhuapur Development Project' which is active in the area along the Brahmaputra where the 'pilot' scheme is to be executed claims that

FAP-20 is a total waste of resources, since the project estimated to cost 17 million US dollars is a 'duplication' of the 1968 Dhaka-Narayanganj-Demra (DND) Irrigation project: "The aim of the DND at the time was to become the field model and case study for other future projects for this country. The results of this project are clear-cut and the examples seem more than adequate for the concepts of compartmentalisation. The effects can also be studied over the last 20-30 years, at a fraction of the cost of the Compartmentalisation Pilot Project. Why is it important to spend another 20 million dollars on projects that can promise little more than the exact same results? Not only that, but why do the same experiment on each bank of the Jamuna?"²

Thirdly, more than questionable is the claim put forward by van Ellen at the Delft Seminar in defence of FAP-20 that "it is an effort in building up and consolidating people's participation, during the phase of planning and building, and also thereafter, during the operation of the introduced water management systems". However, people representing the Bhuapur Development Project, which NGO is active in the char villages of the Jamuna river, state that "there is no recognition of substantial habitation of the calar areas" in the World Bank's plans, that these inhabitants are in danger of being washed away in case of execution of the FAP, and that they have not been informed about the compartmentalisation scheme—let alone consulted!

Lastly, there is every reason to take seriously the warning levelled by the 'Task Force' instituted to review the Flood Action Plan during the period of the interim government after the fall of the military regime. In its report, the Task Force specifically refers to FAP-20. Here it points to the "inherent weaknesses" of polder projects aimed at controlled flooding, "even after building of numerous control structures": silting up of inlets and outlets, waterlogging, changes in the dynamic water regime, etc. The Task Force explicitly questioned the idea of 'mitigating' the 'adverse effects' of major embankments through added projects for 'controlled flooding'.

The Dutch expert connected to the Flood Action Plan, van Ellen, claims that the plan "represents a realistic and balanced approach to a long-term solution to the flood-problem in Bangladesh." I have reviewed some of the major objections against the FAP: it presumes we understand the Bangladesh river system, whereas in fact the state of human knowledge about this highly complex river system is very limited up to date. The World Bank's expensive scheme is neither based on a careful review of the history of discussions regarding flood control in

Bangladesh, nor on a realistic assessment of the experiences gathered with the construction of embankments along the Brahmaputra and other rivers. Most objectionably, the FAP's implementation will have disastrous consequences for the environment; in particular if van Ellens' dream of 'flood prevention' becomes a reality, such will have tremendously damaging effects for Bangladesh's agriculture and fisheries.

Second, a sound management of water resources is key to the achievement of welfare for Bangladesh's population, and to initiate a process of flood mitigation a whole series of 'non-structural' measures may be considered, such as: flood warning, flood insurance, the use of flood-resistant rice-varieties, the planting of natural grasses, canes and trees, and perhaps, 'submergible embankments'. However, as *Le Monde Diplomatique* has correctly pointed out, for the majority of Bangladeshi peasants the annual floods are not the main headache. Instead, their primary source of anxiety is the economic exploitation by landlords and merchants they are subjected to: low market prices for their produce, sharecropping, usurious interest rates and the vastly unequal distribution of land property. Any flood mitigation programme must, therefore, necessarily be based upon the execution of thoroughgoing agrarian reforms.

Lastly, it may be noted that even van Ellen has raised the problem of the FAP's "sustainability". According to his calculation, the Bangladeshi national budget would be burdened with additional costs for maintenance, amounting to 0.9 billion US dollars. These costs, even if spread over two decades, would present the peasantry with an added tax burden, another disastrous prospect in a country where many millions are daily threatened with famine and starvation. In terms of both social justice and sheer effectiveness it makes much more sense to spend a fraction of the sum required for the execution of the Flood Action Plan on support to grass roots' organisations of peasant women and men, i.e. to organisations which have made the task of implementing thoroughgoing agrarian reforms their number one political priority. If organisations sympathising with the rights of landless peasants make a realistic assessment, Bangladesh need not for ever be prey to 'natural' disasters.

Combining Moral Commitment with Pragmatism

Ashok Mitra Commission on Education

Amrik Singh

Three things stand out about the report of the Education Commission appointed by the West Bengal government under the chairmanship of Ashok Mitra. First, except for professional education, the entire educational scene is surveyed and hardly anything worthwhile has been ignored or left out. Second, the report is not only an analysis of the problems, it is also "a feasible programme of educational goals and objectives for the short run as well as the longer time frame". Finally, while it is informed by a certain measure of moral commitment, what the report has to say is utterly free of dogma; it is nothing if not pragmatic.

I

WHEN in August 1991, the West Bengal government decided to have the educational scene surveyed, it was a positive step forward. Not many states take initiatives of this kind. It was equally gratifying that Ashok Mitra was asked to head this commission. Apart from being an academic of repute, he has also had quite some administrative experience as finance minister of that state. The report submitted in August 1992 amply justifies the confidence reposed in him.

Three things stand out in respect of this report. One, apart from professional education, the whole educational scene is surveyed. That is to say, not only are different levels of education (primary, secondary and university) surveyed, the report deals with the related issues of universal literacy, vocational education, autonomy and allied themes. Distance education, supply of textbooks, the role of the public media, the centre-state ties, the constraint of resources and a whole host of related issues are also analysed and discussed. In plain words, hardly anything worthwhile has been ignored or left out.

Secondly, the report is not only an analysis of the problems, it is also "a feasible programme of educational goals and objectives for the short run as well as the longer time frame". Thirdly, what the report has to say is utterly free of dogma or any kind of ideological compulsions. Most people who are familiar with the thinking and writings of Ashok Mitra would have expected some such mode of approach. On the contrary, his feet are firmly planted on

the ground. Whatever he has to say is not only pragmatic, it is also informed by a certain measure of moral commitment which only some one with his background and outlook alone could have had. To say anything more on his subject should not be necessary.

Though the commission consisted of nine persons, it appears that the main load was taken by Ashok Mitra himself. His personal stamp is to be seen throughout the report and it would not be too much to presume that, unlike most such reports, he has likely enough written a great deal of it himself.

The terms of reference as given to the commission need to be referred to; a good deal of the strength of the report flows from the tasks assigned to it and identified at the initial stage. The first task was to review developments since 1977 when the CPM government took over; this was to be done with specific reference to the trends of budgetary outlays and *inter se* allocations. The commission was also asked to review the existing system of evaluation and to appraise the relevance of existing rules and procedures. The framework of cost effectiveness was to be invariably taken into account. Apart from reviewing the kind and quality of the manner in which financial allocations were translated into actual physical achievements, the issues of motivation and incentives were also to be gone into. In plain words, the terms of reference were not only precise but were also oriented towards definite objectives.

In view of the heavy agenda of work, it was too much to expect that the task could

be completed in six months. It must be said to the credit of the commission that all that it asked for was an additional six months. It has now turned in a report which is not only a model by itself, but is perhaps the best document of its kind produced in recent decades. What is more, it can also be adapted by other states to suit their requirements.

There is nothing pompous or high-falutin or doctrinaire about the recommendations. Each one of them is pragmatic and is related to the evolving situation. In its own words, right at the beginning, it is stated, "The priorities the commission may decide to suggest for the proximate future will have to be in conformity with the aims so as to disturb, if not demolish altogether, the 'pecking order' of the existing social and economic arrangements".

II

Quite logically, the report begins with an overall review of work as initially projected in the election manifesto of the Left Front. The text is quoted right in the beginning. The subsequent pages delineate fairly clearly that, to quite an extent, the manifesto was implemented. For example, the proportion of the state budget allocated to education in 1976-77 was 12.89 per cent. By 1992, it had risen to 21.89 per cent. Though satisfactory otherwise, it is pointed out that, in terms of proportions, the allocation on primary education is short of what is allocated to secondary education. This is concretised by quoting the relevant figures. At the primary level, the shortfall was of Rs 84 crore in the non-Plan account. In terms of percentage, it was 40 per cent short of what ought to have been done. On secondary education, an additional sum of Rs 1.03 crore (more than the national norms) was spent.

What makes the situation less than satisfactory is that in the case of both primary and secondary education, as much as 95 per cent of the total outlay goes to pay the emoluments as against 80 per cent in respect of higher education. When it comes to the growth of student numbers, during these years the numbers went up by 81 per cent at the primary level, 17 per cent at the secondary level, 373 per cent at the higher secondary level and 60 per cent in respect of enrolment in colleges. Each one of the comparisons made puts the spotlight on the lags which still require to be made up. For instance, West Bengal was the fifth most literate state in 1981 and remained so even in 1991.

But perhaps the most serious lag is that free midday meals could not be ensured for all children. Nor a free school dress for each girl attending a primary school. This has a good deal to do with the lack of resources confronting the state. In one of the tables, for instance, it is stated that the per capita actual expenditure at the primary level is the highest in Kerala (82.7 per cent), the next highest in Gujarat and Maharashtra at 61.24 and 58.06 per cent respectively. In the case of West Bengal, it is only 34.4 per cent and this is not particularly different from what UP spends, i.e., 33.6 per cent.

Clearly, the administrative and financial structure of the state is in need of a drastic revamp; it is claiming a larger proportion of the budget than is good for the state. Unless that is done and, secondly, unless the income of the state grows as a whole, it would be difficult for West Bengal, despite a relatively more committed government than elsewhere, to find more funding for primary education.

A good deal else is said about some of the other issues; for instance about the lack of training in respect of three-fifths of the teachers and so on. Particular attention is invited to the absence of any scope or arrangement for the teaching of crafts "relevant to an essentially agrarian society".

To move from primary education to universal literacy is again logical. Here the commission is highly critical of the state government. Instead of taking initiative on its own, the state has leaned upon the financial support advanced by the union government and acted like a "demure camp-follower of the centre". Without mincing words, the commission observes that "the outlay called for is of an insignificant order in the context of the results achieved and achievable; millions are being rendered literate and prospects are being opened up of a consequential vast upsurge in productivity and production".

In addition, the commission goes on to make certain other specific recommendations. Perhaps the most important of them is the emphasis on post-literacy programme. What is suggested later by way of development of literacy is described here as an essential part of the programmes. Even if the state government has to bear the cost of supply of one newspaper for each reading centre, it would not come to more than Rs 2.5 crore per year. This is something which the state exchequer can easily bear.

Two other important recommendations may also be referred to. One, in addition to literacy, numeracy too deserves to be emphasised. This skill is important in the modern world. In this respect, the foundations should be made solid right from the beginning. Secondly, if the spread of lit-

eracy becomes effective, as it ought to, it would surely mean further expansion in the number of primary schools. As the commission puts it, "Neo-literates, in the afterglow of their induction into the process of learning, are likely to be eager that their children avail of the educational opportunities that are there."

III

Perhaps the strongest chapter in the report deals with the problems of secondary and higher secondary education. Quite a number of people are concerned about the problems of universal literacy and wax eloquent on the subject. When it comes to higher education, since most people writing on this issue come from that background, there is seldom a problem. Therefore, secondary education is generally neglected. But not in this report.

While conceding that the quantitative expansion since 1977 was 'unavoidable', the shift in emphasis in favour of education is a blow for equalisation of opportunities. That being so, the problem of ensuring quality in state-aided schools has become crucial. They are the ones for which the state is directly responsible. The number of private schools or English medium school is not all that large. Unless the state-aided schools improve in quality, the problem will continue to be real.

One thing that a survey of secondary schools (which the Commission got done) brought out clearly was that while 20 per cent of students said that the syllabus was heavy and they needed private help by way of coaching, etc., about 60 per cent said that if they had to score well, they had no option except to take recourse to private coaching. This survey has thrown up a number of other interesting findings also.

For instance, 25.21 per cent students said that teachers did not attend schools regularly, 28.87 per cent said that even when they were present, they did not take classes. Another significant finding is that 7.6 per cent of teachers thought that the reform of the examination system was a crucial requirement. As to interference in academic affairs, 54.8 per cent of parents and guardians said that it was there; 12.69 per cent said that not only was it there, it was gradually increasing. It is a valuable survey and those concerned with education in other states could organise something similar along these lines.

One question that always remains undecided in regard to secondary education is whether it is a terminal point in itself or a stage leading to higher education or both. After a good deal of discussion, the commission has re-endorsed the Kothari commission's concept of three simulta-

neous options for students—self employment, vocational training or pursuit of further general education. Which alternative is to be followed depends partly upon the students and partly upon the state of the economy.

A question gone into in some depth is the link between secondary and higher secondary education and the role of vocationalisation at this stage. Though the Bhabatosh Datta Committee had recommended the location of these classes in what used to be known as intermediate colleges, this commission is of the view that, given the circumstances, the most feasible arrangement would be to locate these classes in schools, more so when it has been advocated, strongly that there should be a major shift in the outlay on secondary education in favour of institutions located in the rural sector.

In regard to the periodic review of curriculum, not only has the commission discussed this issue in a meaningful manner, it has also (in an appendix) suggested a draft outline of the improved curriculum in respect of natural and life sciences. Any 'stiffening' of the curriculum at this stage would have to be properly phased out. That is why the commission has suggested that pass marks for an individual subject as well as the group pass marks should be raised, but only step by step.

There are important recommendations in regard to inspection of schools, infrastructural facilities, *Madrasah* education, the study of Sanskrit/Arabic at the school stage and several other crucial issues.

Closely related to this chapter is another one on technical and vocational education. While at the higher secondary level, not even 1 per cent of the students opt for a vocational course, less than 5 per cent of those who apply in the ITIs and less than 10 per cent in polytechnics get selected. When this is seen in the context of close to a million children dropping out each year from the school system in West Bengal, what has been happening is truly appalling. There is going to be no marked increase in the facilities in the near future; therefore, a large number of them would have to enter the informal sector of the economy where there are hardly any facilities for training.

As an immediate measure, what the commission has suggested is a ten-fold expansion of technical and vocational education; anything short of that would be totally inadequate. It is also suggested that industry, banks and financial institutions be involved closely in the expansion that is contemplated. Along with the chapter on secondary education, this chapter is not only detailed and factual, it has an air of authority about what is proposed.

IV

No other recommendation of this commission has aroused more controversy than the issue of the teaching of English at the school stage. It was in the early 80s that the state government discontinued the teaching of English in primary schools and suggested that it be undertaken from Class VI onwards. Those who were in favour of the *status quo* refused to accept the argument that West Bengal was about the very last state to conform to the pattern that was laid down by the Kothari commission. Tamil Nadu is the only other major state where English starts before Class V.

This issue is discussed in considerable detail partly also for the reason that in the final analysis two members of the commission dissented from the majority recommendation. In the course of this discussion, the commission has reviewed what the Kothari Commission had to say, the functional-communicative teaching approach adopted with the help of the British Council, the problems encountered at the ground level and so on. As a compromise, the commission has recommended the teaching of English in government and government-aided schools from Class V, proposed a different system of teaching and, above all, emphasised the retraining of something like 20,000 teachers in the craft of teaching English.

Apart from quoting the example of Bangladesh which has switched over to Bangla in a substantive way in the fields of administration and court work, the commission has made a forceful plea for doing that in West Bengal too. Whether everybody agrees with this recommendation or not, on the whole the commission has done an admirable job by staying close to the ground and at the same time trying to evolve a consensus.

This however is not the only recommendation made by the commission in this report. Most people in West Bengal, particularly left parties other than the CPM party in the government, have discussed the report as if this was the only recommendation made. Nothing could be more perverse or more self-defeating. There are crucial problems at the school level which require to be solved on an urgent basis. The commission has given considerable thought to each one of them. Apart from pleading for greater expansion, more particularly in the rural areas, strengthening and diversifying secondary education, the commission's view is that a ten-fold increase in respect of technical education is called for. This is something that ought to have received much more attention than

has happened so far. None however is so blind as the one who refuses to see!

In a sense the commission is on home ground when it deals with the college and university sector. Most members came from this background. In the second chapter itself the commission had described college teaching as "perhaps the greatest contemporary social tragedy". As the commission puts it, students prefer "to elongate the phase of supposed education because of the grim prospects awaiting them in the labour market".

This being the real context, the commission goes on to note that the number of colleges established since 1978 is 51. Out of them, 49 teach pass courses only, either in Arts or Commerce or in both. The commission recognises the fact that the "removal of the pass course is impracticable in the short run". In other words, the number of factors working in its favour are too many and too overwhelming. However the commission is in favour of what is called 'awareness courses' like public health, literacy, environmental studies, etc. While the introduction of the semester system is desirable from several points of view, it does not seem to be all that feasible. In its opinion, there is no alternative except to improve the performance of college teaching within the parameters laid down. And this brings us to the role of the teachers.

The most immediate problem is what the commission described as "the withering academic days is the academic system". It is a national problem no doubt. At the same time, it concerns education much more directly and centrally than otherwise. What the commission has asked for is that the "universities prescribe explicitly the minimum number of teaching days/class days as distinguished from normal working days". It also suggests a "drastic reduction in vacations and holidays" as also a number of other steps which have a direct bearing upon the issue.

This in turn leads to the question of social and academic accountability. The commission is most emphatic of the view that three types of assessment have to be introduced; one, what is known as self-assessment, preferably twice a year, two, assessment by the college principal in the form of an annual report and, three, student assessment of teachers. The promotion of teachers should depend upon the sum total of these three forms of assessment.

It should come as no surprise to any one that this particular proposal has been criticised by teachers' union and several others, as has a somewhat different pro-

posal at the secondary level—raising the pass marks in different subjects as also the aggregate marks in the final count. That proposal too has met with resistance. Over the years, a kind of syndrome has got built up whereby any insistence upon regular work or good performance—anything which demands hard work—is regarded as a form of academic oppression. These reactions are a testimony to that cast of mind.

Amongst the other issues dealt with are the menace of private tuitions, the need for training and re-training, the administrative ambience in which the colleges function, the need for "service conduct rules for all kinds of teachers, including college teachers", the revamping of college governing bodies where the teachers themselves "should not constitute a majority in its constitution", transfer of teachers from one institution to another and several such issues. In regard to each one of them, the approach adopted is forthright and in pursuit of excellence. In the commission's own words "It is by no means against the spirit of democracy to nurture and sustain centres of academic excellence."

As in the case of secondary students, a survey of college students and teachers was also undertaken. Though not as revealing, some of its findings are significant. For instance, 53.57 per cent students said that all teachers took classes regularly but 44.29 per cent said some teachers take classes regularly. How can both statements be correct at the same time? Regarding help extended to students by teachers outside classes, 47.49 per cent said that they do so readily and often, but 4.6 per cent used the expression "sometimes". However, 8.09 per cent of them said that they never do so because "teachers are not present in the college after class hours".

When it comes to university and post-graduate education, the commission presents what it calls an idealised picture of what a university ought to be. While doing so, the commission cannot overlook the fact that enrolment in a university is looked upon as a form of 'distinguished unemployment'. The majority of students go along with the deception since "the alternatives offered to them are, they judge, much worse". The next comment is more devastating:

The country's authorities too have done their cost-benefit analysis; if a genre of social turbulence can be kept confined for an extra number of years within the four walls of a so-called university, a considerable saving of resources would take place at the other end: the creation of employment is (a) relatively a great deal more capital intensive.

Talking in this vein, the commission goes on to describe the working of the university of Calcutta and its 'gargantuan

operation' as also its 'lugubrious' working. No wonder quite a number of more talented students migrate abroad and settle down there. Considering the difficulties of any kind of change, the universities have no choice except to do two things; one is to improve the quality of teaching and research to some extent and the second is to learn to live with the financial constraints which appear to be inescapable.

Any other set of people would have tried to drag their feet but not a commission headed by Ashok Mitra. Without mincing words, the commission says that there is no choice except to relieve universities of the burden of undergraduate examinations. A State Level Council for Undergraduate Education will have to be set up for that purpose and the commission goes into details of how to make that body functional. While emphasising excellence, the commission also observes in passing that tenure in an academic position should be given "only at the end of five years of continuous employment".

As things stand, none of these recommendations can endear the recommendations of this commission to the teaching community in West Bengal or, for that matter, in the rest of the country. For a couple of decades, things have been getting coarser and coarser in every sense of the word. Funds have been relatively easy to get and there was a mood of expectancy and optimism. But funds are now getting tight and the universities in that state, and also those in other states, are faced with a real financial crunch. If in this whole cycle of financial squeeze, the teachers are asked to work harder and perform better, resistance to such an approach is more or less inevitable. Operating in a soft society as we do, many of these things are not so likely to get done in the near future. What the commission has shown is the direction in which we ought to be moving.

Disgusted with the working of the universities, the commission has even gone to the extent of suggesting that engineering and medical institutions should be detached from the universities and given an autonomous status. While it would certainly do good to these institutions, the universities are likely to deteriorate further unless, of course, the responsibility of undergraduate education is taken away from them.

VI

University autonomy is one of the buzz words current in political discourse in our country. As public life has become more and more coarse and political interference has increased, naturally people have felt concerned about the growing encroach-

ment of university space both by politicians and bureaucrats.

Most of this opposition has come from the academics and some part of it from other sources, notably the press. Quite a few outrageous things have been done in different states. The centre has been relatively free from this pestilence though it cannot be said that it is altogether blameless. One favourable factor has been the existence of professional bodies like the UGC. Central institutions have therefore by and large remained safe from political encroachment of interference in academic matters.

The interesting thing here is that the attack on university autonomy and the rise of trade unionism amongst teachers have been two parallel but concurrent phenomena. Beginnings somewhat tentatively, trade unionism amongst college and university teachers became a powerful movement in the 70s. Hardly any state conceded the 1973 scales of pay without an agitation. In almost each state, the teachers got their due only after they had gone on strike and done several other things which need not have been done. In consequence, the teachers became strongly unionised.

In this background, a curious phenomenon began to develop. Most trade unions of teachers posed the issue in such a way that the plea for autonomy became some kind of a shield to protect their sectional interests. Nobody spoke out when there was underperformance or even a certain degree of delinquency. Those weaknesses were glossed over. But if there was any misbehaviour by a politician or someone in authority, it was strongly resisted. It was in this context that the West Bengal Commission was appointed.

In its discussion of autonomy and allied issues, the commission has stayed close to the ground, held firm to the gains made during recent decades and, at the same time, not condoned under performance or non-performance. Were the teachers' movement to also adopt the same line of approach, it would do an immense amount of good both to the teachers' movement and the academic ethos of the country.

The commission has noted that the state government's budget in West Bengal has expanded nearly eight times since 1977. It has also noted that salaries of teachers are being paid directly from the state treasury, the selection of teachers is regulated through a College Service Commission specifically appointed for the purpose and, in various other ways, there has been democratisation as well as some devolution of functioning.

At the same time it has been brought out forcefully that the objective of excellence is not to be equated with any attempt to

encourage privilege. To quote its own words, "The demand for excellence must not be used as surrogate for a kind of snobbery such as is exemplified by the 'navodaya' scheme." Nor is the commission in favour of permitting the country's educational process to degenerate into "a two-class culture with the special privilege on one side of the fence and those denied the privilege on the other". In other words there has to be "a framework of priorities in the education sphere".

The commission is very emphatic on the need for toning up the administration and academic functioning of schools and colleges. It is equally critical of frequent holidays and vacations and, as already stated, favours a minimum of 220 working days. If this is to be ensured, the length of both the summer vacation and autumn recess would have to be cut down. Similarly taking one day off in the week is opposed and college teachers are asked to exercise restraint in this matter. This would incidentally, according to the commission, discourage the growing menace of private tuitions.

After having surveyed the whole scene the commission more or less concludes as under:

The government despite offering the funds must keep its distance. It is however implicit here that academic discipline has to be scrupulously maintained at all levels. In a democratic milieu, teachers as well as senior students as also non-teaching employees have the right to organise themselves and campaign for improvements in the conditions of their work and employment, as the case may be. An educational institution is not a factory establishment, agitations must not be at the cost of instruction time.

This statement strikes the right balance, if one may add.

VII

The Ashok Mitra Commission is alive to all those factors that impinge upon the working of educational institutions. Regular payment of salaries, etc, is one ingredient of good functioning but others are no less important. In several chapters dealing with the selection and training of teachers, examination reform, distance education, libraries, supply of textbooks, English medium institutions, cram shops and help books, the commission deals with a whole range of problems that usually get overlooked. In each one of its recommendations, the commission never loses sight of what is actually happening and what factors, positive as well as negative, predispose things in a certain direction.

If the educational sector is to expand, as is unavoidable, how teachers are regarded

is a crucial question. In view of the "generally satisfactory remunerations" now received by the primary school teachers, the commission is inclined to suggest that the minimum qualifications for a new entrant should be a graduate degree. This cannot be done overnight; however, the objective should be kept in mind.

When it comes to training, the commission is in favour of treating the district as a unit. The number of people involved per district is likely to be in the neighbourhood of 8,000. That being so, any unit other than a district would create problems. What is more, the commission suggests that it should be obligatory for a teacher to undergo a refresher course of a month's duration at the end of every five years. Since quite a number of them engage in other jobs, this should be explicitly forbidden and rules framed accordingly.

If the experience of the College Service Commission is any guide, something similar would have to be done at the lower level. Here again, the unit would have to be the district. Even the number of teachers to be recruited in secondary schools per district is likely to be more than a thousand per year. Such an arrangement would also take care of the problem of employment exchanges sending up names which have been on the register for a long time. Even if they are not suitable, they come up for consideration in preference to others who may be more suitable. There have been certain problems in the working of the College Service Commission. Those are referred to and a caution is given against those being repeated in the new proposed set-up.

This issue of the training of teachers is gone into with a wealth of details. It is said that the most alarming deficiency in this regard is that the existing arrangements for teacher training are "almost irremediably dated". Further, "If anything, that turns our teachers into *status quo*ists". Similarly, a good deal is said about the Diploma in English Language Teaching where too things need to be drastically streamlined.

Talking of the evaluation system, the first thing that the commission says is that the "accuracy of evaluation, there is no question, depends largely on the sincerity of teachers". In the sample survey of colleges sponsored by the commission, it has been pinpointed that 'erratic marking' is the most important deficiency in the present evaluation system. Connected with it is the pattern of paper setting. In order to change the pattern, however the pattern of teaching too would have to change.

In the case of the Secondary School Board, the commission suggests the establishment of a large number of zonal

offices so that most decisions can be taken at the local level rather than at the central level; the latter should concern itself mainly with paper setting and the scheduling of the examination time-table, etc. When the system is extended to the university scene, the same approach can be adopted. But till such time as an undergraduate council can be established, the details cannot be gone into. The issue is discussed in further detail and a number of improvements are suggested, but no conclusive recommendation is made because, unless a decision in regard to such a council can be arrived at, everything would remain fluid.

Distance education is one of the growing areas and the commission supports it. But the commission does not go far enough so as to suggest the establishment of an open university in the state. Instead, it is in favour of making greater use of the over 100 'study centres' established by the IGNOU in that state. One wishes that the commission had been less tentative and more forthright in this regard. This is for the reason that it is mainly in eastern India that distance education is lagging behind. In northern and southern India, a large number of students are enrolled in this stream of education, and with profit.

Perhaps a much more valuable contribution has been made by the commission in regard to the importance attached to the organisation of libraries. The Kothari Commission had said that school children should be integrated in the system of public libraries. Such a system has not yet got going anywhere in our country except perhaps in Kerala. Some progress has certainly been made in West Bengal but not to the extent as to become a regular fixture in the social and educational scene. According to the commission, the focus should be on the establishment of a central library at the block level which may give support to school libraries as well as to reading rooms intended for neo-literates.

Similarly, the commission has projected the idea that the physical facilities available for school and college libraries should be gradually improved. Going further, it says that each school or college should have a trained librarian with the same scale of pay and allowances as are available to teachers. Perhaps this is for first time that any commission has advocated the appointment of a trained and full time librarian even in a school library.

The supply of textbooks to children and related problems are gone into in a detailed manner. In a tentative sort of way, the idea of the state textbook corporation has also been mooted more or less on the Maharashtra model. Unfortunately, since the report was submitted, the Maharashtra

model has been found guilty of corrupt practices and it would be quite a problem to devise a suitable structure to attain it. It is recognised that the public sector mentality is a factor to be reckoned with. At the same time, something has to be done to improve the system of the availability of textbooks. In any case it may not be a bad idea, as suggested, to get such a body registered under the Societies Registration Act as also the Public Trust Act.

The spread of what the commission calls "a business cult institution with an eye on unconscionable profit-making" is also taken note of. This is said with reference to the widespread phenomenon of private tuitions. In regard to the former, it is said that "the commission, lest it be misunderstood, would like to reiterate that as long as instruction through the medium of English does not offend against our cultural identity and does not interfere with the state government's general programmes of introducing the mother tongue as the principal medium of instruction at primary and secondary levels, one need not pick up a quarrel with it".

As to the latter, the commission feels that the most helpful way of controlling the menace of private tuitions would be, one, to ensure that teachers perform better in the classroom and, secondly, "effective social mobilisation". There is also a role for legislation. It should be specifically laid down in the terms and conditions of service of teachers that private tuitions would not be permitted.

In order to improve the functioning of educational institutions, the commission affirms that "Strict enforcement of attendance on the part of teachers and monitoring the nature of contents of teaching in institutions at all levels" is essential. The example of the Indian Statistical Institute is quoted where every member of the academic staff, including the director, records the time of his arrival and departure. There is nothing *infra dig* about such a proposal and it needs to be implemented.

Once academic standards in the aided institutions improve, the state government would have the bulk of the community rallying behind it. It would then be in a position to go down heavily on educational profiteers and academic delinquents.

VIII

It is a measure of the clear-sightedness of the commission's thinking that a chapter is devoted to the role of the public media. The reason is simple. The media has penetrated social life to such an extent that, as the commission puts it, the whole society has been shaken to its roots and the educational sources can hardly be "iso-

lated from the influences set in motion".

One major consequence of this development is the shrinking opportunities for an understanding of "the structure of language or the mysteries of grammar". Widespread popularity of 'comics' has affected the faculty of concentration of the young people. Above all, "the hinterland of the child's mind is thus in danger of being laid to waste. It is no longer even a *tabula rasa*; it is already either full of junk or responsive only to trivialities".

Privatisation of the media is, even in the best of circumstances, a partial answer to the problem. The media has to be used for educational objectives. But how precisely this has to be done is something that has divided people in almost every country. It is a challenge to Indian thinkers and policy-makers to devise a new strategy in this regard.

How can this be done unless the constitutional problem is sorted out? At the moment, it is the centre which has the prerogative to use the air. If it chooses to permit the states to have their own channels, that would be an act of favour. This issue has therefore to be sorted out before any state can even think of moving in the matter. Is it not ironical that even a country with barely 1,00,000 people, being a member of the United Nations, has the prerogative to control its own media but in India, even a state with more than a hundred million people, does not have the same right?

Issues in regard to the education of the handicapped children, those belonging to the scheduled castes and tribes, women's education, hostel facilities, the near-chaotic state in respect of the distribution of certificates to students who pass out and so on, salary and pension payments, retirement benefits of teachers, administrative set up, role of the judicial system and a host of other problems are taken up for an intensive and understanding discussion. Each one of the schemes is handled with understanding and sureness of touch which is not to be found in most of the made-to-order committees and commissions appointed to investigate the problems of education.

IX

In keeping with this general criticism of the centre appropriating more and more powers for itself, the commission is equally critical of what the centre has been doing. The Constitution as adopted in 1949 was to a large extent a replica and elaboration of the Government of India Act of 1935 but this bias against the states received a further fillip in 1974 in the 42nd Amendment whereby education was made a con-

current subject.

posed to this overcentralisation and berates the centre for not having been able to perform better despite all the powers at its disposal. Whether it is the language policy or the *navodaya* schools, it is the same story of confusion of objectives and downright non-performance.

There is an attempt to force things down the throat of the states. According to the commission, this is no way of building national integration. More specifically, the commission observes that a "state has the right; at least up to the undergraduate stage, to decide on the curriculum, the medium of instruction and the methodology of teaching in the area falling within the administrative jurisdiction of the state. Not to respect this convention would be to activate forces which work not for national unification but for national disintegration".

In this connection, the commission draws attention to the way Bangladesh was sought to be lorded over by the rest of Pakistan and the subsequent separation of the two. Similarly, the experience of the Soviet Union in not treating the non-Russian nationals properly is also brought in.

In dealing with the issue of constraint of resources, the commission does not pull its punches. Apart from criticising the centre for spending excessively on defence and internal security and indulging in various other extravagances, the commission is realistic enough to acknowledge that even while asking for greater release of funds, the states would have to make do with whatever is available. Funds at the state level are scarce and the coat would have to be cut according to the cloth available. In this connection the commission makes certain recommendations, with particular reference to West Bengal.

The first one is to levy an educational cess both in urban and non-urban areas. It is estimated that something like Rs 100 crore can be raised from this source. Secondly, while it is not possible to raise fees all along the line, some marginal increase can be brought about. The commission recommends Rs 50 per month at the undergraduate level and Rs 75 at the postgraduate level. Considering that it is currently around Rs 15, the proposal does mark an advance over the existing situation. When it comes to engineering and medical courses, the tuition fee recommended is Rs 250 per month. All this is expected to bring an additional Rs 20 crore per year.

It is curious that more attention has not been bestowed on this problem. Unless some kind of a differential fee system is adopted, the disadvantaged students would always be obliged to pay more than they

can afford and the affluent ones would not be asked to pay as much as they are capable of paying. Furthermore, postgraduate education and, to some extent, professional education in almost all cases, should be more or less self-sufficient. Research would certainly have to be supported but not necessarily instruction at that level.

If the instructional part is to be made self-sufficient, the fees would have to be higher. Since everybody would not be able to pay higher fees, a system of grants and loans is unavoidable. This issue is not even gone into. Was it fatigue towards the end of the report or was it some other compulsion? Or was it recognition of the fact that this is all that can be done in the circumstances? Whatever it be, this particular section of the report gives the impression of not having grappled with the problem closely or constructively enough and is, perhaps, the weakest in the report.

Grants and loans inevitably raise the question of the general climate of not returning the loans. The existing situation is downright unsatisfactory. But surely one cannot live with the existing system indefinitely. One of these days, it would have to be changed. To change it in other spheres of activity is beset with problems. Problems would be there even in the case of education but then the number of claimants involved would be so large that a certain amount of intelligent planning and some degree of patience and persistence can help to evolve a system whereby, for the most part, loans are repaid. Such a system can be enabled to perform. There is a great deal more to say on the subject but it should not be necessary to do so at this stage.

The report concludes with a chapter on goals and responsibilities and begins as follows:

It is almost axiomatic that the social milieu exercises a major influence on the educational environment. But the obverse of the statement is equally true; educational reforms are indisputably key instrument for effecting changes in society. It is thus a two-way relationship.

The commission then goes on to discuss issues like education and integrity. As things have evolved during the last few years, this has become virtually the central problem in education. Let the commission speak for itself:

If to cut corners is the increasing practice among the leaders of society, students and teachers cannot don the mantle of heroic deviants. The education process can scarcely be reduced to a phenomenon subject to the surveillance of the forces of law and order. Only social pressure can stop undesirable

quences for the education system. Neither legislation nor hortatory urgings on the part of the government would be of much help here.

Some people might regard such a view as a form of defeatism but the commission believes that this is an acknowledgement of the realities of contemporary existence. Having said this, it is affirmed, that maintaining the integrity of the education system is an obligation of each and all. No one can say or pretend that he is not concerned. In other words, the entire community has to be involved. That there are class forces at work is not in question and, yet, every one gets affected by the moral deterioration in the educational field and so regardless of class divisions and interests an attempt has to be made to maintain a certain minimum level of integrity. It needs to be added here that:

Even political reforms hinge upon reforms in the educational structure. If through some stratagem, a climate of morality were to be re-established in the sphere of education, it could trigger a chain of consequences which are most unlikely to leave the rest of the society unaffected.

No one working in education can or should adopt the position that since things are rotten elsewhere, they cannot but be rotten in education also. How is this objective to be achieved? Two contributory factors are brought out. One is the emphasis on merit. As the commission puts it, Merit must receive its just reward. It would be idle to pretend that lapses have not occurred, especially concerning this matter, during these one-and-a-half decades. The pursuit of quantitative achievement has sometimes been at the cost of quality. There has been also much avoidable waste and misdirection of energy as well as of resources.

This point is further elaborated by insisting that "recruitment of teachers at all levels...be fair, and exclusively determined by considerations of merit". "The concept of fairplay must also permeate the mode of appointment in all its aspects." The second leg of this argument is best given in the commission's own words:

The government will have to be scrupulous and, at the same time, ruthless, in enforcing rules and procedures so as to safeguard fairplay. If the authorities themselves set and demonstrate standards of excellence and probity, that would contribute immeasurably towards strengthening the campaign against deviation from ethics on the part of sections of teachers and students, as well as, for instance, governing bodies of private and aided institutions.

Towards the end, two important points are reiterated. One is addressed to the government. Over the next five years, the proportion of overall financial education

to 75 per cent in the case of school education and 55 per cent in the case of higher education so that the rest of the outlay could contribute directly towards improving basic facilities. In terms of the total outlay, much more is being spent on salaries than is conducive for the right kind of education. This proportion must be set right.

The second point made by the commission is that while a good deal will depend upon developments in the Indian polity and national growth, "the principal, if not the only educational objective" during the next five years must be a campaign in favour of total literacy.

Unless that objective can be achieved, the right kind of growth would never take place. The commission concludes by saying, "At least for West Bengal, the educational priorities are thus unambiguously defined. The community has to be mobilised in defence of these priorities. That should be the agenda for the remainder of the century."

Two comments might be made in regard to the foregoing. This report is perhaps the first authoritative document which recognises that a key problem in the running of educational institutions is to rid them of corruption that has penetrated them. Not many people recognise this to be perhaps the most urgent problem, but Ashok Mitra's commission does so and it is to be applauded not only for its moral sensitivity but also for having the right order of priorities.

Secondly, more than anything else, it is the role and productivity of teachers at all levels which has been put under the spotlight. It is only when teachers begin to perform better that productivity would increase and quality will become a feasible objective. If there is any dereliction of duty on the part of teachers, says the commission, the "status and supporting rules could also, we have suggested, pro-

from imposition of penalty, erring teachers should be exposed and widest publicity be given to the details of their violation of the code of conduct."

That this report has not been very well received by teachers does not have to be specified. Over the years, they have got so accustomed to an atmosphere of laxity and permissiveness that hardly any one stops to question them either in regard to what they are doing or not doing. Most often, union pressures are used only in one exclusive direction; to oppose victimisation which all these years has been a marked feature of the educational scene, and has not disappeared altogether. But what about the victimisation of students, and the society as a whole? Hardly anybody views the issue in this manner. For reasons which are not difficult to understand therefore, the performance of educational institutions has been declining. This commission has unhesitatingly put its finger on one of the key spots and made out a strong case for ensuring accountability.

The general tendency is to blame the government for everything and for the authorities to "heap the blame for imperfections and blemishes in the framework of education, either on the disinterested community at large or at the colonial heritage". This is wrong. In this connection, a telling comment is made, "each section of society has to be persuaded to take a look at the mirror and ask what its contribution could be to improve the milieu"

[Once a report has been submitted, it is no longer a private document. Why should it be difficult to obtain its copies then? It took the author a couple of letters and two telephone calls to procure a copy. It is for the West Bengal government to ensure that whoever wants a copy should be able to get it. Why must an enlightening document be kept under the wraps?]

Imperial Nostalgia

Vinay Lal

The Raj: India and the British 1600-1947, general editor C A Bayly; National Portrait Gallery Publications, London, 1990; (Illustrated), pp 432, \$ 60.

FOR nearly five months, between October 1990 and March 1991, the National Portrait Gallery in London was the site of an enormous exhibition on the raj. Indeed, the largest exhibition ever staged at this gallery, 'The Raj: India and the British 1600-1947', was accompanied by an equally large and rather unwieldy catalogue bearing the same title. The task of general editor was, not surprisingly, entrusted to C A Bayly, who some years ago acquired a reputation as a historian of late colonial India, and has in recent years ventured not merely into the earlier history of British rule in India, but into the larger realm of British imperial history in general. Bayly's monographs on modern Indian history sought to introduce subtle but nonetheless transparent variations on the crudely wrought theme of Indian nationalism as 'animal politics' for which he and his colleagues at Cambridge (now scattered in numerous places) became known. Although *The Raj* incorporates the contributions of numerous scholars, and in particular arresting essays by Rajnarayan Chandavarkar, John Falconer, and Christopher Pinney, it is largely the work of Bayly, and of a piece with those works which carry the imprint of his name.

Bayly's volume is divided into four sections: each section is prefaced by one or more essays, followed in turn by dozens of exhibits. The references are, in many cases, quite invaluable, and every student of Indian history, whether a novice or an accomplished scholar, will find some tidbit or the other that amuses or instructs. *The Raj* has several hundred illustrations, many in resplendent colour. In short, no effort appears to have been spared to make the volume as attractive as possible, and this is what makes it all the more insidious. As the text does not leap from the pages, it is all the more easily used to reinforce a certain way of writing modern Indian history that should have been buried long ago.

The foreword by John Hayes, director of the National Portrait Gallery, sets the tone for the entire volume. "East is east and west is west", asserts Hayes, and for good measure adds that "this familiar adage has a distinct measure of truth to it" [p 9]. He points out that the exhibition explores a 'noble theme', which he identifies as "the long relationship between the peoples of one of the great ancient civilisations of the east, largely Hindu but part Muslim, and

the representatives of a vigorous western trading nation" which developed "one of the most remarkable administrations—efficient and evangelising—since the heyday of the Roman Empire". What makes this relationship 'noble', and for whom was a relationship that was wholly inequalitarian, built on invidious not to mention oppressive race distinctions, 'noble'? Is it 'noble' because there is, as the whiff of longing for the raj amply demonstrates, an air of 'romance' about this 'relationship', the romance of buccaneers, swash-buckling heroes, pigsticking sportsmen, and empire-builders? As if the essentialism between the 'east and the west' were not enough, the 'ancient civilisation' of India is at once grounded in religion, 'largely Hindu but part Muslim', religion being the very essence of India in orientalist and indological discourse. The 'trading nation', England, was indeed 'vigorous' in the pursuit of empire, and rather modern in its techniques of governance, but the resonance 'vigorous' acquires here comes from the contrast with an 'ancient' civilisation that, to make the implication explicit, was construed as 'effeminate'. Having characterised this rule as an 'administration', thereby endowing it with the sanctity of a governmental apparatus that seeks only to 'improve' the life of a dejected people suffering from the weariness of inertia, Hayes leaves it to the historians to show how 'remarkable' was the British epoch of Indian history.

Bayly's own 'Preface' is scarcely more satisfying: 'resistance' and 'co-operation' emerge [p 11], as they have in many other histories, as the twin themes of British dominion in India, although we have to ask what kind of 'co-operation' and 'resistance'. The history of modern India used to be written as the history of 'collaboration': the only kind of 'resistance' that was acknowledged was the 'resistance' of 'elites', and as this was shown to be yet another form of 'collaboration', 'resistance' was made into an impotent idea. After the interventions of recent years, embodied principally (though by no means exclusively) in the writings of the 'Subaltern' historians, 'resistance' has become less easier to ignore. Indians appear now as 'subjects', endowed with, if we may put it this way, a self-fashioning 'agency'. Bayly's 'noble' contribution here is to affirm the place of 'agency', so that Indians, instead of simply being acted upon,

become willing partakers in their own oppression. "What no one now disputes", writes Bayly, "is the extent to which the nature of British dominion was shaped by Indians as much as by British people, and as much by their co-operation as by their resistance" [p 11]. One would imagine from this that 'co-operation', or what is otherwise, and more frequently, called 'collaboration' had never previously been the leitmotif of historiography on colonial India!

The catalogue, as Bayly goes on to point out, tells a story, a story that he attempts to capture in this pronouncement: "The East India Company suppressed open warfare, unified the subcontinent and introduced a new legal system" [p 11]. Since no one doubts that the suppression of 'open warfare' is a good thing, and since the other accomplishments stand in opposition to it, one must suppose that the unification of the subcontinent and the introduction of a 'new legal system' were likewise commendable achievements. These claims are not really subjected to analysis, merely rehearsed and reiterated, so that again we read [p 130]: "The open warfare of the 18th century was suppressed and new courts of justice were established". P J Marshall, however, in his essay in this volume on the British presence in India until the death of Tipu Sultan in 1799, admits that "it now seems difficult to portray 18th century India in general as a land plagued by disorders so serious that they brought about a marked deterioration in economic conditions and thus compelled Europeans to intervene in order to maintain their trade" [p 20]. It is Marshall's argument that Bayly must reject, if British rule is not to appear as, to use his own word, altogether 'superficial'. If the 'conquerors' did not achieve much more than the suppression of 'open warfare', and the establishment of 'new courts of justice', it is because they were "dependent on Indian clerks and subordinate officials, and beholden to Indian landholders or peasant leaders" [p 130], whose sole ambition appears to have been to thwart the British from bringing to glorious fruition their numerous designs for the moral, social, economic, and political 'improvement' of the Indian people. The 'defective tools' that the British worked with in India were, on Bayly's account, largely Indians themselves [p 130]. Likewise, the 'cultural arrogance' of the Mughals is said to have contributed to the 'long-term failure of the [Mughal] empire' [p 47], but there is not the slightest recognition that the cultural and moral arrogance of the British, which was certainly not any less than that of the Mughals, played its part in the demise of the raj.

British imperialism in India emerges, in Bayly's narrative, as a reluctant imperialism. We return, in *The Raj*, to the earliest

formulations of the 'Cambridge school', as adumbrated in the writings of John Gallagher and Ronald Robinson. The "politics of Indian states were the prime cause for the expansion of the British empire" in the 1750s and 1760s [pp 91-92], and the "true reasons for British expansion", says Bayly of the last quarter of the 18th century, "lay once again in the subcontinent itself" [p 152]. We are to believe that had not their access to trade routes been threatened, and had not Indian rulers sought British intervention to resolve disputes amongst themselves, the British would never have thought of acquiring an empire. However, once, willy-nilly, this empire came into their grasp, they found they could do a whole lot of good. The cries of starved children, the wail of the widow, and numerous bloodcurdling practices of religious 'fanatics' pointed to the need to eradicate such problems as famine, sati, hook-swinging, and 'communalism'. British artists tried to capture the 'exotic' element in Indian customs, as for instance in Johann Zoffany's large painting of the 'Sacrifice of an Hindoo Widow upon the Funeral Pile of Her Husband', but more exotic still is the representation of these 'subjects' in Bayly's volume. Thus, on pages 222-223 of *The Raj*, we have images, all jumbled together in a jolly good show, of an ascetic smoking a hookah, another sannyasi looking rather gruesome, an idealised sati, and spectators observing hook-swinging. These pages are not exceptional, but merely more indicative of the conception that governs the entire volume, which aims to introduce us to the breathless panorama of Indian life under British rule.

By means of legislation the British could perhaps hope to deal with sati, but what of famine? Bayly admits that the policies of the East India Company contributed to the famine of 1769-70 'indirectly', but what is meant by this is unclear, for revenue demands were not lowered during the famine [pp 105, 113]. He notes that the extensive canal systems did not greatly reduce the impact of famines in the early 19th century, but apparently by the early 20th century famine had abated, with "the exception of the terrible man-made Bengal famine of 1943" [pp 198, 200]. Just how 'exceptional' this famine was can be gauged by the terrible statistic that jumps out from the annals of history: three million dead. The famine was indeed 'man-made', but far from going into the question the responsibility of British administrators for this catastrophe, Bayly merely adduces 'poor transport' as the cause of the famine [p 338]. That such a famine could take place, after over a hundred years of supposed experience with management of famines, presents a terrible indictment of British administration, but no occurrence of this sort can be allowed to rupture the picture of the 'noble rela-

tionship' that Bayly and the organisers of the exhibition were determined to present. Anyhow, what could the loss of three million lives truly mean in a country where people have since time immemorial died like flies? Lest this seem like an exaggerated rejoinder, it is useful to note how Bayly represents, again in the most fleeting fashion, the toll of life, and the exchange of populations, in the wake of the partition of India. "Estimates of those killed", writes Bayly, "range from 2,00,000 to half a million and at least 10 million refugees fled", but previously we had been told that "over a million people were killed and tens of millions driven from their homes as new national boundaries were fixed" [pp 415, 413]. From 2,00,000 to half a million, and from a million to tens of millions: these leaps appear to make no difference. Western scholarship on India has rarely been held to those standards that we have come to expect in the study of European history.

As must now be obvious, *The Raj* is a saccharine history of India. Almost nothing is allowed to disturb the placid waters of the well of orthodox wisdom. The few unpleasanties in this account of a 350-year old relationship have less of a bearing upon British relations with Indians than they do upon how Indians interacted with each other. "Many of the fiercest conflicts of the 18th century", writes Bayly, "were between Indian and Indian rather than between Indians and Europeans" [p 88], and this argument is extended for the 19th and 20th centuries as well, as Bayly's allusions to 'communalism' amply demonstrate. Although 'communalism' is a hotly contested subject, Bayly has no qualms in etching it unproblematically into the history of India. It is not quite *kosher*, especially for a historian with Bayly's formidable reputation, to bluntly characterise Indians as essentially communal-minded, but he cannot quite hide his predilection for this kind of argument. The strategy adopted is to affirm that 'communalism' had a pre-history in India before the consolidation of British rule, and then to put this history in doubt, so that he can then also appear as a disinterested and 'objective' historian. Thus, on page 226, we are told that the celebration of religious festivals in the early nineteenth century often led to religious altercations, but on the following page *Urs* ceremonies are said to provide an "object lesson in the close interpenetration of the themes and practices of popular Hinduism and Islam in India in the 19th century". "Most of India's people lived in peace, if not always in harmony", and at least in the early period of Mughal sovereignty, "it is difficult to separate specifically Hindu and Muslim traditions". But no sooner is this admitted than Bayly goes on to a discussion of how Aurangzeb, by alienating "leading Hindus with his more rigid and Islamic court", created the condi-

tions for the dissolution of the Mughal empire [pp 49-50]. How, if 'Hindu' and 'Muslim' patterns of living were so closely enmeshed, could such supposed bigotry so easily find an operative space? What did 'Muslims' have to say about Aurangzeb's animosity towards 'Hindus'? What did it mean to be a 'Hindu' or a 'Muslim'?

The pertinent question, as Foucault has reminded us, is not only one of whether certain discourses are 'true' or 'false', but of the effects of such discourses. Aurangzeb may indeed have been an Islamic zealot, and perhaps there is a pre-history of 'communalism' in India to which we must admit, but what discourses are we to construct around these 'facts', and what shall be the place of these discourses in our histories? The 'Subaltern' historians have asked, for instance, what kind of place the discourse of 'communalism' occupies in the colonial sociology of knowledge, but it is precisely this question that Bayly's volume seeks to evade. There is a section on the 'British Understanding of India', but there is little sense here of the systematisation of knowledge under British rule, or of how the conquest of knowledge became an imperative of the state. Bayly appears to be less attuned to the politics of knowledge than the Englishman, quoted by John Falconer in his essay on "Photography in 19th century India", who in 1863 pronounced that "the calotype, the curious tripod...taught the natives of this country that their conquerors were the inventors of other instruments beside the formidable guns of their artillery, which, though as suspicious perhaps in appearance, attained their object with less noise and smoke" [p 264]. Christopher Pinney, in his essay on colonial anthropology, likewise shows a keen awareness of how science became the handmaiden to colonial administration. But in general 'political' readings are avoided by the contributors to Bayly's volume, and indeed someone like G H R Tillotson, in his essay on British landscape paintings of India, even passes strictures against 'political' readings, for the 'preferences' of British artists for the picturesque were, in his view, "inspired primarily by an aesthetic habit" [p 151]. There is, of course, a politics to the alleged lack of validity of 'political' readings.

The Raj belongs, in its own way, with that stream of works from the 17th century onwards which saw India as a land of exoticism. Fakirs and famine-struck bodies do not give a rounded picture of 'exotic India', and indeed what would 'exotic India' be without the bejewelled, effeminate, and obese princes whom the British first reviled and were later to cultivate as India's 'natural' aristocracy? These princes play more than their part in Bayly's volume; they inform the entire history, and not insignificantly the only full-page or otherwise large portraits of Indians in *The*

Raj are of princes. (The front cover itself reproduces a portrait of maharaja Dalip Singh in magnificent colour.) Countless times before the history of British India has been reduced to a history of few 'great men', and this rather impoverished approach dominates *The Raj*. Even in this respect, the selection is partial, for we hear a great deal more about Hastings, Clive, Tipu Sultan, Ranjit Singh, and other Indian princes than we do about the later Indian nationalists in the 20th century. The foreword by Haynes had promised that the exhibition (and catalogue) would endeavour "to see the British

from the Indian point of view" (p 8). Not only is this promise not kept, but the very opposite transpires: Indians are for the most part written out of history. *The Raj* is like the architectural photography in the 1860s of David Lyon, of whom Bayly says that "he stationed Indian employees out of sight but holding reflectors, in order to light the long corridors found in some southern Indian temples" (p 272; emphasis added). That is all that Indians are really good for in Bayly's volume: for holding the lights which would illuminate the greatness of the raj.

into ruin. The salient trait of doublespeak is the ability to lie, consciously or unconsciously, and to get away with it; it involves the grand scale technology of the superlie, and the masterly capacity to choose and select facts that meets the political imperatives of imperialism.

Doublespeak requires more complex tools of communications, in contrast to the older forms of imperialism that found no compulsion to dress their naked acts of genocide in the garb of 'human rights'. Here the exquisite candour of Lord Beaverbrook, the vaunted baron of Fleet Street's tabloid yellow press, is irrelevant, who once quipped: "I buy and own newspapers to make propaganda for the causes I champion." In Beaverbrook's stance it was superfluous to rationalise the genocide of British imperialism by calling it humanism. This is one of the marked qualitative changes between the old and new corporate media control. There is no imperative for such justification by the hustlers of doublespeak today as they have arrogated unto themselves the supreme moral virtues of what they still have the temerity to label the pluralism of democratic practice; but in reality is tantamount to the singularism of undemocratic repression.

Contrary to the egregious myth, suppression of dissent has always been a central fact of the dominant mainstream US culture. There can be no niche for anything remotely construed as threatening the system. Effective deviance is circumscribed by the drive of money power and the dynamics of profit. In addition to a ubiquitously repressive climate that has marginal tolerance for deviance, a no less insuperable constraint on speech freedom is dissenters' lack of access to the mass media, and thus to the general public. Freedom of such legendary deviants as Herman, Noam Chomsky, Paul Sweezy, Harry Magdoff, Claude Cockburn—their names could be counted on ten fingers—is that their freedom is a personal one with miniscule social significance. Fleeting access to the media is one thing, permanent intrusion another.

Perot, the maverick billionaire, grasped the all-embracing tentacles of money-media power when he proclaimed with his ebullient clarity that he was able to fight the Bush/Clinton machine, and the whole traditional political caboodle "because I've got the money to do it", in itself a ghastly commentary on the diseased state of American politicking. And so he proceeded to bankroll his own campaign to the tune of over \$ 80 million. "I've thrown my hat into the ring because I know, and the American people know, that the name of the game in politics is big money; its big money that gets you the juicy pickings; the

Media Moloch: Blight of Doublespeak

Beyond Hypocrisy: Decoding the News in an Age of Propaganda
by Edward S Herman; South End Press, Boston; 116 Saint Botolph, Boston, MA 02115.

THIS informed essay is about the pervasive business of lying at both the official and corporate media levels. In short an incisive analysis of how tens of millions are bamboozled by the news television programmes they see, the newspapers they read, and the radio broadcasts they hear by an odiously unaccountable leviathan that is the corporate media. Its central theme is the US media, but third world readers and others will recognise that its analytical framework on the global corporate media oligopoly stretch beyond the confines of Clinton's USA. Its essential workings is seen in the propaganda-making and distribution engine, but more surreptitiously by the calculated distortion of words.

The first part deals with the decoding of news in an age of propaganda; the second, the first of its kind to the best of my knowledge, is a doublespeak dictionary for the 1990s of which the Regan/Bush cabal and its grovelling media had scaled the highest pitch of doublespeak, doubletalk and the doublecross.

Simplicity in modes of expression, lucidity in argument and American scholarship are invariably at daggers points. In the case of Edward Herman, of the Wharton School of Finance of the University of Pennsylvania, this is a felicitous exception. It is mandatory reading for those yearning to understand how their visual and printed news is slanted, concocted, corrupted and administered for sinister political ends. Its focus is doublespeak, the travesty of words by implicit redefinition and other pathological deformations of corporate verbal terrorism of the most brutalising species.

What Herman has in mind is no more clearly dramatised than in the daily misuse of certain buzz words and sonorous

moral platitudes to which we are daily bombarded. Let us start off with the designation 'conservative' now currently applied to all shades of opinion opposed to Yeltsin and his G-7 handlers. Doublespeak bludgeons us into believing that he is the saviour of 'democracy', 'human rights', words noble in themselves, but which in their current corporate usage have been reduced to trivialised babblings.

At first sight it may appear that these verbal antics are comical, but their stratagems are more malevolent than such innocent word play may suggest. If Yeltsin's adversaries—not to speak of Lenin, Mao, Castro, and Ho Chi Minh—are branded 'conservatives' then in what barrel should we shovel a Reagan, a Bush, a Major and a Thatcher? Obviously, we perceive that reason has been unceremoniously shoved overboard. Another fatuous cliché of doublespeak, and one deployed in the same semantic breath, is that of 'market reforms'.

For these verbal embezzlers there is no need to probe the historical, social and class foundations of markets and market power. Adepts of doublespeak abhor objective analysis; their overriding stance is the ideological justification of their class status, and the dual forces of doublespeak and state terrorism that underpins it. A vintage illustration is highlighted by that buffoon of *The New York Times*, William Safire, when he pontificates that only the 'market' is the guarantor of your freedom, "base your changes on the inexorable workings of the law of supply and demand, make its freedom work for you". That unqualified morsel of doublespeak crap would be laughable were it not so tragic. It is engineered to drill into the reader's skull Goebbel's dictum that the big lie repeated a thousand times is transmuted

fatter the money the fatter the stakes."

This, indubitably, is one of the most profoundest utterances ever formulated on the roller-coaster carnival of American politics that insists on calling itself democratic; indeed what we are seeing is a swindler's slight of hand: doublespeak. Perot is neither deviant nor dissident. He is an acknowledged cog of the big corrupt machine. Such Tammany-honed pros as Clinton/Bush and their political touts knew that he was one of them. The verbal shadow-boxing was an integral part of the doublespeak showbiz.

In his grand collaborative work with Noam Chomsky, *Manufacturing Consent: The Political Economy of the Mass Media*, they had delineated to what measure media control and ownership was dominated by a tiny minority of media oligarchs of which Turner and Murdoch—both Americans—are prime celebrities. Corporate doublespeak is reinforced by the ideological propensities of corporate advertising, the big bonanza, now running in the US alone, at over \$300 bn yearly. Revenues are not the only mainsprings of hyper-profits and survival for the corporate advertising phalanx. The corporate media has never dissimulated their natural points of anchorage with the White House, the Pentagon, the state department, the CIA and British intelligence that have never ceased to preen themselves as the supreme embodiment of their pathological versions of human rights.

The symbiosis between the organs of repression and the corporate media require no guidelines: they are implicitly understood by media functionaries. Rebels and other non-conformist journalists are excluded from normal news sourcing and processing so that freedom of speech is wholly compatible with barriers to views deemed menacing to the existing power complex, and the celebration of state terrorism.

The big time names in journalism that one encounters, for example, in *The New York Times*, *The Washington Post* and *The International Herald Tribune* (all of which are corporately inter-connected) have little room for manoeuvre. And indeed there is no reason why they should. Pulitzer prize-winners are not selected on the basis of literary merit and research capabilities despite public relations baloney to the contrary, but in relation to their loyalties to the organs of doublespeak. Journalists within the media web work within the limits nailed down by the corporate market system. Their pickings are delectable. It is not surprising that Rosenthal, the Israeli representative on *The New York Times* boasts an income of over \$100,000 a year. As a leading British newsman privately acknowledged, "We've got to eat, got to pay the mortgage on the house,

got to pay the school fees, support a family which means we've got to understand the world in which we live." Translation: effective pluralism is for the birds.

Marginalisation of dissent has been buttressed by the colossal centralisation and commercialisation of the mass media. The same doublespeak juggernaut that rolls on in the US is no less cruelly discernible in western Europe and Japan, and in the capitalist segment of the underdeveloped world. Demolition of public sector TV and privatisation have swelled the grab-bag of a few media moguls, and exponentially boosted media concentration. This is compounded by the total subservience of commercial TV on advertising and hence its enslavement to the mega-billion dollars of the advertising giants. It has thus become more amenable to government cajoling, virtually blocking out any tremors of dissent.

The class power structure that shapes media choices is neatly formulated in what the author designates as 'a power law of access' and 'an inverse power law of truthfulness'. The first law says that the greater your economic and political leverage, the easier your access to the mass media; the less your power, the more difficult your access. At a certain point on the declining power scale, access falls to zero. The validity of these laws is exemplified by the Gulf war, more dramatically by the sheer power of Perot's moneybags.

The demise of the cold war and the UN's tragic colonisation by the US and its ventriloquist dummies in the security council, the UK, France, and Russia has blazed new vistas of control for the imperial doublespeak machine. The US foreign policy no longer mainly requires state departmental alibis. That job has been pushed on to another class of international domestics. Boutros-Boutros Ghalli and the shuddering domesticated UN bureaucracy has prodigiously enhanced the muscles of imperialism. The UN's colonisation, however, commenced well before the USSR's crumbling and the chain reaction of events in 1989. In 1984, the US degutted UNESCO with its representative in Paris brandishing his ultimatum "that UNESCO had better shape up or ship out". It has now done so with exemplary servility. This was synchronised to the declaration, obediently bellowed by all the frontmen of the G-7 that the New World Information Order (NWIO) destined to yield the third world a fundamental freedom of choice in news coverage and interpretation was immediately butchered. The butchery was executed under the phoney pretext that "the NWIO was nothing more than a police state monstrosity whose essence was government control of the media" The obvious model to be emulated was that of the impeccable moral credentials of the

US, UK, Germany and France, precisely the exemplars of Big Capital whose billionaire controlled media was dedicated to the promotion of human freedom as a matter of high principle.

The triumph of this claptrap, mendacious as it was and still is, was but a ghastly portent of things to come as the US spokesmen in the Reagan/Bush cabal and the Heritage Foundation reminded us with each passing day. There were others of course that joined the chase, conspicuously the Thatcher stooges in the tabloid media. With the hijacking of the United Nations and the Security Council by the gang of four, as they are now dubbed by the less boot-licking sorts of UN civil servants, there is no more need for alibis and cover-ups. The UN and its agencies are now to be numbered among the prime players in the macabre game of doublespeak. The odiousness of the corporate oligopoly and its advertising behemoths has multiplied phenomenally over the last five years. This is not the end of the road. Crimes in violation of international law have ceased to exist. Israel's expulsion (the word misused to describe this criminal act is deported) is slurred over or better still distorted by the media.

Obviously, the oligopoly's power is not merely circumscribed by the ownership and control of print, television and broadcasting news in the advanced capitalist economies but now extends, as a perfunctory visit to east Europe and Russia reveals, to vast new territories, not least the underdeveloped segment of the world economy. Its pervasiveness is manifest in the burgeoning information and satellite television technologies joined to the inexorable march of media concentration. The news hook-up between the BBC News Service and the American ABC television network is indicative of the forces at work.

There is no need, however, for pessimism. As Herman emphasises, history knows no end and thus can never be a process of fixity and permanence. In words that that we must cherish he reminds us: "The 'cry of the people' in the third world has not been heard in the west; but the explosive uprising, when it comes, may be beyond the repressive capabilities of Globocorp and its public relations system. The unshackling of the 'mere gooks' and 'mere Arabs' is the future task of historical change, which brings its own surprises." A final word. This work, and others of its kind, as we would expect, would have been spurned by any of the giant publishing houses. We owe a big debt to the South End Press, a non-profit, collectively-run book publisher devoted to the politics of radical change which has had the guts to publish this memorable achievement.

New Economic Policy and Technological Change

Towards New Initiatives

Vinod Vyasulu

Society which funds research and development has certain rights—it is a stakeholder. Innovations and their applications keep society growing, dynamic and competitive and help in improving people's welfare over time. In regard to patents, the issue of proportion among the different stakeholders—the inventor, the consumer, the manufacturer and the society at large—has to be carefully and rationally addressed. The theory of common property resources gives us a framework in which a balance can be struck among the interests of the different stakeholders. This is also an area where game theory and the work of public choice theorists can be imaginatively applied.

That Frog he grinned a grin of glee,
And hit his chest a thump.
"O Pig", he said "be ruled by me,
And you shall see what you shall see.
This minute, for a trifling fee,
I'll teach you how to jump".

—Lewis Carroll

IN response to the balance of payments crisis, a number of reforms were initiated in the Indian economy in July 1991. There has been a great deal of debate among economists (and others) about the merits and otherwise of what has come to be called the New Economic Policy¹—the NEP. Just as equity has not been a major concern of this NEP,² neither, explicitly, has technological change been one of the central themes of this debate, except in passing in connection with the TRIPs and TRIMs being discussed in the Uruguay Round Negotiations of the GATT in Geneva.³ Unfortunately, however, these discussions give the impression that the issue of TRIPs and TRIMs and the economic policy changes are two separate things; that the GATT matters are independent of the economic changes underway, whereas they should be seen as an important aspect of such changes. The NEP is meant to globalise the Indian economy; and the Dunkel proposals deal with the conditions under which such globalisation can now take place. Hence the need to analyse them together.

The objective of the NEP is to put the economy on a high growth path by bringing about the necessary structural adjustments.⁴ In this strategy, an important place has been assigned to growth in exports. Quite fairly, the NEP may be described as one variant of a class of export-led growth strategies, rather than a growth-led export strategy, i.e., a strategy aimed essentially at economic growth in which export growth is a consequence. And in order to help increase exports, it is argued that it is

essential to upgrade quality and modernise technology. Hence the 'opening up' of the economy from restrictions on import of foreign capital and technology. In order to bring in technology, it is considered necessary to remove restrictions on ownership, etc. This explains the need to dismantle laws like the MRTPA and FERA. Once these changes are made, foreign investment is expected to go up, modern technology to enter the country freely and a revitalised Indian economy is expected to compete in world markets. In the words of the managing director of the IMF, this is the process of 'tigerisation' of India.

In this context, there have been debates on the stand taken by the former US trade representative, Carla Hills, and her threats under US laws known as Super 301 and Special 301 to impose punitive tariffs on Indian products, on two occasions, India has even been put on a 'hit list'. These laws enacted by the US Congress, are meant to protect US patents and to open up foreign markets to US firms. They are not international treaties. They are being used in part to pressurise India to accept the GATT proposals on intellectual property rights. This would require drastic changes in Indian patent law as India is not a party to the Paris convention but has its own law, enacted after much deliberation.⁵ And it would require major policy shifts—for example, life insurance is nationalised in India. We would have to open up this field to foreign companies. (In the 93-94 budget, the finance minister has proposed setting up a committee to examine the structure of the insurance industry, taking the first step to politically initiating this change.) Thus, both TRIPs and TRIMs would require major changes in Indian policy and Indian law. The NEP so far has not taken all these steps.

The fact that a comprehensive 'compromise' document on these complex issues has been put together by the secretary

general of the GATT—Arthur Dunkel—and placed before the developing world on a take it or leave it basis, has not helped the debate. Many have reacted angrily to the implicit arrogance involved. These proposals, covering all the issues being discussed in the Uruguay Round, are, on balance, clearly tilted in favour of the developed countries. It is the commercial and trade aspects that dominate the proposals. Whatever the rhetoric about 'sell out' and 'sovereignty' or what not, these decisions have to be taken by a government that we have put in office by a democratic, constitutional process; and to that extent we too are responsible. It is dispassionate analysis and not anger that is needed in this situation. We have to exert political pressure on the government and on parliament and ensure that our national interest is protected.

This question of national interest may require some introspection. Clearly, economic growth is good for the nation. But is economic growth alone enough? If not, then what more do we need? In earlier years, India stood for 'growth with social justice'. Do we now give up social justice? Or do we act on the presumption that growth will lead to greater equity in due course? Or do we replace 'social justice' with some other clearly defined notion of social welfare or equity? If so, what? I submit that we cannot give up equity altogether.⁶ At a minimum, we must take into account the needs and views of at least a simple majority of people in the country if our claims to being a democracy are to have any substance at all. If that majority lives below the poverty line, then, apart from the economic, the moral argument for ameliorating their lot is a powerful one. The need to better the lot of the poor is clear, and imperative, and must be part of any policy in India. There may, of course, be differences on how this must be done. Clearly, there are important and

complex matters here that merit deeper analysis. But that is another story.

There are two contrasting value positions at the base of what is going on today. The economy because of government finances was in a crisis by 1990,⁷ and reforms were needed—on this there is little dispute. Agreement on the need for reform does not imply agreement on the causes of the crisis. Agreement on the need for changes, does not, clearly imply agreement on either the type of changes needed or the sequence in which things must be changed or the speed with which such changes are to be made. There is plenty of scope for discussion. The government assertion that there is no alternative to the NEP is simply not correct.

The other point of view also stresses the importance of deregulation, of dismantling the 'baburaj' of licences and controls that had grown to gargantuan proportions. It cautions against an indiscriminate and immediate globalisation of the economy; domestic reforms must come first.⁸ The public sector enterprises need basic reform as does banking and agriculture. This view stresses the importance of a good public distribution system and effective investment in social services, especially health and education. It sees part of the remedy in decentralisation—to the district and panchayat levels—as an essential step in such deregulation.⁹ It stresses the need for strategic planning by the state, the setting of priorities and the creation of a facilitative environment, as contrasted to the earlier regime of everything being done by the government. It emphasises the importance of equity in the process of adjustment and reform, not merely the need for growth. It is accepted that structural adjustment is painful; but it argues that the pain be shared, especially by the well-off. It argues that the path chosen by the government in the NEP places the burden squarely on the poor—the inflation in the price of food articles is cited as evidence of this. In addition to getting prices right, it is important to get state intervention right.

What I find disturbing in the government pronouncements is the rhetoric of 'free markets'. They are talking of creating an environment, where competition is the key and the consumer the queen. The consumer has a choice of goods and by her choice of what is to be bought and what is not to be bought, she can make or break companies. (Yes, companies like Hindustan Lever refer to the consumer as 'she'; clearly they are gender sensitive!) The central idea projected is that, in all circumstances, the free market is efficient because it is assumed that there will be a larger number of buyers and a large num-

ber of sellers. Those who do not sell their goods at acceptable prices will fall by the wayside, while the more enterprising and efficient ones will grow. This is the (simple minded) logic by which a large number of reforms are brought into play. And this is the logic explained in the undergraduate textbooks of economics. It abstracts a great deal from the complexity of the real world. At the ground level, things seem to work differently. Professional economists cannot wish away this fact; and an uncritical acceptance of the logic of free markets needs to be challenged.

The question to ask is: in order to import all that we require, what is it that we can sell abroad? There is one school of thought which says that our main advantage being in agriculture, we must try to export more of agricultural products. It has been indicated by B S Minhas, that we can export agricultural goods worth US \$ 2 billion a year.¹⁰ Without questioning this figure, we can easily guess that one immediate fall-out of this policy will be a steep rise in the domestic prices of essential food materials and that has its own consequences. Minhas has dealt with these issues in detail; his logic is powerful.

In the agricultural sector, we are not (yet) so dependent on foreign technology. Our farmers have been growing crops for years and with some more support the yield can (perhaps) be augmented, provided the current proposals on agriculture in the Uruguay Round negotiations of the GATT do not legally erect barriers, e.g., by giving multi-national companies a monopoly in production of seeds as a result of the proposal to patent even life forms, which is not allowed by law in India.¹¹ But even if that does happen, it is not impossible that output increases take place, in alliance with agribusiness corporations, on terms that may not be the most favourable to the farmer. But politically, this may not be a realistic option.

Therefore if we cannot rely on the export of agricultural goods, we have to fall back on the export of industrial goods. When it comes to industry, the production has to be based on modern scientific knowledge, on ever changing technology and ongoing R and D efforts. One must also have the ability to respond to the changes in the market scenario. But it is here that our vulnerability becomes quite obvious since¹² we have today an industrial system where nearly everything is made with foreign collaboration, whether hi-tech or low-tech.¹³

It is well known that one of the conditions of such foreign collaborations is that the goods produced with such technology in India will not be allowed to cut into the collaborating firm's markets in other coun-

tries. Even if this restriction did not exist (and it does), it may not be possible for Indian industry to tap foreign markets in such cases. We have got the know-how, but not, I fear, the know-why or the design and development capability which is essential if a firm is to respond quickly to market changes. I cannot think of a (non-traditional) product that is made without collaboration. I cannot think of areas where, starting with imported know-how, Indian R and D has developed the process further to improve quality or develop new products for the local market, let alone the foreign one. In fact, our industry is proud to advertise that shaving blades are made with Swedish collaboration or shoes are made with Italian know-how or pressure cookers with American technology and so on *ad nauseum*. I wonder if there is a non-traditional product based on technology resulting from Indian R and D that is available in our markets. If this be the scenario, I do not see really, what is it that we can sell abroad, in order to buy our essential requirements (like petroleum products) from the foreign market. To my mind, this is the crux of the present problem.

The question is not whether we should participate in international trade or not. We should. It is whether we can identify those few, may be half a dozen, areas of industry, in which we can compete successfully in the foreign market. The ability to do that would depend upon our own resources. This does not mean natural resources alone since countries like Switzerland and Japan, with very limited natural resources, are (really) the world leaders in many sectors of industry. Switzerland, without any iron ore or coal, is a leading nation in machine tools or drug manufacture; Taiwan in computer peripherals; Thailand in garments and sports goods; while Japan has established itself in so many areas that it is difficult to pick just one or two.

We need to train our manpower resources in such a way that we can reach international levels of technology and quality in some fields and gain a reputation in exports.¹⁴ We have to look to competitive advantage rather than comparative advantage. For that, however, we need a cluster of firms in the concerned industry that compete in the domestic market; we need a domestic market as a base; we need firms working in related areas of technology; and we need an industrial culture that invests reasonable amounts in Research and Development constantly. These are the insights of empirical research.¹⁵

Let us now see what we in India can make. Our mistake in the past was that we

tried to make everything. While it is not impossible, the costs would be astronomical and hence we cannot compete with others who specialise. We must concentrate where we have a *competitive advantage*. If it is in software, as we are often told, then let us get our act together and take on the task seriously. The exports in the relevant fields should be brought together in a congenial environment and encouraged to work. An earning of Rs 400 crore from software exports in 1992-93 is just not good enough. What is lacking? What has to be done, and who can do it? And so on. If it is in the peaceful applications of space technology—satellites, telecommunications and the like, let us put our resources together till we succeed, and not repeat the tragedy of the fertiliser industry, where our technological competence was dismantled by ourselves.¹⁶ If it is in leather products, once again it is important that we leave no stone unturned in our effort to become the best in the world. Such areas of potential have to be carefully identified and nurtured—as Korea did.¹⁷ Who would have believed, 20 years ago, that Korea would lead the world in steel-making and ship-building? It is the result of painstaking efforts—an example of the right kind of planning by the government.

We cannot depend upon repeatedly importing technology in all sectors and hope to build up an export presence¹⁸ in world markets. In every major field today, machine tools, electronics, chemicals and so on, we are dependent on foreign collaboration; and repeated foreign collaboration. This is not to say we must not have foreign collaboration, but to stress that we must learn from it and build on it on the basis of a clearly understood strategy. Sadly, that has not been the case in general. If earlier we erred in one direction today we seem to be erring in the opposite direction.

The alternative to the current impasse is not to enter whole-hog into unthinking collaborations as the government has recently begun to permit. The opposite of too much control may be no control: but what we need is proper control based on clearly defined priorities and a clear operational strategy. This option of withdrawal by the government in favour of private initiative chosen by the finance minister is based on the understanding that our industrialists would not like to invest in R and D to develop better products. They will not take such a risk.

There are two ways to maximise profits—by trade and by manufacture. In the west, mercantile capital gave way to industrial capital over time. In India, where there is a long tradition of trade, industry

in the sense of manufacture has been an add-on, a diversification, and not the central motive for being in business. Our large business houses have roots in trade. In trade, via buying and selling, money is recycled quickly; margins are high and attractive. In manufacture the gestation period is long; margins are low and profits depend on turnover. Why get into this complex business when one can trade in MNC goods? Thus, the logic of profit maximisation in this country encourages trade and not manufacture. The current reforms strengthen this tendency.

Indeed, the peculiar and not so complimentary phrase 'foreign collaborated firm' is formally used in Indian industrial statistics. And every major firm, public or private, is one. (It is only in the small-scale sector that we find exceptions.) From 'foreign collaborated firms' they are becoming the Indian offices of foreign firms. Firms that came up to produce on an indigenous base are now becoming subsidiaries/branches of MNCs—Wipro has become Wipro-Sun; HCL has become HCL-HP; PSI has become PSI-Bull; Kinetic Honda has given Honda 51 per cent equity holding, and so on. The much sought-after NRI investment is nothing more than the Indian face of international capital; and it has a logic of its own. Multinational interests and national priorities need not be identical. Today, it is being assumed that they are identical.

It is against this background that we should understand Indian industry's friendly reception to the Dunkel proposals. To quote from an IDRC¹⁹ report "Although the argument for intellectual property protection is often couched in terms of increasing incentive to research, in many ways the motivations and the pressures are much more commercial and trade oriented; patents are being used to protect investment". If in the light of this situation we examine the proposals of the Dunkel Draft, the industry, as a whole, will be supporting it because it will get immediate access to technology and brand names, especially consumer goods technology, along with a reputation for quality that these brand names enjoy, e.g. Sony. Given its reputation for shoddy quality, which has (deservedly) built up over the years, this quality guarantee is important to Indian industry. It will say that in exchange for the MNC brand names, we will have to pay the royalty and that is quite fair. Instead of BPL-Sanyo or Kinetic Honda, we will sell Sanyo or Honda; and as soon as there are changes in the brand in the west, or Japan or wherever we will get them immediately. Our marketability will improve, there will be growth, there will be profit, that is what we want and that is

what the government policies should encourage.

Industry would also argue that multinationals would be attracted here, because of the vast domestic market of some 150 million people who form what is called the 'middle-class'; this investment would create some jobs, e.g. those of agents or retailers and, in a few cases, manufacturing under their supervision. Let the MNCs invest in R and D we are told, they have the size and capacity for it which we do not have; they have the risk taking capacity we do not have; we will manufacture in India with their permission; as long as profits are assured how does it matter whether we become competitive in the world market; the consumer will anyway get world quality products at competitive prices. Export obligations and phased manufacturing programmes should be done away with as they are a disincentive to foreign capital. We are satisfied with the domestic market. As long as industry grows and gives us profit we are satisfied (to sell abroad, any way, we need MNC expertise in both technology and marketing and so we should not antagonise them). Perhaps, as sub-contractors to MNCs, we may get some export orders too and that would be a bonus.

With such an attitude, the industry would endorse the Dunkel proposals with, at best, a few cosmetic modifications here and there. Thus the Indian industry cannot really be the ally of the Indian scientist and R and D worker in opposing the Dunkel proposals which effectively advise us to function by their rules, typified by the opening quotation from Lewis Carroll: be ruled by me, and you shall see what you shall see.

Those who are opposing the Dunkel draft proposals are those who have stakes in R and D, for example, our academics and R and D workers; and those who believe that the national self-reliance that we have tried to build for the last 40 years is worth preserving and pursuing. To avoid any misunderstanding, such self-reliance is not self-sufficiency or autarky.²⁰ It is not export pessimism of the type criticised by Isha Ahluwalia. We may have to change our strategies but not our objective. Our own interests demand opposition to the Dunkel proposals. For, to quote again from the IDRC paper, "What is being contemplated within the GATT and within the bilateral trade negotiations is the wholesale transplantation of a system of legal protection to be used under very different social and economic conditions from those for which the system was designed. The system in question has not even been endorsed by the people of the exporting culture". Here lies the conflict

between two clear-cut values, namely, one of profit seeking (even if as a subordinate in the world system) as opposed to one of seeking self-reliance and the ability to trade in the world market on equal terms.

And here, we must be clear about the magnitude of the task ahead. It is necessary to recognise, as we support the stand of the Indian drug industry in favour of retaining the Indian Patent Act of 1970, that it cannot forever remain an imitator who plays a useful role in enhancing competition but must itself also go in for innovation and R and D to develop new formulations which is a risky business. If the Indian drug industry has no vision beyond dealing with the immediate threat posed by the Dunkel proposals, then, in return for support, pressure must be put on them to embark on an R and D programme of their own. It is necessary to recognise that the rhetoric of the farm lobby hides tremendous inequity; that the benefits, which it is stated are 'national benefits' accruing to 'poor farmers' may in reality benefit a well organised, articulate, politically powerful well-off section in rural areas and not the rural landless labourers. In supporting them in battling the Dunkel proposals, we cannot be seen as supporters of rural exploitation. That too must be fought, and for the same reasons. The domestic devil is no better than the foreign one.

In early 1993, the farm lobby has anyway split, with Mahendra Singh Tikait against the Dunkel proposals and Sharad Joshi in favour of accepting them. Clearly, there are political stakes involved. It is in this complex context that an alternative to the Dunkel proposals must be formulated. Clearly, this is no easy task. This is part of the challenge IPE has accepted in organising this seminar.

One of the points to note is that in areas where we have no access to foreign scientific and technological knowledge and we decide that the ends are important enough, there are proven instances of success. Nuclear energy and space applications are outstanding examples where although we are not fully self-sufficient we have made phenomenal progress. Sometimes, without global links, we seem to grow in self-reliance if given proper support by the government and set up suitable non-bureaucratic systems and institutions for the work programme. (This should not be interpreted as an argument in favour of making nuclear weapons. That is a separate issue.) What I refer to is the context of technological progress; it is not one of globalisation but one of domestic competence in a dialogue with peers, wherever they be.

I thus find it hard to believe that we

cannot build a radio or make shoes or manufacture shaving blades competitively on the basis of our own efforts. It is possible that there are gaps in our capabilities but I doubt if they are insurmountable. Also, as I have stated earlier, we have to select a few areas, go about doing things in the 'mission' mode, invest in it, develop institutional mechanisms; persevere in it; and at the end of a few years we may obtain results. Clearly, this is a difficult task, and it must not be underestimated. And when we obtain results, we must build upon that success; nurture the individuals and the institutions, and encourage further work. This caveat is necessary because, in the past, we have destroyed those who have obtained results—the experience of FEDO and FACT in the fertiliser industry of India is a clear-cut case in point.

The problem is that the regime of intellectual property rights as proposed by the Dunkel draft will make such an option illegal, because then the permission of the patent-holders is essential, whatever the national interest to undertake further R and D; and, in key areas, it may not be given. There is no provision like compulsory licensing.

There is an articulate lobby today supporting the Dunkel proposals and it is surprising that it has not yet pushed the government into signing the draft (particularly when the government has already announced so many packages to satisfy the interests of this particular lobby). If the government of India has not signed the Dunkel draft yet, perhaps this is due to the fact that the other group, namely, the 'self-reliance' lobby too has now got sufficiently well organised. There is a National Working Group on Patents, headed by Dr Nityanand which has been stressing the dangers of signing on the dotted line. There are also eminent individuals like Justice V R Krishna Iyer and Rajiv Dhawan who have opposed the Dunkel proposals. There have been several petitions, statements and articles in the national press which have stalled the progress of the pro-Dunkel lobby within the government. The Indian Drug Manufacturers Association has also got organised on this issue. Based on process innovations, the Indian pharmaceutical industry has made rapid progress, and is among the most cost effective in the world today—that is in terms of production from various processes of products that have been patented elsewhere. Their record of R and D for new drugs is not so impressive, but that is another story. If the Dunkel proposals are accepted, their costs would shoot up blunting their competitive edge.

Consider agriculture. The raw material

for innovations in bio-technology is germ plasm, available in plenty in the tropics, and specially in India. Indian farmers have been using this heritage of mankind for centuries in, say, growing rice. If the Dunkel proposals are accepted, then it will become possible for multi-national firms to patent products that are derived from biotechnology research from the germ plasm found freely in India and given freely by India to them. The firm would then get certain important rights as a patent-holder.²¹ Indian law does not permit patents in agriculture, as it is considered essential for life. But what about the rights of the traditional farmer? Has he no right to seeds, traditional and hybrid? Why should the germ plasm be treated as a free good—the heritage of humankind, especially when such treatment benefits the rich developed nations and always against the poor developing ones? Are these not double standards? The so-called farmers' rights endorsed by the FAO are pitiful in comparison with the absolute right given to the patent-holders and these are in addition to the rights held separately under the category called 'plant breeders' rights'.

A thousand years of tradition in 'Ayurveda' can be set to naught by an MNC that patents ayurvedic formulations by making a minor change in its biotechnology lab. That can hardly be considered just. Such one-sided arrangements are what are being contested by those who question the Dunkel proposals. A system which emasculates research in the developing countries cannot be accepted as a fair one. The developing countries are being diplomatically told that rape is inevitable: it is up to them to lie back and enjoy it.

There were also, I think, some differences within the government on accepting these proposals. If Manmohan Singh and the bureaucrats wish to sign the Dunkel proposals, then Balram Jhakar and Rajesh Pilot, at one time, opposed it. A cabinet committee headed by Arjun Singh was set up to suggest what is to be done. (It is understood to have recommended a discussion in parliament.) But now, in early 1993, apparently these differences within the government have been sorted out. Jhakar is now in favour of signing these proposals. Unfortunately, the public is not given access to all this discussion—it is top secret from the people of India!

Hence, it is at this stage that we must get together and activate ourselves in opposing the proposals, because at a stage when the final decision has not been taken it helps a great deal to add to the political pressures. But it must be done on rational grounds. We must insist on our right to information; on transparency in national decision-making; on proper parliamen-

tary debate. I believe self-reliance as a national goal is rational, however unfashionable this may be made to appear today. I also believe that equity is important; and that equity and self-reliance cannot be separated. We must ensure that the path of progress in science and technology via R and D is not closed to us, as that would mean continuing dependence. If the government position is that none of these will be jeopardised by accepting the Dunkel proposals, then they must explain why and how to the sceptics.

The support that the Dunkel proposals apparently enjoy in the advanced countries is based on the hypothesis (or faith?) that it promotes free trade and is hence beneficial to all the participants in the process of trade. While it is an accepted theory in economics that free trade between nations helps develop specialisation, for this theorem to be valid certain important conditions need to be met. It is true that the free market leads to the lowest cost of production, the lowest prices, to optimal profit. But it also assumes that all parties that take part in the market have equal levels of knowledge and technical information. It is also assumed that there are many players on both sides of the fence so that none can *directly* influence prices. There are only price 'takers', no price 'makers'. What is being done through the Dunkel proposals is to convert one of the sellers into a *monopoly seller* by giving patent protection on very favourable and one-sided terms.

In fact, the Dunkel proposals are the anti-thesis of the free market. Once you give a patent-holder the exclusive right to a process and product for 20 years such that commercial exploitation of the patent can be done only on the terms allowed by the patent-holder, when even importing the product is going to be considered as exploiting the patent within the meaning of International patent law, it becomes equivalent to placing the patent-holder in the position of a monopolist. There can be no rival sellers. The theory of the market says that if a seller sells his goods at Rs 2 we give the opportunity via freedom of entry to another seller to sell it at a lower price. In contrast, the acceptance of the Intellectual Property Rights regime, as suggested by the Dunkel proposals, will prevent such a situation from arising as it erects an unsurmountable legal barrier to entry. We know in economics that under monopoly, output is restricted and profits are inflated. The monopolist can extract rent, he will continue to do so indefinitely if there is no danger of competition from R and D and innovation by others. Product patents will eliminate imitators; in the long run it may even reduce the motive for

R and D. This will eliminate the factor that keeps capitalism dynamic. The pessimism expressed by Schumpeter would then have added justification.²² But that is another story.

Yet another point is that the market works best when the property rights are clearly defined. As far as physical commodities are concerned, e.g. tables, chairs or cars—property rights are easy to define. Once we buy such a commodity, we can use it in whatever way we like, deny everyone else its use and no one can dispute the property rights. But when it comes to intangible items, it is not so easy to define property rights because of search and transaction costs. To define property rights clearly, it is necessary to define the boundary. For land it is easy. But in other cases—say noise a bus makes, or the traditional seeds that farmers use or the air that we breathe—it is not very easy.²³ It is necessary to get all kinds of information, and this can be both difficult and expensive. In economics literature, these are called search and transaction or information costs, and, if they are very high, it is not easy to define property rights in sufficient detail.²⁴ The market then fails.²⁵

While there is a place for market functioning, there are also areas of market failure. In the latter case one can draw help from the concept of externalities and common property resources. R and D has many externalities. And hence the need to get state intervention right. And the need for new initiatives.

It is in this background that the question of patents is to be examined. Once you make an invention, obtain the patent rights on the product and create information barriers, then the conditions of a free market automatically vanish. Process patents like those prevailing in India leave open the possibility of Schumpeterian imitation. Others, with different methods of manufacture, will enter the market and compete, as the Indian drug industry has done. After product patents are granted there will be information barriers, and legal entry restrictions, there will then be only a single seller and hence it becomes a monopoly condition as opposed to a free market one. We are trying to use 'free market' jargon in a situation that does not apply to it at all. All this discomfort about the Dunkel draft proposals, the burden of proof, the period of protection, product or process patent, etc, arises because we are desperately trying to make it appear as a market phenomenon, when actually it is not. It has to be understood in some other way.

It is not enough to reject the proposals, we must present an alternative. As a student of economics, I can think of one way

in which this alternative can be evolved; I am sure there are others. Rather than apply the theory of markets, that is being proposed, we may usefully consider the concept of common property resources. There are certain rules that govern the use of common property resources, i.e., there are certain conditions in which this will thrive and conditions in which this will decay.²⁶ This is now becoming well known in economics and one of the factors that needs to be considered in such situations is that one has to account for the interests of the various stakeholders. I am no longer using the term property, but 'stake' signifying the new institutional economics.

It is my contention that the R and D process be understood as one of sharing a common property resources, where future generations are also stakeholders. In an area like research and development and the invention/innovation process there are several stakeholders: consumers, job-seekers, tax payers, governments, and so on. One of them is of course the researcher who makes the invention. He deserves credit and there can be no debate about it. But does he make his invention in isolation? For example, at the Indian Institute of Science and other such research institutions several inventions have been made and there are several patent-holders but do they make their discovery in isolation? Can they function outside the academic environment of debate and discussions among peers? Innovation is a social process.²⁷ Scientists work in institutions funded by the government, which provides labs and equipment, and they work in an environment of discussion with highly qualified colleagues. In research activity these factors are important and very often a particular discovery may be the last brick in a programme of research that has been going on for a long time and involving a large number of scholars, from professors to students in many places. While one does not intend to deny the credit to the person or group who make the invention, it should be recognised that it is a part of the social process of research. That is what scholarly tradition is about.

In a country like India, we certainly should not risk our tax payers' money in scientific research if the benefits flow only to the scientist concerned or to his employer and not to society. If research is supported by public funds, as in India, it *must* serve a public purpose. (Even privately funded research cannot be divorced from public purposes because there are many stakeholders in research. But the weights assigned to each may well differ²⁸.) It must not be forgotten that, even in the US, research is publicly funded. It must be treated as a merit or public good,

not as private property.

Money for R and D comes from various sources. For example my salary is guaranteed whether I make an invention or not. In return for my salary I put in my energies and (if I am lucky) I get academic credit. But, the society which funds such research has certain rights,—it is a stakeholder. Innovations and their applications keep society growing, dynamic and competitive, and help in improving people's welfare over time. So is the consumer a stakeholder. As an example, look at the case of life-saving drugs. If I succeed in developing a formulation which cures AIDS it will be inhuman to say that unless someone gives me US \$ 20 billion, I will not allow anyone to make this drug. A patient has a right to benefit from the results of society's research efforts. (Entrepreneurs have a stake too—the right to set up productive units to make profits and generate employment.) There must be some sense of what is proportionate. This question of proportion, in the issue of patents vis-à-vis the different stakeholders, between the inventor, the consumer, the manufacturer and the society at large has to be carefully and rationally addressed.

Society has an interest in such issues. It is necessary to come to some balance in relation to these different stakeholders and the theory of common property resources gives us a framework in which this can be done. This is an area where game theory can be imaginatively applied. It is quite possible that, at different points of history this outcome will differ. It is possible that there are many outcomes that may have to be ranked. Of course, this does not mean that every one will be satisfied with the outcome. But at least no one can be ignored and the interest of all parties have to be openly considered. The outcome, if it is through a democratic process, must represent the social optimum and be respected as such. It is possible, in such a process, to change decisions over time—an outcome is not forever. The work of public choice theorists like Buchanan provides a logical base for such a process.²⁹ Other approaches cannot be ruled out. It is essential to work towards such outcomes.

Notes

[This paper draws on material from lectures given over the last year in a number of places, and I am grateful to the participants for their critical inputs. In particular, I must mention the seminars in the following institutions: Forum for Science and Development, Bangalore Social Sciences Forum, National College, National Aeronautical Laboratory, Indian Insti-

tute of Science and National Law School of India all in Bangalore; Department of Economics, Osmania University, Nuclear Fuel Complex and Institute of Public Enterprise, in Hyderabad; and Institute of Development Studies in Jaipur.]

Multiplication of Nations?

Political Economy of Sub-Nationalism in India

Sajal Nag

The nationality formation process in India has reflected itself in multiple ways: in the growth of respective vernacular literature, agitation to establish particular languages as official languages of particular areas, movements of backward nationalities to break away from an advanced nationality and earn recognition for themselves, the movement of a particular nationality group, which was separated from the parent nationality and was living amidst a different cultural group as a result of administrative unitisation, to rejoin the cultural mainstream and, lastly, the movement of groups which are still at a tribal stage of development but have struggled against the exploitation and encroachment of outsiders to have a province of their own to minimise exploitation and encroachment.

In a country where capitalism is slowly reaching new areas and awakening new cultural groups to life, the stream of sub-nationalistic uprisings seems to be unending. New demands and aspirations continue to surface, some of which are demanding complete independence, not just self-rule. The Indian nationality question cannot be studied in exclusion of these aspects because the culmination of this process can alone prove whether India has been a nation-in-the-making or a nation-in-the-unmaking.

UNTIL very recently, the Indian national movement was seen as a unilinear, mono-dimensional movement. Its sole objective was to awaken and rally Indians together to combat British colonialism and after a prolonged, by and large non-violent, struggle, it succeeded in overthrowing British rule in 1947.¹ The only diversion being the separatist attitude of the Muslims. Surprisingly, the entire Muslim community was generally associated with separatism—not just the Muslim League. The British played its divide and rule manoeuvres thereby communalising Indian politics leading to the partition of the country.

One of the foremost challenges to this historiography came when the Indian national movement was characterised as a bourgeois democratic movement, uncovering the basic nature and class character of the movement.²

This tendency pointed out the failings of the national movement. Firstly, it failed to intermingle the currents of national and social discontent into a single anti-colonial, anti-feudal revolution—a lapse which was described as 'tragic'.³ Secondly, it failed to ensure perfect mobilisation.⁴ This radical historiography pointed out that there has been a tendency of the 'elitist' historiography of Indian nationalism to concentrate on Gandhian or Congress stream of nationalism and treat popular (peasant and tribal) movements as an 'abnormal' outgrowth, peripheral to the study of the development of the Indian nation.⁵ In other words, the elitist historiography labelled only the Congress-led movement as 'nationalist'. This critique pointed out that, as such, it presented only a distorted picture of the reality. In fact, though the Congress-led movements and the popular upsurge in various parts of the country flowed separately, often at opportune moments the Congress leadership tried to seize control of these popular movements.

The next challenge dispelled the theory that the achievement of Indian freedom was solely the work of the Indian National Congress. It uncovered vast new material to show that though the British tried to retain India till the end,⁶ it was the immense pressure created by widespread revolt in the country in the second world war period that was more responsible for the British withdrawal.⁷

A further dimension of the national movement was discovered by another group of historians who found that there were two streams during the colonial period—one, based on a pan-Indian identity, fighting against colonialism; another based on a regional identity, working towards self-assertion and often fighting against the domination of advanced nationalities.⁸ This school rejected the preconceived 'one-nation-one-nationalist movement' assumptions and came out with a formulation that considering the diverse linguistic, cultural and even racial constellation that India presented, it is a multinational, multi-ethnic country.⁹ It is a nation-in-the-making perhaps, but not a nation already.¹⁰ It is a country which contains a number of emerging nationalities with different languages and cultures of their own. They are at various stages of development—none of these yet, by itself, form a nation. Together they form the Indian nation-in-the-making and the nationalist aspirations of these nationalities/ethnicities are satisfied or neutralised by the federal structure. The period of Indian freedom struggle was also the period of awakening for these big and small nationalities and ethnic groups. Such awakening often manifested itself in the form of agitations and movements for recognition of their respective vernaculars, formation of unilingual provinces and urge to break away from big nationalities whose domination they wanted to shake off. These movements based on regional identities have

been variously termed little nationalism,¹¹ regionalism,¹² sub-nationalism,¹³ and even fullfledged nationalism.¹⁴ In general, these movements flowed in the shadow of the pan-Indian anti-colonial national movement and did not oppose it. As such these were not isolated movements and were seen as an integral part of the freedom struggle, even though, it sometimes resulted in social conflicts. Understandably, after independence, these movements reinforced themselves and with the redundancy of the anti-colonial struggle appeared magnified.

The resurgence of radical historiography has forced the entry of peasants, tribals, caste and working class movements into the textbooks of Indian national movement,¹⁵ but the ethnic and nationalities' movement unfortunately still remain ostracised.

THE SITUATION

The British had frequently characterised India as a non-nation on account of its multiplicity of languages, religions, castes and so on. But because of the colonial nature of the regime, under the British government the question of linguistic reorganisation of provinces received scant attention. Imperial considerations of the growth of British power and administrative convenience were the guiding principles. Even if implemented, it was done in an opportunistic manner. The principle was grossly violated in the partition of Bengal (1905) but used in 1912 to separate Bihar and subsequently Orissa from Bengal for political reasons. The distribution of provinces in British India was arbitrary and meant to meet the needs of the growth of British power.¹⁶

Such organisation affected the unimpeded development of emerging nationalities and ethnic groups. Several nationality areas were often combined within one administrative unit. Simultaneously the same

nationality areas were shared by several provinces.

The dynamics that set the forces of the Indian national movement (pan-Indian) in motion, were also responsible for the beginning of the process of nationality formation amongst various cultural communities inhabiting different regions of the country. The backdrop was capitalism in colonial form for both these parallel processes. The new mode of production required a unified political territory, homogeneous market and a common language. The British therefore, brought about the administrative unification of the country,¹⁷ recognised the language of the major cultural groups they came across first as the official language of the area and broke open the isolation and exclusivity of regions and social groups. While this encouraged development of the relatively advanced cultural groups into nationality, the backward groups remained suppressed. Due to the headstart, the advanced nationalities not only spread their social, economic and political domination over the backward nationalities,¹⁸ they even sometimes sought to absorb some of the incipient groups into the fold. The backward and incipient nationalities therefore had to resist of this domination and absorption and struggle to assert their status. The homogenisation thrust of colonialism created further complications in this process because it altered the existing administrative boundaries and created provincial boundaries which criss-crossed several ethnic and nationality boundaries.¹⁹ Marathi lands for example were in Bombay presidency, Central Provinces, Hyderabad and small principalities of Deccan; the Andhras were in Madras presidency as well as Hyderabad; the Malayalis in Madras and Travancore-Cochin principalities, the Oriyas in Madras and Bengal presidencies as well as Central Provinces; the Bengalis in Bengal presidency as well as Assam. Such organisation not only stunted the growth of cultural communities but also created conflict situations in ethnic relationships.

The nationality formation process in India had reflected itself in multiple ways: in the growth of respective vernacular literature,²⁰ agitation to establish particular languages as official languages of particular areas²¹ movements of backward nationalities to break-away from advanced nationality and earn recognition for themselves;²² the movement of a particular nationality group, which was separated from the parent nationality and was living amidst a different cultural group as a result of administrative unitisation, to rejoin their cultural mainstream;²³ and lastly the movement of the groups which were still at a tribal stage of development but struggled against the exploitation and encroachment of outsiders, both British as well as Indians, to have a province of their own to minimise exploitation and encroachment.²⁴

RECOGNITION OF THE PRINCIPLE OF LINGUISTIC PROVINCES

The despatch of the government of India dated August 25, 1911, visualised India as a union of autonomous provinces. The contents of this despatch was not known immediately. But when it became known, gave impetus to the growth of the idea of linguistic provinces as a principle for arranging ethnic and nationality groups into geographical areas. People living in composite areas, particularly, felt that unless provincial boundaries were redrawn and provinces reorganised on linguistic basis, provincial autonomy would become meaningless.²⁵ The Montague-Chemsford Reforms considered the linguistic reorganisation of states impractical though they were in favour of small homogeneous states. They however remarked:

It is also a strong argument in favour of linguistic or racial units that by making it possible to conduct the business of legislatures in the vernacular they contribute to draw into the arena of public affairs, men, who were not acquainted with English.²⁶

But this recommendation was not implemented as they contradicted the basic premise of colonial rule. However, there was some awareness of the logicity and force of linguistic nationality interests, though the setting up of Orissa in 1936 was the lone example of the British acceptance of the principle. Even this was granted not because of any people's movement but on considerations of administrative convenience. The repeated agitation of Sylhet to be transferred back to Bengal was not paid much heed. Thus Bengali speaking Sylhet and Cachar continued to be retained in Assam so that the two conflicting linguistic groups did not pose any unified threat to the regime. These are only a few examples of the desire of many ethnic and linguistic groups to be either unified with their kinsfolk or have a separate state. These were, however, persistently brushed aside by the raj. Such neglect retarded the free economic, cultural and political development of these nationalities, developed or incipient.

The principle of linguistic provinces was recognised by the Indian National Congress quite early as a key to tackle the problems arising out of the multinational, multi-ethnic character of India. It implied indirect recognition to such a characterisation of India. It also stated that the basis of the prospective federal structure of India, the distribution of provinces, would be the linguistic principle. The Congress was first seen to have lent support to this principle when it opposed the partition of Bengal.²⁷ Three years later it set up the Bihar Pradesh Congress Committee even before Bihar was actually created into a separate province. Although Sylhet was transferred from Bengal to Assam as a district, it continued to remain under the Bengal Provincial Con-

gress. The official recognition of the principle of linguistic provinces took place in the Calcutta session (1917) of the Congress. It was necessitated by the agitation for a separate Andhra Pradesh. Pressed by the Congressmen from Andhra, the issue had to be taken up in the Congress session of Calcutta but it was received with mixed feelings. Annie Besant, the president of the session, strongly opposed the whole idea. Gandhi while supporting the demand of linguistic provinces, thought the issue could await implementation of the imminent 1919 reforms.²⁸ Tilak said it would serve the interests of provincial autonomy. The subject was debated for two hours in the subjects committee.²⁹

By 1918, Gandhi had come to recognise the underlying logic of the principle. This facilitated its theoretical acceptance by the Congress in its Nagpur session (1920). A resolution was drawn up in the session with a scheme for the division of India into the following provinces: Madras, Karnataka, Andhra, Kerala, Maharashtra, Gujarat, Sind, the United Provinces, the Punjab, the North-West Frontier Provinces, Delhi, Ajmer, Marwar and Rajasthan, the Central Provinces (with Hindi as its principal language), Berar, Bihar, Utkal, Bengal with the Surma valley districts, and Assam and Burma (then a part of British India). This was a comprehensive reorganisation plan based on linguistic considerations with Bombay being an exception. The resolution was passed in the session and a plan for launching a struggle to achieve it was also approved. This acceptance and approval was a result of the pressure from its regional units, especially the Andhra region, and the mass sentiment involved in the issue. The Congress subsequently followed up the resolution by setting up its provincial units on the basis of language. The principle was recognised and incorporated in the Motilal Nehru report (1928) and its recommendations were accepted by the all party conference the same year.

The report of the committee appointed by the all parties conference with Motilal Nehru as chairman known as Motilal Nehru Report (1928) (Jawaharlal Nehru and Subhash Chandra Bose were its other two members) reiterated the need for reorganisation of the provinces in India as it found that the existing organisation of provinces had no 'basis'—geographical, economic, linguistic or historical. It was based largely in administrative considerations aimed at the advancement of British power in India. Sometimes the formation was even accidental.³⁰

The committee took into cognisance the demands arising from time to time for the separation and constitution of independent provinces of Andhra (the Telugu area), Utkal (Oriya), Karnataka (Kanarese), Kerala (Malayalam), Sind (Sindhi), the Central Provinces (Hindi speaking areas) and several

Other such areas. Arguing on the criteria to be used for distribution of provinces, the committee stated that apart from geographical and economic factors the most important consideration should be the linguistic unity of the area and the wishes of the people concerned.³¹

Accordingly, the committee identified the Assamese area, the Bengali area, the Oriya area, the Telugu, Tamil, Kanarese and Malayali areas, the Marathi, Gujarati, and the Sindhi areas, and on the basis of the memoranda and representations submitted by the respective ethnic and nationality groups for their constitution into separate provinces. The committee concluded that the Kannadigas had a strong case for the constitution of Karnataka province. The people of Sind also wanted separation and the area satisfied the conditions of linguistic unity and geographical continuity. Moreover its connection with Bombay was most unnatural as it was not even accessible from Bombay. Hence the separation of Sind was also desirable.³²

From the Oriyas there was no concrete representation except for a booklet and therefore the committee could not make any recommendation regarding the formation of Utkal although Subhas Chandra Bose who was a member of the committee put it on record that Oriya speaking areas should be amalgamated and constituted into a separate Utkal province. Bose also felt that the demand for the amalgamation of the Bengali speaking tracts in Assam and Bihar was also a reasonable and legitimate one. Regarding the unification and separation of Kerala as a separate province the committee opined that such a move would pose great difficulties, one being that Kerala consisted of the states of Travancore and Cochin and leaving out these states would reduce Kerala to a very small area. In such a situation, the committee for the present, did not make any recommendation regarding the constitution of Kerala.³³

As for the difficulties that would come in the way of implementation of these recommendations, the committee opined that "administrative convenience is often a matter of arrangement and must as a rule bow down to the wishes of the people".³⁴ and hence administrative considerations should not prevent such reorganisation. They suggested that normally a province would be expected to bear its own expenses and not "live on hopes of money flowing from outside". But at the same time it felt that "a denial of the right of self-determination on purely financial ground is bound to lead to great dissatisfaction".³⁵

THE MOVEMENTS

The Bengalis, Marathis and Tamils were the overwhelming majorities in the three presidencies of Bengal, Bombay and Madras. Being port cities, Calcutta, Bombay and Madras attracted a major chunk of British industrial investment and they soon

developed into important centres of industry trade and commerce.³⁶ Consequently advance of modern communication, introduction of western education and the development of these cities as administrative centres boosted the nationality formation process.³⁷ The process received further encouragement as these metropolises included most of a particular cultural area. Thus by the time other nationalities were still incipient or in an embryonic stage, the Bengalis, Marathis and Tamils had not only been recognised as relatively advanced, they appeared dominant. The representatives of these nationalities were preponderant in the white collar sectors and dominated the national intelligentsia. These cultural regions emerged as a socio-culturally active zone and even wanted to retain their hegemony over other emerging or suppressed nationalities as can be seen in the case of Bengalis over Assamese and Oriyas, Tamils over Telugus, Malayalis and Kannadigas, Marathis over Gujaratis, Kannadigas, and Konkanis. The situation in Bombay presidency was complex. Although the Marathas were culturally dominant here, the Gujaratis were an economically powerful group. As such the two were competing groups. While the Marathas wanted to gain economic hegemony, the Gujaratis wanted an area where they would have a cultural stronghold. The Bengalis derecognised the language of the Oriyas and Assamese, taking advantage of the closeness of the languages and banished the other two languages as mere dialects of the Bengali language.³⁸ As far as Bihar is concerned, Bengalis were preponderant in the job sector and exercised socio-cultural domination over the Biharis, which became the bone of contention between the two.³⁹ The Tamils had maintained an overwhelming socio-political domination over the Telugus, Malayalis and Kannadigas⁴⁰ until it was challenged by the separatist movements of the latter. Although, the non-brahmin movement was a progressive caste revolt, the Tamils tried to maintain their hegemony over the others through the slogan of Dravida Nadu. Under the Marathas, growth of Kannada and Konkani nationality was stunted which prompted the latter groups to advance separatist claims and demand the formation of unilingual province.⁴¹ Though Gujarati business interests were opposed to the move, the leaders of the 'Maha-Gujarat' movement wanted a province where Gujaratis would be culturally dominant.

The other movement that was seen amongst these advanced nationalities were for unification. The Swadeshi movement in Bengal (1905-11) was a reaction to the British plan to divide and rule the Bengalis. It is significant that though the Swadeshi upsurge struck a chord in far off Maharashtra, Punjab and even the south, it remained an essentially Bengali movement. Bengalis were 'emotional' against this British conspiracy 'to split and weaken a solid body of opponents' to the British raj. In

Maharashtra there was a Samyukta Maharashtra movement which aimed at unification of all Marathi cultural areas into one single province.⁴² The Nagpur-Vidarbha region which was in the Central provinces and Berar and the Marathwada region which was in Hyderabad principality, were cut off from the mainstream. The movement thus was for unification of all the Maratha cultural groups into one administrative zone.⁴³ In Madras the dravidian movement was aimed at unifying not only the Tamils under the anti-brahmin slogan but also the other dravida groups against the hegemony of the casteist Hindi heartland.⁴⁵

Another process that was at work was the nationality formation of groups, which were minorities within the presidencies—e.g. Telugus and Malayalis in the Madras presidency; Assamese, Oriyas and Biharis in Bengal presidency; the Gujaratis and Kannadigas in Bombay presidency and so on. The Kannadigas were spread over Bombay-Karnataka (i.e. Dharwad, Belgaum, Bijapur and north Kanara). They had a number of grievances in Bombay presidency like the dominating Maratha culture, cultural separation, economic deprivation, lack of development and competition from the Marathas in education and employment and above all lack of a political voice.⁴⁶ In response to this situation the mobilisation of the Kannadigas began which prompted the formation of the Kannada Ekikaran Sangha (1890). The struggle during 1890-1956 culminated in the formation of the Karnataka state (Mysore then).⁴⁷ This was the situation of the Gujarat nationality also. The formation of the Gujarat Sabha (1884) was the starting point of the Maha Gujarat movement. The sabha raised its voice against Maratha domination in Bombay presidency. Subsequently the concept of Gujarati Asmita was developed and a steady move for separation of Gujarat from the Marathas as well as a unification movement of the entire Gujarati speaking people came to the surface.⁴⁸ Though K M Munshi who coined the term 'Gujarati Asmita' was against what he termed 'linguism',⁴⁹ the separation of Gujarat from Bombay was inevitable. The Telugu speaking people of Madras presidency felt that they were being discriminated against and neglected by the Tamil majority. The articulation of the need for unification of the Telugus and separation from the Tamils commenced in 1903 when the Yuva Jana Samiti was founded. In December 1911 the idea of the separate state was circulated and it took the form of a movement from 1913 through the efforts of the Andhra Mahasabha.⁵⁰

In Bihar, the demand for a separate state had initially centred round the issue of the preponderance of Bengalis in jobs and education.⁵¹ The Assamese⁵² and the Oriyas⁵³ also complained of the imposition of Bengali socio-cultural domination and Bengali attempts to manipulate their lin-

guistic cultural identities. The attempts to resist their absorption into the Bengali nationality was the starting point of the separate state movements. In Assam the demand for a separate state was redundant as it was severed from Bengal and constituted into a chief commissionerate in 1874 by the colonial administration itself.

Again, there were groups which belonged to a particular nationality but were either cut off from it or administrative organisation compelled them to live amongst a different cultural group—the Marathas in Vidarbha-Nagpur and Marathwada region,⁵⁴ the Gujaratis of the Saurashtra-Kutch region,⁵⁵ the Bengalis of Sylhet and Cachar in Assam,⁵⁶ the Hindi-speaking population of Jabalpur in Central 'provinces'.⁵⁷ These isolated groups launched movements for unification with their kinfolk both during the pre-independence and post-independence period.

In the wake of the imminent withdrawal of the British there occurred some very significant movements which led to the integration of some states to the Indian union: The Punnappa-Vayalar rebellion in the present Kerala, the Telengana uprising in the Nizam state of Hyderabad, Irawat Singh's movement in Manipur and the Anti-Chief Movement of the Mizos in Mizoram.

The non-Malayali citizens of south-Travancore were disgusted with the tyrannical rule of the Malayali king of Travancore and directed their anger against the Malayali community itself. On the basis of this situation the ambitious dewan of this princely state manoeuvred an independent Travancore and Cochin movement and declared its intention (June 1947) of not joining the Indian Union. It came out with an American model of constitution for these independent states. The communist workers who had built a very powerful base among the coir factory workers, fishermen, toddytappers and agricultural labourers employed by the jenmi landlords, launched a massive campaign against this conspiracy. Police repression was followed by the rebels undergoing military training for self-defence. There was a violent confrontation between the state and the rebels in Punnappa and Vayalar where at least 800 people were massacred by the police.

Around the same time there was a Kerala unification (Akhila Kerala) movement also in operation. It worked for a united multi-lingual Kerala state. The king of Cochin state supported the movement and the Kerala Pradesh Congress Committee, Travancore State Congress and the Cochin Praja Mandalam together worked for unification. The brutal suppression of the Punnappa-Vayalar movement aroused sympathy and attracted mass support for the Kerala unification movement and its integration with the Indian union. Even though the royal family tried to back out and retain its independence, the Punnappa-Vayalar movement prevented a possible separation and simplified the

merger of Travancore-Cochin with the Indian union.⁵⁸

July 1946 to October 1951 saw the rise of another massive communist-led peasant movement in the Telengana region of the Hyderabad state, where a small Urdu speaking Muslim elite maintained its 'religio-linguistic domination' over the majority of the Telugu, Maratha and Kannada linguistic groups. There was a total absence of political and civil liberties and the grossest form of feudal exploitation was practised by the Muslim and high caste Hindu deshmuks landlords and jagirdars who extorted veti (forced labour) and maintained attached labourers through debt-bondage. While the ambitious nizam was conspiring to set up an independent state and opt out of the Indian union, the peasants rose in revolt. The bloody guerilla warfare of the peasants against the ruthless razakar army of the nizam stretched over a long period of time and the communists succeeded in establishing isolated independent zones in the Telengana countryside. This anti-nizam movement brought about the collapse of the autocratic feudal regime of India's biggest princely state with the entry of the Indian army and paved the way for the integration of Hyderabad with Indian union as well as the formation of Andhra Pradesh on the basis of linguistic principle.⁵⁹ The highlight of the movement was not just the massive peasant uprising and its bid to overthrow the feudal regime of the nizams but also the integration of Hyderabad with India. In fact, the movement weakened once the communists added the slogan of overthrowing the newly independent Indian government which had less mass appeal than the slogan of overthrowing the nizam.⁶⁰

Similarly discontented with the tyranny of the king, the people of Manipur under Irawat Singh led a Telengana-like revolt which alarmed the moderate section of the Manipuri leadership belonging to the provincial Congress, and they initiated a process which hastened the accession of Manipur into India.⁶¹ The decision not to join the Indian union in Mizoram was similarly reversed and the popular movement supporting the merger started when it was circulated that joining India meant the abolishment of Mizo chieftainship and an end to the exploitation and oppression of the peasant community by the chiefs.⁶²

Another type of autonomy movement was seen in the Chattisgarh and Jharkhand region both of which were overwhelmingly tribal and rich in forest and mineral resources. Consequently it attracted the perpetual encroachment by exploitative and oppressive elements, both British and Indian. There was not only a drain of wealth from these regions, the penetration of outsiders also destroyed the exclusivity of the region and its people, upset the socio-economic balance and thoroughly impoverished the tribals through colonial and feudal institutions. The consciousness and

struggle of the tribals in these regions dates back to the 18th century.⁶³ Some of these struggles were the Rajas' uprising of Dalbaun (1769-74); the Chaur uprising of Midnapur (1779); the Bhumij Chaur of Manbhum, Chhotanagpur and Santhal Parganas (1795-1800); Tanar revolt of 1820; the Kol, Ho, and Munda uprising of Chhotanagpur (1831-32); the Santhal uprising of Bihar (1855-86); the Bhakta uprising and Rai movements (1857); the Sardari or Mulki Larai (1857); Kharwar movement (1871); the Birsa uprising (1895-1900); the Bhagat movement (1902); and the Kol insurrection (1931-32). These uprisings represented a sort of 'class war' against relative deprivation.⁶⁴ The tribals in these movements attempted to throw out the exploitative 'diku's (encroachers) be it the British or Indians. In the Tana Bhagat movement (1915) there was an attempt to establish a millennial area of Oraon rule and liberate it from foreign settlers. Subsequently Jaipal Singh, a Munda-Christian organised the All India Adivasi Mahasabha (1930) which resisted British domination and non-tribal encroachment in tribal lands. During the 1940s various reform movements were launched to raise the consciousness of the tribals and work for their socio-economic upliftment. The phase between 1947-54 was marked by the emergence of the Jharkhand Party which regarded the formation of a separate state as the only way to safeguard the interests of the tribals. It is important that despite the multiplicity of language and culture, the tribals of the Jharkhand area were united to fight against exploitation and assert themselves. But the 1955-63 period saw the rejection of the demand of a Jharkhand state comprising districts of West Bengal, Orissa, Bihar as well as Madhya Pradesh by the Indian state and the subsequent merger of the party with the Congress (1963). The 1964-69 phase witnessed the weakening of the Jharkhand movement due to factionalism and cleavages within the movement. Following this there was renewed effort to foster inter-tribal and inter-regional solidarity to reinforce the movement.⁶⁵

The Chattisgarh tribals saw a similar solution to exploitation and encroachment by non-tribals but organised effort for a separate state is still lacking.⁶⁶

THE STATE VERSUS NATIONALITY MOVEMENTS

The commitment to the principle of linguistic provinces was reiterated by the Congress on two more occasions before independence—in the Calcutta session of 1937 and in the election manifesto of 1945-46 wherein it promised linguistic reorganisation of Indian states if it came to power. But the reality of 1947 was very different. Independence ushered in high hopes for groups demanding the formation of their respective linguistic states. In view of the

various resolutions adopted by the Congress over the years prior to independence and especially the promises made in the 1945-46 election manifesto they could now place their demands with some vehemence. The Congress on the other hand was not in much hurry to take up the issue. Overwhelmed by the unforeseen problems and difficulties independence brought in its wake and also because of the complications involved in the reorganisation of linguistic states the Congress was more than willing to stall the issue. Moreover, integration of the Indian states had to precede reorganisation.

Although the first phase of the process of the country's integration was accomplished with the accession of princely states during 1948-49, still the federal system of India comprised units like A, B and C categories of states. The Congress had already recognised that the formation of the so-called composite states consisting of peoples speaking different languages had been one of the ways adopted by the British to dissipate the force of nationalism. Hence, one of its commitments was the formation of linguistic states when it assumed power. It seemed therefore only natural that once India was free, its internal map would be recast in accordance with the principle of linguistic states. Some members of the constituent assembly even pressed the government to implement this principle even before the introduction of the new constitution. Nehru as prime minister, however, gave the matter 'low priority'.⁶⁷ No doubt Andhra had a strong case but if their demand was conceded, it was feared that similar demands from other groups would create a critical situation because the question was not just one of conceding provinces but also of alteration of the existing provincial boundaries. This would raise a plethora of claims and counter-claims which would precipitate a minor crisis when the priority ought to be country's security and stability. Under the circumstances, the government was in favour of delaying any decision and the best way to do it was to appoint a committee to examine and report on the feasibility of linguistic provinces. If this committee obtained a large measure of agreement, then one or more specific boundary commissions could be appointed. Accordingly, a commission was set up under Justice Dar's chairmanship. The report of the commission came as a surprise since its recommendations went against the earlier stand adopted by the Congress. The commission was against the formation of linguistic provinces on the basis of administrative considerations. It pointed out that the creation of linguistic provinces would be harmful from the point of view of the development of a national language and national awareness particularly at a time when national unity itself was endangered.⁶⁸

The formation of provinces exclusively or even mainly on linguistic consideration is not in the larger interest of the Indian nation and should not be taken in hand.⁶⁹

Obviously the Dar Commission had failed to grasp the spirit of the principle of linguistic provinces. It gave primacy to administrative convenience over national and ethnic aspirations. Demands for separate states were taken to be a threat to national unity and integration. As expected, the report created discontent among Congressmen who were from the non-Hindi speaking areas. They petitioned the Congress working committee to reconsider the issue. The issue could not be shelved as discontent gathered momentum.

At the behest of Nehru, the Congress formed a committee in late 1948 with Nehru himself, Sardar Patel and the Congress president, P Sitaramayya as members, known as the JVP committee. It submitted its report in 1949 wherein it said.

We should prefer to postpone the formation of new provinces for a few years so that we might concentrate during this period on other matters of vital importance and not allow ourselves to be distracted by the question.⁷⁰

The need for postponement also seemed desirable because the fate of the Indian principalities had not been decided till then and without that the formation of linguistic provinces seemed impossible. However, it also proposed that some steps could be taken in individual cases—like that of Andhra—if there was agreement between the concerned parties. Accepting the report, the Constituent Assembly in Article 3 of the Constitution, provided for the creation of such provinces in future. But by admitting the legitimacy of the Andhra demand the report plunged the entire issue in confusion and ambivalence. The Congress still resisted the actual reorganisation. On December 21, 1949, the Congress working committee in a resolution on Karnataka stated,

Further in view of the vital change in the states of India and the inauguration of the constitution within less than five weeks from now, it is outside the range of feasibility or propriety to consider a constitutional change of this magnitude at this stage.⁷¹

With the adverse reports of the commissions, the Constituent Assembly refused to make any proposal regarding linguistic states. It listed 14 national languages in the eighth schedule, but refrained from any mention of linguistic reorganisation of states.

Later, however, under tremendous pressure of popular demand, mass discontent and rebellion of Congressmen at the provincial level, the government was compelled to announce the establishment of Andhra province (1953). The decision to create an Andhra province logically encouraged similar demands throughout the country so much so that it seemed, "we are on the verge of a civil war".⁷² It also seemed that "we have disturbed a hornets' nest and I believe most of us are likely to be badly stung".⁷³ The creation of Andhra Pradesh did not calm the unrest as its constituents were the Telugus and Telenganas. On the one hand there was a move to unify all the Telugus in

one political unit called 'Vishal-Andhra' and on the other, the Telengana region wanted to separate from Andhra and form a different state of their own. The Telengana region complained deprivation at the hands of the dominant Telugus. There were widespread disturbance over the issue all through the 1960s and early 1970s.⁷⁴ Under the circumstances the government was forced to announce the appointment of yet another commission to draft recommendations on not just the problem of linguistic provinces but also on the redistribution of provincial areas on the basis of all relevant considerations. The commission known as the State Reorganisation Commission consisting of Syed Fazl Ali, H N Kunzru and K M Panikkar did a great deal of work, examined documents, memoranda, etc, and interviewed about 9,000 persons. The report published in 1955 recommended the establishment of Kerala and Karnataka as separate provinces on linguistic grounds and the wishes of the people but said that Bombay would continue to remain a bilingual area consisting of the Marathi and Gujarati speaking people. The Marathi speaking areas of Hyderabad were to be transferred to Bombay but certain other Marathi speaking areas were to be taken away to form a separate Vidarbha state. The Telugu speaking districts of Hyderabad were also not to be transferred to Andhra until 1961. The apprehensions of the Dar Commission and JVP Committee had faded by the time the State Reorganisation Bill was introduced in parliament by the then home minister Gobind Ballabh Pant. The home minister's speech of course and the long deliberations on the bill showed no trace of any second thoughts about the linguistic principle behind the reorganisation.⁷⁵

Parliament passed the act on the reorganisation of states on the basis of the SRC's report. The process of territory and language delimitation, however, continued even after the reforms of 1956.

The unrest, however, did not die out. The chief centres of trouble now were Punjab, where the Sikhs wanted a Punjabi speaking state of their own, and Bombay where the Marathis and Gujaratis wanted separate states for themselves instead of being clubbed into a single province. In May 1960, Bombay was divided into Maharashtra and Gujarat state. The Akali movement emerged on the Punjab scene as a gurudwara reform movement to liberate gurudwaras from exploitative clutches of the 'mahantors'. Initially, it developed a strong anti-imperialist and even a proletarian character. But when the leadership went to the feudal and the feudal-turned-capitalist elements the character of the party also underwent a significant change. This change was responsible for the diversion of the Punjabi state movement into communal channels. Such diversion was conspicuous because at this point of time there were many such separate state movements which revolved more or less around language

After partition when the Congress-Akali coalition in Punjab weakened and Master Tara Singh raised the demand for a Sikh homeland, the Hindus feared another partition on communal basis and began to renounce the Punjabi language. They claimed that Punjabi was a bilingual area where Sikh Punjabis spoke Punjabi whereas the Hindu Punjabis spoke Hindi. These claims led to communal polarisation which was fuelled by respective communal organisations. The report of the state reorganisation committee which rejected Punjab's reorganisation on linguistic basis kept the communal divide alive.

The Akali-Congress Agreement of 1956 to divide Punjab into Punjabi and Hindi speaking areas eased the situation to some extent. But the compromise did not last long as Akali leaders resented Congress hegemony and contrary to its promise took part in politics. This eventually led to a split in the Akali Party which lost control of the Siromani Gurudwara Prabhandhak Committee (1958). But it bounced back to power in the gurudwara election of 1960 and enthused by the victory Master Tara Singh immediately launched a *morchha* for Punjabi Sooba, giving it a communal colour. The Hindus countered it by recording Hindi as their mother tongue again in the 1961 Census.

During all these years the Congress did not take a consistent democratic stand on the issue. In contrast the Communist Party launched a counter-campaign against the communalisation of the linguistic reorganisation of Punjab. The party also detected that the Haryana region of the state was neglected and remained backward while the Punjabi speaking areas developed. Accordingly, it organised the people of the Haryana region to demand a separate state for themselves.

Sant Fateh Singh who succeeded Tara Singh realised that the Punjabi Sooba agitation could not succeed if it ran on communal lines. He came out with a new platform and declared that his demand for a Punjabi state was for all Punjabis—irrespective of their religious affiliations. Under pressure of the agitation the government was forced to announce the appointment of the S Hukum Singh Committee to look into the matter. In the wake of the Indo-Pak war of 1965 in which Punjab as a border state was affected and the simultaneous pressure from the agitation launched by Sant Fateh Singh the government was compelled to appoint the Shah Commission to inquire into the reorganisation of the state. Accordingly, the government agreed to reorganise the state on the basis of the Census of 1961. There was some controversy over the acceptance of the 1961 Census Report as it was known that the report was distorted. However, on the insistence of the government the state of Punjab was reorganised into Punjab and Haryana by an act adopted in parliament (1966). But it left many vital issues like

distribution of ~~river~~ water unresolved resulting in further complexities later.

The course of nationality formation in Punjab was very important. Like the Muslim question Punjabi nationality question had a religious dimension but the language question was also seriously involved in it.⁷⁶ Comprising Hindus, Muslims and Sikhs the Punjab region was also the hotbed of successive green revolutions. The complex class formation process initiated by colonialism went through further transformation with the green revolution. It was also complicated by the question of hegemony and organised political mobilisation. Punjabi speaking followers of the Sikh religion comprising only about 13 per cent of the Punjabi population (as against 55 per cent Muslims and 30 per cent Hindus) in pre-independence India, struggled to emerge from a sect to 'a people' who lately claimed separate nationhood. The Punjabi Sooba movement was not just a question of linguistic problems. It successfully masked their agitation for an essentially religious identity too.⁷⁷ The Punjabi Hindu attitude to identify themselves to Hindi language further communalised the issue. The Urdu movement in Uttar Pradesh had marred overall Hindu-Muslim relationship.⁷⁸ The Maithili movement in north Bihar did not have any religious cleavage.⁷⁹ But it failed to unify the Biharis as Maithili was just one of the media alongwith Bhojpuri, Avadhi and so on, that the Biharis spoke and with the resurgence of Hindi, these languages have been reduced to the status of dialects spoken at home. But the Bihari nationality formation process was inextricably linked to Uttar Pradesh and the Hindi speaking regions of Madhya Pradesh.

The process of carving out new states did not stop there. On January 26, 1950, the north-east consisted of the state of Assam and the union territories of Manipur and Tripura. The entire region consisted of about two hundred and seventeen scheduled tribe groups besides the plainspeople. The number of language groups inhabiting the region can be imagined from this. In view of the secessionist demand from some Naga quarters countered by a demand for a separate state from some other quarters, a state of Nagaland comprising most of the Naga areas of the region was carved out in 1963. In the rest of the areas the Assamese language groups retained their hegemony which was slowly begun to be challenged by the emerging middle classes of different tribal groups. It was fuelled by the consistent neglect of the non-Assamese regions of the state in terms of development and the attempts at forcible Assamesisation. The language policy of the Assam government (1960) was the final straw. The hill people resented imposition of the Assamese language and launched agitations for separate states. As a result, the states of Meghalaya, Mizoram and Arunachal Pradesh, Tripura, Manipur were created in 1971-72—some as union territories, some full-fledged states. However, by the

mid-1980s all the areas were granted full-fledged statehood. In spite of the difficulties involved the principle of linguistic provinces was followed to a large extent in the creation of these states.

The tribal states movements of north-east India were a reaction to the chauvinistic efforts of the Assamese to Assamesise the tribal group, besides being a response to the encroachment by outsiders into the tribal area.⁸⁰ This is true of all states of the region except Nagaland which, visualised its prospective marginalisation in the overall polity of India and put forward separatist claims. Tripura was an ex-princely state, subsequently accorded the status of the chief commissionerate and then statehood to promote the upliftment of the tribals.

NEHRU AND REORGANISATION OF PROVINCES

As seen above, the period immediately following independence saw the climax of various separate state movements. Since Jawaharlal Nehru was at the helm of affairs he became the centre of attention in this turmoil. He was looked up to for his socialistic leanings and pragmatism on the one hand and severely criticised on the other by his own partymen for his delaying tactics and apparent opposition to the creation of linguistic provinces. He was attacked for going back on his party's earlier commitment to the creation of linguistic states. His stance was found to be ambivalent, compromising and disrespectful of people's wishes.

But to Nehru, *first things must come first* and for a nation that had just come out of colonial rule, suffered the trauma of partition and was still unconsolidated, 'the first thing is the security and stability of the country'.⁸¹ A strong India had to be built before its component parts could be considered. But the agitating groups were not willing to wait; they felt that Nehru was going back on his promises and principles.

Nehru always wanted a democratic solution to the nationalities question in India. He was one of the constituent members of the Motilal Nehru Committee which for the first time had recognised and prescribed the principle of linguistic provinces for India. He obviously had a hand in the drafting of the Congress election manifesto which reiterated the party's commitment to form linguistic provinces. But Nehru wanted time.⁸² The country was facing extreme crises and there were innumerable more urgent issues awaiting government's attention. Nehru was sympathetic to the Andhra cause, but he knew that if a start was made in this direction there would be a plethora of similar demands. Hence he wanted to delay any decision by appointing commissions. When the Dar Commission Report instead of cooling down the temper of the people, aggravated the situation further, Nehru installed himself in the JVP Committee and drafted its report himself which recommended postponement of the creation

of linguistic provinces for ten years. It is evident that this is exactly what Nehru wanted—that the next ten years should be used for strengthening and stabilising the nascent Indian nation subsequent to which these issues could be taken up. To him during this period the economic problems should take precedence. The matter of linguistic provinces was 'trivial' nor was the time ripe yet for its implementation. But Nehru's personal involvement in the JVP Committee did not help the situation. Pressures from his own partymen from different provincial units had become acute. The granting of statehood to Andhra as anticipated, worsened the situation. Expectations ran high. The case of Andhra was taken as a hopeful precedent by other language groups clamouring for statehood. The timing of such movements and the violence unleashed upset Nehru. He found the hurry and the inconsiderateness shown, a little too parochial.

On principle, Nehru did not find these demands objectionable. In fact, "a linguistic mosaic might well provide a further base for national unity". But what he found difficult to come to terms with was the "feeling on the part of the people who make the demand that they did not (so far) have a square deal; that if they are left alone to manage their affairs, they would see that they got it".⁸³

He pleaded with people to be logical in their approach and not get excited. During the debate on the Report of the State Reorganisation Commission, he said:

I recognise that the language of the people is a vital matter for their development, whether it is education, administration or any other matter. But there is a distinction between developing the language to the fullest extent and this passion for building up a wall around a linguistic area and calling it a border. I completely accept the statement that people cannot really grow except through their language but it does not follow that in order to make them and their language grow, a barrier must be erected between them and others.⁸⁴

While he appreciated the importance of a language in a community, he was not wholly committed to the creation of monolingual provinces.⁸⁵ This was a clear denial of his party's age old commitment and involved shifting his own position. On another occasion also there was a dichotomy in Nehru. When pressed he agreed to take up the cause of Andhra and Karnataka but refused any alteration in the provincial boundaries and was emphatic that the Congress was not committed to such alterations.⁸⁶ It is surprising that Nehru treated the creation of separate states and alteration of provincial boundaries as separate issues. It suggests that Nehru was angry at the growing passion for separate states. He wanted "Healthy nationalism... to counter these foolish and tribal attitudes as also provincialism".⁸⁷ Asserting that India was an integral entity, he claimed that provinces were created only with 'administrative objectives'.⁸⁸ Of course

the nature of the problem was such that Nehru was 'not to be seen at his best'.⁸⁹ In fact, now Nehru started finding virtues in composite states created by the British. The example of Hyderabad where people spoke different languages as diverse as Telugu and Hindi appealed to Nehru as potential centres of composite culture in south India while Bombay had developed as a cosmopolitan centre which would be 'vandalistic to throw away'.⁹⁰ As a matter of fact, by 1955, Nehru was thinking of creating large composite city-states out of Bombay, consisting of the Gujarati and the Marathi speaking areas including Vidarbha. This he felt would be the ideal way of having larger as well as fewer states. He even went to the extent of persuading the chief ministers of Bengal and Bihar to agree to merge with each other to form one state,⁹¹ while Madras agreed to include Travancore and Cochin. There was even talk of a larger Dakshina Pradesh consisting of all the Tamil, Kannada, and Malayalam speaking areas. But all these ideas proved short-lived in view of persistent agitations and angry demonstrations leading to riots which spread specially in the Bombay presidency and Punjab. Disgusted and bitter, Nehru said in the Lok Sabha in 1960:

We live in a closed society—not one closed society, but numerous closed societies. There is a Bengali closed society, a Marathi closed society, a Malayali closed society and so on.⁹²

INDIAN BOURGEOISIE AND LINGUISTIC PROVINCES

The opposition to the demand for linguistic provinces came from another quarter—the Indian bourgeoisie. In the wake of the demand for creation of a Samyukta Maharashtra, the Indian capitalist class struggling to consolidate itself after independence, became vociferous in opposing the theory of linguistic provinces. The Indian Merchants Chamber, comprising leading industrialists and businessmen, adopted violent opposition to the theory and its application for creating a unified Maharashtra. They had panicked at the prospect of Bombay—the industrial city being transferred to the unified Marathi-dominated Maharashtra which could jeopardise their investments as most of these industrialists were Gujaratis, Marwaris, Parsis and so on, i.e., non-Marathis. This organisation of Indian capitalists manoeuvred a committee of 69 prominent citizens to give evidence before the Dar Commission. In a meeting (August 26, 1948) a resolution moved by Ramdas Kilachand and seconded by S A Brelvi urged the Constituent Assembly and the government of India to postpone the consideration to the demand for linguistic provinces for some more years.⁹³ Another resolution moved by A D Shroff and seconded by Vakil demanded that a separate state be created for Bombay, in case the government was con-

sidering the creation of linguistic provinces⁹⁴ for Maharashtra and Gujarat. The convenors of the meeting claimed to be spokesman of the citizens of Bombay but it turned out that they represented interests of a small and powerful group. Invitations were sent "only to a few panicky capitalists, mainly, Gujaratis, Marwaris and elements alien to Bombay, who were known to be against the incorporation of Bombay in its natural environment—Maharashtra".⁹⁵ With the prospect of Bombay being transferred to Maharashtra some leaders of the Gujarati state movement, which was simultaneously going on in the Gujarati speaking region of the presidency, Saurashtra and Kutch, backed out and opposed the formation of provinces on linguistic basis. K M Munshi, who coined the term Gujarati 'Ashmita' (identity) as well as the phrase 'Maha-Gujarat' (Greater Gujarat) has presided over the 1948 convention of Maha Gujarat Sammelan which unanimously expressed the sentiment for the unification of all the Gujarati speaking people and resolved to struggle to achieve a unilingual Gujarati province.⁹⁶ But in 1952 during his tenure as the governor of UP, he urged the Gujaratis to oppose the movement for a Gujarati state expressing a sentiment which was expressed by the Gujarati industrialists of Bombay.⁹⁷ It is well known that K M Munshi was the lawyer of the industrialists of Bombay and he was merely a spokesman of the latter. It is interesting, though understandable, that the man who was hailed as the father of 'Gujarati nationalism' criticised the movements for creation of states on linguistic basis as 'linguism' and prophesied that such 'linguism' could spell doom for the nation.⁹⁸ Another eminent Gujarati who had opposed the Gujarati state movement and was labelled as a part of the capitalist lobby was Morarji Desai. However the regional bourgeoisie of Gujarat probably found the prospect of a Gujarati state with Ahmedabad as its prospective capital a lucrative idea as it would give them an open, new area to operate and without competition from its stronger counterpart settled in Bombay. The Ahmedabad Chamber of Commerce lent its support to the movement and agreed to bear the financial expenses of the movement (1956). A strong faction of the chamber even boycotted the ceremony (August 8, 1956) organised to welcome Morarji Desai, who had been a vocal opponent to the Maha Gujarat movement.⁹⁹

All through the 1950s the Indian bourgeoisie continued to be hostile to the movement for separate states on linguistic basis. Interestingly even after the consolidation of its hold over Indian economy and polity, the Indian capitalists perpetuated its tirade against the movements. In 1969, the president of Federation of Indian Chamber of Commerce and Industries, Kirloskar while moving a resolution on national integration and the business community remarked that the two most serious and administrative blunders committed by the Indian state were: first,

the adoption of a federal constitution and secondly, reorganising the federating units in linguistic states.¹⁰⁰ According to him the ugliest form of provincialism has emerged in India due to the idea of linguistic states.¹⁰¹ Interestingly the assembly also found that victory of CPI(M) in 1967 and again in 1969 mid-term poll a dangerous turn towards regionalism which represented an alarming trend.¹⁰² The involvement of big money in the reorganisation of Bombay was apparent when the Congress working committee proposed an independent status for the city of Bombay. Similarly Tata House persuaded the government of West Bengal to surrender to Bihar about 600 square miles of territory in the districts of Purnea and Santhal Pargana containing the coal reserves and the water works of the Tata Iron and Steel Company.¹⁰³

In other words the struggles of different nationalities for self-rule and development were constantly attempted to be thwarted by the big bourgeoisie and its allies holding the state power in India. It also exposed the weakness of the ruling class and its strong alliance with the big bourgeoisie.¹⁰⁴ Even as democratic a demand as the linguistic state had to be wrested only after a protracted and bloody struggle.¹⁰⁵

The opposition of the big bourgeoisie of India to the linguistic principle of state creation was understandably based on the following premises. One, big bourgeoisie was fundamentally opposed to the concept of federalism. A centralised state remains a prime necessity for its unhindered growth and development.¹⁰⁶

Two, the big bourgeoisie being the leading partner in the class alliance that ruled India and increasing its control and operating through the centre and its decision-making organ—the cabinet, is extremely reluctant to concede greater power to the states in any meaningful way.¹⁰⁷ More linguistic states means sharing power with one more set of regional bourgeoisie. State movements also often are followed by a demand for more autonomy which the big bourgeoisie resent.

Third, linguistic provinces means encouragement to the development to local language, culture and so on. But theoretically, the big bourgeoisie prefers homogenisation of the market, development of a single language as the all-India market lingua franca (Hindi in this case) essential precondition for the furtherance of the cause of capitalism and the implication of the linguistic states are antithetical to both. Hence, there has been this trust on a massive middle classification of the entire country, an ever increasing English educated and Hindi speaking middle class which despite its heterogeneity are similar in dress, tastes, habits and outlook and so on. Javed Alam felt that the 'pan-Indian' big bourgeoisie in India, unlike in Europe, did not need to champion any particular language and hence the Stalinist formulation that the bourgeoisie promotes regionalist, linguistic state

movements is false¹⁰⁸ as far as Indian situation is concerned. Here the role of the regional/local bourgeoisie who are to be distinguished from the big bourgeoisie becomes important. The local investors, unfit to compete with the big bourgeoisie, want to eke out their own field of operation in the form of linguistic states where they could use their potential coverage to reduce the impact of big money. Apart from Gujarat, Maharashtra is in fact a good example of the rise of local entrepreneur (particularly in the sugar industry).¹⁰⁹ There were also an increasing number of job-seekers from the lower middle classes without proficiency in English, thronging the gates of public and private offices. The creation of new states and elaboration of their apparatus creates new opportunities for the local job seekers, politicians and investors. For these job seekers adoption of Hindi for official purposes would expose them to unequal competition against those whose mother tongue is Hindi. In other words the functional logic behind the support or opposition to state autonomy movements was simple. Big operators wanted big areas of operation, small operators small ones. Big business and big industry would like to function unhindered by the political constraints of linguistic states while smaller business and industry wanted the protection of their state. Similarly, the most educated professionals wanted an all-India opening for jobs and occupations while the less-educated, less-resourceful middle class hoped for safer berths in their own states created on linguistic principle where they constituted the dominant majority.¹¹⁰

HINDI SUB-NATIONALISM

The making of the Indian nation was not complete yet in 1947. India had merely got rid of the foreign power and started working on the task of channelising the pan-Indian sentiment towards the making of the nation override the regionalist sentiments. As a mark of the beginning of the decolonisation process and providing India with its own unique identification, the concept of national language was ushered in. Hindi was chosen as the only potential national languages in India but its implementation gave rise to acrimonious debate and political turmoil. It is ironical that though the overall purpose of the introduction of Hindi as the national language of India in place of English was to consolidate the decolonisation process and integrate different diverse regions of the country it threatened to disintegrate the nation even before people could reconcile with the fact of the last partition.

HINDI FOR HINDUSTHAN?

The most prominent language controversy in colonial India was the Hindi versus Urdu and Devnagari versus Persian-Arabic script issue. Hindi was identified with Hindu and

Urdu with the Muslims. After partition however there was no question any longer of making any significant concession to the Muslims on the language front. The question that dominated the proceedings was whether and how long English should continue to be retained as the official language. It was also a matter of anxiety as to what should be the lingua franca of the diverse linguistic groups of India.

English was agreeably India's 'window to the world' and its retention for official purposes had practical as well as emotional implications. The practical questions concerned international communication and dissemination of ideas of modern science and technology for which none of the Indian vernacular languages was yet fit, either in vocabulary or in the availability of translated texts. At the same time there was emotional antipathy towards the use of the former master's language. Retention of English language was considered to be an impediment to the unhindered process of decolonisation. But it was understood that as far as English was concerned, it had to be given some more time till the transition to an Indian language took place. But the major debate was: which of the major languages of India could be adopted as the official language. Poet Tagore was clearly in favour of Bengali before he died. Hindi was emerging as a medium of communication during the anti-colonial upsurge. Congress leaders addressed mass rallies in Hindi. Subhas Bose used Hindi in his INA movement. But most important the identification of Hindi with Hindus was vigorously reinforced after partition. There was a tacit attempt to project Hindi as the language of this part of partitioned India where Hindus were now an overwhelming majority. The 'Hindi for Hindusthan' slogan was used to back up the introduction of Hindi as a national language. The association of Hinduism with Hindi was clearly evident when Hindi was chosen over Hindusthani, which was a mixture of Hindi and Urdu, as the national language of India. When Hindi was officially proposed as a national language the arguments made were:

- (a) It had the largest number of speakers and had intensive spread in northern India;
- (b) Being a Sanskrit-based language it could qualify more than any other language, as the lingua franca;
- (c) The language did not belong to any particular province of India. The proponents rejected other languages as their speakers were confined to provincial boundaries only. Hindi was also projected as a 'link' language—both real and potential.

The centre's soft attitude towards Hindi unleashed an acrimonious debate leading to violent protest all over the country except the Hindi speaking zones. It seemed the forces of disintegration were unchained even before the country could consolidate its new found freedom.

In the initial period, the modern Indian political scene was dominated by the Bengalee. Both British as well as other Indians feared that if the British withdrew from India power would be transferred to the Bengalees. In fact it was also apprehended that the introduction of representative institutions or competitive job market would mean the dominance of the 'advanced' Bengalees. But the preponderance of the Bengalee elements in the central leadership in the nationalist politics witnessed a consistent decline from the 1920s. By the 1940s the modern Indian leadership came to be dominated totally by the representatives of Hindi speaking zones who were the proponents of Hindi language. United Province, Bihar and Central Province were the largest provinces of India. Added to it were the supporters of Hindi language from Punjab (Punjabi Hindus), the present Haryana and Himachal Pradesh who were otherwise bilingual. By sheer weight of numbers the representatives of these areas in the central legislature were so preponderant that together they could easily make or break any proposed policy. The support to Hindi as the national language came from this lobby which was otherwise a heterogeneous group. In fact their heterogeneity actually strengthened the claim of Hindi.

The resurgence of Hindi was not only a part of the Hindu resurgence in post-partition India, it also was a manifestation of the process of subnationalistic upsurge. Post-independence India witnessed an upsurge of subnationalism on the basis of regional identity. There was a commensurate mushrooming of regional political parties based on regional identity and aspirations. While in the rest of India there was vigorous ethnic and nationality formation process, on the basis of regional/local identity the reverse was happening in the so-called 'Hindi Heartland' which comprised roughly the area under the province of Bihar, Uttar Pradesh and Madhya Pradesh excluding the tribal zones. In these areas, the nationality formation process among the Maithili, Bhojpuri, Avadhi, etc. speaking people took a reverse turn with the standardisation of Hindi language. Instead of separate nationalities emerging on the basis of Maithili, Bhojpuri and Avadhi cultural groups, they emerged as one broad group (not a nationality) for whom Hindi became the symbol of identification as well as unification. Although there was no culturally distinct Hindi group, Sanskritisation, the brahminical ideology and its caste system became the integrative symbols of this group. Support for Hindi from this group was an aggressive reaction to the subnationalist currents that had surfaced so strongly all over post-independence India. This is not to say that these groups were more pan-Indian than subnationalistic forces or were more concerned about the integration of the new nation. It reflected merely the subnationalistic

cultural and political aspirations of this dominant group. Their hostility to Urdu, the Hindiisation of the tribals living in those provinces and the antipathy towards the cultural and political aspirations of other minor constituents of the Indian nation reflected the chauvinism and lack of belief in the democratic principles of this group. The association of Hindi with Hindu had its emotional appeal to the wounded psyche of the people who were ravaged by partition. But soon small nationalities and ethnic group began to see through this appeal and its implications. The aggressiveness and the domination shown by the Hindi lobby in the introduction of Hindi as the national language made clear who was going to rule India henceforth and how. The subnationalistic movement had to strengthen itself in self defence.

HINDI VERSUS NON-HINDI

In the wake of the debate the country got divided into Hindi speaking versus non-Hindi speaking groups. While the proponents of Hindi called for its recognition as the 'national' language of the country, the representatives of the non-Hindi speaking people insisted that their language was equally 'national'; and if Hindi was to be recognised, it could only be as the official language of the union. For internal communication within their own regions, non-Hindi speakers expected to retain the use of their own languages and the right to use English for inter-provincial communication as well as communication with the central government. This controversy also had another material dimension to it. The declaration of Hindi as the national language would mean the dominance of the Hindi speaking aspirants in competition for employment (public services). The non-Hindi speakers insisted on retention of English as the only way to block the elevation of Hindi.

The Constituent Assembly resolved this demand for retention of English for a transitional period by granting Hindi the status of official language of the country, but postponing its implementation for 15 years.¹¹ In the meantime English would continue to be the official language of the union and of inter-provincial communication, and the major regional languages would continue to be used permanently in their own provinces and would also be recognised as 'national' languages through their incorporation into the eighth schedule of the constitution (also to be used in the UPSC entrance examinations). The constitutional compromise also provide for the establishment of language commissions in 1955 and 1960 to survey the progress of Hindi and also to give 'due regard' to the interests of people from non-Hindi speaking regions with regard to employment in public services, etc. After the interim 15 years parliament would take up the issue again.

The final voting on the compromise

amendment revealed the basic lines of division in the country over the matter. On the one side were the most prominent members of the Congress including Nehru himself arguing strongly for Hindi and against the pluralist solution advocated and on the other hand were representatives of southern states as well as states like Gujarat, Bengal and Assam.

Efforts, however, to prepare for the transition to Hindi as the sole official language of the country in 1965 made little progress because of the opposition from regions. Promotion of Hindi in schools had little success except in Maharashtra and Gujarat. A three-language formula was introduced in undergraduate education.

In 1963, two years prior to the scheduled transition to Hindi, the Lok Sabha took up the question of India's official language. Amidst heated debate the proponents of Hindi demanded immediate implementation of the constitutional provision on national language while MPs from Bengal and south India insisted on the retention of English. A compromise was reached and the Official Language Act 1963 was passed under which Hindi was to become the official language of the country in 1965 but English was to continue as an associate additional official language. The act also provided for a parliamentary review committee to reconsider the situation in 10 years with the power to extend the retention of English if Hindi had not made sufficient progress among non-Hindi speaking people. Prime minister Nehru gave his personal assurance to parliament that there would be no attempt to impose Hindi on non-Hindi speaking people.¹²

The ambiguity inherent in the act left an unresolved tension which exploded after the death of Nehru (1964). In 1964, during Gulzarilal Nanda's tenure as home minister (known for his pro-Hindi leaning) a directive was issued from his ministry to all other union ministries, that in conformity with constitutional provisions on official language and the Official Language Act of 1963, they report on the progress made in promoting "the use of Hindi for official purposes and to indicate what steps they proposed to take to use Hindi" after the designated day of transition, i.e. January 26, 1965. When news of this directive reached Tamil Nadu, there were massive student demonstrations, riots and self-immolations which continued for several months in late 1964 and early 1965 as a consequence of which, a grand convocation of the Congress Party leadership, union ministers and chief ministers, met in Delhi in June 1965. At the meeting a consensus was reached on removing the remaining ambiguities in the Official Language Act. Under the terms of this compromise, the non-Hindi speaking states were assured that Hindi would never be imposed on them, that English would be retained as an associate additional official language so long as even a single non-Hindi state desired it. In addition, on the material issue of en-

try into the union public services, it was agreed that all the languages listed in the eighth schedule of the Constitution of India, that is all the major languages as well as Hindi and English could be used as the medium of examination.¹¹¹

The compromise of 1965 was introduced formally into the Official Language Act through the Official Language (Amendment) Act 1967. The nature of the resolution of this long-standing controversial issue was basically bilingual. The act provided for the joint use of Hindi and English in parliament, for the use of Hindi as the language of communication between the centre and the Hindi speaking states and the use of English for communication between the centre and non-Hindi speaking states. However, the act and the overall compromise also contained multilingual elements particularly on the matter of the languages of communication for entry into union public services.¹¹⁴

As mentioned earlier the main features of these movements which reflected various national and ethnic questions originated during the colonial period and continued in the post-independence period. During the colonial period most of these movements generally did not come into conflict with the national movement nor did it digress from its anti-imperialist character. The Dravida movement for example initially was as much an anti-brahmin movement as it was anti-British.¹¹⁵ The Akali movement was essentially a peasant movement supported by demobilised soldiers. During the Gurudwara reform movement the Akalis had declared that their ultimate task was to cleanse the bigger Gurudwara (i.e. India¹¹⁶) of the British. The movement had even acquired a proletarian bias before it was communalised during the Punjabi Sooba movement.¹¹⁷ The Andhra state movement was in fact led by the provincial Congressites. Both the leaders of the separate Orissa movement, Gopabandhu and Madhusudhan Das clarified that their movement was a part of the Indian national movement.¹¹⁸ The Karnataka Ekikaran Sangha maintained that the Kannada identity question was not a threat to India's national identity.¹¹⁹ In Gujarat K M Munshi made it clear that Gujarati ashmita was not antithetical to pan-Indian ashmita.¹²⁰ This aspect of regional identity was illuminatingly brought to life by a new group of historians, by studying individual cases.

It is commendable that the Indian National Congress, as a professed representative body of all sections of Indian people, had recognised the relevance of the principle of linguistic provinces and promised to reorganise Indian provinces according to the principle. In a country where capitalism (under the aegis of colonialism) had instilled life in the national and ethnic groups who were at different stages of development, this recognition was the right stimulus. It raised the hopes and aspirations of the national and ethnic groups. But after independence when expectations were high from the na-

tional government and linguistic recasting of the country was eagerly awaited the issue was relegated to the background. This dampened the spirit of the national and ethnic groups which was unwelcome for a country that had just emerged from colonial rule and was yet to establish itself as a nation. It weakened the foundation of the federal structure even before it acquired a firm footing. Discontentment, agitations, violence and even contemplation of secession followed. Nehru's favourable interference was eagerly expected as his socialist leanings were well known. But his disapproval for an immediate recasting of India on linguistic lines came as a severe disappointment. The caution advised against such recasting by both the Dar Commission and the JVP Committee was enough for the nationalities to lose hope. At least the former saw some inherent dangers in any such reorganisation of Indian states from the point of view of national integration. It was suspected that the monopoly houses which wanted a single unified country as its market pressurised the government not to concede to linguistic provinces. But the significant point is that, despite these warnings and disavowment of the principle of linguistic provinces, the government was compelled under popular pressure to concede many new states during this period.

Curiously enough, the demand for a separate linguistic state has always been seen as 'secession'—a threat to national integration.¹²¹ The history of the principle of linguistic province in India shows that such suspicion was a new—a post-1947—phenomenon, before which national bodies, like Indian National Congress, themselves had repeatedly accepted the linguistic recasting. The Nehru report had even specified the areas that would need reorganisation. The post-partition milieu gave rise to this phobia which saw every demand for states' reorganisation as an offshoot of partition¹²² or another potential partition scheme. Similarly, the reorganisation of states was usually a 'concession' to the democratic urges of the people and not a recognition of the historical development of the concerned nationality as reflected in its consciousness and as articulated in the demand for a separate state. A nationality's final aspiration is to self-rule. Some ethnic groups were compelled to demand separate states because of 'majoritarianism'.¹²³ Pushed to the wall by the growing accent on 'numbers' and majority rule, and betrayed by the large nationalities such ethnic groups demanded a territory at least where they would at majority. Except for Kashmir, the Nagas and Mizos, initially demanding the right of self-determination, the separate states movements so far were not secessionist. They usually did not challenge the sovereignty of the Indian nation but wanted to remain an integral part of the Indian nation and participate in the development process as a constituent unit. Moreover in a composite state small nationalities and

ethnic groups were often neglected by the dominant nationalities in the allocation of resources for development. The argument that was often used against the creation of new states was financial unviability. The Nehru Report of 1928 had categorically stated that if the popular will was in favour of a separate state, financial viability should not be a constraint though normally a state was expected to bear its own maintenance cost. But all regions of the country were not equally endowed and needed to be totally financed by the centre. Under the arrangement, the centre was after all a surplus extracting body whose one principal task was to pool the resources and surplus revenue of the country and distribute it equitably among the various nationality areas so that people of different region develop at an equitable pace. If there was any disparity between states, it would be manifested in the attitude of the people. The edifice of the Indian nation would crumble if a region and its people was to remain backward just because, accidentally, its soil was not rich enough.

One obvious fear was that there would be no end to such demands for separate states. But if the country could have 25 provinces, could it not afford 50 as well, especially if it curtailed political tension, precipitated development and strengthened the integrity of the nation. USSR, for example, had 15 Soviet Socialist Republics, 20 autonomous republics, 10 national areas and eight autonomous regions. Also the US with just 230 million people has 50 provincial units. The Indian federal structure had already shown incredible flexibility to accommodate fresh demands and evolve its own device to smoothen a crisis situation. In some cases it evolved an effective device of granting autonomy through the district councils system (as seen in the Gorkhaland case) which showed the flexibility of the system, which is organic and is capable of overcoming its own obsolete features and confronting situational exigencies. As against this, ethnic and national movements reflected the fear, will and aspirations of the constituent nationalities and ethnic groups. The national language policy of the new government in free India increased the fear and misgivings and at the same time was a blow to the will and aspirations of these constituents. It was feared that Hindi subnationalism was turning chauvinistic and emerging as a dominant force whose designs were 'expansionist' and hence reactionary. The assertive attempts of these subnationalistic forces in retaliation seemed to rock the very foundation of Indian nation for a while and threaten to disintegrate it again. Concessions and grant of self-rule lessened the intensity of the subnationalistic movements since then. But in a country where capitalism is slowly reaching new areas and awakening new cultural groups to life, the stream of subnationalistic uprisings seems to be unending. New demands and aspirations continue to surface some of which are demanding complete in-

dependence not just self-rule.

The Indian nationality question cannot be studied in exclusion of these aspects because the culmination of this process can only prove whether India has been a nation-in-the-making or a nation-in-the-unmaking.

In our discussion, advanced nationality refers to a group of people who not only share common language, culture, mental make-up and consciousness but also had a headstart as far as nationality formation was concerned. They are generally large in number too, e.g. Bengalis, Tamils, Marathas. As against this the backward nationalities are those who have similar traits but a late-starter due to weak ethnicity, adverse socio-political environment.

EXECUTIVE DIRECTOR FOR R. G. V. N.

RASHTRIYA GRAMIN VIKAS NIDHI, a Fund created by the IFCI and IDBI and registered as a Society, promotes, supports and develops rural economic activities through voluntary organisations engaged in social and economic uplift of the poor by providing financial, technological and managerial support to agencies concerned, and by addressing problems of the rural sector through research, consultancy, training and workshops. Having concentrated initially in the North-Eastern Region, the RGVN has now spread its activities to other less developed States like Bihar, Madhya Pradesh and Orissa.

RGVN needs **Chief Executive/ Executive Director** with proven leadership capability, commitment to the uplift of the poor, ability to work with NGOS and insight into project planning, financing, appraisal and monitoring.

Age : Above 35.

Experience : About 15 years in rural development, including 5 at a senior level in planning and decision-making.

A Post-Graduate Degree in any field. A degree /diploma in rural management/rural development/business management preferable. Knowledge of HINDI essential.

Salary and perquisites commensurate with post and are negotiable. The position is based at RGVN Headquarters in Guwahati. Nominations of deserving candidates also welcome. Please write in confidence within 21 days to :

Rashtriya Gramin Vikas Nidhi
C/o Director, Entrepreneurship
Development Institute of India
BHAT, P.O. Chandkheda-382 424, Gujarat.

Technological Innovations in Agriculture

Policy Options for Social Welfare

S S Kutaula

The concept of social welfare, viewed through income growth rate and welfare weights, after proper assessment, is extremely important for the betterment and material well-being of the society along with the basic objective of reducing income disparities specially when there exists a widening inequal income distribution. For this purpose, a sound policy is needed. A thorough examination to allow income redistribution through social value judgment is necessary for tending the masses towards an egalitarian society along the path of social development.

I

Introduction

EVEN with tremendous pace of technological advancement, the outstanding issues, like reduction in magnitude of poverty, unemployment and income inequality which have direct interdependencies on morphology of income distribution, still appear to be frustratingly circumscribed amidst the planning agenda impinging with the policy horizons of developing economies of the world.

Income distribution analysis which economists study under two major approaches, namely, functional income distribution and size income distribution, signifies the importance of development policies for suitable distribution of income. Functional income distribution is based on a certain set of restrictive assumptions propounded by neo-classicals. The trickling down mechanism, based on the dogma of harmonies of interest and automatic equilibrating adjustment for self-reinforcing economic forces is a dark spot on the face of neo-classical theory of development because it fails to provide a satisfactory explanation when income inequality between 'haves' and 'have-nots' grows persistently.

In the context of agriculture whenever technological innovations take place, 'the manna from heaven' approach that brings higher levels of output, which in turn, generates enormously increasing levels of income, thereby gives a great setback to the doctrinaire principles of neo-classicals in the sense that the self-correcting built-in mechanism loses a good deal of validity, for its inability to explain simultaneous visibility of inter-sectoral disequilibrium in an economy. The drastic failure of neo-classical thesis is so unbelievable that the heterogeneous distributional consequences of factor bias propels inequal income distributions embodied in a new agricultural technology but its improvement *per se* becomes disembodied effectively without theory.

The theory of induced technical and induced institutional change which generates controversial issues of selective

mechanisation versus land augmenting or labour saving because of the distortion in price mechanism, biases in factor substitutability and displacement of labour gives rise to the problem of direct and indirect employment effects in the whole economy. In view of such existing critique levelled against neo-classicals, it is less convincing to draw inferential results judiciously while applying the approach of functional income distribution. As such, there are obvious reasons to believe that the approach of size income distribution gains superiority to functional income distribution especially in third world economies.

II

Rational Approach

A clear picture emerges for implication of suitable policy when planners are able to identify what proportion of income from total income realised by the community of farmers is being received by different categories of farmers. For size income distribution, Lorenz Curve represents actual quantitative relationship between percentage of income recipients and percentage of total income received during a given period. In order to draw conclusions regarding nature of income distribution of a given society, deciles or quintiles under the framework of Lorenz Curve are generally used. The extent to which inequality prevails in society and corrective measures to be taken for equitable distribution of income with the instrumental policy parameters, namely, growth rates and welfare weights of income under the concept of quintile distribution is extremely useful.

However, the aim of social justice cannot be fully met because there are a priori reasons to believe that the richest take away major chunk of income while the poorest are left with a negligible share. Inherently, this is a grim reminder of the fact that socio-economic justice cannot be provided if the richest manifest increasingly higher growth rates whereas the poorest are not able to exhibit any significant growth rate of income. At this juncture,

economists suggest alternative policy options and try to achieve goal of social justice by allowing growth rate of income in a way that treats whole population equally. If the basic goal of society is to uplift the poorest from their poverty and to make them better off, then the welfare weights are assigned only to the poorest with no welfare weights to the richest although they show significant growth of income.

From the point of view of social, political and economic justification, for allowing the improvement in the condition of farmers, the most common basis on which the provision of relief measures are made appears to be farmers' landholding sizes. How far the validity of the farm size is consistent specially when new technologies are introduced in agriculture is a questionable issue. Obviously, the result of income distribution will be misleading and ambiguous unless the analysis is based on the net disposable income of the farmers. Despite the usefulness of net disposable income over gross income, the viewpoint that the gross income gains superiority to farm size for designing a policy not only facilitates economic rationale but also tries to resolve some of the most outstanding issues concerning validity of the inferential results especially when neo-classical tools of analysis are forcibly applied to the farm data which itself is far from perfectly competitive environment of the production technology.

Although farm size does not enter into the income distribution analysis directly, it still helps the planners from backup as it is implicitly present in the analysis. In other words, a more simplified and convenient approach is to assume an economic variable, say, gross income which has the capacity to capture all the characteristics of small, medium and large farms. In this way, we do not straightway seek departure from underlying manifestations of farm sizes, rather we try to accommodate it in income distribution analysis with a more realistic viewpoint. In view of the forementioned facts, the following section presents a conceptual

framework of income distribution analysis and suggests an alternative approach of using quintile distribution rather than farm size to construct various indices of social welfare for allowing fiscal measures rationally.

III

Conceptual Framework

Let us consider a simple equation of gross income Y for i th farmer

$$Y_i = \sum_{j=1}^K C_{ij} P_j \quad (1)$$

$i = 1, 2, 3, \dots, N$ farmers

$j = 1, 2, 3, \dots, K$ crops

where C and P are output and selling price, respectively.

These incomes for N families can be arranged in ascending order for showing the rising levels of incomes. As usual, the population is divided into successive quintiles and deciles according to ascending level of income for determining what proportion of total income is received by each income group. These quintiles are very important for the interpretation of growth of social welfare.

Farm size is an important variable used in the calculation of gross income which itself is directly obtained as sum of the products of respective prices and farm sizes of paddy and wheat crops in respect of each family under community of farmers adopting land reclamation technology. Though the farm size differs considerably in both the cases of paddy and wheat, still it implicitly reflects rising levels of incomes.

The basic idea underlying the concept of quintile distribution under analytical framework of Lorenz Curve for measuring the overall index of growth of social welfare is availability of income units to the 20 per cent of population in each quintile which are grouped according to rising levels of income. If the interpretation is carried forward with a judicious rate of income growth provided externally to each of the quintiles, then the overall growth of social welfare index (SWI) can be measured by

$$SWI = \sum_{i=1}^5 \omega_i q_i \quad (2)$$

where ω_i and q_i are welfare weights and growth rate of income of i th quintile, respectively.

This measure of social welfare provides a sanguine view of income distribution and is immensely helpful in the interpretation of the improvement of social welfare in achieving goals of equitable distribution through different policy alternatives for a society displaying inequal distribution of income. For this purpose,

economists construct three indices of overall measure of index of growth of social welfare, namely, distributive share index, equal weights index and poverty weighted index. For example, we are led to construct distributive share index of social welfare if we assign suitable growth rates of income to respective welfare weights of quintiles. Similarly, equal weights index of social welfare can be constructed if we assign equal weights to each of the different quintiles while retaining same growth rates as in the above example. Finally, there may be a need to construct poverty weighted index of social welfare if welfare weights are exclusively assigned to the population residing in the first two quintiles.

The above concept of social welfare, if interpreted for designing policy options through the help of socially desirable indices of social welfare, is an alternative view which, in fact, is generally employed for determination of policy incentives or curbs to be allowed in agrarian economy. Though, farm size is a crucial economic determinant for the award of relief measures given to the marginal farmers in terms of price incentives, subsidies, credit facilities, the concept of social welfare if translated in terms of income speaks greater volumes for our realistic approach rather than the farm size.

In our opinion, the concept of social welfare when transformed directly into the economic profile of agriculture, presents a more sanguine view for attaining social justice. Further, when this type of income distribution analysis is applied particularly to those areas where crop production is assimilated under the premises of technological innovations, it draws a realistic picture of the socio-economic conditions of the community of the farmers realising income from crop enterprises. This approach is further strengthened in view of the fact that the manifold rise in income levels, reflected by accelerated productivity takes place on threshold of the new technology introduced in agriculture.

In the broader sense of this fact under the profile of quintile distribution, our present approach is to establish a mutual relationship between the respective quintiles and manifestations revealed by large, small and medium size farms. In other words, we assume a situation that provides some characteristics which are inherently associated with different categories of farmers not by varying farm sizes but by varying levels of income shares reflected by different quintiles. More specifically, in the context of the adoption of land reclamation technology for crop production, the community of farmers is under following economically distinguishable, practically viable, plausibly acceptable

and logically arguable categories associated with different quintiles.

CATEGORIES OF FARMERS

The top 40 per cent, the richest category of farmers which has full command in the disposal of factors of production suited to land reclamation technology. It is further assumed that due to their sound financial status in the society, they have easy access to non-usurious credit, bargaining power in marketing activities and strong assimilation of technological know-how supplemented by research and extension service components in their crop production. They have risk-bearing capacity and negotiable power at the time of natural calamities like drought, famines, low rainfall, storms, cyclones and uncertainties created by prevailing market conditions. Production takes place under competitive environment and the objective function of the farmers is maximisation of income. Finally, it can be succinctly asserted that this category of farmers have all characteristics that are generally displayed by the farmers of large holding sizes. It can be stated that most of the farmers of this category are owners of lumpy capital inputs like tractors, tube-wells, machine harvesters, etc. In the given sample, the production technology is dictated by the most modern inputs consistent with the requirements of seed-fertiliser technology and the sample represents proper application of suitable inputs like gypsum while enjoying assured supply which are most important components of the package of land reclamation technology.

The most integrated approach for disseminating idealised adoption behaviour of a technology depends on human resource development, which in turn is an integral function of adult literacy rate, life expectancy and basic purchasing power for maintenance of a decent life. This is the high income bracket class of a given society whose production techniques invariably are dictated by favourable socio-economic and socio-political conditions. In view of the aforementioned facts, throughout the empirical illustrations, they are assigned fourth and fifth quintiles with 5 and 10 per cent growth rates of income for interpretation of the concept of social welfare, respectively.

The bottom 40 per cent is the poorest category of farmers having relatively little command in the disposal of factors of production, which is not fully consistent with requirements of recommended package of land reclamation technology. It is assumed that the level of income which they realise from their crop production is not sufficient to maintain desirable level

of consumption. Therefore, production and consumption are identical and their low levels of income are reflected by extremely small crop yields on marginal prices of land. Evidently, their production technology is characterised by minimal capital investment, non-availability of capital units, labour-intensive production techniques, socially demeaning status and operation of the law of diminishing returns to shrinking pieces of land. There are a priori reasons to believe that this class is presumably a depressed segment of the society and can therefore be characterised by low level of literacy which otherwise happens to be a necessary condition for masterminding production techniques efficiently.

Evidently, within production scenario, human development component is missing. They do not have risk-bearing capacity (risk averse) and therefore, are contented with low mean yield but cannot tolerate higher variances of yields around mean. In other words their objective function is neither profit maximisation nor income maximisation implying that the theory of neo-classical mode of production does not remain valid and they are practically immune to risk and uncertainty due to impoverishment and economic vulnerability. At the instances of missing modern inputs, their basic goal appears to be not maximisation of income or profits but chances of subsistence. More specifically, this category of farmers reveals the characteristics of marginal/small farms. A heavy dose of incentives and concessions is required to bring this class to a desirable level of production.

TABLE 1: SIZE DISTRIBUTION BY INCOME SHARES

Per Cent of Income Recipient	Deciles		Per Cent of Income Recipient	Quintiles	
	Percentage Share in			Percentage Share in	
	Total	Income		Total	Income
10	3.34	3.34	20		
20	4.94	8.28	20	8.28	8.28
30	6.52	14.81			
40	8.53	23.34	40	15.06	23.34
50	9.36	32.71			
60	10.28	42.98	60	19.64	42.98
70	11.27	54.25			
80	12.48	67.73	80	23.75	60.73
90	14.07	80.80			
100	19.20	100.00	100	33.27	100.00

TABLE 2: GROWTH OF SOCIAL WELFARE ASSOCIATED WITH VARIOUS TYPES OF SOCIAL WELFARE INDICES

Types of Social Welfare Index	Top 40 Per Cent				Middle 20 Per Cent		Bottom 40 Per Cent				Overall Measure
	Q_4		Q_3		Q_2		Q_1				
	ω	ρ	ω	ρ	ω	ρ	ω	ρ	ω	ρ	
1 Distributive shares index SWI (DS)	23.75	5	33.27	10	19.64	2	8.28	0	15.06	0	5.06
2 Equal weights index SWI(EW)	20	5	20	10	20	2	20	0	20	0	3.40
3 Poverty weighted index SWI(PW)	0	5	0	10	0	2	70	0	30	0	0

Therefore, throughout all the empirical illustrations, we have assigned first and second quintiles with a 0 growth rate of income in the light of preceding arguments of subsistence agriculture.

The middle 20 per cent category of farmers exhibits a mix of characteristics of the two extreme categories between which it lies, namely, the bottom 40 per cent and top 40 per cent. Apparently, this category of farmers exhibits all the characteristics of the medium sized farms under the premises of land reclamation technology. For empirical simplicity, they have been assigned third quintile and 2 per cent growth rate of income.

IV

Empirical Setting

Rapid industrialisation and urbanisation accompanied by population explosion has increasingly limited availability of land for agriculture. Bearing in mind, the low carrying capacity of earth and sustaining pace of agriculture without deforestation, the feasible solution to satisfy the food demands for additional masses, in years to come, compels planners for revitalising, reconsidering and restructuring their existing policy prescriptions to provide surplus land to increasing population of farmers without disturbing the development programmes. The answer to such questions lies in the reclamation of 952.06 million hectares salt-affected soils in the world. The conversion of barren land into fertile soils not only resolves the numerous unresolved outstanding economic problems in agriculture but also alerts the

governments about man-made alarming situations, the menace of which comes into play whenever water is taken into fields due to faulty management of irrigation projects. The problem of salt-affected soils is equally important in Indian context as the estimated government figure 7 million hectares recorded in 1971 continues to increase day by day. The severity of this problem was realised by the government of India since the inception of Fourth Five-Year Plan and the research which was previously being done in disorganised and sporadic manner became integrated with the establishment of Central Soil Salinity Research Institute (CSSRI) at Karnal, Haryana in 1969. In order to meet this challenge of national importance, a package of land reclamation technology has been introduced in agriculture.

In order to interpret the above conceptual framework in terms of technological innovations in agriculture, the data of land reclamation technology is considered. Realising the tremendous success of land reclamation technology, even the farmers growing their crops on normal soils began to migrate from low productivity neighbouring areas of Karnal district in Haryana to such areas where the salt-affected soils were fully reclaimed due to joint efforts of Haryana Land Reclamation Development Corporation (HLRDC) and Central Soil Salinity Research Institute (CSSRI) Karnal in particular and favourable policy of government of Haryana for resettlement in general. The attraction was so much alarming that the 'bajigars' switched over from traditional professions to agriculture hoping to increase the living standards with the rising levels of income from such land where nothing was grown earlier. Even landless labourers who have been impoverished due to fragmentation, economic vulnerability and loss of land to rich and powerful landlords for long time became owners of land on reclaimed soils. In fact, the land reclamation programme on salt-affected soils has been initiated since 1970-71, but it received momentum only in the late 70s when it was completed. Also, full swing of migration took place during the periods 1975-76 to 1978-79, only after the entrance of the

package of land reclamation technology for experimental laboratories of CSSRI through various operational research projects (ORPs) revealing the outcomes of multi-disciplinary research components of technology to farmers' fields.

In view of the research findings confirming the fact that the crop production on the reclaimed soils comes at par with normal soils in a span of about 2-3 years, the present study considers the data of paddy and wheat crop pertaining to the year 1983-84. Further, the package of technology recommends the crop production of paddy and wheat only in the region. Therefore, the entire income generated by the community of farmers is due to paddy and wheat crop grown on reclaimed soils.

More specifically, Karnal district was selected in view of the highest land reclamation. Finally, 110 farmers of Moonak and Rair Kalan adopting land reclamation technology and growing paddy and wheat during the year 1983-84 were randomly selected from Gharaunda block of Haryana state.

V

Empirical Illustrations

To provide a more detailed breakdown of the size distribution of income decile (10 per cent) distribution is used. Looking at the decile distribution in Table 1, we find that the bottom 10 per cent of the population receives only 3.34 per cent of the total income while top 10 per cent receives 19.20 per cent.

The second decile shows that bottom 20 per cent of population receives only 8.28 per cent of the total income and so on for each of the other remaining cumulative decile groups. As such, it can be noted that bottom 50 per cent of the population receives 32.71 per cent of total income.

Obviously, under the framework of income distribution, the sum of weights always adds up to unity and are non-negative.

$$\sum_{i=1}^5 \omega_i = 1 \quad (3)$$

Naturally, every quintile has a particular growth rate of income. However, the income growth rate of quintile may be less, equal or greater than that of the remaining four quintiles. But it is certain that the overall measure of the growth of social welfare will be between minimum and maximum value of income growth rates in the various quintiles. The various measures of income inequality suggest that its value lies between the two extremes, namely, 0 (perfect equality) and 1 (perfect inequality). We may further assume that the first four quintiles have no

the top 20 per cent account for cent per cent share of income. Under such perfect inequality, the value of SWI obtainable from (2) is

$$SWI = \omega_3 q_3 = 1.0 q_3 \quad (4)$$

Measurement of income inequality is circumscribed by the problems of lack of precision of data and ambiguities in its measurement. However, we extend the concept of quintile distribution to construct the overall measure of social welfare while trying to find out the alternative approaches by using different rates of income growth and social welfare indices for community of farmers adopting land reclamation technology is presented in Table 2.

Let us assume a realistic situation where the growth of income in the first two quintiles remain static while the last three quintiles record 2 per cent, 5 per cent and 10 per cent growth of income, respectively. Therefore, the overall measure of growth of social welfare based on distributive shares of the community of farmers adopting land reclamation technology attains the value of

$$SWI(DS) = (.1964) (.2) + (.2675) (.05) + (.3327) (.10) = .0906 \quad (5)$$

It implies that with such respective growth of income on third, fourth and fifth quintiles, the social welfare index increases from 100 to 105.06 per cent. With such respectable growth rate of SWI(DS) that has provided equiproportionate amount of social well-being to all persons in society, our income distribution plan projects a disturbing picture because the bottom 40 per cent still have only 8.28 and 15.06 units of income, respectively.

This worsening of income distribution compels policy planners to suggest some alternative measures that would make bottom 60 per cent population better off than before. Ironically, planners at this stage are not much worried about the improvement in SWI. Basically and more interestingly, they are solely concerned with the betterment of bottom 60 per cent population of farmers even at the cost of deterioration in the social welfare index. The impasse around the point of inequitable income distribution analysis as seen through empirical illustrations, compels the planners to seek departure from data-based judgment even though it provides a sound footing for alternative approaches leading to equitable distribution of income.

In fact, increase in social welfare has direct bearing on material well being of the society. This can be attained when a heavy premium of high growth rate of income is assigned to top quintiles. Although, such growth rate of income would result in considerable increase in overall measure of social welfare, it is certain that the group of persons falling in other quintiles would not be better off than before. We are in between the policy options whether 1 per cent increase in income of top 20 per cent is implicitly assumed to be over four times as important to society as a 1 per cent increase in income of bottom 20 per cent. Again, if we want to retain same rate of growth as illustrated in the previous example, a judicious way to arrive at a feasible solution is by equating 1

per cent increase in the income of the richest to 4 per cent increase of the poorest. Highly inequitable distribution of income depicts a dismal picture if a persuasive illustration is not given importance with social valuation. It implies that policy-makers should forget the empirically deduced unequal shares in original units (income weights) for carrying forward a computational result which necessarily demand a new thought around the framework of policy incentives. At this juncture, we are interested in subjective values tending towards egalitarian society. Under such situation, we are left with policy options to select arbitrary weights. However, we should be quite cautious while exhibiting preferences in the selection of weights in an arbitrary manner and it should be ensured that the particular choice should represent and reflect an important social value judgment about fundamental goals and basic objectives of a given society.

In our attempt to get rid of unequal income distribution that places a high premium on the growth of income of top 20 per cent population for maintaining a desired level of social welfare, an alternative way is to construct equal weight index of social welfare by assigning equal weights to the quintiles. More specifically, we are keeping 8.28, 15.06, 19.64, 26.75 and 23.33 units of income shares aside and assign an equal weight of 20 per cent to the growth of income to each of the quintiles.

$$SWI(EW) = 0.20 q_i \quad (6)$$

Using the same growth of income as discussed in previous illustration (5), we now get

$$SWI(EW) = 0.2(.02) + 0.2(0.05) + 0.2(0.1) = .004 + .01 + .02 = .034 = 3.4 \text{ per cent} \quad (7)$$

Undoubtedly, absolute increase in income for bottom group will be much smaller than the upper groups under this scheme of plan. But it is interesting to infer that there is equiproportionate bearing of all the quintiles on the overall measure of social welfare index. It is commonly seen that the bottom 40 per cent population is not able to maintain their living standard because of the low levels of income received by them from their crop enterprises. They are the poorest group of society because the factors of production are not under their control due to financial constraints. The prime question before the government is to consider their material well-being. This can only be achieved when the government places subjective social values on the income growth rates of the bottom 40 per cent. This can only be possible when no welfare weights are assigned to top 60 per cent. Evidently, this type of arbitrary selection of welfare weights advocates standing arguments to uplift the poor and such welfare weights are useful to construct poverty weighted index of social welfare. Again turning to our previous numerical illustration (5), the social welfare index (PW) will be given by

$$SWI(PW) = (0.7 \times 0) + (0.3 \times 0) + (0 \times 0.02) + (0 \times 0.05) + (0 \times 0.1) \quad (8)$$

Although, the idea of poverty index is not capable of recording any improvement in

social welfare, it has certainly increased the material well being of the poorest category of farmers residing in a society.

Concluding Remarks

New technologies emerging in agriculture are potentially bestowed with high volume of income generation. In order to transform the community of farmers adopting new production techniques in their crop production into the egalitarian plane of income distribution, policy-makers have a set of three alternative policies based on distributive share index, equal weighted index and poverty weighted index under the concept of overall measure of social welfare associated with quintile distribution of income. For the measurement of overall index of the community of farmers, computational framework is quite simple and straightforward. Increase in social welfare appears to be quite effective but the value judgment for meeting the goals of desired social objectives depends on the 'welfare weights' and 'income growth rate' attached to each of the classes of farmers falling under each quintile.

If the goal of the society is simply to witness the 'data based' computational figures of the overall index of social welfare, then the 'distributive share index' is usually constructed without disturbing the income generating mechanism from outside. Even at the instance of high value of overall social welfare provided by 'distributive share index', the actual distributional scenario is quite disturbing because the conditions of lower bottom class of farmers have worsened due to lack of any reasonable growth of income, alongwith comparative absolute share of income. Under the situation, policy-makers can improve the material well-being by allowing 'equal weight' to each of the quintile groups. Where high unequal distribution of income is frequently visible due to presence of chronic poverty, then the alternative policy option is to construct 'poverty weighted index' as explained in our empirical illustrations.

This simple exercise with socially justifiable equitable distribution of income and thereby increasing the social welfare of the community of farmers adopting LRT in their crop production can be extremely useful if the scope of the study is supplemented with higher volume of data associated with the location specific technologies under different agro-climatic zones of the country. In fact, income generation due to crop production under the purview of a specific technology requires a different set of policy prescriptions. When inherent characteristics of different farm sizes get its interpretation through the respective quintiles as explained in our conceptual framework, a sanguine view of income distribution in terms of social justice can obviously be reflected by the production scenario under the regime of a given technology, if not possibly with one year's data but with the data spreading over a reasonable period of time.

Creating a Community of Discourse in Sociology in India

Ananta Giri

IN her provocative article 'Sociological Research in India: The State of Crisis' (EPW, June 5) Veena Das has raised some important questions regarding the practice of sociological research in India. One cannot disagree with Das's description of the lack of competence in sociological research in India today. Her plea for restoring "a dignity to dull, honest, plodding research" calls for critical reflection and creative response from all of us who are concerned with the problem.

Das is keen to pursue such research and "build up a critical mass of empirical data" within "the accepted paradigms of a discipline" (p 1161). But what are the accepted paradigms of the sociological discipline in India? Over the last 70 years of practice of sociology in India have we really cared to create a curriculum of sociology and anthropology in India which takes seriously our own cultural predicament and the Indian point of view? Das finds it alarming that many students whom she has met in interviews have forgotten where Malinowski did his fieldwork. But is it not equally alarming that some of the thoughtful interpreters of the human condition from within the Indian tradition such as Gandhi, Sri Aurobindo and Tagore do not find a place in the sociological curriculum of even the centres of advanced study in our country? Das takes for granted the discursive field of sociology in India. But apart from the lack of competence in the average research scholar that she points to, the real crisis of Indian sociology continues to lie in the fact that it is a colonial and metropolitan implant. Our curriculum is flooded with material coming from the west. If one is teaching religion in a department of sociology then why should one teach only Emile Durkheim's *Elementary Forms of Religious Life*? Why, for instance, is a student not also taught Sri Aurobindo's *Life Divine*? If one is teaching theories of culture and society, then why should only Giddens and Geertz steal the show? In our curriculum does a scholar such as Govind Chandra Pande find a place?

In fact, when one reads carefully Das's text, one is pained to discover that an uncritical metropolitanism permeates her thinking and vision. There is no denying that an efficient knowledge of English is a must for the practice of sociological

research in India. But is it also not true that competence in one's own mother tongue and several Indian languages is a must for carrying out research in India and understanding our culture? But our problem is that we are more interested in reading and writing in English than in the Indian languages. Writing in English provides us a quick access to a global audience and brings laurels for us. It also provides us access to national and international publishers. We hardly write in our own mother tongues. But if we do not publish in our own mother tongues then how are we going to communicate the perspective gathered from empirical research to the people of our land? In any critical reflection on research the question 'knowledge for what?' cannot be altogether avoided in the name of competence or keeping off populism. As practitioners of sociology we must widen our audience by writing in one or several Indian languages. We must not forget the fact that we are teaching and carrying out research in India, not in the US or England. It is very much possible to write efficiently in both one's mother tongue and in English and this I consider to be a national task. But Das seems to be prejudiced against writing dissertations in the Indian languages. One agrees with her that "sociological works in the regional languages nor regional contributions add up to a sufficient body of literature" (p 1160). But instead of trying to remedy this situation by encouraging us to read and write in one or several Indian languages, Das ends up only with a plea for English.

This metropolitanism gets in the way of our being enriched by the work that is produced in India. The problem with the practice of sociology in India is that we have hardly cared to build up a community of discourse. A community of discourse requires egoless interaction and communication among those who think they belong to it by either professional role-playing or choice. But our egoism whipped up by our metropolitanism does not make us interested in the work of fellow research scholars of our land. We hardly care to know about the work that is produced in the social science departments across the country. Das remarks that only five or six departments are competent to

guide research scholars, but what kind of a community of discourse are we going to create with such a bent of mind? If a majority of departments lack in competence then the challenge is to better the situation rather than withdraw support from these. Instead if only five or six departments thrive it would further accentuate the alienation of Indian sociology by confining it to the language and reality of the metropolis.

Das draws our attention to the problem of sub-standard publications and plagiarism in India. This is a problem and we must face it squarely. But here we must also realise that the problem is not merely that of sub-standard publication but lack of publication. As members of the academic community in India, a majority of us do not have the urge to publish. Therefore, even when scholars publish in their university or departmental journals, they should be read with care rather than ignored because of our a priori biases. Utkal University's department of anthropology produces an annual journal, *Man in Society*. But how many in India know about it? On the other hand, we are more acquainted with such departmental journals as *Cambridge Anthropology*. Even if papers published in journals such as *Man in Society* do not compare favourably with those published in *Cambridge Anthropology*, we have a duty to read the former because they are written by scholars in our country. Without such care and humility born out of one's commitment in building a community of discourse in India, the prospects for sociology in India are bound to be gloomy. Das gives more importance to publication in referred journals than elsewhere. There is no denying that referred journals demand more professional competence from the authors. But we cannot decide a priori about the quality and coherence of articles published in either referred or non-referred journals. Since there are very few professional journals of sociology in India, we must welcome young scholars publishing in any forum they get and look for the best in them in unknown places.

Das is worried that "there may not be a next generation" for sociology in India which has been nourished by "such eminent scholars as Radhakamal Mukherjee, G S Ghurye, N K Bose, D N Mazumdar and M N Srinivas" (p 1161). But the next generation has to be prepared, it does not fall from the air. The problem in contemporary India is that institutions are so little concerned about their own survival and reproduction by being open to and

welcoming of the young who are going to join them. In fact, the youth in India face a problem of institutional closure. Positions lie vacant in universities and institutions of research for ages without being filled up. When they are called for interview, in 99 per cent of the cases they are not provided any support for travel and stay. Both the experts and the interviewees are called for the same purpose, but while the experts are taken care of by the universities the poor students are left to the streets. The experts are men and women of means, while the student might have borrowed her bare travel money by mortgaging her mother's bangle. Is such treatment fair? With such a framework for the meeting of generations, what kind of inter-generational solidarity can we expect?

Das describes for us her disappointing experience in interviews. But she does not subject the existing framework of recruitment to critical scrutiny. First of all, is the prevalent mode of recruitment through a haphazard interview the best way of getting the most efficient scholars into institutions? What can the experts find out in a mere 15-20 minutes? As an alternative we could have a two-tiered process of selection. An interview with experts can lead to a short-listing of candidates, who then should make presentations to an audience of students, teachers and concerned citizens. This is a better mechanism of recruiting the best than the prevalent method of interviewing where an expert sometimes does not care to read the whole of a paper written by a student and produced before the board, but asks about some author cited in the text. A communicative interaction requires fairness on all sides and an interviewee should not be given the impression that he or she is being asked questions out of context.

Das prefers to the Indian Sociological Society in her paper. She wants this body to prepare a report on the state of the crisis that she highlights. Indian Sociological Society has not had its annual convention for years. It also seems that the Society has not been able to involve the majority of practising sociologists in India in its work. We, interested sociologists in India who want to interact with our colleagues, do not have any platform for interaction and exchange of ideas. This is tragic and unfortunate. Without regular annual meetings of our supposedly professional bodies, such as the Indian Sociological Society, we continue to live within our own particular oases and have little opportunity for interacting with fellow scholars which could transform our taken-for-granted assumptions about the Self and the Other. The plight of the

Indian Sociological Society heightens the urgency to build functioning professional bodies which would have an all-India character and not simply be metropolitan in their composition and ethos. It also underscores the importance of building a community of discourse in India where we

give as much importance to good work coming from Coimbatore as we give to that coming from Cambridge. But in building such a community of discourse the problem of egoism, though less visible, is far more threatening than the problem of invidious politics.

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been, over the years, a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India, what still remains is massive and of a kind that is not remedied quickly or smoothly. Even with radical policies, the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century. In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth, these issues, have been largely obfuscated. It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it.

Schedule 17—Accounting Policies and Notes on Accounts

I. ACCOUNTING POLICIES

a) GENERAL

The accompanying financial statements have been prepared on the historical cost basis and unless otherwise stated conform to the statutory provisions and practices prevailing in the country.

b) FOREIGN CURRENCY TRANSLATION

Assets and Liabilities in foreign currencies are translated into Indian Rupees at the rates current at the balance sheet date, but for deposits from Non-Residents in Foreign Currency Non-Resident Accounts which are translated at the rates specified by the Reserve Bank of India. Resultant gains or losses are taken to the Profit and Loss Account.

Transactions during the year are translated into Indian Rupees at the rate current at the date of transactions.

Gain/Loss on forward contracts are accounted for in the Profit and Loss Account on the date of settlement. However in case of outstanding forward contracts at the year end, loss if any, is accounted for in the books.

THE SANWA BANK LIMITED

(Incorporated in Japan with Limited Liability)

NEW DELHI BRANCH

c) INVESTMENTS

Investments in approved Government Securities have been classified under 'permanent' and 'current' categories.

The current investments are valued at the lower of cost and market value. Permanent investments are valued at cost. However in case of differences between the cost and redemption price the same has been accrued over the period from acquisition/April 1, 1992 (in case of investments carried over from last year) to redemption date and has been recognised as income or expense, in terms of letter from the Reserve Bank of India, DBOD No 841/27.02.003/93, dated February 25, 1993 [Phalgun 1914(s)].

d) ADVANCES

Since there are no doubtful advances during the year, the accounting policy on the same has not been commented on.

e) FIXED ASSETS

Fixed assets are stated at cost less depreciation. Depreciation is on a straight line method at the rates specified in Schedule XIV of the Companies Act, 1956, except for improvements on leased premises which are depreciated over the period of lease.

f) STAFF BENEFITS

The Bank has taken a Group Gratuity Policy with the Life Insurance Corporation of India (LIC) under the Group Gratuity (Cash Accumulation) Scheme, for the non-expatriate staff which covers the full contractual liability towards gratuity in the event of death/retirement, out of the balance remaining with LIC in the running account and under the term assurance. However in the case of employees leaving before retirement LIC would only repay the premium paid in respect of those employees. In the aforesaid cases the shortfall will be borne by the Bank. Excess payment over recoveries from LIC in such cases will be treated on cash basis in the accounts.

g) NET PROFIT

The net profit disclosed in the Profit and Loss Account is after provision for taxes on income in accordance with statutory requirements and other usual and necessary provisions.

II. NOTES ON ACCOUNTS

1. The current account with the State Bank of India is pending reconciliation. This includes large amounts of unexplained debits amounting to Rs 8109 thousand and unexplained credits amounting to Rs 8093 thousand as of 31st March, 1993 which remain to be identified and adjusted.
2. Advances classified as secured by tangible assets include Rs 111765 thousand for which confirmations from the concerned Lead Banks are yet to be obtained. As a result these advances could not be segregated into standard/sub-standard accounts. Consequently provision, if required, in respect of any sub-standard accounts, could not be made in the accounts for the year ended 31.3.93.
3. Remuneration paid to the Principal Officer-General Manager, New Delhi Branch.

	Current Year	(Rs in thousand) Previous Year
Salary	360	286
Allowances	17	-
Monetary value of any other benefits/perquisites per tax rules (excluding leave passage)	173	119
	<u>550</u>	<u>405</u>

4. Figures in Rupees have been rounded off to the nearest thousand.

Auditor's Report

1. We have audited the attached Balance Sheet of the New Delhi Branch of The Sanwa Bank Limited (incorporated in Japan with limited liability) as at 31st March, 1993 and also the Profit and Loss Account of the New Delhi Branch of the Bank for the year ended on that date annexed thereto.
2. The Balance Sheet and Profit and Loss Account have been drawn up in accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 read with Section 211 of the Companies Act, 1956.
3. The Current Account with the State Bank of India is pending reconciliation as at 31st March, 1993. Consequently, adjustments are to be carried out for unexplained debits of Rs. 8109 thousand and credits of Rs. 8093 thousand on its reconciliation.
4. Advances of Rs. 111765 thousand have been classified by the Management as secured by tangible assets for which confirmation from the concerned Lead Banks are yet to be obtained. As a result, these advances could also not be segregated into standard/sub-standard accounts. Consequently provision, if required, in respect of these sub-standard accounts, could not be made in the accounts for the year ended 31st March, 1993.
5. We report that subject to our observations in Para 3 and 4 above:
 - a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have been found them to be satisfactory.
 - b) The transactions of the Bank which have come to our notice have been within the powers of the Bank.
 - c) In our opinion, proper books of account as required by the law have been kept by the Bank so far as appears from our examination of those books.
 - d) The Balance Sheet and Profit and Loss Account of the New Delhi Branch of the Bank dealt with by this report are in agreement with the books of account.
 - e) In our opinion and to the best of our information and according to the information and explanation given to us, the said accounts read with the Accounting Policies and notes thereon, give the information required by the Companies Act, 1956 in the manner so required for Banking Companies and on such basis:
 - i) The Balance Sheet gives a true and fair view of the state of affairs of the New Delhi Branch of the Bank as at 31st March, 1993, and
 - ii) The Profit and Loss Account gives a true balance of the Profit of the New Delhi Branch of the Bank for the year ended on that date.

CORE

Let love
invest around
the drop

**One of the world's largest.
Exports to more than 60 countries.
Sales to increase 4 times*
Profits 6 times*. And EPS to be Rs.31*.
All by 1995.**

Consider Core's world-class technology, and its production capacities comparable to world leaders.

Its leadership in the domestic market and export.

The fact that Rs. 79 crores of funds being raised would generate Assets worth Rs. 148 crores.

And that our Sales will increase more than 4 times and Profits more than 6 times.

The fact that we have a tradition of ploughing back our Profits for growth

Consider Core's financial fundamentals, its estimated Profits & Net Worth and borrowing capacity,

which would provide substantial financial surplus for continuous future expansions

And finally, the fact that all shareholders have multiplied their investments several times in the past

Now isn't this opportunity to invest in Core at Rs. 140 premium an extremely attractive one ?

**Public Issue of 47,34,000 Equity Shares of Rs. 10 each for cash
at a premium of Rs. 140 per share aggregating Rs. 7101 lacs.**

RISKS AS PERCEIVED BY THE MANAGEMENT

- As there is no financial (term loan) participation from ICICI, the deployment of funds and the implementation of the project is left entirely to the promoters. However, the proposed project has been appraised by ICICI for the purpose of underwriting based on in-house estimates of Company management.
- The Company will be affected as much as the industry is influenced by Government policies and business cycles.
- Risk of cost overruns in the implementation of project. However, major cost of project in the form of imported and critical indigenous equipment is already tied-up.
- The Company is yet to obtain sanction from the Gujarat Electricity Board for power requirement at its Sachana unit. However, the Company is confident of obtaining the same in due time. It is also planning to install its own generation units

* Projected (As appraised by ICICI)

as an alternative

- The Company imports some critical raw materials and consumables. This is subject to changes in Government policies and fluctuations in exchange rate. The Company imports these raw materials and consumables of international quality from world leaders to be able to manufacture IV Fluids of international standards. The CIF value of such imports accounts for approximately 15% of the sales value per unit. Most of these items are under DGL and attract special concessional rate of import duty for use in manufacture of IV Fluids. Further, since the Company is exporting a significant portion of its production, import of these items is not likely to become a cause for concern.

If the Company does not raise minimum subscription amount of 3% of the value of the Equity Shares, the listing agreement of underwriters within 10 days from the date of opening of the issue, the Company shall not and entire subscription amount received exceeds the value of Equity Shares raised. The money with interest for delay payment 18 days before the date of closing of the issue.

Growing... Growing... Growing... And your gift to him keeps growing too!

Give your child a gift that grows with him. Invest in Unit Trust's Children's Gift Growth Fund.

When your child turns 21, the money you invest is ready to help him do what he wants.

He will have the option of withdrawing the money at 18, should he need it. Unit Trust's

Children's Gift Growth Fund. A little planning can ensure a prosperous future for your child.

Money keeps growing... and growing with CCGF - Dividends have been growing.

Current year's is 14%. - Bonus is now paid every 3 years. - Bonus, reinvested in Units,

earns more dividends. Application forms will be accepted at Unit Trust branches,

all banks and collection centres. For application forms-cum-brochures contact any

Unit Trust branch, Chief Representative or Agent.

**UNIT TRUST
OF INDIA**

At the service of 27 million Unit holders.

Invest in Unit Trust's Children's Gift Growth Fund.

All securities investments carry market risk. Consult your investment advisor or agent before investing.

Vol XXVIII No 31

July 31, 1993

Reform Agenda

The finance ministry's 'discussion paper' on the economic reforms contains some indicative targets whose consistency merits attention. Also, the document differs in some subtle ways from past pronouncements of individuals and committees spearheading the 'reform' process. Most importantly, the agenda outlined in it is essentially a sneak preview of the conditionalities likely to be attached to the Extended Fund Facility (EFF) loan which the government, after a short-lived bout of bravado, has decided to seek from the IMF. 1563

The far-reaching changes in the macro-economic management of the economy proposed in the next three years in the finance ministry's 'discussion paper' will widen the gaps in the availability of essential social services and contribute to worsening of the problems of poverty and unemployment. 1556

Caste Cleavages

Central to the discourse on communal representation and reservation between 1850-1916, the related administrative processes and the non-brahmin response to them were the statistics collected from time to time. These made the non-brahmins and the British officials increasingly aware of the structural cleavages in south India. Such awareness in turn sharpened these cleavages, pitted the non-brahmins against the brahmins and gradually paved the way for the non-brahmin movement. 1585

No Case

The 'inherent disadvantages' of Indian industry which the Chelliah Committee advances as the reason for advocating protection are really domestic distortions which should be dealt with by domestic reform. And even in the interval during which they persist, there is no justification for favouring domestic sales over export sales which the tariff structure recommended by the committee certainly does. 1599

All Talk

The current enthusiasm of Bihar's political leaders for reforms in the state's panchayati raj legislation is unlikely to result in any real change. 1567

Math Myths

India's mathematical heritage offers much to be proud of, but claims that it offers quick solutions to all sorts of computational problems can be proved to be false. 1577

Assessing Liberalisation

The ongoing debate on the country's economic liberalisation programme has been marked by some careless reasoning about what is expected to happen and why; whether the consequences are good or bad is quite another matter. 1612

Barter Blues

Russia is attempting to revive the barter system in trade to cope with the economic crisis it is currently facing. 1575

Little Men and a Giant

The audacity of little men. The centenary of P C Mahalanobis' birth had been observed not for history's sake, but for their own. They came to praise the Professor while making sure that each of the goals he had set his heart on remained aborted. 1554

In Decline

Privatisation is hardly a solution to the ills that plague Assam's synthetic weaving mills which were promoted at a time when the cotton textile industry elsewhere was in the doldrums. 1569

AKR

A K Ramanujan was a poet, translator, folklorist and linguist. While he was proficient in all these, it is for his translations of classical Tamil poetry that he will be chiefly remembered. 1571

Blind Policy

The impact of the World Bank-prescribed policies of 'structural adjustment' are becoming evident in the field of education where the Bank is wholly in favour of privatisation. 1561

LETTERS TO EDITOR

Ban on Use of Pesticides

THE announcement by the union agriculture secretary, M S Gill, that the use of 12 pesticides is banned and 13 additional pesticides is restricted in agriculture is welcome news. While this signifies the acceptance by the government that pesticides are dangerous from health and environment angles, restricting the ban to use in agriculture is meaningless.

Pesticides have affected the health of industrial workers producing them, dealers marketing them and farmers using them in their fields. More than that, they affect the entire world of living beings as consumers of farm products treated with pesticides during cultivation and storage. We marvel at the sight of fruits and vegetables not attacked by pests even though fully ripened; however, we hardly realise that these edibles are totally covered with pesticides which affect our health. Studies have now proved that pesticides cause many a serious ailments including cancer and respiratory diseases.

Pesticides contaminate the soil and water. However the most damning impact is that the use of pesticides promotes the proliferation of the population of damaging pests by killing simultaneously the natural enemies of targeted pests. Pesticides in addition inhibit the process of photosynthesis in the very plants intended to be protected. Thus not only are the pesticides toxic to living beings, but they

serve no purpose because they promote the proliferation of pests or their more pernicious mutations.

Pesticides are used in public health operations in addition to agriculture. The DDT banned for use in agriculture is the most preferred pesticide of the public health department. In India a government-owned industry manufactures the DDT, hence even though it is known to be the most pernicious pesticide having the most adverse impact on human health, it is patronised in public health.

No control whatsoever is exercised on the manufacture and marketing of pesticides. Large quantities of pesticides are imported and disposed of without any control being exercised at any stage as no machinery exists for monitoring the route of pesticides from manufacture/import to the end use via marketing. In fact large quantities out of the pesticides manufactured and imported find their way to farming operations even though their use is banned in agriculture. Switching off from other operations to agriculture of pesticides is so natural that that is hardly perceived. Ban or control on use of pesticides for agriculture when they are manufactured and marketed in India is therefore self-defeating.

With the majority of damaging insects developing immunity against most of the synthetic chemical pesticides, with some developing immunity against all of them and with more pernicious mutations com-

ing up, it is clear that chemical pesticides are no cure against pests, including those dangerous to living beings and vegetative life. What is required is the total ban (and not control) on the manufacture and marketing of all chemical pesticides making them unavailable in the country for use in public health, agriculture or any other operation whatsoever.

The total ban is a prerequisite for conservation of better environment and better health. The decision to ban and control chemical pesticides will have to be cabinet decision at the central and state government levels throughout the country and will have to be all-encompassing so that no banned pesticides are allowed to be manufactured, marketed and used for any purpose. That is the only guarantee for protection to the people against the dangerous pesticides.

Report on Oustees of Bargi Project

SINCE the National Workshop on 'Human Rights, Environment and the Law' held at Bangalore between June 1 and June 5, the Indian People's Tribunal has begun to make its presence felt. The IPT responded to an emergency situation at Bargi and within a week sent a fact-finding team to Bargi to view the situation. Justice S M Daud kindly consented to head the team and was accompanied by advocate M Desai. After a 24-hour long and arduous journey justice Daud reached the affected villages where 1,000 villagers had gathered specially to meet him. The entire two-day trip has been documented in a report released by IPT. The report gives an insight into the kind of injustices that have been perpetrated on the people and the families that reside within the purview of the dam and also how in spite of large amounts of funds employed the dam is functioning far below the projected governmental statistical approximations. Copies of the report, for which the suggested contribution is Rs 5 per copy, are available at the address given below.

Some Headway

THE no-confidence motion in the Lok Sabha, which the government of Narasimha Rao survived by the skin of its teeth through a characteristically sleazy operation, was as much a tussle between the Left Front-Janata Dal on the one hand and the BJP on the other, though nominally both supported the motion right to the end. It was, on the face of it, ludicrous for the BJP to support a motion expressing lack of confidence in the government for, among other grounds, specifically "its compromising attitude to communal forces resulting in failure to tackle the threat to the secular basis of the Constitution arising out of the Ayodhya dispute and its aftermath" and "not bringing to book those responsible for the demolition of the mosque structure at Ayodhya". It supported the motion, moved by the CPI(M), not only out of the calculation that the possible defeat of the government might hasten mid-term elections in which it claims to be confident of significantly improving its strength in parliament if not of actually winning an outright majority. The BJP needed the no-confidence motion to break the logjam in the Congress(I) after the demolition of the Babri masjid in December last and the communal, mostly anti-Muslim, violence sparked by it which has compelled prime minister Narasimha Rao, who had till then followed a more or less explicit strategy of tilting to the BJP to ensure the continuance of his minority government, to strike anti-BJP postures and, most important of all, dismiss the four BJP state governments formed after the last elections. The objective of the left parties and the Janata Dal, on the other hand, had been known: by confronting the Congress(I) with the threat of its government being defeated in the vote on the non-confidence motion they hoped to bring pressure on the ruling party to effect a change of leadership, removing Narasimha Rao and his group whom they have, with good reason, held responsible both for the government's complacency, and worse, towards the Hindutva forces led by the BJP which made it possible for these forces to carry out the demolition of the Babri masjid and for the economic policies of rushing headlong into liberalisation and globalisation under pressure exerted quite openly by the IMF and the World Bank.

The fate of the no-confidence motion, it was clear from the outset, hinged on the decision of the Janata Dal(A) group. If the group chose to continue its support to the government, the motion would have been reduced to a routine exercise more or less, though the margin of its defeat would have been somewhat narrower than on earlier occasions because of the AIADMK's recent alienation from

the Congress(I). In that sense the decision of the Janata Dal(A) to switch sides and join the opposition was the highlight of the political drama of the no-confidence motion. As soon as Ajit Singh made his announcement the Left Front reiterated that what it was after was a change of leadership in the Congress. And within the ruling party, it is known, a move was initiated to call a meeting of the Congress parliamentary party which was abandoned only after the group around the prime minister succeeded in 'inducing' seven of the Janata Dal(A) MPs to cross over and support the government and was able to convince the party that the government would survive the vote on the no-confidence motion.

In terms of the Left Front-Janata Dal's objective of bringing about a realignment of secular and democratic forces the no-confidence motion, despite its defeat, was not wasted effort entirely. The expected admission of the seven former Janata Dal(A) MPs into the party is bound to become another issue in the ongoing tussle within the Congress(I). The methods which are widely believed to have been employed by the prime minister's group to wean away these MPs lend further substance to the charge of "all pervading corruption even at the highest levels of the government" which formed one of the grounds for the no-confidence motion. And in the bills which the government has introduced in parliament ostensibly to delink religion from politics the left parties-Janata Dal combine has another ready plank to continue its campaign. The bills vest the powers to disqualify candidates in the bureaucracy. Apart from the real danger of highly discriminatory use of these powers in view of the repeatedly revealed communal bias of the administrative machinery, these provisions leave the door wide open for abuse of the proposed legislation by the government and the party in power against their political opponents. But even more important, though the stated objective of the legislation is to prevent the use of religion for mobilising political, specifically electoral support, the bills have been deliberately so drafted as to diffuse the focus on this vital objective by seeking to cover also parties and organisations which espouse causes related to caste, language and region. This exposes once again the spuriousness of the government's and the Narasimha Rao group's self-proclaimed efforts to counter the political offensive of the Hindutva forces. There is thus no lack of grist for the mills of the Left Front and the Janata Dal if only they can muster the will for effective action in parliament and, no less important, outside.

Deepening Recession and Other Bad News

THIS is the season for the publication of the annual or periodic commentaries on world economic trends by international and multilateral agencies, such as the IMF's *World Economic Outlook*, the World Bank's *World Development Report*, the *Annual Report* of the Bank for International Settlements (BIS), the OECD's six-monthly *Economic Outlook* and annual *Employment Outlook* and the *Economic Bulletin* of the UN Economic Commissions for different continents. In recent years, there has occurred an increasing degree of convergence of the assessments, views and perceptions of these institutions on the working of the world economy, unlike in the past when their stances differed, particularly on the nature of the world economic order, based on each institution's assigned mandate and role. Now all of them sing the same song of the virtues of globalisation and the free multilateral trading system, and the need for developing countries to follow structural adjustment policies, holding out the success stories of a few Asian countries as examples to emulate.

Be that as it may, the latest issues of the above reports along with other pieces of information provide evidence of the disappointing macro-economic performance of the developed countries, the depressing social scenario in those countries and the inadequacy of narrow supply-side fiscal and tight-fist monetary policies to remedy the situation.

First, the current recession in the developed countries is proving to be much more intractable than expected. In fact, with the repeated downward revision of the forecasts of growth for almost all the leading economies, it is turning out to be the longest post-war recession. The IMF's latest *World Economic Outlook* has projected a modest real GDP growth of 1.7 per cent for all industrial countries in 1993 (from 0.2 per cent in 1991 and 1.5 per cent in 1992). This was based on an expected pick-up of the US economy from a growth of 2.1 per cent in 1992 to 3.2 per cent in 1993. But the more recent indications of consumer and business confidence, sales of new houses and trends in the index of leading indicators all show a renewed slow-down and overall US growth in 1993 is unlikely to be more than 2.5 per cent. The outlook for Europe and Japan has also weakened and thus the three principal poles of the industrialised world are all facing a synchronised deepening of the downturn.

The recession in the world economy is also reflected in a sizeable weakening of the growth of world trade. After increas-

ing by 6.9 per cent in 1989, the growth of world trade decelerated to 4.4 per cent in 1990 and 2.2 per cent in 1991. In 1992, international trade was supported by a surge in Germany's imports following reunification and a further stimulus derived from reconstruction in the West Asia. There was a volume growth in world trade of 4.2 per cent in 1992, but the recession is reflected in an absolute decline in unit value realisation in SDR terms by 0.7 per cent in the year on top of a fall of 2.2 per cent in 1991.

Though there are country-specific and continent-specific issues concerning the current recession, including cyclical and structural ones, world economic growth and world trade have suffered drastically because of one overriding factor, namely, the ruthless monetary squeeze and disinflationary policies pursued by the authorities in every western country (with the exception of Japan) which is reflected in persistently high real interest rates, depressed levels of business confidence, considerable financial tensions and the need for extensive balance-sheet restructuring. There is no doubt that as a result there is the universal acclamation of the achievement of the industrialised countries in inflation control. But the contractionary policies and inflation control are reflected in a pervasive weakening of final domestic demand. The real income gains from lower inflation and reduced interest rates have been used to reduce debt rather than increase spending. Apart from household debt reduction in some of the countries, household consumption has been dampened by the slow-down in total earnings growth and the slackening of the demand for labour. Even as consumer confidence has been shaken due to increasing uncertainty about employment, fixed investment has generally remained sluggish due to high interest rates, deteriorating profits and bleak corporate sales prospects and, in some cases, the need to strengthen corporate balance-sheets.

It is significant that while tight monetary controls have been widely used to squeeze the inflation rate, none of the macro-economic imbalances in the industrialised countries (except Japan) has been resolved. Thus they continue to face large budget deficits, relatively high real interest rates, inadequate domestic saving rates, turbulence in foreign exchange markets, growing imbalances in current account deficits and surpluses and, above all, high and stubborn levels of unemployment. In this respect, these countries face a major dilemma. In fighting sluggish output growth, fiscal policy could not provide any stimulus partly because of the already high levels of public debt and partly because of the need to prevent an

increase in interest rates

burdens. The prospective position in this respect is also bleak with the objective of debt stabilisation requiring further fiscal policy tightening in all industrialised countries with the exception of Japan. Amongst the industrialised countries, Japan alone is in a position to pursue a policy of stimulating public investment. The contrast is very clear. While the US has faced allround sluggishness in domestic expenditure—household, corporate and government (also due to reductions in the defence budget)—Japan has retained the initiative of being able to deploy stimulative public expenditure; its public fixed capital formation rose by 6.7 per cent in 1991 but accelerated to 13.3 per cent in 1992 and is expected to see a rise of 8.9 per cent in 1993.

These macro-economic impulses are increasingly leaving behind a growing number of unemployed, reducing household earnings and imposing serious demand constraints on growth which the monetarist policies of industrial countries do not seem to take cognisance of. In the first place, despite a decade of uninterrupted economic growth, unemployment in most of the developed market economies at the end of the 1980s remained high and it has been further pushed up rather sizeably by the current slow-down in economic activity since 1990. Unlike in earlier recessions when slower services employment growth was confined to the cyclically sensitive trade and transport sectors, this time cutbacks have also affected the administrative staff of industrial enterprises and the financial services sector. This has been observed in several countries and can be attributed to automation and excess capacity in the financial industry. In the government sector, displacement of labour, particularly in defence and defence-related establishments, has worsened the unemployment scene. Showing acute concern over the bleak employment outlook for its 24 member-states, the OECD has estimated that their unemployment would rise to 36 million by 1994, a sharp rise of 46 per cent over the previous cyclical low of 24.5 million in 1990. Besides, in a large number of OECD countries, chronic joblessness or the proportion of persons unemployed for prolonged periods has shot up. The OECD report, therefore, acknowledges that, given the complexity of the unemployment problem, "even the best designed human resource development policies would provide only a part of the answer".

Apart from measured unemployment, there are a number of other disabilities which the labour markets have faced in the developed societies, leading to progressive erosion of purchasing power among the lower income groups. First, the OECD report suggests that a number of

people are either discouraged from looking for work owing to poor job prospects or are part-time workers who want to work longer hours. It is estimated that as many as 13 million people fell into these two categories in 1991 and that their number grew significantly in 1992. Secondly, part- and short-time employment, which were already rising during the recovery phase of the 1980s, has expanded significantly during the past two years. In fact a large proportion of all new jobs have been part-time, mainly in the services sector. This brings us to the third question of significant structural changes in the industrial economies where the importance of manufacturing employment has dwindled. Manufacturing and construction industries lost more than 2.6 million jobs in North America between the third quarter of 1990 and the second quarter of 1992 and 1.6 million jobs in western Europe during the same period. Today 70 per cent of America's GDP and 75 per cent of its employment are in the services sector. Apart from part-time jobs, the services sector is also known for harbouring a large proportion of low-paid jobs. With the loss of manufacturing, the loss of skills amongst workers has been a factor causing reduced average earnings.

These structural changes are reflected in growing inequalities among wage-earners. In the 1970s wage inequalities declined or were stable in most countries, but in the 1980s the gap widened in 12 of the 17 countries studied by the OECD. America and Britain experienced the most pronounced widening of wage differentials. In America, in 1980, the highest paid decile of workers earned 4.8 times as much as the lowest paid decile; by 1989 the ratio had risen to 5.6. In Britain the ratio increased from 2.5 in 1980 to 3.4 in 1991. Apart from the structural changes cited above, decentralisation of wage bargaining, increasing resort to performance-based pay, cuts in minimum wages and decline in union power have contributed to rising wage differentials in the market economies. As wage incomes constitute a large component of overall earnings in these societies, the rising labour income inequalities have tended to widen overall income inequalities. A study in the US has reported increased inequality in earnings for both men and women during the 1980s. Further, poverty rates prior to the grant of transfer incomes have increased. The greatest deterioration has occurred in the bigger cities which experienced large losses in manufacturing employment. In the case of the UK, the Labour Party's Commission on Social Justice has brought out that apart from growing inequality of incomes, there are now more signs of serious social deprivation. These developments are intimately bound up with the

kind of economy Britain has built. By choosing to compete internationally as a low-wage, low-social-cost economy with little protection for labour, Britain under Conservative Party rule has fostered growing income inequality which has been made worse by the lack of success of the overall economic strategy. "Economic under-performance has become the trigger of social division, which in turn has created a labour force that is only capable of competing on price rather than skills—and so the vicious circle intensifies", according to the Labour Party Commission's report.

As income disparities are widening in the rich countries, the distribution of world income among different countries is also becoming increasingly unequal. For instance, as reported in the latest BIS report, 20 per cent of the world population (excluding China) with the highest per capita incomes received 58.3 per cent of world income in 1960 and their share rose to 64.6 per cent in 1990. At the other extreme, the share of the lowest 20 per cent of the population which was 4 to 5 per cent of world income in 1960 has steadily fallen. Secondly, despite so much talk of LDCs gaining from the supposedly open and free multilateral trading system, the terms of trade of the developing countries for their non-fuel exports, which had risen by 11 per cent between 1960 and 1975, declined by 20 per cent between 1975 and 1990, leaving these countries' share of world exports unchanged at slightly over 20 per cent throughout the past four decades. It is in such a hostile environment that countries like India are being brainwashed into adopting outward-oriented economic policies.

POPULATION

Do We Need a 'Policy'?

THE UN-sponsored International Population and Development Conference to be held in Cairo in September 1994 has given rise to much activity and interest among women's groups and other NGOs. Preparations are on to organise a parallel NGO meet on the lines of the one held with the Rio environment summit. An *ad hoc* international alliance of women's organisations, the Women's Alliance, has been formed and preparatory committee meetings (prepcoms) are already being held.

This interest comes in the wake of deliberate revival of the refurbished myth

of the population bomb since the late 1980s. As early as 1985, the growth of world population was being seen as inimical to US security interests. Henry Kissinger's now well known memorandum to the US National Security Council has even exhorted policy-makers to employ development assistance and population planning "every bit as much as new weapons systems". The strategy of portraying population growth of third world countries as a security risk has prompted a number of initiatives including the recent trend of linking women's reproductive rights issues with the objectives of a population policy.

As a first step in countering this onslaught which is likely to be the major theme of the international conference at Cairo, the Women's Alliance, with the aim of having "women's voices heard" there, has prepared a women's declaration on population policy as a means of mobilising worldwide support for a critique of the official position which is likely to be taken at Cairo and influence and inform individual country positions there. The statement focuses on women's reproductive health and rights and calls for a "fundamental revision in the design, structure and implementation of population policies". It suggests that population policies must be responsive to women's needs and must be grounded in certain basic ethical assumptions: that women can and do make responsible decisions, that they have "individual rights and social responsibility to decide whether, how, and when to have children and how many to have". Such policies must seek to reduce and eliminate "pervasive inequalities", "support women's organisations committed to women's reproductive health and rights" and promote the development and provision of the widest possible range of appropriate contraceptives to meet women's multiple needs throughout their lives.

This declaration has however come in for some critical comment from some women's groups, especially from the third world. They do not accept the stand taken in the declaration of attempting to create a 'feminist' oriented population policy, but instead question the very need for a population policy, pointing out that such policy has been and, given global power relations, will be sexist, racist and imperialist. They also point out that reproductive rights encompass the rights of each individual woman, while population policy is an attempt of governments and

It is regretted that the Review of Political Economy, which should have been a part of this issue, has had to be dropped on account of the ongoing revamping of our typesetting facilities.

aid agencies to impose their will on people and the two cannot therefore be reconciled. This critique has also pointed out that the coupling of population policies and development aid has had disastrous consequences for women of the third world.

The two statements also differ in their demand for women's health services. The critique points out that what is lacking is an efficient and accessible health care system which caters to all aspects of health and not merely to reproductive and sexual needs of women which, centring as it does on women's reproductive functions, makes sense only in the context of a population policy.

These two statements represent the extremes of the range of positions that women's movements all over the world have taken in the course of the last two decades. If indeed the NGO forum is able to create a platform for discussion of the various points of difference and agreement in Cairo, it will have accomplished a great deal even if the official conference is not influenced by these deliberations.

PAKISTAN

Power Troika in Place Again

PAKISTAN has been through an extraordinary couple of months, which have seen little government and a lot of political bargaining. What adds piquancy to the situation is the army's role: where it could have taken power once again, it was forced by circumstances to play the mediating role in resolving the constitutional deadlock between the president and the prime minister. This may indeed be, as many commentators point out, because of the very definite signals from Pakistan's donor friends, especially the US and Japan, that military rule would not be welcomed. However, the fact of the revival of democratic aspirations, indicated in some measure by the massive preparations and enthusiasm for the opposition march to Islamabad which was called off at the last minute, cannot be dismissed as a factor in the army's actions.

After Ishaq Khan's dismissal of the Nawaz Sharif government in April had been reversed by the Supreme Court, relations between the then president and prime minister went steadily downhill. Several attempts were made by interested parties to resolve the situation. Most of these, including one reportedly facilitated by Saudi interests, were aimed at keeping opposition parties, especially the Pakistan People's Party (PPP), at bay and only appear to have made matters worse. Ishaq Khan wanted his April dismissal to be adhered to by Sharif and for him to resign, while the latter wanted the presi-

Supreme Court's order overturning the presidential dismissal.

While the army was not visible on the political front until July, it had obviously been kept in the picture. In fact Ishaq's dismissal of the government in April was, according to some commentators, blessed by the army. However, given the circumstances, the army seems to have decided to play a mediating role. It was clearly none too keen on going against the decision of the highest court of the land; nor could it ignore the vociferous and widespread demand for fresh elections. Sharif, on the other hand, even while he crowed about his triumphant return, could not ignore the pressures for fresh elections under a neutral government. Even so, he seems to have tried his best to get the best of a bad bargain. It was clearly the looming threat of thousands of opposition supporters descending on Islamabad, a situation he could not have coped with unless the army was brought in, that forced him to accept the 'suggestion' that he dissolve the National Assembly and resign.

After the prime minister's resignation, the president too laid down office appointing a caretaker prime minister, Moeen Querishi, a former World Bank vice-president, and a cabinet has been formed. Governors and chief ministers of the provinces have also been appointed, all of whom are either bureaucrats or army officers and none of whom can contest in the forthcoming elections in October. Once the new government is in place the presidential elections will take place.

There is, not surprisingly, a lot of confusion in the political scene right now—alliances are no doubt going to be formed and broken many times over before October. The first major jarring note was the resignation of the PPP's secretary, who found the party's actions uncharacteristic and going against its avowed principles. And certainly, while the PPP was the prime mover in planning the opposition march, its actions in April have to be called into question. By supporting the president's decision it was tacitly accepting the powerful constitutionally prescribed role the president plays. And Benazir Bhutto's capitulation to the 'request' of the army chief to call off the march, inevitable at that point of time no doubt, and her subsequent parleys with the army show that the power troika is well in place in Pakistan. And the PPP is unlikely to attempt further changes in the scheme of things if elected. The biggest sufferer of all this will be the movement towards institutionalising democracy: apparently, no party or group of parties which makes it to the prime minister's office can afford to undo the set-up Zia had put in place—unless there occurs a massive mobilisation of popular opinion for achieving this end.

TWENTY YEARS AGO

EPW, July 28, 1973

The union government is, to all appearances, on the threshold of a major shift in its general industrial policy. There will be from now on increasingly less emphasis on the observation of the provisions of the Monopolies and Restrictive Trade Practices Act. The government will lean over backwards to accord expansion of capacity to whoever asks for such expansion and to permit retroactive authorisation of capacity expanded without prior approval; all that will be necessary is an extra measure of liberalism while interpreting the new frame of policy announced last February. There is not much foreign exchange to play around with, but, within the limits of this restraint, industrial enterprises will be allowed an additional latitude to import essential components, spares and materials. Requests for new licences, it may be assumed, will be somewhat speedily processed, whatever the nature of the proposed industrial activity and not much will be heard on the theme of priority and non-priority sectors. Reports that a single, cradle-to-grave type of agency is on the anvil to oversee the entire gamut of formalities concerning new ventures, beginning with the issue of the letter of intent and going to the stage of arranging the required capital funds from public financial institutions, confirm the suspicion that the so-called socio-economic considerations, or what have you, are being ditched in a desperate bid to perk up the rate of industrial growth. . . . The induced bias in private investment toward activities marked by inordinately high short-run profitability can be trusted to harm the cause of effective expansion of capacity in the more basic sectors. A liberalisation of the rules and procedures can thus hardly provide an answer to the problem of industrial stagnation unless resources can be transferred from elsewhere. The government can forget about co-ordinated industrial planning and give up the paraphernalia through which it was till now trying, not too successfully, to regulate the allocation of industrial capital. . . . By scuttling the present regulatory arrangements, no additional resources are going to be created; all that will be achieved is a re-allocation of given resources in a manner which satisfies the doctrinaire non-egalitarians.

Core Parenterals

CORE PARENTERALS, which has made a big success of its business of manufacture of intravenous fluids, having recorded a 21-fold rise in sales in five years from Rs 2.17 crore to Rs 45.37 crore with another 70 per cent leap reported in 1992-93 and an 82 times growth in net profit from Rs 11 lakh to Rs 9 crore in the same period, is expanding capacity and to finance the proposed expansion it is offering to the public equity shares at a premium of Rs 140. If the premium is exceptionally high, the company explains its EPS is impressive at Rs 24 as per the financial year ended March 31, 1993. "Based on the EPS for 1992-93 (annualised)," the company declares in its prospectus for the capital issue, "the P/E ratio in relation to the issue price of Rs 150 per share works out to 6.3 times, which is well below the composite P/E ratio for the pharmaceutical industry of 49". The comparison is not exact, since it is the multinational pharmaceutical industry to which it relates. For IV fluid manufacturing companies, the P/E ratio is less than half of that at 20.9 per cent. But the company has made it good and is demanding a price for it from new investors. It is also making a rights issue in fully convertible debentures which it is offering the shareholders for conversion into equity at a premium of not more than Rs 15. The company manufactures IV fluids in both large volume parenterals (20 ml to 1,000 ml range) and small volume parenterals (less than 20 ml) and has an existing capacity of 420 lakh bottles of LVP fluid per annum and 600 lakh bottles of SVP fluid per annum. It is now expanding this capacity respectively to 1,725 lakh bottles and 1,800 bottles. The bulk of the additional LVP capacity will be set up in a new plant at Viramgam in Gujarat, while all of additional SVP capacity will be installed at the existing location at Rajpur village. The company is also setting up a unit to manufacture 672 lakh intravenous sets and variants. The project is appraised by ICICI to cost Rs 161.70 crore. The company is issuing 52.59 lakh shares of which 24.73 lakh shares it is offering to the public and 21.03 lakh shares to the NRIs. The issue at Rs 140 premium is to net Rs 78.89 crore. Of the balance amount of Rs 82.81 crore of project cost Rs 18.83 crore is being raised by the rights issue of convertible debentures to the shareholders, Rs 34 crore by way of term loans and Rs 29.98 crore as internal accruals. The company has projected for 1993-94 a turnover of Rs 98.66 crore (up 117 per cent over 1992-93) expecting it to go up to Rs 210.57 crore by 1995-96, with post-tax profit to correspond to Rs 25.52 crore (EPS Rs 20) and Rs 64.16 crore (EPS Rs 31), respectively. Sushil Handa, Sunil Handa and B R Handa are the promoters of Core Parenterals. The company's capital issue opens on August 3 under ICICI Securities and Finance Company, IFCI and Bank of Baroda as lead managers.

Dintex Dyechem

Dintex Dyechem, which is manufacturing dyes and dye intermediates with a capacity of 510 tonnes per annum at Vatva, Ahmedabad, is undertaking a Rs 6.20 crore expansion by taking up manufacture of vinyl sulphone and

reactive dyes with a capacity 1,200 tonnes of each of these. The project is appraised by Bank of India and it is being funded with Rs 5.20 crore of equity and equipment finance loan of Rs 1 crore. The company is issuing 26 lakh equity shares of Rs 10 each at a premium of Rs 10 per share and offering 20.50 lakh shares to the public and one lakh shares to banks' mutual funds. For the year 1991-92 the company earned a net profit of Rs 48.45 lakh on a turnover of Rs 8.04 crore. The turnover for 1992-93 was less at Rs 6 crore, as due to political turmoil in east European countries the company lost export orders worth Rs 6 crore. It has since sought out markets elsewhere and secured orders for Rs 5.15 crore from Taiwan and Belgium. With the expansion which is to become operational this September, the company expects sales of Rs 18.67 crore for 1993-94, Rs 22.05 crore for 1994-95 and Rs 24.83 crore for 1994-95. Net profit is placed at Rs 1.88 crore, Rs 2.29 crore and Rs 2.95 crore respectively for these three years. The company is coming into the market on August 4 under BOI Finance as the lead manager.

Parasrampur Plantations

Parasrampur Plantations has acquired 2,700 acres of land 110 km from Bombay near Shahapur on the Bombay-Nashik highway. On this land the company plans to build 250 orchards and 500 cottages as part of a Rs 5 crore resort which is expected to be completed by October next year. The company is offering various investment proposals relating to agro-industry. In November last year it had offered an investment opportunity in orchards and in February this year it launched a scheme called Green Earth Unit Series I. The company has now announced further investment schemes. Green Earth Unit Series II envisages an initial investment of Rs 2,500 and promises 15 per cent return from the first year to the 15th, at the end of which period the unit-holder is to get a teakwood tree, the expected value of which is claimed to be Rs 50,000. Both the returns and the capital appreciation will be tax-free. Under the Green Earth Vegetable Garden Units, the investment will be for five years. Each unit envisages an investment of Rs 15,000/Rs 25,000 for a vegetable garden of 500/850 sq ft respectively. The unit-holder is promised 18 per cent returns tax-free, paid every six months. At maturity the investor gets back his money with 5 per cent appreciation. The company's Little Woods resort will consist of orchards and cottages. An investor investing in a cottage will own the cottage and is promised his investment back in 15 years plus teakwood trees which, it is claimed, would give him an income three times the value of his investment. Cottages range in size from 540 sq ft to 1,100 sq ft and in price from Rs 2.90 lakh to Rs 7 lakh. Under Orchard Phase II, the orchard-owner owns his plot of land and is promised 150 per cent tax-free agricultural income during 15 years and at the end of that period teakwood and rosewood trees planted in the orchards. The orchards range in size from 10,000 sq ft to 1,00,000 sq ft and in price from Rs 1.95 lakh to Rs 13.70 lakh.

CIDCO's Seawoods Estate

CIDCO, a Maharashtra government undertaking especially set up with a flexible and autonomous company status to plan and develop the New Bombay metro centre which has so far constructed over 90,000 dwelling blocks and spent over Rs 2,000 crore in development expenditure, has planned to build an exclusive residential complex covering an area of 58 acres mainly for NRIs at Nerul in New Bombay where the most elegant and contemporary style of apartments/penthouses have been designed. The site, which is a short drive from the central business district being developed at Belapur and about 10 minutes walk from the Nerul railway station, is to be connected to Radio Club near Gateway of India Bombay by a water transport facility just half a km away, in addition to an existing 60 mtr wide Eastern Express highway with a 10 mtr wide service road on either side which directly connects the site with the fully developed Vashi node. The complex, to be christened Seawoods Estate and designed and planned by a well-known firm of design consultants "Architect Hafeez Contractor" from Bombay, will consist of 1,134 elegant apartments including 102 duplex penthouses with an option regarding parking space. The well-connected apartments comprising of well-designed and planned kitchen, living and dining areas and a range of two to four bedrooms, will be located in 12-storey high towers linked by podiums and terraced lawns, the upper terrace being common and designed as an amenity deck.

The other facilities to be provided include approximately 15,000 sq mtrs of green landscaping surrounding with man-made water-bodies, mounds, downs and meadows to avoid any monotony in the landscape, an extensive well-designed recreation ground for children situated away from the traffic area, a club house with a swimming pool, a promenade along the seaface and a convenient and modern shopping arcade and a school within the layout. Other facilities like super markets, cinema halls, medical facilities, are situated in close proximity to the site.

NRIs, foreign citizens of Indian origin who have held Indian passports at any point of time, or whose father or grandfather was an Indian citizen and Indian companies with foreign collaboration, are eligible to apply. The sale prices ranging from US \$ 47 to \$ 50 per sq ft are to be paid only in US dollars in six instalments over the construction period of two and a half years till December 1995 after which, barring unforeseen circumstances, possession will be given to the buyers in a phased manner during the first half of 1996. For those interested in this excellent scheme, a detailed informative booklet is available at designated branches of State Bank of India located in London, New York, Dubai, Hong Kong, Singapore and Bombay. Booking will be done on first-come-first-served basis.

—JK

Profitable Acquisitions

Jairaj Kapadia

BROOKE BOND INDIA, having come in the Lever fold and under the same chairman, S M Datta, has shown an urge for acquiring going companies. Hindustan Lever is taking over the second largest company in its field, Tata Oil Mills Company. Brooke Bond during 1992 took over Kothari General Foods Corporation under a scheme of rehabilitation-cum-amalgamation which was sanctioned by the Board for Industrial and Financial Reconstruction. It has since succeeded in acquiring UB group's Kissan Products by purchasing 10,712 equity shares of Rs 100 each representing 67 per cent of the share capital of the company. Meanwhile the boards of Tea Estates India and Doona

India have unanimously approved the proposal for amalgamation of TEIL and DDIL with Brooke Bond with effect from January 1, 1993. The proposal has been approved by the shareholders of the three companies and is awaiting sanction of the High Courts at Calcutta, Madras and Guwahati. The proposed amalgamation is expected to bring in economies in Brooke Bond's operations and accelerate profitable growth.

In the meantime, the amalgamation of Kothari General Foods, as this was a sick company, has earned Brooke Bond tax benefits, with the result that, while its gross profit for 1992 has shown a modest improvement from Rs 6,750 lakh at Rs 6,953 lakh,

the net profit has amounted much more at Rs 4,299 lakh compared to Rs 3,475 lakh in the previous year. With earnings per share increasing from Rs 5.90 to Rs 7.30, the dividend, which in the previous year on the bonus-increased share capital was declared at Rs 3.60 per share against Rs 4 for the year 1990, is now restored at Rs 3.90 per share. Kothari Foods having a capacity for manufacture of instant coffee has served to enhance Brooke Bond's export of such coffee by augmenting the existing capacity. With new markets established in CIS countries for both tea and coffee, the company's exports increased 55 per cent to Rs 7,444.08 (fob) and yielded a surplus of Rs 6,175 lakh in foreign exchange earnings after allowing for an expenditure of Rs 1,269 lakh. Value added exports amounted to Rs 6,233 lakh against Rs 4,120 lakh in the previous year.

A shortfall in the tea crop during 1992, coupled with aggressive buying by CIS countries, resulted in a sharp increase in prices towards the end of the year. While the advantage of this is reflected in a 6.9 per cent growth recorded in sales turnover, it is to accrue still more in this year. And particularly so since the company has broadened the base of its operations with the acquisition of other companies. At the same time, in the domestic market, in order to cover growing rural markets, the company is availing of its network of support dealers to supplement direct selling of its products. It made in September 1992 a national launch of noodles manufactured by Indo-Nissin Foods with encouraging results. There has been an appreciable change in the long-term component of the company's loan funds. With Rs 3,465 lakh of term loans from banks and financial institutions and issue of Rs 52.62 lakh of debentures, there has been an accretion in long-term borrowings, whereas with a decline in bank overdrafts from Rs 4,655 lakh to Rs 1,424 lakh, short-term borrowings have come down.

JAY SHREE TEA

Lower Production and Sales

Like Brooke Bond, Jay Shree Tea and Industries has also had during the year ended March 31, 1993 improved average sale realisations for varieties of its tea and could exploit the emerging CIS markets for export. But due to a lower production of 1,46,26,957 kgs (1,48,15,938 kgs in the previous year) and a still lower quantity sold at 1,41,10,493 kgs (1,55,41,962 kgs), the year's financial results have shown a setback. The main reasons for this, according to the directors, are: (1) inclement weather retarding crop harvesting in some of the tea estates (in south India, Darjeeling and Sibsagar district); (2) all-round increase in costs and escalation in wages; (3) shortfall in plywood prices to cover enhanced costs; and (4) adverse freight rates and escalation in wages affecting profitability of the shipping unit.

Jay Shree Tea is a diversified company, although it is very much embedded in tea. For instance, it owns also fertiliser units, two of which are at Khardah in West Bengal and one in Gurgaon in Haryana. All the three units are making phosphate fertilisers, the sale and prices of which were decontrolled from the end of August-1992, together with the withdrawal of the subsidy. Prices of single superphosphate fertilisers registered a sharp rise after decontrol, which affected offtake. However, the two units at Khardah reported increased production of SSP fertilisers and also despatches respectively of 1,30,264 tonnes and 1,12,484 tonnes compared to 1,10,796 tonnes and 1,14,111 tonnes in the previous year as production of sulphuric acid was more at 47,969 tonnes compared to 40,106 tonnes and so also despatches at 1,009 tonnes compared to 100 tonnes.

The directors have taken an optimistic view of the prospects for the company on the basis of its business in tea. Tea exports during 1992-93 were a record at Rs 343 lakh. Quality improvement is assumed as a key thrust area for the current year while the rupee's full convertibility is expected to give a further boost to tea exports. Despite the setback in financial results, the directors have thus maintained the dividend at Rs 3.25 per share for the year 1992-93.

WARTSILA DIESEL

Closer Integration

Wartsila Diesel India has changed its accounting year to close in December against March earlier. The directors say this is done in order to simplify the financial reporting to the collaborators, Wartsila Diesel, Finland, and to the group's product companies as well as to harmonise the company's budget and action plan with that of the group and present a common identity with the group's goals and objectives. All this shows that in consequence of the globalisation spirit which now characterises the government's fiscal and economic policies, Wartsila Diesel India has sought to integrate itself with the Wartsila Diesel group. Yet it has become during 1992 a victim of the cutback in government spending in order to control fiscal deficit. The company's financial results for the period of nine months are poor. And the cause of it is the drastic reduction in government expenditure.

This resulted, according to the directors, in lower demand from many large process industries which are the company's customers. This was particularly the case of the cement industry where the company's present strength of 430 MW of diesel power generation is installed. In the period under review a further 30 MW of power plants were commissioned. But the demand constraints combined with extremely high cost of capital compelled most industries to delay investment plans and the company's order intake suffered resulting in a lower turnover. The rupee's unfavourable exchange parity reduced the margins while the funds squeeze drove interest costs up and due to a combination of these factors profits were lower. Nevertheless, the directors have maintained

the dividend at 15 per cent annualised, declaring it at the rate of Rs 1.125 per share for the nine-month period.

But the company, headed by Mantosh Sondhi, sees opportunities for itself in the new government policies. By dovetailing with the Wartsila Diesel group as observed earlier, it has received with the support of its collaborators a major export contract for delivery of seven engines aggregating 32 MW to the Philippines, shipments of which are to be completed in the first half of this year. This is said to open a new dimension in the company's export prospects for the future. It has also received orders for special application captive power plants using biogas for conversion to electrical energy, again a new opening. Import liberalisation has facilitated fulfilling varied application needs from the Wartsila Diesel group's portfolio of engines. In fact, the company made a breakthrough in securing an order for a large Vasa 46 captive power plant for import from Finland.

It also received a repeat order for nuclear standby generating sets. Efforts are continuing for supply of engines for marine ap-

plications. Privatisation in power utilities and the incentives offered to attract foreign investment in the power sector are further areas of new opportunities for the company. It earned during 1992 foreign exchange worth Rs 32.10 lakh, Rs 22.50 lakh of it by deputing service specialists on overseas assignments, while it expended foreign exchange worth Rs 2,700 lakh.

The company made investment of Rs 377 lakh in Units 1964 of the UTI whose value at the close of the year is put at Rs 391 lakh. This earned a dividend income of Rs 62 lakh as against which interest income has gone down from Rs 35 lakh to Rs 14 lakh. However, the dividend earned on UTI units and a refund of Rs 62 lakh of customs duty of earlier year, together with increased duty drawback of Rs 58 lakh against Rs 34 lakh in the previous year, have gone to boost 'other income' from Rs 94 lakh to Rs 239 lakh. This, in turn, has gone to raise the year's profits. Capital work-in-progress, forming part of gross fixed assets, has shown a substantial increase from Rs 6 lakh at Rs 28 lakh.

Indira Gandhi Institute of Development Research

announces

Vibhooti Shukla Visiting Research Fellowship

This fellowship has been instituted in memory of Dr. Vibhooti Shukla, who died in a freak accident on August 8, 1992, through an endowment created by her family. It will be awarded annually to scholars in India and abroad for doing research at the Indira Gandhi Institute of Development Research (IGIDR) as Visiting Research Fellow for 6-9 months, in any of the following areas, with primary focus on the Indian situation: (i) Urban Economics (ii) Urban Development: Policy and Perspective (iii) Urbanization and Regional Development (iv) Environmental Consequences and Energy Requirements of Urbanization.

The amount awarded under the Vibhooti Shukla Visiting Research Fellowship will depend on the background of the candidate and will range from Rs. 6,000/= to Rs. 10,000/= per month. Campus housing on usual terms will also be available. Candidates should have a Ph.D. and academic appointment in an institution or a record of published research. Applications on plain paper, along with bio-data, list of publications, an outline of proposed research and addresses of two referees should reach The Director, Indira Gandhi Institute of Development Research, Gen. A. K. Vaidya Marg, Goregaon (East), Bombay-400 065, India.

Calcutta Diary

AM

Planning is dead, the apparition of national self-reliance has been successfully put to the sword. A bonfire has been made of all the ideas Mahalanobis stood for. The prime minister could now afford to be expansive in his homage to the man. Neither dead men nor murdered ideas would, hopefully, rise in combat.

THE audacity of little men. Grammarians to a fault, they will not let any historical occasion not being made use of. The centenary of P C Mahalanobis's birth had to be observed, not for history's sake, but for their own. They were present with their subalterns when the year-long ceremonies got going. The Indian Statistical Institute is an institute of 'national importance'; the statute says so. Do they not, *ipso facto*, represent the nation? They therefore have the prerogative to exploit to the hilt the external economies the Mahalanobis celebrations offered. There could be no question of their not daring to dare; the necessary courage could be borrowed, much like the country's accumulated pile of foreign exchange. They came to praise the Professor while making sure that each of the goals he had set his heart on remained aborted. As is now well known in the neighbourhood, native hypocrisy and imported bravado make for a hideous nostrum.

All told, it was a command performance, intended to gladden the heart of those who now take the basic and crucial decisions on this nation's economic policies, for the edification of themselves and their *compradors*, from distant shores. Mahalanobis's ideas have, for long years, laid buried several fathoms deep. That has not, repeat not, been the doing of an autonomous process. Those in the helm of affairs have gone about the job with a rare thoroughness. The prime minister could thus avail of the opportunity the centenary occasion provided to make short shrift of planning and the objective of self-reliance. It was time, his stentorian voice informed the assembled cynics, to dispense with ideology, which was, with great courtesy he rubbed it in, Mahalanobis's Achilles' heel. That megalomaniac academician loved his country, he believed in the potential indivisibility latent in the vast reserve of natural resources that waited to be exploited. Men like him are dangerous. In case they had their way, they would ensure the nation's emergence as a strong economically independent entity. That danger, thank providence, has passed. Certainly for the next

half a century or thereabouts, India stood little chance of extricating herself from the external debt trap. The trusteeship of the G-7 countries would therefore continue; follies such as trying to sign cryogenic engine deals in violation of the Missile Technology Control Regime would be brought home by the masters. Whether this skewed sort of equilibrium is sustainable for any length of time, given the tenuous domestic circumstances, is a question that is incapable of detaining small minds. The prime minister and his entourage are happy with the immediate denouement: planning is dead, the apparition of national self-reliance has been successfully put to the sword. A bonfire has been made of all the ideas Mahalanobis stood for. The prime minister could now afford to be expansive in his homage to the man. Neither dead men nor murdered ideas would, hopefully, rise in combat.

To be fair, the sabotage is not of recent occurrence. It started in the decade of the fifties itself, when Mahalanobis was, going by appearances, much the central personality in the domain of policy formulation. Appearances were deceptive. Even at that particular juncture, finance ministers were much abroad. One snatch of memory is eminently reportable. The Professor had the basic data at his fingertips; his syllogisms were without a flaw; he had worked out the inter-industry linkages; he had arranged to have the unit cost calculations done at different levels of capacity utilisation and under different assumptions. Three steel plants with rated capacity of two to two-and-a-half million tonnes were both necessary and viable. The Professor had convinced Jawaharlal Nehru. The bureaucratic resistance had collapsed. The foreign and private sector lobbies had started to get themselves accustomed to, wearing long faces. Never, never, never, never, ever however say die. The ministry of finance was well versed in the knowledge that tomorrow was another day. The incumbent finance minister had a civil service background, with a distinguished tutelage under the British. He was, in addition, addicted to quoting Sanskrit scriptures. Mahalanobis, a mere

academic, could not possibly be allowed to have it all his way: the prestige of the colonial heritage was at stake. The finance minister gleefully described to his cronies how he put the first spoke in the wheels. The theoretical exercises on inter-industry linkages were all right, but, as minister of finance, he had the moral obligation to take a second look at the projections of demand; after all, with the Korean war petering out, was not a global depression looming, what use would there be for all this steel, the nation could not eat up six or seven million tonnes of steel every year, year after year; why should we then unnecessarily produce them? Someone had to act as spoiler of the fun irresponsibly set in motion by Mahalanobis. The finance minister's happiness spilled over; he, as the minister responsible for husbanding the nation's resources, did it, he put the first spanner in the works. He demanded fresh calculations of the values of the parameters involved on the demand side of the equation; the projects were as a result stalled for more than a year. The finance minister could have danced all night. He had succeeded, even if for only a while, in blocking the nation's economic advance. His cronies must congratulate him; most of them did, barely a few slunk away. It is a small footnote to the chronicle of the times that some years hence this same minister, now without a job, accepted a sinecure position offered to him by the Professor. Magnanimity was the latter's revenge.

Those were nonetheless heady days. Pinpricks were clearly not enough to waylay the Professor. He was not wont to give vent to his emotions in the presence of outsiders. Even so, a good bit of his will-power was propelled by patriotic emotions. He did not flinch from recourse to the weaponry of contempt either when such contempt was called for. Another bit of memory lingers. A meeting of the Planning Commission, with Jawaharlal Nehru presiding, to discuss the contours and contents of the Mahalanobis plan-frame. A pigmy of an Englishman, a former member of the Indian Civil Service, had imagined that the Indian pasture was still eminently grazeable even following the formal transfer of power. He stayed back. His decision was applauded by the national leadership with expression of sentiment that was a pot-pourri of neo-colonial fervour and faith in universal brotherhood. The gentleman continued to flourish, and was duly made an advisor to the Planning Commission. He was scandalised no end by the Mahalanobis projections; the scale was much too wide for his taste. What madness was this;

India should remain a polite and humble country; the western nations had the wisdom and the expertise; they were willing to extend their benign hand of co-operation; courtesy should beget courtesy, such kindly gestures deserved to be reciprocated by squeamish deference. If India were instead to compete with these countries in the manufacture of basic industrial goods, why, the latter would have good reason to take offence; once India embarked on wild silly adventures, epitomised by grandiose five-year plans with targeted annual rates of growth of 5 per cent or therabouts and a programme placing emphasis on the necessity to produce machines to produce further machines so as to attain complete self-reliance, the country would in no time end up in a mess. It would also in the process squander away the precious sterling balances the benign imperial government had so generously allowed it to accumulate during the war years. Mahalanobis did not turn a hair; he listened. Once the imperial peroration was over, he focused his full fury on the person. He knew his facts, he was in total command of his premises and hypotheses; he was, besides, a proud Indian. His clipped sentences did not for one moment get derailed from the integrity of either thought or syntax. There was nonetheless the unmistakable ring of patriotism in his voice. The colonialists had done enough harm to this country for two centuries; it could now do without them; it had now, the pommes ought to know, a different kind of agenda, aimed to replace economic retardation by economic growth; in case imperial mind-sets encountered some difficulty in adjusting to the notions of accelerated development and social justice and full employment in India, would it not be better if they made themselves scarce.

Perhaps there is a dividing line between scorn and contempt. On that afternoon in that building on Parliament Street at that session presided over by a bemused Jawaharlal Nehru, the dividing line however became both irrelevant and indecipherable. The pommy squirmed in his seat; his red face turned redder. But he was a battle-scarred journeyman; he also read his personal horoscope well. He withdrew to East Africa where the colonies were to exist for a few more years. He picked up a few thousand hectares of lush farming land, and turned himself into a gentleman-farmer. When the country he had settled in had to be conceded its independence in the sixties, the gentleman had to be compensated for his recently acquired property. An international finan-

cial institution, you know which one, worked out an extraordinarily generous schedule of compensation and bulldozed the national government, not yet quite sure of itself, into accepting its provisions. Negotiated freedom had to bear such crosses. This chore of transfer of land and corresponding transfer of compensation money could not be left to the superintendence of the natives; they had got their independence all right, but what did they know of the complexities of economics and accountancy. The international financial institution had to guide and monitor this particular operation. They needed experienced men for the purpose. The former member of the Indian Civil Service, the erstwhile advisor to the Indian Planning Commission, the too-recent gentleman-farmer who had acquired the right to be compensated, ideally fitted the job description. He was therefore inducted into the international financial institution, and advised it on how to continue to squeeze the surplus out of the East Africans even after they had, at least nominally, received their freedom. His passion for the raj however did not ebb away; when Indira Gandhi declared her Emergency, he wrote to the London *Economist* in fulsome praise of the lady's decision, was she not a real empress in the making, and would she not recall the imperial administrators?

It took some more while, but, finally, East Africa has come to India. The colonials, manning the ramparts of the international financial agencies, have taken over the country. They have liquidated planning and five-year plans; the building which housed the Planning Commission still exists, but the conference rooms are all deserted. Some routine essays continue to be written, but planning has been abandoned both as a modality and as a goal. The public sector is scuttled, development outlay is cut back; that does not however mean that those inclined to indulge in the pastime of constructing plan models are to be discouraged. The Mahalanobis centenary should, however, marginally, therefore augment the flow of research funds which could go as input towards the formulation of whimsical models with far-out assumptions. Neat-looking papers, heavily cluttered with difference equations and matrix algebra, will get composed; some of these will, after varying periods of waiting, no doubt get published in this journal. The homage to Mahalanobis will thereby be considered as duly accomplished.

The rituals could not be faulted. The inauguration of the centenary celebrations by the nation's prime minister, no less, and

twenty- or thirty-odd research papers to be churned out at the end of the year; the collective conscience should be adequately assuaged. Meanwhile, the objective of self-reliant growth would be even more comprehensively ditched. Availing of the occasion, and overcome by a sense of history, the prime minister was expansive enough to let the nation into the secret: ideology was *passee*, and from now on it was the epoch of private initiative and globalised intercourse.

We are thus officially listed as a dependent nation; our present rulers are determined to ensure that we do not stray away from that destiny. According to statisticians, during the first five decades of this about-to-end century, the per capita income in the country had remained invariant. It was, in other words, a state of economic stagnancy. In the nineteenth century, when colonialism and imperialism were in fullest bloom, there was actually, the same statisticians suggest, a perceptible economic retardation, that is to say, a substantial fall in per capita income. Perception of this phenomenon had inspired Dadabhoi Naoroji to launch his drain theory. We are back to the nineteenth century, even if the calendar says we are on the threshold of the twenty-first. The calendar can be misleading, as misleading as the celebrations currently on to offer tribute to the memory of Prasanta Chandra Mahalanobis. The intent is not to praise him, but to ridicule him. Were they still around, the finance minister of yore, and those bureaucrats of the colonial era, could indeed have danced all night.

Discussing Economic Reforms

Achievements and Future Intent

JM

In complete contrast to the main presumption of the finance ministry's 'discussion paper' on the economic reforms, that stabilisation has been achieved and that the path is now clear for long-run 'structural adjustment', the conclusion must be that the policies so far have at best landed the economy into a precarious steady state where inflation has been moderated at the cost of accepting negligible growth and, even then, continuation of the present situation depends critically on the fickle generosity of the rain gods and the aid donors.

THE ministry of finance has in the past two years often been criticised for being less than open about its economic policies. Indeed, the impression has got around that it discusses policy only and secretively with aid donors, presenting parliament and people in India with decisions which are not only in the nature of *fait accompli* but also partial because the government is wary of stating its strategy in full since this would show that it has accepted *in toto* the broad contours dictated by the IMF and the World Bank as revealed in their past reports. Therefore, the release recently of a discussion paper entitled *Economic Reforms: Two years After and the Task Ahead* in which the government has assessed its own policies and, more importantly, outlined its medium-term future strategy should be welcomed by all those who value open government. Not only is this a major departure from past practice, but the document itself is sufficiently important to merit much more attention and informed response than it has received so far. In fact, apart from carrying the usual press handout, the media has largely ignored the discussion paper.

This reticence on the part of media buffs who are usually quick to respond to any government policy statement is surprising, but probably understandable given that the headlines recently have been about political and not economic issues. In general, there appears to have been a certain diminution of interest in economic matters both among the liberalisers and their critics. The pre-occupation of government with other matters has meant a slow-down in the pace of 'reforms', and, after Ayodhya, the opposition parties has also been less willing to press on with the economic debate. Indeed, given this inertia and the sense of political instability all

around, a moot point is why the government chose this time to publish a frank and fairly lengthy discussion paper. The answer is clearly not that this is simply the finance ministry's contribution to the celebration of Narasimha Rao's completion of two years in office: the paper is potentially too controversial and, although self-congratulatory, its style is not gushingly laudatory enough. Indeed, there is a distinct sobering of tone even when compared to the finance ministry's own pre-Budget *Economic Survey* earlier this year.

The contents of the discussion paper fall into two parts: the first is the by now well known routine employed to justify the past 'reform' effort, and the second, more interesting part, is to make public the agenda for further 'reform' during the remaining three years of this government's normal term in office. Neither part contains much surprise: the first is the by now shop-soiled litany of how the government inherited an economy on the edge of default and turned it around so that both the balance of payments and inflation are now under control; and the second is largely a rehash of what once used to be confined to the grey cover reports of the World Bank, repeated of course by the few local commentators who did honestly share that view, but which in the past two years has become a mantra preached *ad nauseam* by almost the entire tribe of journalists and academics who wish to be on the 'right' side.

Yet, the paper needs to be discussed, not only because failure to do so would be construed as a walk-over, but mainly because the paper is interesting in that it does contain some indicative targets whose consistency merits attention. There are also certain subtle ways in which it differs from past pronouncements of individuals and committees spearheading the

'reform' process. Most importantly, it is almost certain that the agenda outlined in the discussion paper is essentially a sneak preview of the conditionalities likely to be attached to the Extended Fund Facility (EFF) loan which the government, after a bout of bravado a few months back, has finally decided to seek from the IMF. That this is in fact the case is suggested strongly by the high degree of overlap between the further 'reforms' envisaged according to this document and those already promised by the finance minister to the World Bank in the context of an External Sector and Investment Liberalisation Programme Loan, as well as official recognition in the IMF of this discussion paper as the indicator of future policy. It is also fairly obvious that the purpose of the discussion paper in this context is a two-track one: to 'soften-up' domestic public opinion in an effort to build up at least a facade of consensus while, simultaneously, signalling to the donors that the government is confident that it can muster enough support to implement the package of measures which might be demanded as the quid pro quo for the EFF loan and other structural adjustment funds that the government intends to seek.

EVALUATING THE REFORMS SO FAR

The section of the discussion paper entitled 'The First Two Years of Reform', which reviews the policies undertaken since June 1991, makes up about half of the contents and is predictably upbeat. The main claim made in this section is that the government which "took office at a time when the country was in the midst of unprecedented economic crisis and socio-political turmoil" was able through "immediate and swift action to restore international confidence in the economy and redress the imbalances which had emerged both in external and domestic financial conditions". The claim is buttressed by familiar statistics: the fall in the annual inflation rate from 17 per cent in August 1991 to 7 per cent by the end of 1992-93; the rise in foreign currency reserves from just over \$1 billion to \$6.4 billion; the recovery in the rate of economic growth from just 1.2 per cent in 1991-92 to an estimated 4 per cent in 1992-93; the increase in approvals of foreign direct investment to \$3 billion in the period since August 1991; and the stability of the foreign exchange value of the rupee after the shift to 'full convertibility' on the trade account. According to the discussion paper, "these favourable macro-economic outcomes were a product of both the emergency stabilisation

the initiation of a medium-term strategy for consolidating hard won macro-economic stability and undertaking long overdue structural reforms in the foreign trade and payments regime, the tax system, industrial policy and financial and other sectors".

Much of the section is devoted to outlining these reforms and stating their rationale. Thus, under the head 'Correcting Fiscal Imbalances', the high and rising fiscal deficits during the 1980s are identified as a major villain which simultaneously caused high inflation, large current account deficits, high interest rates and low international competitiveness; and due credit is taken for its reduction from 8.4 per cent of GDP in 1990-91 to 5.7 per cent in 1992-93 and to a targeted 4.7 per cent in 1993-94. Under 'Reforms in Industrial Policy' comes the familiar claim that industrial licensing, MRTP laws, reservation of industries for the public sector, and restrictions on access to foreign technology were all holding back private investment and contributing to inefficiency; and credit is taken for the virtual abolition (except in a few cases) of all such restrictions on the private sector. Under the title 'Trade and Exchange Rate Policies', India's earlier import protection regime is blamed for causing inefficiency by suppressing the benefits of trade and accused of discriminating against agriculture and exports. The government's initiatives in this sphere are presented as "a bold programme of reform in a sequence of steps" moving through Eximscips and 'partial convertibility' to the present regime where the exchange rate has been unified, quota restrictions on imports virtually eliminated (except on consumer goods), and duties reduced. Under 'Foreign Investment Policy', comes the view that such investment is a non-debt inflow which is widely welcomed throughout the world for the linkages it can provide to international technology and markets; and the government's contribution here is identified in its having been able to remove various legal and bureaucratic hurdles in bringing the terms offered to foreign investors closer in line with current practices elsewhere in the world. On 'Tax Reform', the basic philosophy of moderate rates, broad tax base and fewer exemptions is reiterated, and progress on the implementation of the Chelliah commission report recounted. On 'Financial Sector Reforms', the Narasimham committee's views are endorsed and the securities scam said to reveal the weaknesses of the banking sector which is identified as being "over-regulated and under-governed". Lack of transparent accounting, multiple regulated interest rates and a deteriorating assets base are identified as the main ills of the banking system. The

counting and capital adequacy norms for banks, reduction in the SLR and higher interest on government's market borrowings, provisions for recapitalising the public sector banks including both direct government finance and permission to these banks to issue new equity in capital markets, removal of restrictions on the growth of private sector banks, and moves towards deregulation of interest rates along with a strengthening of the RBI's supervisory system. In the case of capital markets, the purpose of reform is identified as a move away from direct government control over volume and pricing of issues to a more market based system subject to closer regulation by an independent authority. The abolition of the office of Controller of Capital Issues, the setting up of the Securities and Exchange Board of India (SEBI), and the decision to allow private sector mutual funds and foreign institutional investors subject to SEBI regulations are the main achievements claimed. As for 'Public Sector Reforms', the purpose of reforms is defined as increasing the efficiency of public sector units (PSUs) and to stop all budgetary provision to such units whether to cover losses or to finance expansion. This section is, however, rather short on achievements claimed, these being the amendment of the Sick Industrial Companies Act to bring PSUs within the jurisdiction of the Board for Industrial and Financial Reconstruction (BIFR), sale of public sector equity, and intent to allow PSUs greater flexibility in pricing and equity issue.

The noticeable features of this list of 'structural reforms', and of the rationale given for them, are, first, that they constitute a rather mixed bag selected on the basis of what the government obviously considers to be its 'successes'; secondly, that assertions dominate over argument on the desirability of the various 'reforms'; and, third, that there is a remarkable degree of dogmatism so that there is never any hint of complexity at all about any of the assertions made. Thus, on the issue of selectivity for example, the entire discussion of the fiscal deficit is devoid of any distinction between its components, the revenue deficit and public investment (which by now is familiar even to most laymen), presumably to hide the fact that there has yet been no cut in administrative waste and that the axe has fallen hardest on public investment. The section on industrial policy makes no mention at all of the contentious area of industrial exit, or of industrial restructuring, although this is clearly crucial. The section on trade and exchange rate policy makes out that there was a planned sequence in the move from Eximscips through 'partial convertibility' to the present combination of an unified

whereas in fact the first stage in this sequence was clearly a detour because the present regime is nothing but the pre-reform regime with a much wider list of goods on OGL. And the inclusion under public sector reform of the sale of public sector equity to bolster the budget is clearly a *non sequitur* resorted to only because there is nothing positive to write about on the matter.

As to the validity of arguments advanced, the substantial issues regarding the logic of 'reforms' are considered below while discussing the agenda for the future. It is sufficient to note here that, just as the list of reforms is drawn up so as to show up 'successes' even where there are none, the arguments advanced are not particularly sophisticated but do have that ring of plausibility which sounds good from the pulpit. Clearly, the whole purpose of the exercise is propagandist: to argue that things have gone according to plan so far and, with short-run stabilisation achieved, the government must concentrate 'boldly' on a programme of 'structural adjustment' based on these and further 'reforms' which need to be completed "in the shortest possible time".

The main point which needs to be taken up therefore is the extent to which things have really gone according to plan and stabilisation achieved. This is a matter not just about empirical facts but also about conceptual issues regarding both the goals of policy and the meaning of 'stabilisation'. When the government took office and decided to go for the IMF 'stand-by' arrangement the argument put forward repeatedly was that there was 'no alternative' and that the loan was being taken to avoid default and restore international confidence. This confidence had been weakened by the rapid growth of international indebtedness during the 1980s and was battered by the combined fall-out of the Gulf war and the domestic political instability which followed the upper caste reaction to V P Singh's Mandal decision. At least implicitly, the hope was that the 'stand-by' arrangement would achieve two objectives. First, that this would signal to other creditors the IMF's confidence in the Indian economy and so help to restore India's international credit rating. Second, that, by helping to build up short-term reserves, this would buy time to put into place an adjustment policy which would correct, without causing undue recession, the unsustainable imbalances in the external balance of payments and on the revenue account of the government's budget that had been bequeathed by previous Congress administrations. This was the basis of the fairly broad consensus which seems to have been reached at that time, and it is important to note that the critics of government policy were in fact at the

forefront pointing out the need to correct these unsustainable imbalances. Their main point of criticism was that the IMF-World Bank package was really 'no alternative' because it would not only not correct these imbalances but push the country into a trajectory from where it would be sucked into a vortex requiring further loans with even stiffer conditionalities.

The very fact that the government now has really no alternative but to approach the IMF for an EFF package, complete with the Enhanced Structural Adjustment Facility (ESAF) loan which attracts the maximal joint World Bank-IMF conditionality and monitoring, has vindicated the critics' fears, and casts doubts on the government's claims of having achieved stability. Of course, it may be argued, quoting sections of earlier memoranda from the government to the IMF, that the government's game plan all along was to take recourse to these extended facilities. But, although there are undoubtedly elements in government who have always relished the idea of such Bank-Fund imposed discipline, this would be a somewhat disingenuous defence. As late as April this year the finance minister had himself indicated that there were no plans to seek these extended credits.

It is true that such statements too should not be taken at face value because the finance minister, like his critics, must have been aware all along that taking the stand-by loan itself implied a high probability of having to go the whole course, and because it is rumoured that the bravado earlier this year was caused by a departmental bloomer regarding the foreign exchange situation. However, it should also be obvious that the expectation in government was clearly that if recourse to EFF became unavoidable this could be obtained while conceding conditionalities much less onerous than those which appear to be likely to be conceded now. The real problem, which should be obvious to all once blinkers are removed, has surely been that the policies of the past two years have failed precisely in those respects which mattered most from the point of view of providing the country with the leeway to consider alternatives other than rigid adherence to the Bank-Fund agenda.

First, despite the discussion paper's claim that "reforms in the trade and payments regime have encouraged exports", the fact remains that in dollar terms exports in 1992-93 were not significantly (only around 1 per cent) higher than what they were two years previously. Calculations by both government and independent analysts in 1991 had shown that an export growth of around 15 per cent per annum was required to avoid another payments crisis in 1994-95 when the scheduled repayment of the stand-by

loan begins. Exports at the end of last financial year were at least 20 per cent below these projected requirements. And, despite imports continuing to be below 1990-91 levels in nominal dollars, the ratio of the external current account deficit to GDP in 1992-93 was no lower than the Sixth Plan (1985-90) average, which almost all analysts agree was profligate. Consequently, there has been a worsening of every indicator of the country's external debt situation. And the projected payments hump beginning 1994-95 is now unbridgeable without recourse to 'exceptional financing' from abroad, unless of course there is willingness to tolerate an even greater import compression than the one which needed to be resorted to in 1991.

Secondly, despite the government's loud and self-congratulatory claims of success in the reduction of the fiscal deficit, the fact remains that, as a percentage of GDP, the revenue deficit of the central government in both 1991-92 and 1992-93 was no lower than the high and unsustainable Sixth Plan average. Whatever reduction which has been achieved in the fiscal deficit has come about as a result of cuts in the government's capital expenditures and on productive subsidies on exports and fertilisers, and as a result of its disinvestment in the equity of public sector enterprises. Moreover, since the latter has not been used to reduce public debt there has been no permanent reduction in the future profile of interest obligations, and, since cuts in public investment have the largest multiplier effect (because of its complementary relation with private corporate investment), the recessionary consequences have been needlessly large. Industrial production in 1992-93 was barely 1 per cent up on what it was in 1990-91, with manufacturing faring much worse, so that currently output is at least 16 per cent below projections using the pre-reform trend. Also, according to the latest CSO estimates, private investment in the economy fell by 16 per cent in real terms in 1991-92, and, though later official estimates are as yet unavailable, the available data on the production and import of capital goods suggests that it is unlikely to have recovered fully in 1992-93. Moreover, the latest NCAER survey of business confidence continues to show poor investment expectations in 1993-94, so that the crucial and much heralded supply response from the domestic private sector to the more liberalised industrial climate is simply not yet in evidence. In this context, the complacency the discussion paper expresses about the 'achievement of fiscal consolidation', brought about through cuts in public investment which presages serious infrastructural shortages in the short to medium run, is rather inexplicable, to say the least.

Third, and most importantly, despite all

the concessions made and despite the government kowtowing almost humiliatingly to foreign bankers and investors, India's international credit rating has not improved even an iota from the depths to which it had sunk in 1991. Also, high approval figures notwithstanding, the government's 'open door' policies have so far been unable to bring about any marked upturn in the actual quantum of foreign investment inflows. As a result it remains as severely dependent on the munificence of aid donors to finance the looming external payments gap as it was in 1991. This disappointing state of affairs may or may not come as a surprise to official analysts, but it certainly vindicates the critics who had continuously pointed out that, whatever the media hype to the contrary, foreign creditors and investors are more interested in results than in reforms *per se*. The experience everywhere in the world has been that credit rating agencies look much more closely at political factors and into the economic bottom line (i.e., at debt indicators and export and savings/investment performance) than at mere 'success' in meeting formal IMF conditionalities; and it is also well known that foreign investment typically follows a boom, and rarely causes it. The failure here reflects the fact that the government, as shown by its own list of 'achievements' in the discussion paper, seems to have put much more stress on obediently following the liberalisers' handbook than on evaluating and responding to the resulting outcomes in the performance of the real economy. Moreover, the political situation continues to be less than satisfactory for foreign creditors and investors, mainly because the government's attempts to cosy up with the BJP on the reforms have clearly boomeranged after Ayodhya, despite the subsequent display of pusillanimity that it has put up in order to minimise the damage.

Of course, it remains true that the Indian economy has shown remarkable resilience. Most important among the positive outcomes of the last two years has been the performance of agriculture whose output in 1992-93 was 3 per cent above that in 1990-91, itself a record year, and indications are that it may grow by a further 3 per cent in the current year. Linked closely to this is the downturn in the rate of inflation, which is attributable almost entirely to a sharp reduction in the inflation rate for agricultural goods and agro-based manufactures. To the extent that these good harvests were a consequence of good monsoons rather than the fruits of good government policy, the lower inflation rate is also largely a result of benign divine intervention rather than an outcome of successful stabilisation policy. However, the experience of 1991 shows that inflation would have been

much higher if the rupee had devalued more, and here the government is absolutely correct in identifying as an important stabilising factor the observed stability of the nominal exchange rate of the rupee since it was allowed to float.

Clearly, earlier fears of an inflation-devaluation-inflation spiral, expressed for example in this column, have so far been proved wrong, given the combination of good harvests, the support of aid donors, and the continuing deflationary stance in fiscal and monetary policy. The positive implication of this is that the Indian economy, which has historically experienced much lower inflation rates than Latin America, may be less vulnerable intrinsically to potential capital flight and dollarisation. But, equally, it is important to remember why inflation in India has historically been damped fairly quickly. One reason for this is the very low degree of wage indexation in the large unorganised sector and the fact that the main objective of India's international trade policy with regard to agricultural commodities has so far been to maintain domestic price stability, through restricted exports and counter-inflationary resort to imports and domestic buffer stock management. As a result, falling real incomes of the poor have cushioned inflation in the short-run, and long-run inflation has been moderated by matching supply to demand within a fairly narrow range of domestic relative prices without much regard for world price relatives. Another feature of the Indian economy has been a financial sector which has so far not only been insulated from the foreign sector but has also not been allowed to offer any hedge against inflation. Consequently, inflation has invariably led to a stabilising redistribution of income from creditors to debtors, allowing hikes in interest rates on new loans to be effective in choking off marginal demand. Both these mechanisms were prominently in evidence recently and must, along with the more important facts of good harvests, relative generosity of aid donors and the needlessly large deflation, have helped to moderate inflation and inflationary expectations. However, since the 'reforms' still to come envisage major changes in both these areas and since it would be foolhardy to bet on a further run of good monsoons, one cannot as yet rule out the possibility of an inflationary spiral appearing with even a moderate restoration of growth, particularly since further import liberalisation is a key aspect of the future reform agenda.

Thus, in complete contrast to the main presumption of the discussion paper, that stabilisation has been achieved and that the path is now clear for long-run 'structural adjustment', the conclusion must be that the policies so far have at best landed the economy into a precarious steady state where inflation has been moderated at the

cost of accepting negligible growth and, even then, continuation of the present situation depends critically on the fickle generosity of the rain gods and of aid donors. This may indeed be argued to be preferable to the crisis situation that prevailed when the present government took office. But it would be irresponsibly premature to assume either that macro-economic and political conditions have improved so much that a recurrence of that situation is now impossible, or that the private sector has responded so well to liberalisation that it is now possible to proceed vigorously with further withdrawal of the state without risking long-run stagnation. Unfortunately, despite containing many measures which should be acceptable broadly, the discussion paper's agenda for the next three years seems to make precisely these assumptions.

FUTURE 'REFORM' AGENDA

This agenda has three broad thrusts: to liberalise foreign trade (including in agriculture and consumer goods) somewhat more rapidly than envisaged earlier; to continue with the withdrawal of subsidies and of state involvement in industry and finance, while increasing investment in infrastructure and agriculture; and to remove perceived barriers to private investment, both domestic and foreign. These essentially micro-economic measures are sought to be accomplished while meeting two macro-economic targets by 1996-97: the reduction of the external current account deficit from 2.2 per cent of GDP in 1992-93 to less than 1 per cent, and the reduction of the fiscal deficit of the central and state governments together from about 7 per cent of GDP in 1993-94 to 5 per cent, involving a cut in the centre's fiscal deficit from 5.7 per cent of GDP in 1992-93 to about 3 per cent. The stated objective of the reform agenda is to "put the economy on a sustainable path of 6 to 7 per cent growth".

Considering the macro-economic numbers to begin with, several important but unstated implications need to be noted. Firstly, given that interest payments are bound to rise, the deficit targets, both on the external and fiscal accounts, imply much larger adjustments in the relevant primary deficit. In fact the proposed numbers (the central government fiscal deficit to reach 3 per cent of GDP by 1996-97, the overall centre and states deficit to reach 5 per cent of GDP and the BOP current account deficit to reach 1 per cent of GDP by 1996-97) imply primary surpluses in fiscal and current account balances. On the fiscal front, this task is even more formidable than appears at first glance, since the previous cuts in overall fiscal deficit have come about through cutting capital expenditure and using income from disinvestment of public sector

enterprises as revenue. The latter has contributed to the decline in fiscal deficit by around 0.5 per cent of GDP per year, but this clearly cannot be sustained. Further, to achieve primary surplus, the revenue deficit of the government, which has so far remained large, has to be turned around and made positive, even if capital expenditure can be brought down to zero. This implies a much more serious belt-tightening exercise than the government has yet suggested it is capable of. In turn, the balance of payments targets assume a greater adjustment than is immediately obvious. Elsewhere in the document, the assumption is made of \$2 billion capital inflow by 1996-97. Since that must have its counterpart in the current account, it means that in the event of capital inflow being less than this amount, the external adjustment required of the domestic sector would be even greater than is suggested by the figure of 1 per cent of GDP, and essentially implies a surplus of the exports of goods and services over imports.

Secondly, the section on 'Tax Reforms' makes abundantly clear that these large deficit reductions are to be accomplished while halving the average import tariff rate and cutting the rate of corporate taxation. Although this section also envisages some welcome steps towards increasing the tax base, through removal of exemptions and better compliance, it is more or less certain that the net result will be a fall in the proportion of GDP that is collected in the form of import tariffs and direct taxes. The burden of adjusting the fiscal deficit would therefore fall either on the expenditure side or involve increases in indirect taxes and increasing user charges on government supplied goods and services. Of these, the section on 'Fiscal Consolidation', in keeping with the experience so far, is relatively quiet about cutting wasteful expenditure in government proper but eloquent on the need to reduce subsidies and increase user charges.

Many of the subsidy cuts actually proposed, e.g., on irrigation, electricity and higher education, are unexceptionable in principle but will in practice involve complicated issues requiring much more careful thought and open discussion than has been evident so far, for example in the manner in which the fertiliser subsidy was cut or PSU shares disinvested. In addition to the need to avoid sheer incompetence in design, considerable political skill will be required to implement these cuts, all of which will have to involve the states and will also imply major changes in the distribution of incomes and resources across states and sectors. And it is almost certain that any attempt by the centre to force the pace by unilaterally cutting plan transfers to states will boomerang politically, aborting both the fiscal and efficiency objectives of these cuts. Indeed, since in the long run the efficiency gains from

cutting waste are likely to be greater than the immediate subsidy amount, there is a case for beginning by replacing subsidies with direct income transfers, but then the immediate fiscal adjustment would have to be done differently.

In addition to the problem of the feasibility of achieving the fiscal and current account targets specified, there is the issue of stability and sustainability of these in the broader macro-economic context, and especially in terms of the external sector. Here the anticipated response in terms of vastly improved export performance is absolutely crucial, not only for achieving balance of payments targets, but for ensuring some degree of stability and output growth. The projected policy for the external sector involves two main elements: an increasing concentration on agricultural exports and liberalisation of consumer goods imports, both of which are potentially destabilising. The first may raise domestic prices of exported commodities and thus have inflationary implications, while the second is likely to put further pressure on the balance of payments. Despite this, however, clearly the government must now take some decision regarding the freeing of consumer goods imports, quite apart from World Bank pressure, for the current situation which encourages investment flows into these consumer goods production while allowing freedom in the import of capital and components for such production is obviously unsatisfactory. The pity is that if the government had made its primary goal the reduction of bias against exports and not reduction of protection in general, and persevered with the Eximscip scheme extending this to consumer goods, the dangers of both too high an effective protection in this sector and the possibility of a sudden import surge could have been avoided with less uncertainty than exists now.

The section on 'Financial Sector Reform' contains very little that is new, essentially repeating the usual arguments about the need to free interest rates and allow greater freedom for the operation of private financial institutions, which is also seen to entail reductions in the Statutory Liquidity Ratio of banks to 25 per cent and the Cash Reserve Ratio to 10 per cent. The explicit aim of the strategy, "to make a wide choice of instruments accessible to the public and to producers", is one which completely ignores the possible fallout in terms of greater financial instability, as well as the implications of the removal of the cushion against inflation which was provided by the existing financial arrangements which did not really allow for index-linking of financial returns. The one heartening change from earlier statements on financial reform (including the

Narasimham committee report) is that, aside from a rather meek proposal for "careful targeting of concessional lending to the really needy", there is no talk of further cutting priority sector lending. If this reflects a greater understanding of Indian economic reality on the part of the finance ministry, then it is greatly to be welcomed.

As observers of the present government's economic strategy have by now come to expect, there is hardly any substantive content to the 'Industrial Policies' discussed here, other than the general point about deregulation of the licensing system and the urge to close down as many loss-making units as possible, both in the public and private sectors. The discussion of exit policy is guarded and muted, although some references are made to the need to review the Industrial Disputes Act, the 'rigid rules' inhibiting flexibility of the labour market and policies with regard to the use of urban and designated industrial land. The notable feature of this section, however, is not these stray references which are in keeping with the general 'free' market orientation, but the total absence of any real strategy for industrial restructuring. Indeed, this section would not pass as a viable statement of industrial policy anywhere else in the world, since there is no consideration of the desired pattern of future industrial growth and the consequent linkages or any discussion of the related issues of technology and skill development. A further cause for concern relates to the kind of signals this entire package sends to private industrial and other entrepreneurs, in terms of creating industrial discipline and an orientation towards productive investment. There is nothing in this entire document that suggests that there will be clear incentives for such motivated entrepreneurship rather than for sheer acquisitiveness of the 'get rich quick' variety that has so far accompanied the liberalisation measures.

For agriculture, one notable feature of the discussion paper is the rediscovery of the importance of land reforms and changes in tenancy regimes. This marks a major change from earlier papers of this government in which such considerations were brushed aside as unrealistic and harking back to some unfulfilled socialist dream, and can only be welcomed as one more indication of the (possible) coming of age of the finance ministry. As far as public expenditure for the rural sector is concerned, the paper argues that the aim should be to shift from subsidies to infrastructural investment; in fact, the final two sections are focused on the need to provide better infrastructure especially for agriculture and for exports generally.

Indeed, infrastructure investment is the crux on which will depend the fruition of

the lofty vision of future sustained growth that the document lays out. But, given the fiscal targets, the rapid import liberalisation, and the tardiness so far of the private sector, it might also turn out to be the Achilles' heel of the entire agenda. The discussion paper shows awareness of the fiscal problems ahead and suggests solutions in the form of both privatisation and more realistic pricing by public sector concerns, but the problems may turn out to be much more hairy. For a start, it is not clear that the political problems involved in getting states to get on with subsidy reduction will be solved in the time available, given the gestation lags involved. And, secondly, it is not clear that the private sector will enter into these areas without the sort of cast-iron profit guarantees now being demanded by potential foreign investors in the power sector compared to which the inefficiency of the much berated retention price scheme currently existing in the fertiliser sector is small change. The jump start necessary in this area can only come from direct public investment, and finding the funds and avoiding the possibility of adverse BOP effects should be the government's prime concern.

Finally, although the discussion paper is eloquent about human development while setting out the goals of reform, it devotes little space to spelling out its programme. The only concrete things mentioned are that priorities must shift from higher to primary education and from curative to preventive health care, and that JRY, IRDP and PDS must be better targeted towards the poor. All of this implies reallocations, not additions, to the commitment to human development and poverty alleviation. And it may safely be assumed that when the fiscal squeeze starts to bite, even the pretence of maintaining overall spending in these social sectors will be among the first to be given up. After all, if Rs 1 crore can be provided to each MP out of the rural development budget before a no-confidence motion, even more worthy use of such funds can surely be thought up by those who would give everything to maintain the political momentum of the reforms.

'Structural Adjustment' and Education

Arun Ghosh

The damage structural adjustment is doing becomes evident from the government's policies on education.

SINCE July 1991, India—under the tutelage of the World Bank and the IMF—has embarked on a policy of 'structural adjustment'. The purpose of 'structural adjustment' is to make for such changes in the production structure as would make India 'competitive' in international markets. In order to make India competitive, structural adjustment policies are attuned to the 'globalisation' of the Indian economy, so that the Indian production system—as well as the foreign trade of India—are fully in tune with international demand and supply. Also, in the process, and in an effort to make space for private initiative and enterprise, the focus is on the reduction of government revenues as well as of government expenditure.

How misplaced this policy is becomes evident from the present government's policy on education. Again, the World Bank—and a lot of misguided neoclassical economists advising it—are wholly in favour of *privatising* education. Apparently, anything connected with government is by definition 'inefficient'; the 'market system' is *ex hypothesi* more efficient.

Let us pause for a moment, and go back to an economist who is regarded (by all neoclassical economists) as one who advanced the subject greatly, and who ruled as a colossus in the domain of economic theory for nearly 40 years. Alfred Marshall, whose textbook constituted the core of economic theory until about the beginning of the second world war—and certainly until 1936, when Keynes' *General Theory of Employment, Interest and Money* appeared—has this to say: "Capital consists in a great part of knowledge... Knowledge is the most powerful engine of production... The distinction between public and private property in knowledge and organisation is of great and growing importance; in some respects of more importance than that between public and private property in material things..." (*Principles of Economics*, 8th edn, 1920; Macmillan, London, 1947; pp 138-39).

Note the two points made by Marshall: (1) that "knowledge is the most powerful engine of production"; and (2) that "the distinction between public and private property in knowledge is... of more importance than that between public and private property in material things..."

It is difficult to imagine that the finance minister of India, an erudite economist—a one-time Adam Smith prize winner in economics at the University of Cambridge—has not read Marshall. At any rate, he may be expected to have read W Arthur Lewis, and more recently Theodore Schultz, both of whom have emphasised the importance of education in the process of development. But Marshall's pointed reminder, as far back as 1920, about the distinction between public and private property in knowledge is getting to be increasingly more relevant by the day, both in terms of who dispenses education, and who holds the monopoly of knowledge in regard to technical progress. One would need a separate essay on the Dunkel proposals to include Intellectual Property Rights as an issue for surveillance by the reformed GATT; and we may merely note this important point, and delve into the problem of who is best fitted to dispense education and provide for the dissemination of knowledge and technical skills.

No, it is not either lack of understanding of the issues facing the country or his lack of faith in education as the most important factor in development which prevents the finance minister from pursuing policies which may help to develop the people of India, through better dissemination by public authorities of education and skills. After all, the finance minister was himself a professor of economics at the University of Delhi before he joined the government in the early 70s; and he himself (coming from a relatively poor family in rural Punjab by his own admission) owes his meteoric rise to his education. No, perhaps the compulsions lie elsewhere; he is clearly no longer in charge of economic policy-making; he has to do as he is told to, by a bunch of 'uneducat-

ed' degree-holders occupying important positions in the World Bank. Or, maybe, those gentlemen *know* what they are recommending; they are just not interested in seeing India develop.

There are two facets to education policy. There is on the one side the problem of universal primary education and better (and more widespread) vocational education. Secondly, there is the problem of higher education, which has to cope with rapid developments in science and technology around the world. There is also the other basic issue: should education be publicly funded or privately organised and privately marketed, same as any commodity?

We obviously would not succeed in 'globalising' the Indian economy without creating a domestic base of industrial growth based on a high level of scientific and technological skills. In the absence of such development, the 'globalisation' of our production structure is tantamount to accepting that India should remain a backward society, producing (and exporting) only primary products, and dependent on imports for all sophisticated manufactured goods. Currency devaluation never has and never will help the process of industrialisation. The structural change we need is by way of developing the people of this country.

Let us quickly get the problem of universal primary education out of the way. Primary education is essentially the responsibility of the state governments. But in India, the founding fathers of the Constitution gave all the flexible sources of revenue to the centre; they also devised the mechanism of a quinquennial Finance Commission to ordain the devolution of finances from the centre to the states, so that the latter could discharge their constitutional responsibilities for the development of education, health, etc. Unfortunately, over the years, the inroads of central planning have changed the scenario dramatically. Only a small part of central revenues today devolves to the states under the formula evolved by the Finance Commission; much the greater part of funds is devolved at the behest of the Planning Commission, and close to a third of the total devolution of funds is through centrally sponsored schemes. So, the states really dance to the tune played by the centre; and that goes not only for primary education but also primary health, expenditure for agricultural improvements, and all other

areas which, under the Constitution, are the responsibility of the state governments.

What about higher education? Well, the country is facing a crisis, and all government expenditures must be cut. Of course, we must increase the outlay on the police; 'law and order' must be enforced. We must also tax the rich less; for, in terms of World Bank philosophy, we must create more space for private initiative.

The result: the central grants (even to the central universities) have been cut drastically. And since university employees must be paid higher dearness allowances—as granted by the centre to its own employees, in terms of the Fourth Pay Commission recommendations—and since the total grants to universities have been frozen, the economy to be effected hits libraries, science laboratories and similar facilities. Let us take a look at the Delhi University Library. The figures in the accompanying table speak for themselves.

Of course, one must note that the Ratan Tata Library has, of late, been fortunate. First, in 1992, through the efforts of some senior bureaucrats, donations were collected from businessmen for the Ratan Tata Library. And now, in 1993, the finance minister—a one-time professor in the Delhi School of Economics—has made a Rs 5 crore grant to the Ratan Tata Library (as a capital fund), and another Rs 3 crore grant to the Delhi School of Economics to start a new Centre (for studies).

One should not grudge anyone's good fortune. So, good luck to the Delhi School of Economics. But what about the physical sciences? The number of journals subscribed to by the science library of Delhi University has come down from 795 to 195 in a matter of two years. An outsider cannot delve into the state of the science laboratories. Presumably, they would be facing a likewise cut.

And so, the inevitable response: privatise education. This is an easy escape route, but a route full of dark holes and pitfalls. Let us hearken back to Alfred Marshall who was vehement in defending 'competition' and private enterprise. Knowledge is not only the engine of production, a distinction has to be drawn between public and private property in knowledge. From Adam Smith down to neoclassical economists like James Meade and Theodore Schultz, all of them favoured: (a) public education, and (b) public property in knowledge. The latter, one must note, is a direct attack on the concept of Intellectual Property Rights, so close to the heart of reformers of the GATT. But we are not discussing the Dunkel proposals, which, in the present context, only focus on the problem of how to internationalise US patent laws.

So, the issues are two-fold: First, the issue is private *versus* public supply of education; and secondly, if education were to be publicly funded—and we should remember that even privately run schools and colleges are financially aided by the government, even though most of them are of the nature of 'money-making institutions'—how does one raise the resources required for publicly funded education?

The first issue then is whether public or private supply of education is better. Except for a very few elitist schools, out of reach of more than 99 per cent of the population, few people would question the superiority of public educational institutions as compared to private 'money-making institutions'. Certainly, the universities are all publicly funded. Some colleges, run by private charitable institutions, are reasonably well run; but of late, there is a mushrooming of commercial enterprises dispensing higher education, set up on the basis of highly concessional land and other facilities, with heavy

capitation and other fees. Basically, they are money-spinners for the promoters.

There is doubtless enormous scope for improvement of the quality of education dispensed by publicly funded institutions of higher learning. In particular, the state of libraries and laboratories in public institutions today is deplorable. There was a time when our educational system was narrow yet full of idealistic teachers. We had men and women of dedication as our teachers. Today, many teachers do not teach in their classrooms; they give private tuition to the same students at home for a separate (and a high) fee. How does one change this? But ask any parent; he would still prefer a state run university for his ward to a privately run institution. Does 'market preference' of consumers of education have any lesson for us?

Again, let us talk only of higher education, because primary education in rural areas does not interest our educational entrepreneurs. Before the second world war, the standard tuition fees for university education were Rs 12 per month for the BA classes, and Rs 15 for MA classes. These continue to be the fees even today, when many students come to the university in scooters and motor bikes (and some even in Maruti cars). One could argue in favour of free studentships and merit scholarships for the deserving poor. But how does one justify, in 1993, the same tuition fees as in 1939?

A government which can implement savage policies of economic reform is yet unable to muster the courage to raise tuition fees at the university level. The authorities also lack the courage to revise the curricula. The question of instilling proper values in our educational system just does not arise. We glibly talk of privatising education. Education has become another commodity to be marketed, based on demand and supply, available at a price; for the educational entrepreneurs charge heavy 'capitation' and other fees, and generally make money, even as they get concessional land and other facilities. But then, making money is the motive force behind the capitalistic system, is it not? Why complain? Self-interest rules the country, not what is good for the long-term interest of the country.

So, this is the background. What kind of structural adjustment are we attempting to introduce into the country in this framework? Do we not realise that a country which falls behind in education is also likely to become increasingly less efficient by international standards? Even the 'efficiency criterion' should warn the finance minister—an educated person—against this danger.

Sugar-Coating for Tougher Conditionalties to Come

EPW Research Foundation

The finance ministry's so-called discussion paper on the economic reforms is really an attempt to prepare the ground for the far tougher conditionalities to which the country is to be subjected as the price for the EFF and the ESAF borrowing from the IMF and the loan for financial sector reform from the World Bank.

THE ministry of finance has published what it calls a 'discussion paper' titled 'Economic Reforms: Two Years After and the Task Ahead' ostensibly to start a debate on the structural adjustment programme and to seek a consensus on economic policies as the government prepares to go to the International Monetary Fund (IMF) for an extended fund facility (EFF) loan.

IS THERE A CHOICE?

Before examining the substantive issues raised by the discussion paper, one is tempted to enquire of the finance ministry whether any alternative policy path is at all available once the government chooses the IMF's EFF and the World Bank's structural adjustment route? If, for instance, the consensus of the domestic debate were that the fiscal adjustment had been too severe, that the recessionary conditions in Indian industry were attributable to the sledge-hammer kind of fiscal and monetary compression, that the adverse effects of such compression were to be seen more in drastic reduction in the growth of industrial output and employment rather than in inflation control, that the private sector in India (including foreign direct investment) would not be in a position to fill the gap created by reduced public expenditure and public investment programmes in real terms for many years to come, that the structure and size of the investment were significantly different from the nature and size of public investment that the private sector would contemplate undertaking for some years to come and hence the restructuring route would imply a colossal waste of past investments not only in bigger units (like the BHEL) but also in downstream ancillaries and small-scale units.... Assuming that this was the consensus judgment, would we have the option of retaining over the next three years the gross fiscal deficit at the level of 5.7 per cent to which it fell in 1992-93 or even at 4.7 per cent to which it is proposed to be reduced in 1993-94, and of not reducing it to 3 per cent by 1996-97, i.e., the three-year period of the proposed EFF. It can be systematically ar-

gued on both theoretical and empirical grounds that a 5 per cent gross fiscal deficit of the central government is undoubtedly sustainable even in the long run, that it would be non-inflationary. Would this choice be available to us once government seeks the EFF?

Or if the consensus were that in order to avoid a possible external debt crisis after the EFF is over, due to drastic and premature import liberalisation and growing debt service commitments, we need to go slow on import liberalisation, would the option be available to us to reintroduce some of the import restrictions and to decide not to eliminate import controls on consumer goods in the next four years? Or if the consensus were that in the financial sector, the mere existence of a large number of players in the market (like many and different types of commercial banks) does not ensure competition or fair play and that, therefore, some degree of social regulation including cross-subsidisation is necessary; would it be possible then for the RBI to re-introduce one or two more slabs of interest rates for bank deposits as well as for bank lendings? Still worse, like the Narasimham committee for the financial sector, we now have an R N Malhotra committee for the insurance. Considering that insurance business is a gold mine and that there is still a vast area of social insurance remaining uncovered in India, would the government have the option of rejecting the Malhotra committee's recommendations if these were to include foreign sector participation in the insurance sector in India?

The fact is that having chosen the IMF/World Bank programmes with very high tranches of structural adjustment borrowings, the country has been pushed into a situation where it has little choice but to accept the severe conditionalities and performance criteria imposed by the multilateral agencies. What is more, the IMF/World Bank package is a tight-knit, highly integrated one and the country has not the freedom to choose any part of it. An outstanding example is that of the forced disinvestment of PSU equities during the past two years because there were

the IMF/World Bank conditions to be fulfilled, including those on bringing down the gross fiscal deficit. We know from the former secretary to the department of public enterprises how he was given just three months to complete the sale of Rs 2,500 crore worth of PSU equities, ignoring all national interests, because the IMF condition in regard to the gross fiscal deficit had to be fulfilled.

Therefore, the call for debate is a ruse by the bureaucracy to sell the reform package. If it is not a concerted effort by a coterie of the bureaucracy, how does one explain that all the committees appointed by the government—Narasimham committee on the financial system, Rangarajan committee on balance of payments, Chelliah committee on tax reforms, Rangarajan committee on disinvestment of PSU bonds and now in all probability Malhotra committee on insurance—should be singing the same song of structural adjustment, liberalisation, privatisation and opening up for foreign competition without a single member dissenting.

That the discussion paper is a subtle bureaucratic attempt to prepare the ground for the more severe conditionalities under the IMF's EFF and its 'soft' window, the enhanced structural adjustment facility (ESAF), and the World Bank's loan for financial sector reforms, is evident from the fact that it contains nothing which has not been articulated so far in IMF/World Bank documents on India, that there is not a shred of evidence of any hard bargain a country of India's size may hope to strike with the multilateral agencies in the proposed negotiations. For instance, every aspect of the financial sector reforms proposed in the discussion paper has been already agreed to with the Asian Development Bank (ADB) for its financial sector loan (the details of which have already been obtained by members of parliament). Progressive deregulation of interest rates, elimination of ceiling on bank deposit rates and phasing out of the floor on lending rates have already been agreed to with the ADB; likewise, reductions in the cash reserve ratio (CRR) to 10 per cent and the statutory liquidity ratio (SLR) to 25 per cent. When such is the backdrop to the discussion paper, where is the scope for any debate?

THE PHILOSOPHY OF THE REFORMS

While dealing with the substantive issues it should be clarified at the outset that it is nobody's case that there was no scope for reform in different sectors of the economy in 1991-92, when the current reform phase began, nor is it being contended that India ought not to borrow from the multilateral agencies when it needs to borrow. It is just that we ought to realise that borrowing from the IMF and the World Bank has a significant cost

attached to them. The larger the borrowing the higher the cost. As stated earlier, the multinational agencies have such a rigid attitude to the package of macro-adjustment policies that the borrowing country has no freedom to modify them to suit its policy preferences or the stage of development. There is by now universal acceptance, despite protestations to the contrary, that the social costs of adjustment fall heavily on the poorer segments of society. The higher the incidence of poverty, the more difficult it is for society to bear the shocks of adjustment. All talk of adjustment with a human face has turned out to be a facade because the economic logic of a market-oriented system is decidedly against the poor; it also deprives the state of control over resources badly required for protecting the interests of the poor. Therefore, certain preconditions essential for broad-based development have to be met before the reforms can be begun. The reforms have to be gradually introduced so that the vulnerable sections of society are not deprived of employment and the other sources of their basic livelihood and social expenditures. In the meantime, many checks and balances have to be continued so that the scarce resources of a poor society are not frittered away in non-functional activities. These and many other significant alternatives have been set out in the literature, but the discussion paper ducks these crucial issues by making emotional and repeated references to the success stories of the east Asian countries (China, Korea, Malaysia, Indonesia and Thailand) without making an effort to appreciate the preconditions which made those success stories possible.

There are four aspects of the discussion paper which call for detailed comment: the philosophy behind the reforms; the reform measures so far undertaken; the initial impact of the measures; and the structural adjustment programme proposed to be undertaken in the next three years as a part of the EFF and financial sector reform programmes.

As part of the broad philosophy of the new economic policy, the discussion paper argues that "the only durable solution to the curse of poverty is sustained growth of incomes and employment..." There is unshakeable faith in structural reforms putting the economy on a sustainable 6 to 7 per cent growth path which would take care of the age-old problems of poverty and unemployment. A basic question that has been posed in the literature, which the discussion paper does not even take cognisance of, is whether the Indian economy as yet possesses the necessary preconditions for the kind of rapid and drastic structural adjustment that is sought to be imposed on it. In this respect, the document repeatedly quotes the examples of the countries of east Asia, referred to above, which have transformed themselves within a generation and attained high living standards. Their poverty levels have come down to below 10 per cent. They are the ones which are attracting sub-

stantial foreign direct investment and also tourism earnings.

But the reference in the discussion paper on the success of the east Asian countries' is superficial. If we have to draw lessons from these countries, experience, we have to compare their historical setting, the preconditions for success created by them and the strategies adopted. First, these countries had not faced in their history such intense, systematic and prolonged colonial exploitation as India had faced, resulting above all in a persistent drain of domestic savings, relative stagnation in per capita income, and consequently erosion of the vitality for development; it had also bestowed on India a semi-feudal structures with the inherent tendency to waste and dissipate physical and financial resources in non-productive activities. China, which was no doubt similarly placed, could recover from the erosion and replace the deficient structure through intense socialist reconstruction. Second, all these countries have created, on attaining self-rule, a socio-economic environment conducive to broad-based development. Almost all of them undertook effective land reform which not only released the forces of production in their rural areas but also created more equitable distribution of incomes and wealth. "It is highly significant that the three non-socialist countries in east Asia that had the most equitable income distribution (Japan, Korea and Taiwan) are those that also underwent significant land reforms. As these societies were largely agricultural at the time of the reforms, these changes had profound effects on income distribution" [Steinberg 1988]. The estimated ratio of the top quintile to the bottom quintile income share in the population was 4.9 in the Republic of Korea in 1981, whereas it was 10.1 in India in 1975-76 [Amsden 1993].

Besides, these countries attained high levels of literacy, particularly female literacy, and substantially better health standards. In 1965, the percentage of females in the relevant age group enrolled for primary education was 99 per cent in Korea, 86 per cent in Thailand, 84 per cent in Malaysia, 64 per cent in Indonesia and 57 per cent in India. "The high-level of education in Korea contributed tremendously to its economic development as well... Korea achieved a literacy rate of nearly 80 per cent by the early 1960s, the highest of any country at a similar level of development" [Kihwan Kim 1988]. Likewise, maternal mortality rate (per 1,00,000 live births) for 1980 was 34 for Korea, 59 for Malaysia, 270 for Thailand, 800 for Indonesia and 500 for India. Also, with better female participation in the labour force and more than one earning member in an average household, these Asian countries could generate a rapid increase in household and overall domestic saving ratios. In the early phase of development of these countries (except for Korea which picked up very soon), their domestic saving ratios had generally reached

25 to 30 per cent—much higher than that of India. The higher level of social consumption with relatively better distribution of income and wealth vastly widened the demand base of those economies and facilitated more broad-based development. Higher literacy and health standards were the most crucial factors in enhancing labour productivity which in turn went to facilitate significant import substitution and export promotion.

What is more, in the strategies of development pursued by these countries, (a) the state played an active role in industrial restructuring with packages of incentives and disincentives, including for import substitution and export promotion; and (b) they resorted to an aggressive pursuit of import substitution combined with export promotion. An incisive study on the five Asian countries (Korea, Indonesia, Malaysia, Thailand and Taiwan) has brought out how the singular lesson from their industrialisation experience is that ongoing export promotion may fail to become diversified and knowledge- and capital-intensive if it is not followed by subsidised import substitution [Amsden 1993]. Referring to Thailand, the same study argues that as much as 50 per cent of exports were from import-substitute industries.

An important aspect of the new policy is the dependence on foreign direct investment for accessing non-debt sources of foreign resources and for facilitating improved technology transfers. Even liberal portfolio investment has been permitted, though at a very high cost to the economy. First, there is a significant body of evidence to the effect that excessive dependence on foreign sources tends to hurt the process of expanding domestic savings. Secondly, and more importantly, a study on the role of foreign direct investment in effective technology transfer in the context of the Asian countries has the following judgment to offer: "Passive dependence on foreign technology can transfer the results of innovation done elsewhere, but it cannot provide a domestic base of technological capabilities that long-term growth and diversification require. Of all the modes of technology transfer, FDI carries the largest risk of creating such dependence. This may not matter for developing countries with relatively small industrial bases and weak capabilities, such as Bangladesh or Sri Lanka. It does matter for countries such as India that have a base of innovative capabilities and can fruitfully add to it. The entry of foreign investors then has to be controlled and directed to promote the development of local innovative capabilities. FDI should be encouraged when it feeds into local innovation and should be restricted when it threatens to substitute for local innovation. Where possible, foreign investors should be stimulated to undertake local adaptive and innovative effort. Where necessary, the government must step in to assist indigenous innovation to coordinate the technological efforts of local firms" [Sanjaya Lall 1993].

Thus the whole philosophy behind the dra-

matic changes through a structural adjustment strategy has a questionable basis at this stage of the country's socio-economic development. In the first place, a sustained growth of output is not possible to be established on such a low base of domestic demand. Nor is it possible to squeeze a sustained export growth of 14 to 15 per cent per annum unless there is significant import substitution effort on a wide front of Indian industries and on an ongoing basis. In any case these activities will not generate adequate employment growth such that the poor get a share of the benefits of development.

BIASED VIEW OF PERFORMANCE

In presenting the achievements of the past two years in implementing macro-economic policies as also the responses to these policy changes, what the discussion paper does is a repetition of the myopic view of performance the government has been dishing out for the past year or so. The annual inflation rate steadily came down from 17 per cent in August 1992 to 7 per cent by the end of 1992-93. Foreign currency reserves crossed \$ 6.4 billion and the overall economic growth increased to about 4 per cent in 1992-93; industrial growth showed significant recovery in the first eight months of 1992-93, registering a growth of about 4 per cent over the corresponding period of 1991-92. The process of fiscal consolidation is being continued further in 1993-94, with the fiscal deficit targeted at 4.7 per cent of GDP. The industrial liberalisation has created an environment of competition and freedom to invest, expand and modernise in response to market conditions. Reforms in the trade and payments regime have encouraged exports and dispelled fears of the economy being swamped by imports. Exports to the general currency area (OCA) grew by 10.8 per cent and the reforms in industry and trade and in the payments regime would promote a pattern of industrialisation which is both sufficiently labour-intensive and also internationally competitive. The direct foreign investment, even if it reaches \$ 1.0 billion by 1995-96, would still be less than 4 per cent of total industrial investment in India and the notion that it would swamp our economic independence is not warranted. Apart from substantial tax reforms and financial sector reforms, a beginning has been made in reforming the public sector such that the actual budget would not bear the burden of maintaining sick public sector units nor of providing resources for expansion of PSUs in general. Finally, with a view to minimising the social costs of structural reforms, a national renewal fund has been set up, the public distribution system has been strengthened and expanded, and expenditure on the social sectors including rural development, health and education, has been substantially stepped up in the 1993-94

budget.

While each one of the above claims may appear to be correct, what has been left unsaid may go to dispute the claims rather substantially. Inflation control, for instance, has been to a great extent made possible by better crops in the past two years. While fiscal compression has no doubt played a role, but its role in creating recessionary conditions in industry has been more potent than in reducing the price rise. The earlier peak price rise rather quickly to 17 per cent from about 12 per cent was also largely contributed by the rupee devaluation. Even now there are significant sectoral pressures on prices (such as in many industrial products, sugar and edible oils). On the question of fiscal compression, the discussion paper is silent on its many consequences. We now have it on the authority of the deputy chairman of the Planning Commission that the erosion in the Plan outlay of central public sector enterprises in 1992-93 was of the order of 14.4 per cent. Similarly, there was a shortfall of 7 to 10 per cent in the state plans for agriculture, irrigation, and social services; in the power sector, the shortfall was as much as 14 per cent. The budgets of most of the 25 states for 1993-94 do not present an encouraging picture due partly to reduced resource mobilisation and partly to lower central assistance. Due to fiscal compression, the central government has reduced allocations for public enterprises and productive subsidies, but significantly raised interest payments from Rs 32,500 crore in 1992-93 to Rs 38,000 crore in 1993-94 (an item that would continue to rise, despite fiscal adjustment, due to unreasonably steep increases in yield rates on treasury bills and dated government securities). It is impossible to get a clear perspective of the fiscal performance unless these distortions and their consequences are highlighted.

The claim that reforms in trade and payments regime have dispelled fears of the economy being swamped by imports shows how biased the perception is about the functioning of the economy. In the first place, the decline in imports in 1992-93 were due to severe recessionary conditions in industry following the structural adjustment programme. But this does not disprove the fact that Indian society, given the opportunity, has a high import propensity. This is as much true of industrial goods as of consumer durables as well as of gold and silver. While detailed data are not available on the inflow of consumer durables, the clandestine as well as officially recognised import of gold and silver on a sizeable scale is enough of evidence on this phenomenon. Also, the argument that over time, reforms in industry, trade and the payments regime would promote a pattern of industrialisation which is both sufficiently labour-intensive and also internationally competitive fails to take note

of a few specific possibilities: (i) Indian industry, which has created a reasonably strong industrial base, may be swamped by unmitigated foreign competition and thus a process of deindustrialisation may be set in motion; (ii) a substantial export expansion of a wide range of technology-oriented, capital and skill based products is not possible unless there is the simultaneous promotion of import substitution; and (iii) due to pent-up demand for consumer goods, including precious metals, it is necessary to contain their imports at least until a viable balance of payments situation emerges as otherwise there is the danger of a debt crisis. Finally, it has been pointed out in the past but bears repetition that all corroborative evidence suggests a deterioration in the employment situation in the recent period. For instance, the employment exchange statistics, for what they are worth, suggest that both vacancies notified and placements effected were lower in 1991-92 and 1992-93 than in the preceding years. The discussion paper has no place in it for such relevant aspects of the performance of the economy.

ROAD AHEAD

This brings us to the reform agenda the government has proposed for the 'next three years', which exactly corresponds to the period of the proposed EFT programme. The first two years of structural adjustment have thrown up a number of lessons but the discussion paper does not even refer to them except for the platitudinous observation that the gains made in some areas could be reversed if we were not careful to consolidate them in the years ahead. In the next three years, mind-boggling changes are proposed to be effected in the macro-economic management of the economy which, if economic logic and the structure of the Indian economy are any guide, are likely to widen the gaps in the availability of social services as also contribute to a worsening of the problems of poverty and unemployment.

Apart from reducing the gross fiscal deficit of the centre to 3 per cent of GDP by 1996-97, significant reduction in subsidies, a new approach to administered prices, further reduction in budgetary allocations to PSUs, raising of user charges for electricity, irrigation, public road transport and non-primary education with some element of cross-subsidisation to cover the costs of services, completion of the tax reform agenda including gradual reduction of income and corporate taxes as also of the average custom tariff level, a move towards a full-fledged value added tax (VAT), and widening of the scope of presumptive tax, are some of the substantive reforms contemplated in the fiscal area. Reform of the financial sector will cover phasing out of ceiling and floor for bank deposit and lending rates with a single concessional lending rate

set about 3 per cent below the rate charged to prime customers, targeting the concessional rates to the really needy, and a phased reduction in SLR and CRR to 25 per cent and 10 per cent, respectively; widespread computerisation and special (probably drastic) attention to banks that remain weak and insolvent. With a view to making the provision of general and life insurance services more efficient and effective and for introducing greater competition for this purpose, the report of the Malhotra committee on insurance is awaited.

In industrial policies, apart from expecting the state governments to remove all fetters on industrial investment and production, the central government's focus will increasingly shift to restructuring unviable enterprises, both public and private, and also to carrying out a strategy of disinvestment in the equities of all public sector enterprises on the lines of the recommendations made by the Rangarajan committee. For small-scale industries, the emphasis in the future will be on promotion rather than excessive regulation and protection. (A secretary to the government of India recently revealed that the government was anxious to remove the protection given to 800-odd small-scale industries though it was facing certain hurdles in this respect.) There will be considerable reorientation of public expenditures on health, education and agricultural development. It is proposed to reduce subsidies being provided for water, electricity and fertilisers. "Taking the centre and states together, the pattern of public expenditure for agriculture has to be radically restructured to favour durable and productive investments and adequate provision for their operation and maintenance instead of input subsidies, whose benefits are typically appropriated by better-off farmers." Likewise, in infrastructure, the losses of State Electricity Boards would have to be eliminated. Generally, the monopolistic nature of public enterprises will have to give way to the induction of private service providers, the PSUs will have to operate on commercial principles with corporate status in some cases, special privileges like preferential purchase policies will have to be phased out, many PSUs will have to be ready to sell equity to the public and foreign investment will be expected to provide a critical supplement to resources and technology in some sectors. "All of this will require new thinking, fresh management approaches and, in some cases, legislative changes." Finally, in the external sector, important reforms contemplated are: phasing out of quantitative restrictions on exports and remaining restrictions on imports, elimination of all anti-export bias in trade and industrial policies and, finally, beginning a process of reducing the absolute protection provided to consumer goods. Also on the agenda are further measures to attract foreign investment with the goal of achieving

an annual flow of \$2 billion by 1996-97, and a progressive move towards full current account convertibility to encourage foreign investment. With considerable reforms in the regulatory framework, foreign investment in infrastructure industries will be promoted. An avowed objective is to reduce the current account deficit to below 1 per cent of GDP by 1996-97.

In the first place, the reform agenda, with its inspiration from structural adjustment programmes, concentrates essentially on monetary, fiscal, financial and external sector policies, ignoring the more basic questions of the real economy. For instance, domestic savings have generally remained stagnant during the past 10 to 12 years, which is the most crucial element in the macro problems of the Indian economy today. As mentioned earlier, the entire policy package concerning the industrial, trade and fiscal regime is sure to encourage conspicuous consumption, including investment in gold and silver, and hence prevent augmentation of domestic saving. The east Asian countries quoted in the government paper were already generating substantially high domestic saving ratios when they embarked on adjustment programmes. Thus in 1980 Malaysia had a domestic saving ratio of 33 per cent, Indonesia of 29 per cent and Thailand of 22 per cent. Though the Republic of Korea began with a low saving rate, by 1979 it had reached 28 per cent. India's saving rate has remained almost stagnant for more than a decade at around 22 to 23 per cent. It may be argued that the current high domestic saving ratios of these other countries are attributable to their rapid economic growth, which is only partly true. An equally important factor was the pursuit of an aggressive policy of saving promotion in the early phases of their development, apart from the impetus provided by a more egalitarian economic structure.

Likewise, shorn of all clichés about industrial restructuring, the future of Indian industry lies in policies on technological upgradation, adaptation and assimilation and promotion of local research and development. The discussion paper is practically silent on these basic issues.

A theme that runs through the reform agenda is the role of state governments in carrying forward the structural adjustment programmes in their next phase. First, in fiscal consolidation, it is proposed to reduce the gross fiscal deficit of the centre and states together as a percentage of GDP from about 7.7 per cent in 1993-94 (not 7 per cent as mentioned in the paper) to around 5 per cent in 1996-97. Of this reduction, at least one percentage point would be on account of state governments. As it is, the states will face considerable reduction in central transfers of budgetary resources. They will get a lower share of revenues as the centre brings about substantial reduction of income taxes and

excise duties which would affect the states directly and would reduce the centre's ability to effect transfers. A number of additional costs have been imposed on the state governments. Interest rate on their borrowings from the centre and on small savings have been drastically raised. While the size of their market borrowings in real terms is being reduced, the cost of such borrowings has already been substantially pushed up. No doubt, the discussion paper expects a drastic reduction in the massive subsidies extended on irrigation, power and road transport, but achievement in this regard can only be very gradual; likewise, the expected improvements in tax compliances, tax administration and buoyancy in tax revenues. Second, in implementing the new policy on industrial investment and production, the paper admits that many fetters are still quite pervasive at the state and local levels; enterprises continue to face difficulty in procuring land, water and electricity connections. It is said, rightly, that the responsibility of improving the industrial climate in this respect lies with the state governments. Third, substantial emphasis has been placed on the restructuring of public expenditure in areas which predominantly concern the state governments: education (primary education and literacy programmes as distinguished from higher education) and health (preventive and primary health care as against curative and referral facilities and urban hospitals), agricultural investment combined with reduction in agricultural subsidies, provision of infrastructural services with appropriate economic pricing, and special employment programmes like the IRDP and Jawahar Rojgar Yojana.

There is no gainsaying that in all these areas the administrative machinery at the states' level has a major role to play but there are two issues which deserve to be raised here. First, there is no awareness in the discussion paper of the fact that if the state governments have to play a more effective role in all these areas, that new role has to form an integral part of a more decentralised pattern of governance. The existing pattern is highly centralised and is not conducive to it. It is revealing to see, in this respect, how in China the provinces have been given the powers to negotiate foreign collaboration agreements and how they are vying with each other to attract foreign direct investment, particularly in infrastructural areas. Secondly, the question is not merely one of restructuring the expenditure programme; it is also one of generating adequate growth in expenditure, say, as a proportion of GDP. While the discussion paper gives emphasis on shifting the relative share, for instance, in public expenditure from higher education to primary education and literacy programmes, or in public health, from curative and urban hospital facilities to providing primary health care, it is not realised that the gap in these services

is so vast that unless there is a substantial increase in the overall expenditure, the amounts assigned to these areas in real terms would fall short of the requirements and hence the gap in the availability of these services would get widened. So is the case with financial and physical resources allocated for special employment programmes like the IRDP and the Jawahar Rojgar Yojana. These schemes are looked down upon with contempt by the bureaucracy and during the last four-five years, the funds allocated for them have been pitifully small. The biased attitude of the government in this respect is evident from the fact that its immediate response to the high level of food-stocks with it was to resort to their export and not think of using foodgrains for the creation of assets through special employment programmes.

In the fiscal area, the reform agenda would also involve substantial reductions in subsidies for fertilisers, food, and several petroleum products like kerosene and LPG, as also the overhauling of administered prices and elimination of budgetary support for public sector undertakings. The major tax reforms anticipated are: gradual reduction in the average customs tariff level to 25 per cent with maximum rates at about 50 per cent; rationalisation of customs duties and import policies for consumer goods, and gradual reduction of income and corporate tax rates. A singular achievement of the east Asian countries during the initial period of their growth was the relatively high share of direct taxes as a proportion of GDP (for instance, 4.7 per cent in the case of Korea in 1970 as against 2.5 per cent in the case of India now). The reforms contemplated now are unlikely to achieve such a high incidence of direct taxation in India. Those countries also had significant protection for their consumer goods which facilitated the creation of a comparative advantage for themselves in such goods. India has a relatively vast market for consumer goods and therefore, from all macro-economic angles, one of the most important candidates for selective intervention by the state relates not only to protection for consumer goods industries but also a general restraint on their domestic production as well for some years to come. Finally, the complete surrender by the state of the potency of fiscal and monetary instruments to establish a set of priorities for production and investment as also for imports and exports, will be contrary to the experiences of all the successful Asian countries.

In industrial policy, overwhelming importance is being given to the restructuring of weak and unviable enterprises, both public and private, as also to the disinvestment programme for public sector enterprises. In a patently unequal society some amount of protection for labour is a necessary condition for social peace. There is, however, the discussion paper argues speciously that the

rigid labour market rules limiting the flexibility with which labour can be hired and retrenched can tend to push entrepreneurs into more capital-intensive technology so as to reduce the number of workers they have to deal with. This is nothing but an apology for entrepreneurial preference for capital-intensive technologies as a natural response to fiscal and other policies favouring capital. If casual labour is preferred to regular workers, it is because the state permits the breach of labour laws. The government's National Renewal Fund (NRF) for training displaced labour has provided nothing beyond termination benefits for staff opting for so-called golden handshakes. In this context, some results of a recent study by the Organisation for Economic Co-operation and Development (OECD) in respect of its 24 member-countries should be revealing. According to the OECD, the two remedies most favoured, namely, active labour policies (such as labour market training, direct job creation, etc) and flexible policies of hire and fire have been found to be ineffective. A study of the industrial training programmes in a few major countries found that training for a group of unemployed persons made no significant difference to their future earnings and employ-

ment or claims for unemployment benefits. To quote the OECD report, "Indeed, a high turnover will weaken the human capital and productivity gains that normally come with more stable work arrangements and practices". Secondly, the OECD report points out that flexible policies of hire and fire cannot but have a damaging fall-out for the training that employees receive; such a system does not facilitate the promotion of a work place with sophisticated skills and healthy labour attitudes towards better productivity and efficiency.

Partyless Polls to Powerless Panchayats

Tilak D Gupta

Neither the Janata Dal nor the Congress is interested in the devolution of powers to the panchayats, even though this would mean little more than a marginal shift in decision-making authority.

THE news that the panchayat polls would be held soon in Bihar has roused considerable interest among the major political parties in the state. That is not really surprising, given the fact that the elections to these village-level local bodies were last conducted, way back in 1978. Though the Bihar chief minister, Laloo Prasad Yadav, after coming to power more than three years ago, did initially make noises about holding early panchayat elections, no follow-up action was taken to fulfil the promise at that time. Meanwhile, the panchayats were kept in a state of suspended animation through promulgation of ordinances from time to time.

But with the coming into force of the 73rd Constitution Amendment Act, 1993, that has made direct elections to village, intermediate and district level panchayat bodies, mandatory every five years, Laloo Prasad Yadav has apparently woken up to the need for an early poll. What obviously interests the Bihar chief minister most is the fact that the central act leaves it to the state legislatures to make "provision for reservation of seats in any panchayat or office of chairpersons in the

panchayats at any level in favour of backward class of citizens". As a matter of fact, Yadav has lost no time in announcing that reservation of seats for the backward castes would be made in proportion to their population in the state. For ascertaining the strength of the backward caste population in Bihar, the chief minister has urged for an immediate caste survey to be done by the state administration.

True to his new-found enthusiasm for reinvigorating the panchayati raj system in the state, the Bihar chief minister took the initiative for holding a number of all-party meetings at the state capital, Patna, in an effort to evolve a consensus regarding the nature of a new panchayat law required for holding the elections. Already, the Panchayat Raj directorate of the Bihar government is working overtime to give final shape to a draft legislation for amending the existing Bihar Panchayat Act. Such an amendment, it may be recalled, has become necessary to bring the state law in line with the 73rd Constitution Amendment Act. The central act, for example, has laid down the guidelines for the composition of panchayats at various layers,

preparation of electoral rolls and reservation of seats, including that of chairpersons, for scheduled castes, scheduled tribes and women. Besides, the 73rd Constitution Amendment also stipulates the constitution of a state finance commission for allocating resources to the panchayats under various heads. The state panchayat law therefore, has to be suitably amended to incorporate these mandatory provisions.

Those hoping that a regime led by Janata Dal—a party vocally advocating decentralisation of economic and political power—would devolve some real financial and administrative authority to the Bihar panchayats, however, are in for a big disappointment. Going by the pronouncements of the chief minister, the Janata Dal government, like its Congress predecessors, is showing a distinct unwillingness to critically evaluate the failed panchayati raj experiment in Bihar in order to inject life to these virtually defunct bodies. The suggestions made by the state government representatives, in the all-party meetings, for instance, virtually skip the issue and instead deal primarily with the various technicalities of holding the panchayat polls. Secondly, the present regime too, by all accounts is disinclined to plug the loopholes in the state panchayat laws that made all powers granted to the panchayats on paper, inoperative in actual practice.

Indeed, the Bihar Panchayat Act, 1947, the first of its kind in post colonial India, presents a classic example of the gap between the law and reality. As it is, the umpteen amendments made to it from time to time, the plethora of clauses and sub-clauses and the legalist verbiage, makes it a decidedly unreadable document. Going through the agonising experience of deciphering an act which is professedly meant to equip the rural folk in the business of running the bodies of village 'self-rule', one comes to understand better how the Indian law-makers made it a point to make the statute books as unintelligible as possible for the common people.

More pertinently, one seldom comes across a piece of legislation that so flagrantly contradicts the ground realities of rural Bihar. Look at the act to discover how the chairpersons of the panchayats are made accountable to the village assemblies holding their meetings at regular intervals. Turn to real life to know that such assemblies are absolutely unheard of in the Bihar countryside. Read the law to find that elaborate provisions have been made for the panchayats to raise resources through a variety of taxes, levies and fees. But enquire at any Bihar village to learn that these local bodies have never been allowed to raise any finance of their own. Again, for form's sake, the act does grant elaborate administrative and judicial powers to the panchayats. But what is bestowed in one clause is taken away through another sub-clause that makes such powers dependent on executive sanction. As a number of informed observers of the Bihar

panchayat scenario note, the act is so formulated that a simple letter from the chief secretary can invalidate most of its provisions.

LEADERS' RELUCTANCE

Interestingly, the all-party meetings held to discuss the amendments to be made to the existing act, demonstrated a remarkable unity of thought between the ruling Janata Dal and the Congress, the main opposition party in Bihar, on the question of keeping these 'institutions of self-government' non-functional, as before. Going by their recent utterances, both Laloo Prasad Yadav and the leader of the opposition in the state assembly, Jagannath Mishra, seem to be equally disinterested in granting any real administrative or financial power to the panchayats. While the Bihar chief minister is not prepared to go further than making delightfully vague promises about more power to panchayats, Mishra, skirts the issue by talking about granting more judicial power to these bodies. The Bihar Panchayat Act, it needs to be mentioned, unlike the laws of some other states, provides for a judicial wing of the panchayat to deal with petty crimes and local disputes.

The reluctance of these two leaders to devolve some authority to the panchayats appears all the more striking because of their reputation as champions of more fiscal powers to the state. While Yadav's outbursts against growing centralisation of power at Delhi has often hit the headlines in recent times, it may not be equally known that Jagannath Mishra as chief minister, has been most vocal among the state Congress leaders protesting against centre's discriminatory attitude towards Bihar. Evidently, according to this kind of view, devolution of power from Delhi should stop at Patna, and go no further.

What, however, demands a deeper analysis is why both the Janata Dal and the Congress are unwilling to shed some power to the panchayats when in the given socio-economic set-up, that would perhaps mean little more than a marginal shift in decision-making authority from the district level officialdom to the dominant class-caste combines in the Bihar countryside. To put it another way, it may be profitable to examine whether the socio-economic forces that prompted Ramkrishna Hegde to grant a certain amount of power to the panchayats do not exist in Bihar to pressurise Laloo Prasad Yadav to effect even a Karnataka-type reform of the Bihar's panchayati raj system.

Pending a detailed study of the subject, one may venture to suggest that the dominant class-caste combines in the state themselves are not quite enthusiastic about partially taking up the task of planning and executing rural development with corresponding accountability to the people. Shorn of rhetorics, that would in point of fact, have merely amounted to strengthening the capitalist sector of the

agrarian economy by using the panchayati raj institutions. But the upper caste rural gentry in Bihar, traditionally aligned with Congress, by and large did not get transformed from zamindars to capitalist farmers. Rather, this class has in the last four decades or more, used its pre-eminence in the panchayati raj system as yet another instrument to siphon-off development money, of course, in connivance with the local bureaucracy. The total bankruptcy of the state-level financial institutions and collapse of the co-operative movement in the state, do bear an eloquent testimony to the looting spree of this class.

This primitive accumulation through plunder of state resources obviously needed and got political protection. That in turn, gave birth to a well-entrenched patronage network linking the political bosses at the state capital to the 'mukhtias' (chairpersons) of the panchayats, for sharing of the unearned income. In such a situation, the village-level vested interests are neither keen to give up their middleman role between a growingly inaccessible and heartless bureaucracy and the people, nor to break the existing patron-client relations with their political masters.

The upper strata of the backward castes that have come up in recent times, in comparison, generally had a more industrious background either as non-cultivating 'ryots' actively supervising the agricultural operations or as well-to-do cultivating peasants. But in a milieu where non-participation in productive work signifies social status and corruption enjoys social sanction to a large extent, this strata with growing prosperity, has also begun to ape their upper caste brethren. The struggle of the neo-rich among the backwards, to speak the truth, is not for destroying the patronage network based on usurpation of development money, but to rebuild it, in their favour.

Moreover, from the ruling party's point of view, giving more power to the panchayats is also fraught with grave consequences considering the growing spread of the rural poor's struggle in large parts of rural Bihar. As it is, the panchayati raj institutions have not become a part of the political system proper and have not posed any threat to the established centres of political power. But given the fact that the militant organisations of rural poor so far have remained more effective in changing the power equations at the grass roots, some genuine power to the panchayats may indeed, lead to the emergence of alternative power centres posing a challenge to the state-level political authority. That is a possibility which the ruling circles will wish to nip in the bud, for obvious reasons.

It follows that Laloo Prasad Yadav's primary concern is to carry through the present backward caste dominance in Bihar politics right up to the panchayat level, by building an alternative network of influence-peddlers and wire-pullers. No wonder, the Bihar chief minister is most vociferous about reservation

of seats for the backward castes and insists on non-party polls. Caste polarisation at election time, instead of a party-wise division, plainly suits Yadav's interests better in a state where backward castes alone, are estimated to constitute roughly half the population.

The upper caste Congress leadership equally keen to safeguard its old dominance over the panchayati raj system, is however, in no position to openly oppose the reservation of seats for backward castes in a province that has come to be known as the Mandal-land. Though perhaps fighting a losing battle, the party in an attempt to engineer a split within Yadav's backward caste-Muslim alliance, has come out with a counter-proposal for reservation of seats for the Muslim community. Further, the Congress has also demanded that the bulk of the reserved seats for

the backward castes should be kept aside for the most backward sections among them.

As the things stand, what therefore seems to be really on the cards in Bihar, are partyless elections leading merely to powerless panchayats. For the moment, the ground realities of rural Bihar, apparently, do not permit a moderate dose of grass roots democracy even in the most narrow official sense of the term. Nevertheless, the panchayat elections, whenever held, promise to be bilaterally contested with violence that might surpass all records. That is simply because of the fact that though the panchayati raj has been an unmitigated disaster, 'Mukhia raj' remains a tempting proposition for the aggressive and powerful dominant class-caste combines, with the added Jawahar Rojgar Yojna charm of recent times.

Textile Mills of Assam

Is Privatisation the Answer?

Sriparna B Baruah

In the mid-80s when everywhere in India centralised weaving units were on the way out, the government of Assam established weaving complexes and process houses in the public sector. The recurring losses have now forced the government to attempt to privatise these units.

IN Assam the synthetic mills were promoted in the public sector as downstream units of the BRPL and were expected to in turn promote the decentralised power loom and hand loom sector and other related economic activities to this end. The mills were conceived at a time when the cotton textile industry in the country was reeling under one of the worst ever recession. But the textile industry in the country was often characterised by such ups and downs—good years were invariably followed by disastrous ones. By the time these mills were put on commercial production the synthetic spinning industry was flourishing elsewhere in the country.

The spinning units of all the three textile mills of Assam under the industries department, Assam State Textile Corporation (ASTC), Assam Polytex and Assam Syntex (ASL) were established in the middle of 1980s. The ASTC had been envisaged as an apex body for the planned development of the textile sector in the state. This was however not realised and the weaving complexes and process houses were also approved in the public sector. When everywhere in India, centralised weaving units were on the way out, the government of Assam established such weaving complexes each promoted by one of the existing spinning mills, viz, APOL, ASTC and ASL.

The total equity investment of the state government is around Rs 30 crore. The loans given by the state government amount to

another Rs 8 crore approximately. Thus the total outgo of funds from the state government has been about Rs 44 crore.

Established under this background the performance of spinning mills has been far from satisfactory. A comparison of the Assam mills and the all-India mills make it more evident.

	Assam Mills	All India	Scope of Improvement (in per cent)
Capacity utilisation	50-60	95	45
Efficiency/total	65-73	92	25.3

The capacity utilisation of the weaving and processing units of ASTC and ASL is very low. One of the main reasons for this is the low working capital sanction from the banks.

The weaving operation is also not profitable in the centralised sector set up with large overheads. Even private business houses have disbanded weaving units in the face of competition from the decentralised weaving sector which operates at negligible overheads. The process houses also require a much higher degree of professionalism and expertise as compared to spinning mills. The production of the weaving and processing units is very poor. The capacity utilisation of the weaving unit of ASTC is 12 per cent and ASWMCO is between 38 and 40 per cent. The processing house of ASTC utilises only

2.5-3 per cent of its capacity. The ASWMCO is yet to be commissioned.

On the whole, the performance of the three synthetic mills has been very discouraging and till 1991-92 the mills have been incurring huge net and cash losses. The outlook for the future also looks very bleak because there are a few more problems which the mills are likely to incur in the near future: (i) there would be the impact of revised pay scales, (ii) there has been a hike in the excise duty on yarn but the selling price has not risen proportionately, (iii) the sales tax exemption for purchase of PSF from BRPL has expired for all the mills, (iv) the power tariff has gone up, and (v) the VSF shortage has become more active.

There is little likelihood of the state government being in a position to provide funds for making up cash losses. In such a situation, the spinning mills seem to be leading for certain closure in the near future.

PERFORMANCE

The poor performance of the mills has been because of a number of factors, some of which are uncontrollable, some are partially controllable (by the management) and some are controllable. Factors like proper planning, time and cost overruns and imbalances in some machinery are beyond the control of the mills at present. Besides these, there are certain partially controllable factors.

The synthetic mills are plagued with a perennial shortage of viscose staple fibre (VSF). In this connection the efforts made by Assam Polyester Co-operative Society (APOL) to solve the problem is really commendable. APOL has changed its raw material to 65 per cent polyester staple fibre (PSF) and 35 per cent of VSF. This change in ratio has also enabled APOL to produce more yarn with the same amount of viscose.

The power position in the state has been very unsatisfactory and the mills are being affected by this to a great extent. However it has been found out by NITRA teams' report that proper utilisation and maintenance of the DG sets can solve the power problem to a great extent.

The yarn price has not increased in proportion to the hike in excise duty, this has also been mainly because of deficiency in the marketing strategy. Besides the problems stated above, there are certain other problems and these problems have arisen mainly because of certain shortcomings of the management and these are all controllable factors.

The labour productivity is very low. This has resulted mainly because of poor training and motivation. The workers are not educated about the norms they are supposed to achieve and the shortfall in performance. The low productivity standards have been allowed to continue and have now almost been recognised as the norm for all the mills. The

labour absenteeism is comparatively high particularly during night shift and festival time. It is stated that there is no work culture. But no attempts have been made to improve work culture through orientation, training, incentives and cultivation of a sense of belonging among the workers. There is also poor supervisory control over workers resulting in loss of production, low spindle speeds, unnecessary stoppage of machines, etc.

Market realisation is poor and this is mainly because of substandard quality, distress sales and corruption. No attempt has been made to diversify and plan more profitable product mixes. There is lack of accountability at all levels, also lack of thorough monitoring and reporting system. The various MIS records maintained by the mills are confusing and do not help to control the critical operations.

The spinning mills in the public sector were established with a view to promote textile industry in the state, viz. weaving, processing and textile units, for example, readymade garments were expected to get a fillip due to local yarn availability. Unfortunately this has not happened, despite huge government investment of about 36 crore in public sector textile units, they have contributed little to the growth of textile sector in the state. The three public sector mills have been producing about 200-MT of PV yarn per month. However they are sending majority of their yarn to Bombay and outside places.

The local power loom units are starved of yarn and this is a major constraint in improving capacity utilisation of power loom units. It is indeed unfortunate that the public sector spinning mills which were established with government fund should totally disregard the needs of the weaving units located within the state and continue to supply outside the state. One reason quoted by the spinning mills for not supplying yarn to local units is that these units do not pay in cash. The so-called cash sale of yarn to Bombay agents actually involve a credit of not less than 27-30 days—(1) transit period of 10-16 days, (2) holding period in Bombay prior to final sale maximum—10 days and average five days, and (3) cash recovery period of seven days from the date of lifting.

Again when yarn is sold outside Assam, the following extra costs have to be incurred: (1) transportation cost Rs 2 per kg, (2) cash discount—1.5 per cent on sale price, (3) commission—2 per cent on sale price, and (4) CST—2 per cent. The actual sales rate is also often not quoted correctly by the spinning mills when fixing yarn prices for the local units. No attempt has been made to cultivate the local weaving market in power loom and hand looms. The original intention behind the establishment of public sector spinning mills was to promote downstream weaving units. This plan is totally defeated as the entire yarn is being sent outside the state.

The mills are all facing problem of working capital. Yet there is lack of initiative of

the management (particularly ASTC) to procure job works. The machine maintenance is also not satisfactory. There is a lack of concern on the part of the management to improve the existing situation. This is probably because no one really has at stake the performance of the mill nor is any one accountable for poor performance. The management normally puts the blame of every thing on shortage of raw materials, unreliable power supply and inadequate working capital. Every year proposals were being presented to the state government to (a) compensate for cash losses, and (b) purchase of equipment to increase production/productivity. While presenting the proposals a rosy outlook for the future was presented and very soon this was forgotten.

It would however be a mistake to think that the textile units are intrinsically unviable. There are certain factors which make the textile units quite attractive and present a picture very different from the one presented by their current operational results.

—The machinery is new and reasonably in good condition. With a little expenditure on repairs, the machinery belonging to ASTC would be worth the value of new machinery of the best quality.

—The layout and infrastructure of all the mills is excellent and there is adequate scope for expansion.

—There is no surplus workforce. This is a very significant strength which does not exist in other public sector undertaking of the state

government.

Two clear premises arise out of the above are: (1) the poor functioning of these textile units has been largely due to mismanagement, and (2) the state government is not in a position to offer continuous budgetary support to make up for the losses.

In this background, the committee on textile units under the industries department which was advised to deliberate on the options for reorganising/restructuring of the textile units has felt that it has become expedient to go in for private sector participation and for this purpose regrouping of the mills would be necessary. The committee had recommended partial disinvestment, therefore private placement with transfer of management (joint sector). Based on the recommendations, the government has started the process of privatising the textile mills.

The government has taken the decision to transfer 89 per cent of the shares of these textile units to the private sector. The advisory committee had recommended a disinvestment of 25 per cent in order to enable the government retain its control over the board. Again, it has been observed that prior to the final decision of privatising the mills, the management of ASI, in consultation with the employees union had submitted a proposal to the state government on how the employees proposed to run the mill. In its effort to privatise textile mills, the government seems to have disregarded other viable alternatives for running the textile mills.

A K Ramanujan

A R Venkatachalapathy

A K RAMANUJAN (AKR) passed away suddenly on July 14, at Chicago. Born in Mysore into a Tamil brahmin family, AKR had, as he was fond of remarking, two mother tongues: Tamil and Kannada. For a while he taught at Madurai before he went to the University of Chicago in 1962, where he eventually became professor in The Department of South Asian Languages and Civilisations. AKR was a poet, translator, folklorist and linguist. He was equally proficient in all these vocations, but as a student of Tamil, I would like to believe that he will be chiefly remembered for his translations of classical Tamil poetry.

AKR's affair with Tamil poetry had a dramatic beginning. On one of his first Saturdays in the University of Chicago, 'the ignorant heir' to arguably the longest unbroken tradition of poetry in the world went looking for an elementary grammar of classical Tamil but ended up sitting on the floor between the racks browsing through an anthology of classical Tamil poetry. The accompanying prose commentary unlocked the doors to 'realms of gold'. "Even one's own tradition is not one's birthright", he was to write later: "it has to be earned, repossessed". Translating classical Tamil poetry into English was AKR's way of earning and repossessing his Tamil tradition.

Some years later, *Fifteen Poems from a Classical Tamil Anthology* (1965) was to issue from the Writers' Workshop, Calcutta. It was to be followed by a fuller translation of love poems from the *Kuruntokai*, *The Interior Landscape* (Indiana University Press, 1967) to rave reviews and enthusiastic response. The evocative phrase, 'the interior landscape', which AKR employed to suggest the richness of Tamil love poetry with its close association of romantic moods and situations to the physical milieu and environment has since been referred to one knows not how many times. By 1985, a more comprehensive selection, *Poems of Love and War: From the Eight Anthologies and the Ten Long Poems of Classical Tamil* (Columbia University Press, 1985), which attempts to represent the entire corpus of ancient Tamil literature, was published.

These translations not only won a name for AKR, but also secured for Tamil its rightful place in the literatures of the world. Ancient Tamil poems are now a standard presence in many anthologies, thanks largely to AKR. Some Tamil scholars have pointed out that, apart from quite a few mistranslations, AKR's English versions also reveal an excessive reliance on commentaries. Be that as it may, objectively speaking, there is no gainsaying

that AKR has achieved more than anybody else in this sphere. His sensitivity to the nuances of the English language (especially American English) and its idiom has contributed in no small measure to his success. Many of his translations communicate on their own and stand independently as poems in English. This is not to take away credit for the skilfully-written, scholarly introductions and afterwords, which enriched the poetic experience of the readers. There is a beautiful poem which AKR has translated thus:

Enemies,
take care
when you enter
the field of battle
and face
our warrior

who is like a chariot wheel
made thoughtfully over a month
by a carpenter
who tusses off eight chariots
in a day.

One is tempted to think of AKR's translations as such chariot wheels.

Apart from ancient Tamil poetry which is about two thousand years old, AKR has also translated the Tamil devotional poetry of the seventh century Vaishnavite saint Nammalvar (*Hymns for the Drowning*, Princeton University Press, 1981). It may be no exaggeration to say that, in AKR's death, Tamil has lost the most. With no able translators around (save a few like M L Thangappa), non-Tamil readers have little to look forward to from the considerable riches of Tamil literature.

AKR has also done his bit for his other mother tongue, Kannada. Apart from two collections of poetry and a novel in Kannada, he has also translated the radical poetry of the Veerasaiva saints (*Speaking of Siva*, Penguin, 1973). U R Ananthamurthy's acclaimed novel *Samskara* has also appeared in AKR's sensitive English translation. At the time of his death, AKR was rehearsing Girish Karnad's Kannada play, *Naga-mandala*.

AKR's translations were first published when foreign scholarship on India was moving away from Indology, with its exclusive emphasis on 'the Great Tradition' as exemplified in Sanskrit, towards other aspects of

India's plural (if not rival) traditions. AKR's translations are best seen in this context and have also contributed in no small measure to this shift.

AKR is a highly rated Indo-Anglian poet, whose published collections include *Striders* and *Second Sight*. Included in a number of anthologies, his poems have also found their way into Indian school and college textbooks.

Apart from his literary accomplishments, AKR was also an acclaimed folklorist. *Another Harmony* (Oxford University Press, 1986), which he edited with Stuart Blackburn, presents critical essays on Indian folklore. More recently he published *Folktales from India* (Viking, 1993) where he retells a number of Indian folktales in his inimitable style.

As an academician, he published a number of scholarly papers, which appeared in various edited volumes and journals. His 'Indian Oedipus', 'Is There an Indian Way of Thinking?', etc, are some of the more acclaimed ones. Though he often tended to repeat himself, AKR wrote in the most engaging fashion. An apt tale in the beginning, a metaphor mixed to make his point, a newly-coined phrase, quotations skilfully woven were all hallmarks of his papers. It is a pity that his papers have not been put together as a volume so far. It is hoped that some of his colleagues will take the lead in this matter: it would no doubt be a fitting tribute.

AKR inspired three decades of South Asian scholars in the US, as a teacher and research supervisor. With the welcome emphasis of American Universities, unlike those in England, on acquiring at least rudimentary skills in the language of the field area, a number of scholars have gained from AKR's expertise. Few indeed are the scholarly works on south India, produced from American universities, that do not owe something to AKR.

AKR received much acclaim in his own lifetime. He was awarded a Padmasri by the Indian government in 1976 and a MacArthur Fellowship in 1983.

Born in 1928, AKR had many more years of poetry and translation in him. His sudden death comes as a shock, and it will be long before we can reconcile ourselves to the loss.

Teaching Women's Studies: The Problems

Vimal Balasubrahmanyam

Women's studies, like the women's movement itself, is under constant threat of getting hijacked.

I REMEMBER how excited I was when I first came across the expression 'women's studies'. It was in the early 80s and there was this book I had picked up from the British Library, *Half the Sky*, a collection of scholarly articles on a variety of women's issues. It said a lot of things which I recognised to be true, either because I had experienced it myself, or had observed it, but had never thought of analysing and articulating. It sounds dreadfully common place today to say that the personal is political but when one discovers it for the first time there is exhilaration in knowing that something which you have all the time tried to deny even to yourself is actually a valid way of looking at things. And to be told, as that book told me, that all this is 'knowledge', worthy of being recorded, researched and theorised, and actually put into textbooks, made one feel that there is some meaning to life after all. It opened up a whole new world in which the possibilities seemed infinite.

The possibilities are still infinite but the probabilities make one feel sceptical, even cynical. For women's studies (WS), like the women's movement itself, is under constant threat of getting hijacked. UGC-supported WS cells and centres have sprung up all over the place. According to one list there are at least 37 universities/colleges and 26 autonomous organisations promoting WS in 16 states and union territories. A directory compiled by SNDT University has a mind-boggling array of WS courses offered at undergraduate and postgraduate levels in colleges all over the country, complete with syllabi and reading lists. The Indian Association of Women's Studies has conducted six national conferences over the last 12 years. And every major and minor publishing house has a long and growing list of WS titles.

Surely a matter for rejoicing it might be thought, but it is this highly quantitative phenomenon which makes one seriously wonder what on earth is going on under the guise of women's studies. Apparently it has not only found a place in higher education, it is also succeeding in digging its heels in.

During the last decade workshops and seminars have been organised at various universities to discuss how WS can be promoted. One objective has been to get die-hards in academia to acknowledge the validity and necessity for introducing the WS element into curricula, orienting teachers and planning new courses

with a WS component. Another objective has been to share experiences in teaching WS and to identify the problems and lacunae which have surfaced as a result of WS getting the official nod from authorities like UGC and ICSSR, even though university establishments largely remain hostile or indifferent.

Teacher orientation seems to be the single major problem. For although there are no hurdles to conducting research with a feminist perspective, teaching WS is an altogether different kettle of fish. By and large feminist academics teaching postgraduate social science appear to have relative freedom to design courses on women and conduct these with both rigour and ideological perspective. The problem comes when a teacher who does not have the perspective is required to teach a structured, compulsory course especially to undergraduates. It is not easy (I personally think it is impossible) to persuade teachers to subscribe to an ideology through orientation courses. This is one reason why many WS proponents have misgivings about the whole business. For, women's studies *not* taught is more likely to serve the feminist cause than women's studies badly taught.

Another problem is the paucity of appropriate teaching materials. It is pointed out that there is plenty of published stuff available, containing masses of information, but very little of it is in a form appropriate for classroom use. Much initiative is required from teachers to compile this suitably but why are they going to bother unless they feel some sort of personal commitment to the cause? Besides, library personnel too need orientation to be able to look for and collect material from unconventional sources which were earlier not regarded as academic sources at all. Obviously academia is not going to turn feminist all of a sudden simply because UGC has responded to demands from activist teachers and decided (very reluctantly, I suspect) to support women's studies.

Assuming that in spite of this orientation problem some headway could still be made if basic teaching materials were available, what is needed is the sort of initiative described by four American teachers from the disciplines of economics, sociology, psychology and political science. Co-authors of a textbook, *Women Today* (1980), they explain in their introduction how they started teaching an interdisciplinary seminar in a WS course and found that there was no text which satisfied

their requirement. "Our solution was to prepare a text which met our needs."

Considering that there is a boom, bordering on an explosion, in WS publishing, it seems odd that the absence of classroom material and curricular texts is not being tackled. A columnist who writes on the publishing scene remarks that an aspiring author need have no trouble finding an eager and willing publisher as long as the subject is woman. Which perhaps accounts for the large volume of verbiage coming continuously into print, only a fraction of which is worthwhile stuff.

On the one hand, there is a growing pile of studies on women many of which lack even a basic ideological framework. (Putting together heavily referenced data on women and explaining it away with a vague argument on women's oppression/subordination/historic invisibility—the WS buzzwords—seems to be the easiest thing in the world.) On the other, there is also a growing body of solidly researched work, couched in dense, polysyllabic polemic and impossible to make head or tail of. Like the collection of essays written by some of the current stars in feminist research, which figures in Delhi University's MA History reading list. I believe I have enough of a grounding in feminist analysis to attempt to read a postgraduate text but I found the opening chapter such an obstacle race that I could only sympathise with the earnest student who said he had even tried breaking sentences into individual clauses in an effort to decode the message but found the going too tough.

An economist whose contributions to women's studies are highly respected (and I have never found any jargon in her writings) tells me that turgid prose is typical of all social sciences, not just women's studies. All the more reason then for WS people to avoid the pitfall of being incomprehensible and making sure they get across to the people they are trying to reach—people whose support or conversion they can by no means take for granted.

As a contrast I would like to offer the example of a chapter on 'Women and Society' which I chanced upon in a textbook prescribed for sociology undergraduates at MS University, Baroda. It is a British publication aimed at both students and the general reader, and the 36-page section on women puts together in reasoned terms the arguments of different schools of thought over time. It gives due place and emphasis to feminist interpretations and theories and handsomely acknowledges the contributions of the women's movement in transforming various aspects of sociological analysis.

Free from jargon and shrillness, the summing up on 'sociology, ideology and women' shows that it is possible to take sides and also sound convincing. Even an unconverted student could not deny that the argument makes sense. Which surely is why women's studies has to be taught—because it makes sense, not because it is ideologically correct.

India's Supercomputers

M G G Pillai

India has produced four parallel-processing supercomputers which, while not as fast as the Cray or other supercomputers on the international market, come at a tenth of the cost of the others. Selling them overseas, however, will be tough without adequate servicing facilities and appropriate software.

INDIA's unexpected rise to be only the world's third country to manufacture supercomputers, after the US and Japan, smashes a carefully nurtured colonial myth that science and technology could only develop in the better-endowed research laboratories in the west. Post-colonial challenges, by word and deed, to the west's dominating presence gather momentum. The west has to fight for what it once took for granted—its primacy in knowledge and technology.

India moved into supercomputers 11 years ago when Washington imposed unacceptable political conditions for selling a Cray supercomputer to the Indian Institute of Science in Bangalore. The Cray India bought earlier for weather forecasting undoubtedly benefited Indian agriculture, and outweighed the American insistence on a full-time minder to ensure that it was not used for military or nuclear weapons research. The US position, conditioned by the cold war, also led to its complaint against the Soviet Union, as it then was, from supplying equipment for India's space research programme that could be conceivably used for military purposes. India needed supercomputers for space, medical, agricultural, defence-related research, was unwilling to allow outsiders access to its research and set out to build them. The result is, as yet, four parallel-processing supercomputers, not as fast as the Cray or the other supercomputers on the market, but a tenth of what the others cost: the Flosolver, the PARAM, Chippis 16 and ANURAG. Indian institutions have installed at least two dozens of them.

These supercomputers, even without the 'bells and whistles' of their rivals, have one in-built advantage: India's dominance in front-rank computer programs. Hewlett Packard found so many of its programmers were Indian that it shifted most of its software development unit from the US to Bangalore. Swissair's computerised global accounting system moved lock, stock and barrel to Bombay. Barclays Bank and British Rail engaged Indian software developers for state-of-the-art software to run their business at a fraction of what they would have paid western software houses.

India sells the supercomputers overseas, but its toughest battle is to convince potential clients of the supercomputers' hardware maintenance and software compatibility with state-of-the-art features. It has

one advantage though, especially if it were to write programs that works exceptionally well on home grown supercomputers, for its international clients, at a fraction of what they would cost on Japanese or US supercomputers.

The US scientific establishment forced the Massachusetts Institute of Technology (MIT) a few years ago to reject an offer of an NEC supercomputer, when American manufacturers could not come up with a suitable machine. A Japanese supercomputer in a leading scientific research institution would mean, so it was argued, the availability of operating systems and software, to give it an unfair advantage over American manufacturers. When NEC offered supercomputers free or at nominal cost to other American scientific establishments, there were also no takers.

The Indians can expect problems similar or worse for their supercomputers in the west and the third world tends to disparage comparable products from the third world. New Delhi's main problem is to prove how good her supercomputers are but they mesh hardware competence with software brilliance for the computing power it produces that Washington now wonders if, unwittingly, it has played midwife to a potentially serious competitor.

The British National Health Service sur-

vived on doctors from erstwhile colonies whose peoples the British even now look down upon. The west's Canadian insistence that nuclear weapons be manufactured by, and restricted to, those countries which already have them is unacceptable in the same way as its restrictions are on transferring scientific and technological developments to the rest of the world. Political and economic superiority by, and colonial dominance of, one over the other worsens the east-west (or north-south) divide. Those in poorer countries inevitably reject conditions that maintain the *status quo* as much as the industrialised countries want to preserve them for commercial and political advantage.

Knowledge expands frontiers of the centuries ahead, as industrialisation did these past two centuries. Political, economic, scientific, technological restrictions can hold back progress to a point but someone—often, these days, from countries which the west least expected them to—will always make a better mousetrap. The flow of third world 'brains' to the industrialised west will always continue, the numbers depending on how liberal immigration policies are at any given time. But it is as difficult to prevent an India, a South Korea or a Taiwan from making a super-computer as it is to prevent New Delhi, Islamabad, Tel Aviv, Pretoria or Pyongyang from making a nuclear device.

But the west reins in those it does not like, or do not behave as expected. The west's destruction of president Saddam Hussein's western financed developmental edifice in Iraq is well known. North Korea is challenged about its nuclear programme, Israel is not. The west ignored South Africa's, which became known only when Pretoria announced it. But the processes of growth of technological expertise are irreversible.

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been, over the years, a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India, what still remains is massive and of a kind that is not remedied quickly or smoothly. Even with radical policies, the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century. In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth, these issues, have been largely obfuscated. It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it.

Patalganga: River Fighting for Life

Ashish Chadha

Patalganga a short river which meanders through many villages near Bombay providing drinking and irrigation water and a livelihood to fisherfolk is rapidly being polluted by the rampant growth of industries.

INDISCRIMINATE dumping of effluents into the Patalganga river and contamination of air with toxic fumes from major industries in Raigad district has resulted in large-scale air and water pollution severely affecting the teeming population of this area, economically as well as physically.

Industries in the area particularly Hindustan Insecticides (HIL), Hindustan Organic Chemical (HOC), the Maharashtra Agro-Industries Development Corporation and the private sector company Lona flush out about 35,000 litres of effluents into the Patalganga river. Despite claims of treating effluents, there have been a number of instances of shoals of floating dead fish in the river, and crops have been destroyed. A case in point is the sweeping away of drums containing chemicals (along with residual chemicals) into the river during the flood in 1989 causing large-scale fish-kills. In fact, a source from the water works department of Chavane dam disclosed that so toxic was the water that even the dreaded dysentery causing bacteria could not survive in it. Due to such enormous amount of fish-kill many fishing villages have virtually been wiped out.

The water of the river close to Apte village reeks of chemicals that freely float over the surface. Pipelines carrying sulphuric acid to the industries at Rasayani sometimes rupture oozing a frothy white acidic fluid. These factories not only dump the liquid waste into the river but have been dumping solid wastes on land kept fallow by the farmers. They have hired contractors who lease land from unsuspecting farmers to dump wastes. Some of the fallow fields have streaks of bright blue on the ground—a sign of the copper sulphate content of the waste. During the rains, the colour enters the river. Farmers complain that fields can no longer be used, but dumping continues. Private sector company, especially Lona, freely dumped chemical wastes on the countryside, marring the scenic beauty. However, fearing surprise checks from the collector, the mounds of chemical wastes are covered with mud and gravel.

Other source of pollution of Patalganga river water is due to the release of sullage and sewage from the Khopoli township and the washing of trucks used for carrying chemicals in the river. Random samples of waters taken from villages on the bank of the river and sent to the government laboratory in Pune have revealed appalling information. Laboratory officials contend that all but one sample was fit for drinking. The figures in the report and a comparison with the permissive limits laid down by MPCB show that toxicity of water is very high. Water samples from villages near HIL, HOC and Turade Nalla near Rasayani emit a foul smell and are hazy in colour and turbid. Free and saline ammonia which should be nil in water was 3,600, 360 and 710 parts per million (PPM) in the samples. Biochemical Oxygen Demand (BOD) that should not exceed 20 was high as 50 and 325 PPM in HOC and Turade Nalla sample respectively. Besides, the PH value of the samples indicated acidity in water. The pesticide test too was positive.

Patalganga river, originating from the Sahyadri mountains ranges near Khandala, gains strength from the tail waters of Tata Hydro Electric project. It runs through Apte, Kharpade and Rawa, ending its short journey of around 65 km near Dharamtar in the Arabian Sea. Until the arrival of industries on its banks it provided the local people with fish and was used for irrigation. The drinking water scheme at Chavane waterworks between Apte and Ladivili village meets the needs of nearly 60,000 people living in 42 villages. The river therefore assumes a vital significance and is virtually the lifeline of a population of more than a lakh people including those at Khopoli.

The demands on this little river increased with the fast mushrooming of industries. By 1987 these industries numbered 150 units manufacturing a wide range of products such as alcohol, steel, pipes, detergents, paper and chemicals and not only discharged poisonous effluents but also perpetuated a massive deforestation all around. These industries lacked ade-

quate measures for the treatment of disposal of hazardous effluents. Many new units are now coming up under the MIDC conveniently ignoring the Ganguly Committee report on Bhatsai river pollution which recommended that no chemical factories be allowed within three miles of the river, only small industries be allowed within five miles and major ones beyond eight miles from the river.

River water pollution is a serious health hazard too. Residents of Apte and Sarva complain of a constant throat and lung irritation. During morning hours visibility in the villages is almost nil and there are breathing difficulties owing to a heavy smog. Epidemics and hitherto unknown diseases are breaking out in the villages. Once an epidemic breaks out everyone denies responsibility or accuses each other, for the helpless public have no scientific monitoring system to identify the culprits. Some of the local doctors of the area are of the firm conviction that the river Patalganga has become the main source of many ailments of local people.

For the last few years local people have been voicing their protests but in vain. The Maharashtra Pollution Control Board (MPCB) has long ceased to be a pollution monitoring and controlling body and the government has no time to pay attention to such 'trivial issues'. MPCB officials say that Patalganga is an A-2 grade zone which stipulates that water should be fit for public supply after conventional treatment involving sedimentation, filtration and disinfection. But this ignores the chances of leakages and spillage of untreated chemical effluents. According to a spokesperson of one of the industries, conventional treatment is far from adequate in combating untreated effluents. In other words, every leakage would result in contamination of the river which supplies drinking water to the villages. Many industries are quick to point out that the effluents are not strictly pumped into the river as the pipeline carrying wastes have to extend into the saline creek of the river.

Following the enactment of various legislations, an effluent treatment plant is a pre-condition for approval from the government for setting up new industries. Renewal of approval for existing industries has also been linked to the industry acquiring treatment facilities within a fixed period. But MPCB officials admit that there is little they can do if the industries flout this requirement. "We do take legal action but only after several warnings have been issued."

Most of the major industries are equipped with treatment facilities. Effluents from each plant are detoxified, neutralised

and treated further before being disposed. However, such measures often collapse during heavy rains when the drains get flooded. For instance, Reliance Industries situated on the banks of Patalganga has storm water drains opening into the river. The Reliance complex producing polyester staple fibre and polyester is reported to have a full-fledged treatment plant with treatment for biological oxygen demand (BOD) and chemical oxygen demand (COD). But local people living close to the area allege that there have been occasions when effluents have been discharged through drains meant for storm water.

HOC, a government-owned company, manufacturing a range of chemicals needed for dyes, drugs and pesticides among others, boasts of wide-ranging effluent treatment facilities. Nevertheless, HOC along with Hindustan Insecticides and Lona Industries is facing a court case lodged by the Bombay Environmental Action Group on charges of pollution. HOC officials however lament, "Our openness as a public limited company has gone against us. Moreover, as the oldest company in the area, the entire industrial complex is identified with the HOC. Besides, there were no charges of pollution till private industries started springing up." The absence of complaints of pollution before may be attributed to the general lack of awareness prevalent at that time. HOC officials allege that the MPCB instead of carrying out specific investigations to identify the culprit, satisfies itself with sending out warning notes to all. Even those industries which have treatment plants may simply shut them off with none the wiser, till a complaint is made. The state government's environment department's officials acknowledge the truth of this.

Taking a leading part in a movement comprising of local villagers are also activists from the Yusuf Meherally Centre, which runs an integrated rural development project at Tara village on Bombay-Goa highway near Karnala Bird Sanctuary. Also active on the agitational front to save the Patalganga waters were prominent leaders of Peasants and Workers Party. The agitation has been spearheaded by an apex body called Patalganga Pradushan Nirmulan Kirti Samiti comprising of the sarpanchs of the villages on the banks of the river and activists from the Yusuf Meherally Centre. The agitation began way back in the early 1980s when the doctors at the centre suddenly had an influx of people suffering from water-borne diseases and epidemics. On further investigation it was found that the pollution of Patalganga river may have been the

reason for these health hazards. Social activists took up the issue and organised villagers to fight for their survival. By 1984 there had already been number of dharnas and morchas to protest against deteriorating environmental situation.

In 1988 the situation was aggravated due to massive fish-kills and deterioration in crop production due to lack of irrigation. This led to full-fledged agitations of rasta-roko, sit-ins, demonstration and picketing if the industries did not respond to their demand that the effluents from the industries be treated and then discharged into the sea. They also demanded the government to stop diversion of Patalganga to Nhava Sheva and other urban-settlements. The other demands included developing an alternative source of water supply, releasing more water into the river, setting up an independent laboratory to test water pollution and stopping new chemical industries in the area.

In the first week of January 1989, the agitation was postponed following an assurance given by the state government that it would persuade industries in the Khopoli belt to collectively raise a sum of Rs 70 lakh for the construction of an effluent treatment and dilution plant on the river banks, before it is discharged into the river. But this project was suspended and instead the Patalganga Rasayani Industries Association (PRIA)—a collective of industries on the banks of Patalganga—

constructed a 9 km pipeline in the following few months. This pipeline runs from upstream of the river where water is comparatively cleaner to the villages and the fields.

This was a unique instance when a group of industrial units took up initiative due to pressure from local people and voluntary agencies with the help of city-based environmental groups has taken such steps for the common good. But, unfortunately the project ran into trouble at the commencement of the construction of the pipeline. The lackadaisical way in which PRIA undertook the project is visible. Today the pipeline has developed a number of leakages at the joints. The construction of the pipeline was taken so lightly that at a number of places it goes above ground level instead of three feet below ground level as stipulated in the plan. Where the pipeline runs above the ground leakages are more due to which neighbouring fields often get flooded with several inches of water. According to a spokesperson of PRIA this reporter was told that the association was not directly responsible for the leakages but were willing to pay for necessary repairs. Now again the Kruti Samiti is planning to launch an agitation to pressurise PRIA to pay for the necessary repairs and the damages caused. The Kruti Samiti has also decided to change their strategy. Instead of protesting against the individual industry they now plan to fight the MIDC.

Russia's Ailing Economy Reviving Barter System

R G Gidadhubli

While the system of barter trade transactions is not a new phenomenon in Russia, there is a move today to promote and strengthen the system through the creation of barter trade centres.

IT is a well known fact that the Russian economy has been suffering from acute problems of huge budgetary deficit, hyper-inflation, widespread shortages, growing unemployment, adverse balance of payment, steep decline in production and so on. While there are no signs as yet of the abatement of crisis, Russians are trying to find ways and means to keep the economic wheel moving. The barter system is one of the means by which economic activities are managed in Russia today. According to V Nesterovich, the deputy director of the Institute for Research of Goods Transport and Conjecture of Wholesale Trade, barter trade

transactions have an important role in the period of economic transition of Russia to a market economy. Writing in the Moscow weekly economic paper *Ekonomika and Life* (formerly the famous Russian weekly *Ekonomicheskaya Gazeta* published since November 1918, No 14, April 1993), Nesterovich has argued in favour of promoting barter transactions through the creation of barter trade centres (BTC) in Russia. But there is no unanimity among economists and policymakers in Russia on these proposals. Moreover, even its relevance in the long run is questionable.

The barter system of transactions is not

TABLE: PERCENTAGE SHARE OF BARTER IN TOTAL PROCUREMENT

	1991	1992
Steel tubes	2	9
Finished steel metal	12	34
Coal	8	25
Machinery equipment	12	35
Coking coal	8	58

a new phenomenon in Russia. It existed under the Soviet socialist system and even expanded due to inefficiencies of centralised distribution of material and technical supplies. Soviet enterprises received material inputs from ministries for the purpose of fulfilment of given plan targets. In practice, enterprises always tried to get more quantities of the materials for building up surplus stock not only for fulfilling plan targets but for exchanging with other enterprises on barter basis in times of need. Although barter was officially prohibited and was considered illegal in the former Soviet Union, the barter system survived with the full knowledge of party bosses and government officials. In other words, barter system was considered a necessary evil for the functioning of the imperfect socialist economy. In fact, officials in charge of supplying materials in enterprises known as 'tolkachi' (pushers) were well oriented in the operation of this illegal market including knowing details of how much metal was needed for the production of a specific lathe or a machine or what would be the exchange equivalent of cubic metres of lumber for the specific quantity of metal. In other words, tolkachi worked out a system of equivalence of different items in barter deals in the absence of market prices for those products.

Under Gorbachev's policy of perestroika, enterprises were working in a new system which was marked by reduced centralised control of ministries and self-management. In effect this meant legalisation of barter trade. Subsequent to the disintegration of the former Soviet Union, there was a strong view prevailing in Russia that, the end of centralised distribution meant the end of barter. But in fact in the last couple of years there has been a sharp increase in barter transactions as observed in the case of 67 engineering and construction enterprises in Russia (see the table).

From the sample survey conducted by the state committee of Statistics of Russia, it is evident that barter deals have become very important for enterprises for their functioning in the transition period. Considering that rouble as a monetary unit has been fast losing its role, the economy

is facing virtual hyper-inflation, earlier economic links are broken and the government has been losing control over enterprises, barter transactions have been saving the total collapse of the Russian economy. In this sense the tolkachi who know the details of supplier enterprises in the former Soviet republics and conversion norms for products well are able to keep the production machinery moving at this critical moment bypassing currency transactions.

What is true of domestic economy is also true of external economy. According to unofficial sources, about 40 per cent of foreign trade was accounted for by barter transactions in 1992. This is particularly the case so far as transactions among the CIS countries are concerned since there were close economic linkages among enterprises which are now situated in different republics of the former USSR.

A paradoxical situation concerning barter system has arisen in Russia. Barter has not only become legalised but has also become a commercial secret. But at the same time it is often difficult to establish a barter transaction since there are separate entries in the documents for purchase and for sale in value terms in roubles. Sometimes barter transactions take place in a cyclical fashion, as in Tatarstan where, for instance, miners are provided with food products on barter basis, miners in turn give coal; coking coal is bartered to metallurgists who in turn give metal such as steel to other enterprises. Another important feature of the barter system is that till recently metal was the universal form of settlement of account among producer units and some portion of their material supply problems was solved through the medium of metal deliveries. Reportedly even at present metal is very frequently used for facilitating large payments. At present in Russia the usual system of contracts for material supplies are almost absent and there is a low level of discipline among enterprises with regard to the compliance of terms of contract. As a result various types of unions and associations have come up on the basis of territorial location, production links, or technological ties. Moreover, auctioneering societies have come up linking enterprises in several parts of Russia as in Volgograd and Ural, etc.

What are the prospects for barter trade in Russia? There is a strong view among one section of economists in Russia that barter has wide scope in future. This is based on the contention that barter as a form of organisation of trade has a role to play even in a normally functioning

market economy. Hence it is argued that its role is legitimate and significant during the period of transition to a market economy. This argument is being reinforced by Nesterovich, according to whom there are over 400 barter clubs operating at present in the US and as such barter trade can flourish in Russia even after market economy is established.

As is well known barter systems by its very nature is very imperfect and is not suited to a complex modern economy. There are inherent problems of non-equivalence in barter trade arrangements. Moreover, there is inevitable imbalance in barter transactions. The contention of Nesterovich about the prevalence of barter system in the developed market economies and in the US appears to be highly doubtful and questionable. In view of this, proposals for prescribing barter system in Russia in the long term are not convincing. While barter system is flourishing in Russia at present due to exceptional politico-economic circumstances and as a result of the continuity of its role in the past, barter will not necessarily help the development of the market economy in Russia. On the contrary, perpetuation of this barter system as a government policy may hamper the creation and growth of market mechanism and institutions. Barter system will certainly not promote the achievement of the objective of integrating Russia with the world economy.

'Vedic Mathematics': Myth and Reality

S G Dani

Ever since 'Vedic mathematics' was introduced in school textbooks in Uttar Pradesh last, there has been much curiosity about the origin of its contents, its authenticity and its relevance vis-a-vis modern mathematics.

OF late the term 'Vedic Mathematics' is acquiring a curious new meaning. While scholars as well as lay people would normally interpret it to mean something like mathematics from the Vedic scriptures or mathematics known in the Vedic times, etc, for a growing number of people, fast approaching an alarming proportion, it has come to mean the mathematics from a book called *Vedic Mathematics* written by Jagadguru Swami Shri Bharati Krishna Tirthaji Maharaja published in 1965 (by Motilal Banarasidass Publishers)! What does the latter have to do with the former? Nothing really, if one is to approach the question objectively. It has been known from the beginning that there is no evidence of the contents of the book being of Vedic origin; the general editor's 'Foreword' to the book and an account of the genesis of the work written by Manjula Trivedi, a disciple of the swamiji, make this clear even before one gets to the text of the book. No one has come up with any positive evidence subsequently either. There has however been a persistent propaganda of the material being from the Vedas. The claim has got entangled with a sense of national pride, as a result of which even well-meaning and educated people have tended to accept it uncritically. In the mid-80s the then human resource minister was reported to have made a statement in parliament about how this book showed that we had made great strides in mathematics in Vedic times and how there was a possibility that the sutras in the book could possibly lead to improvements in computers themselves! Large sums have been spent both by the government and several private agencies to support this 'Vedic mathematics', while authentic Vedic studies continue to be neglected. The emotional appeal generated by the attribution to the Vedas is also exploited to get enthusiasts, adults as well as children, to learn and spread the contents of the book. With missionary zeal several 'devotees' for this cause have striven to take the 'message' all around the world; not surprisingly they have even met with some success in the west, not unlike other kinds of messiahs of modern times,

from this country. Several people are engaged in 'research' in the new 'Vedic mathematics'.

To top it all, when last year the UP government introduced Vedic mathematics in school textbooks the contents of swamiji's book were treated as if they were genuinely from the Vedas and swamiji's name was listed in a chart on 'brief history of Indian mathematics', with S Ramanujan's as the only other one from this century! A warped perspective is being forced on children in the name of revival of Indian heritage. Though temporarily it might seem convenient to glorify a modern swami who "discovered sutras in Atharvaveda" which "apply to and cover each and every part of each and every chapter of each and every branch of mathematics..." (quotation from the 'Preface' to the book), by doing so we would not only be harming the cause of proper pursuit of knowledge but it would be a matter of shame when the truth comes out. Our mathematical heritage offers a great deal to be proud about and efforts are called for to put it in perspective and make it widely known. On the other hand, mixing spurious material with it in an effort to achieve instant popularity would be counter-productive in the long run.

It is not the contention here that the contents of swamiji's book are not of any value. Indeed for a few elementary problems the book does offer quicker solutions than by standard methods (though the comparisons made in the book in this respect are facetious and misleading). Its judicious use may also be of some help in enabling children to enjoy mathematics. However these aspects should not be allowed to cloud the issue of the origin of its contents or create a false picture of their providing solutions to all kinds of problems. The intellectual upbringing of a whole generation would be at stake, if improper attitudes championed by vested interests are allowed to persist.

The book contains 16 of what are called sutras and another 13 'sub-sutras' (what a phrase for a 'Vedic' entity!), each made up of just about two to four words

in Sanskrit, such as 'Ekadhikena Purvena' or 'Paravartya Yojayet', etc, and the rest is supposedly applications of these to various mathematical problems. Where did the sutras come from? The only mention of any reference for the sutras appears, in passing, in the Preface where it is said that "...exceedingly tough mathematical problems(...) can be easily and readily solved with the help of these ultra-easy Vedic sutras (or mathematical aphorisms) contained in the parishishta (the appendix portion) of the Atharvaveda in a few simple steps and by methods which can be conscientiously described as mere 'mental arithmetic'." And where is this appendix of the Atharvaveda? The swamiji has not considered it necessary to share with us any details in this regard! K S Shukla, a renowned scholar of ancient Indian mathematics, has mentioned in a paper presented at the National Workshop on Vedic mathematics held in 1988 at the University of Rajasthan, Jaipur, under the auspices of the Rashtriya Veda Vidya Pratishthan (proceedings published in association with Motilal Banarasidass Publishers, 1991), that on one occasion he personally went to the swamiji and requested him to point out the sutras in question in the parishishta of the Atharvaveda, of which he even carried a copy (the standard version edited by G M Bolling and J Von Negelein), but was told by the swamiji that the 16 sutras demonstrated by him were not in those parishishta and that "they occurred in his own parishishta and not any other"! What justification swamiji thought he had for introducing an appendix in the Atharvaveda, the contents of which are still to be viewed as from the Veda, is anybody's guess. In any case, even such a parishishta, written by the swamiji does not exist in the form of a Sanskrit text. One wonders if the swamiji just meant the book itself to be the appendix to the Atharvaveda.

The general editor of the swamiji's book, V S Agrawala, has in fact stated in his foreword that "...this work of Shri Shankaracharya deserves to be regarded as a new parishishta by itself and it is not surprising that the sutras mentioned herein do not appear in the hitherto known parishishta." He adds later that "A list of these main 16 sutras and of their sub-sutras or corollaries is prefixed in the beginning of the text and the style of language also point to their discovery by Shri Swamiji himself" (italics mine). So much for the contents of the book being from the Vedas, from a person responsible for the publication of the book. The general editor nevertheless is content to

say that the question of whether the sutras exist anywhere in the Vedic literature loses all its force if we inform ourselves of the definition of Veda given by Shri Shankaracharya himself and this is followed by a quotation from the swamiji's preface that "The very word 'Veda' has this derivational meaning, i.e., the fountainhead and illimitable store house of all knowledge. The derivation, in effect means, connotes and implies that the Vedas should contain within themselves all the knowledge needed by mankind...". This escape route of hiding behind a convenient definition, at variance with the ordinary meaning, is comical and totally inconsistent with the portrayal in the book, typified by the use of such phrases as 'ancient Vedic mathematics' or 'ancient India's Vedic lore', etc. to the same body.

Let us suppose for a moment that the author indeed found the listed sutras in some manuscript of the Atharvaveda, which he came across. Would not he then have preserved the manuscript? Would not he have shown at least to some people where the sutras are in the manuscript? Would not he have revealed to some cherished students how to look for sutras with such profound mathematical implications as he attributes to the sutras in question, in that or other manuscripts that may be found? While there is specific mention in the write-up of Trivedi, in the beginning of the book, about some 16-volume manuscript written by the swamiji having been lost in 1956, there is no mention whatever (leave alone any lamentation that would be due in such an event) either in her write-up or in the swamiji's preface about any original manuscript having been lost. No one certainly has come forward with any information received from the swamiji with regard to the other questions above. It is to be noted that time could not be a factor in any of this, since the swamiji kindly informs us in the preface that "Evershine (i.e., since several decades ago), we have been carrying on an incessant and strenuous campaign for the India-wide diffusion of all this scientific knowledge...". The only natural explanation is that there was no such manuscript.

THE BOOK

Let us now consider some of the sutras themselves. One for instance is 'Ekadhikena Purvena' which literally just means "by one more than the previous one". In Chapter I the swamiji tells us that it is a sutra for finding the digits in the decimal expansion of numbers like $1/19$, $1/29$, etc. where the denominator is a number with 9 in the unit's place; he goes on to give a page-long description of the procedure to be followed, whose only con-

nection with the sutra is that it involves, in particular, repeatedly multiplying by one more than the previous one, viz, 2, 3, etc. respectively, the 'previous one' being the number before the unit's place; the full procedure involves a lot more by way of arranging the digits which can in no way be read off from the phrase. In Chapter II we are told that the same sutra also means that to get the square of a number like 25, 35, etc (with five in unit's place) multiply the number of tens by one more than itself and write 25 ahead of that; like 625, 1225, etc. The phrase 'Ekanyunena Purvena' which means by one less than the previous one is however given to mean something which has neither to do with decimal expansions nor with squaring of numbers but concerns multiplying together two numbers, one of which has 9 in all places (like 99, 999, etc)! Allowing oneself such unlimited freedom of interpretation one can also interpret the same three-word phrase to mean also many other things not only in mathematics but also in many other subjects such as physics, chemistry, biology, economics, sociology, politics and so on.

Consider, for instance, the following 'meaning': the family size may be allowed to grow, at most, by one or more than the previous one. In this, we have the family-planning message of the 1960s; the 'previous one' being the couple, the prescription is that they should have no more than three children. Thus the 'lal trikon' formula may be seen to be 'from the Atharvaveda', thanks to the swamiji's novel technique (with just a bit of credit to the author)! If you think the three-children norm is now outdated, there is no need to despair. One can get the two-children or even the one-child formula also from the same sutra; count only the man as the 'previous one' (the woman is an outsider joining in marriage, is not she?) and in growth of the family count either only the children or include also the wife, depending on what suits the desired formula.

Another sutra is 'Yavadunam' which means as much less; a lifetime may not suffice for writing down all the things such a phrase could 'mean', in the spirit as above. There is even a sub-sutra 'Vilokanam' (observation) and that is supposed to mean various mathematical steps involving observations. In the same vein one can actually suggest a single sutra by which one could do not only all mathematics but many many subjects: 'Chintanam' (think).

One knows of course that there are cyphers which convey more information than meets the eye. But the meaning in those cases is either arrived at from the knowledge of the encyphering code or deduced in one or other way using various kinds of contextual information. Neither

applies in the present case. The sutras in the swamiji's book are in reality mere names for various steps to be followed in various contexts; the steps themselves had to be known independently. In other words, the mathematical step is not arrived at by understanding or interpreting what are given as sutras; rather, sutras somewhat suggestive of the meaning of the steps are attached to them like names. While such associations can be put to various uses, such as in remembering and communicating with others knowledgeable of the terminology the steps in various exercises, one of the main purposes the sutras seem to serve in the present case is to give the contents an antique finish, they being in a language which the popular mind unquestioningly associates with the distant past!

An analysis of the mathematical contents of the book also shows that they cannot be from the Vedas. Though unfortunately there is considerable ignorance about the subject, mathematics from the Vedas is not an unexplored area. Painstaking efforts have been made for well over a century now to study the original ancient texts from the point of view of understanding the extent of mathematical knowledge in those times. For instance, from the study of Vedic 'Samhitas' and 'Brahmanas' it has been noted that they had the system of counting progressing in multiples of ten as we have today and that they considered remarkably large numbers, even up to 14 digits, unlike other civilisations of those times. From the Vedanga period there is in fact available a significant body of mathematical literature in the form of Shalva-sutras, dating between 800 B C and 500 B C, some of which contain expositions of various mathematical principles involved in the construction of sacrificial 'vedis' needed for rituals. These texts show, in particular, a remarkable familiarity with what is currently known as Pythagoras' theorem and many other facts from the so-called Euclidean geometry and it is clear that considerable use was made of these, long before the Greeks formulated them. The work of George Thibaut in the last century and that of A Burk around the turn of the century brought to the attention of the world the significance of the mathematics of the sutras. An authoritative text is available on Shalva-sutras, containing the original sutras, their translation and a detailed commentary which includes a survey of a number of earlier works on the subject, in the form of a monograph prepared by S N Sen and A K Bag under the sponsorship of The National Commission for the Compilation of History of Sciences in India (planned and published by the Indian National Science Academy, 1983). There are

also several books on ancient Indian mathematics dealing in particular with mathematics from the Vedic period.

CLAIMS OF ANTIQUITY

The contents of the swamiji's book have practically nothing in common with what is known of the mathematics from the Vedic period or even with the subsequent rich tradition of mathematics in India until the advent of the modern era; incidentally, the ancient mathematical texts are quite explicit in their description of mathematical principles or procedures and do not involve cryptic sutras. The very first chapter of the swamiji's book (as also chapters 26 to 28) involves the notion of decimal fractions in an essential way. If the contents are to be Vedic, there would have had to be a good deal of familiarity with decimal fractions, even involving several digits, at that time. It turns out that while the Shalva-sutras make extensive use of fractions in the usual form, nowhere is there any indication of fractions in decimal form. It is inconceivable that such an important notion would be left out, had it been known, from what are really users' manuals of those times, produced at different times over a prolonged period. Not only the Shalva-sutras and the earlier Vedic works, but even the works of mathematicians for over 2,000 years after them, including that of the stalwarts in the golden age of Indian mathematics such as Aryabhata, Brahmagupta, Bhaskara, etc, are not found to contain any decimal fractions. Is it possible that none of them had access to the Vedic source that the swamiji could lay his hands on (and still not describe it specifically)? The fact is that the use of decimal fractions started only in the 16th century, propagated to a large extent by Francois Viete; the use of the decimal point (separating the integer and the fractional parts) itself, as a notation for the decimal representation, began only towards the end of the century and acquired popularity in the 17th century following their use in John Napier's logarithm tables.

Similarly, in chapter 22 the swamiji proclaims to give "sutras relevant to successive differentiation, covering theorems of Leibnitz, Maclaurin, Taylor, etc, and a lot of other material which is yet to be studied and decided on by the great mathematicians of the present day western world"; it should perhaps be mentioned before we proceed that the chapter does not really deal with anything of the sort that would even remotely justify such grandiloquent announcement, but rather deals with derivation as an operation on polynomials, which is a very special case reducing to elementary algebra, devoid of the very soul of calculus, as taught even

at college level. Given the context, we shall leave Leibnitz and company alone, but consider the notions of derivative and successive differentiation. Did the notions exist in the Vedic times? While certain elements preliminary to calculus have been found in the works of Bhaskara II from the 12th century and later Indian mathematicians in the pre-calculus era in international mathematics, such crystallised notions as the derivative or the integral were not known. Though a case may be made that the developments here would have led to discovery of calculus in India, no historian of Indian mathematics would dream of proposing that they actually considered something like the derivative, leave alone successive differentiation; the question here is not about performing the operation of derivation on polynomials, but of the concept. A similar comment applies with regard to integration, in chapter 24. It should also be borne in mind that if calculus were to be known in India in the early times, it would have been acquired by foreigners as well, long before it actually came to be discovered, as there was enough interaction between India and the outside world.

If this is not enough, in chapter 39 we learn that "analytic conics have an important and predominating place for itself in the Vedic system of mathematics" and in chapter 40 we find a whole list of subjects such as dynamics, statics, hydrostatics, pneumatics, applied mathematics, etc, listed alongside such elementary things as subtractions, ratios, proportions and such money matters as interest and annuities(!), discounts(!) to which we are assured, without details, that the Vedic sutras can be applied. Need we comment any further on this?

The remaining chapters are mostly elementary in content on account of which one does not see such marked incongruities. It has however been pointed out by Shukla in his paper mentioned earlier that many of the topics considered in the book are alien to the pursuits of ancient Indian mathematicians, not only from the Vedic period but until much later. These include many such things as factorisation of algebraic expressions, HCF of algebraic expressions, various types of simultaneous equations, etc. The contents of the book are akin to much later mathematics, mostly of the kind that appeared in school-books of our times or that of the swamiji's youth, and it is unthinkable, in the absence of any pressing evidence, of their being from Vedic lore.

ABSURD ASSERTIONS

Apart from claims of antiquity the swamiji's book is full of such extraordinary assertions as "there is no part of mathematics, pure or applied, which is

beyond their jurisdiction" or "... 8 months (or 12 months) at an average rate of 2 or 3 hours per day should suffice for completing the whole course of mathematical studies on these Vedic lines instead of 15 or 20 years required according to the existing systems of the Indian and also foreign universities". The present-day champions of 'Vedic mathematics' seem to soft-pedal such claims, for reasons not far to seek and it would be rather pointless to argue against them at this stage. It is, however, important to see the absurdity of such assertions since, when the book is viewed in totality, they point to the flawed motivation of the endeavour, patently contrary to a sense of objectivity that is vital in the pursuit of knowledge. Mathematics means a lot more things than arithmetic of numbers and algebra of polynomials; in fact multiplying big numbers together, which a lot of people take for mathematics, is hardly something that a mathematician of today needs to engage himself in. The mathematics of today concerns a great variety of objects beyond the high-school level involving various kinds of abstract objects generalising numbers, shapes, geometries, measures, etc, and several combinations of such structures, various kinds of operations, often involving infinitely many entities; this is not the case only about the frontiers of mathematics but a whole lot of it including many things applied in physics, engineering, medicine and various other subjects.

Despite all its pretentious verbiage page after page the swamiji's book offers nothing worthwhile in advanced mathematics whether concretely or by way of insight. The book really deals with only a small segment of middle and high-school level mathematics; this is true despite what appears to be chapters dealing with some notions in calculus and co-ordinate geometry and the mention of a few more advanced topics, in the book. Modern mathematics with its multitude of disciplines (topology, differential geometry, functional analysis, ergodic theory to name just a few) would be a big leap from that stage. There are occasionally reports of some 'researchers' applying the swamiji's 'Vedic mathematics' to advanced problems such as Kepler's problem but such work involves nothing more than tinkering superficially with the topic, in the manner of the swamiji's treatment of calculus, and offers nothing of interest to professionals in the area.

When the superimposed 'Vedic' garb is taken off, the material in the swamiji's book looks like a compilation of tricks in elementary arithmetic and algebra, discovered by some intelligent hobbyists. What it contains are ways of working out some classes of computations; in certain

special cases these ways turn out to be faster than the standard school-book methods. They are, however, based on well-understood principles and there is no mystery about them. It should be remembered that the author has an M A degree and it is not too surprising if he could use such principles with effect; it is also to be noted that he is supposed to have spent "eight years of concentrated contemplation in forest solitude" in "recovering the long lost keys". There have also been other instances of exposition and propagation of such faster methods applicable in special situations (without claims of their coming from ancient sources). The *Trachtenberg Speed System of Basic Mathematics* (English edition by Ann Arther and Rudolph Mcshane, published by Asia Publishing House, New Delhi, 1965) and Lester Meyers' book *High-Speed Mathematics* (Van Nostrand, New York, 1947) are some well known instances of this. Trachtenberg had even established an institute in Germany to provide training in high-speed mathematics. While the swamiji's methods are independent of these, for the most part they are similar in spirit.

It is worth considering why such methods are not commonly used for practical purposes. One main point is that they turn out to be quicker only for certain special classes of examples. For a general example the number of digital calculations involved (the count of the individual operations needed to be performed with digits, in arriving at the final answer) is about the same as required by the standard methods; in the swamiji's book this is often concealed by not writing some of the steps involved, viewing it as 'mental arithmetic'. Using such methods of fast arithmetic involves the ability or practice to recognise various patterns which would simplify the calculation. Without that, one would actually have to spend more time, in first trying to recognise patterns and then doing it by rote anyway, since in most cases it is not easy to find useful patterns. Shopkeepers and professionals who have to do their computations as they arise, rather than choose the figures suitably as in the demonstrations, would hardly find it convenient to carry them out by employing umpteen different ways depending on the particular cases, as the methods of fast arithmetic involve. It is more convenient to follow the standard method in which one has to follow a set procedure to find the answer, even though in some cases this might take more time. Besides, equipment such as the calculators and computers have made it unnecessary to tax our minds with arithmetical computations. Incidentally, the suggestion that this 'Vedic mathematics' of the Shankar-

acharya could lead to improvement in computers is totally fallacious, since the underlying mathematical principles involved in it were by no means unfamiliar in professional circles.

The swamiji tells us in the preface how "the educationists, the cream of the English-educated section of the people including highest officials (e.g. high-court judges, ministers, etc.) and the general public as such were all highly impressed; nay thrilled, wonder-struck and flabbergasted!" at his demonstrations of the 'Vedic mathematics'. Sometimes one comes across reports about similar thrilling demonstrations by some of the present-day expositors of the subject. Though inevitably they have to be taken with a pinch of salt, I do not entirely doubt the truth of such reports. Since most people have had a difficult time with their arithmetic at school and even those who might have been fairly good would have lost touch, the very fact of someone doing some computations rather quickly can make an impressive sight. This effect can be enhanced for well-chosen examples, where some quicker methods are applicable. Even in the case of general examples where the method employed is not really more efficient than the standard one, the computations might appear to be fast, since the demonstrator would have a lot more practice than the people in the audience. An objective assessment of the methods from the point of view of overall use, can only be made by comparing how many digital calculations are involved in working out various examples, on an average, and in this respect the methods of fast arithmetic do not show any marked advantage which would offset the in-

convenience indicated earlier.

The various observations in the book can, however, be put to some use in teaching in schools. Firstly, they have an evident recreational value. They may be used suitably to enable children to enjoy mathematics. It would be more appropriate to do so by highlighting along the way the underlying principles, rather than use them as a series of tricks. Ultimately, it is the understanding that is more important than the transient excitement that may be derived (and channelled for wrong purposes). Perhaps it needs to be emphasised, however, that this pedagogical use also has a limited scope and it is important not to be carried away by the motivated propaganda in this regard. It may be mentioned that some well known mathematicians such as P L Bhatnagar have made some pertinent observations on the possibilities and scope of such uses.

It is shocking to see how much people driven by misguided notions are able to exploit the Indian society's urge for self-assertion. One could hardly have imagined that a book which is transparently not from any ancient source or of any great mathematical significance would one day be passed off as a storehouse of some ancient mathematical treasure. It is high time the saner elements joined hands to educate people on the truth of this so-called Vedic mathematics and prevent the use of public money and energy on its propagation, beyond the limited extent that may be deserved, lest the intellectual and educational life in the country get vitiated further and result in wrong attitudes to both history and mathematics, especially in the coming generation of children.

Managerial Pilgrimage to Indian Ethos

N R Sheth

Managerial Transformation by Values: A Corporate Pilgrimage by S K Chakraborty; Sage Publications, New Delhi 1993; pp 215, Rs 195.

S K CHAKRABORTY is a distinguished management scholar, teacher and consultant. He is also a citizen on a clear-headed social mission. His mission is to establish the supremacy of ancient Indian psychology and philosophy as means for transformation of managerial behaviour and attitudes in order to resolve the rapidly growing pressure of personal and social conflicts afflicting the performance and peace of people responsible for the performance of their enterprises. The author's learning, wisdom and exposure to the realities of Indian corporate and executive performance for over two decades have deeply anguished him about the increasingly evil effects of consumerism, greed, corruption and rat-race for personal power and control on the mindsets of managers and consequently on their executive effectiveness. These are symptoms of a "degenerate consciousness" which needs urgent transformation. Chakraborty is well acquainted with the wide spectrum of philosophies, approaches, methods and techniques developed in the western society and countries like Japan to deal with the human problems of industrial civilisation. He is convinced that the rationalistic-liberalistic value system of the west would not provide a durable means for the transformation of managerial values in the Indian context. He is impressed by the recent history of Japanese management philosophy and practice which have combined western technology and indigenous values with positive effects on both corporate performance and managerial happiness. In this background, Chakraborty has developed a firm belief that the degenerate consciousness of the Indian manager can be transformed in the right direction only by promoting the acceptance of the Indian spiritual ethos. The mission built on this prognosis has resulted in half a dozen books aimed at integration of managerial effectiveness and Indian values.

The book under review is the latest addition to the author's remarkable labour of love. It is, however, unique in the sense that it contains documentation of Chakraborty's involvement in a process of managerial transformation in a single

organisation, the Bombay-based Godrej and Boyce (GBL). The Godrej lineage, promoters of GBL, hold a high reputation for their humanistic and philanthropic values and management style. As the company moved towards its century in 1977, it found itself increasingly under pressure of market forces and careerist managers from professional schools with self-centred behavioural traits as against the traditional Godrej ethos of humanistic service. Hence the promoters wanted to reinforce the value of the old culture as a part of their overall strategy of responding to the changes in their business environment. They decided to launch a management development effort in human values in tandem with their acceptance of the new approach of total quality management (TQM) in the context of integrated resource management. Meanwhile, they learnt about Chakraborty's mission and work and invited his help in their plans for education in human values. For the 'missionary', this was a godsend opportunity to undertake a holistic exercise in managerial transformation by values in an enterprise. The professional-intellectual aspect of his involvement was passionately dominated by the sacred spirit which gave the mission and the book under review the purifying sub-title "corporate pilgrimage".

THE INGREDIENTS

The pilgrimage was intended to provide the subjective aspect of TQM. It would help the company managers to develop a quality of mind to raise both their effectiveness at work and happiness in life. The programme began with a three-day workshop in early 1990 for top managers followed by three separate modules at quarterly intervals for top and senior managers and one compact four-day module for junior managers. Participation of executives in this programme was invited on a voluntary basis at the senior levels and by nomination by bosses for the junior categories. By the end of 1991 each departmental head "had aligned around himself a fairly large number of juniors who were imparted the trans-

formation-by-values principles and processes". Two separate workshops were also held for office-bearers of the workers' union and those of the staff association. The company had further planned to identify some executives who would take special interest in the consultant's mission to serve as catalysts to sustain the process of transformation of the quality of mind in GBL on an ongoing basis.

The main ingredients of the programme in the first module included a serene physical environment, mind-stilling exercises, the superiority of the higher 'self' over the ubiquitous egoistic self and exposure to the Indian value concepts of *guna*, *karma* and *samskara*. The second module focused on leadership and teamwork with special emphasis on the interpersonal values of love, self-restraint, respect for others, compassion, etc. The third module was devoted to management of stress, counselling and communication with the aid of Upanishadic and later spiritual models of achieving work efficiency without mental stress and building a helping relationship with colleagues. Between modules, the participants were asked to hold fortnightly meetings with a leader appointed for each meeting by rotation.

The company's Human Response Development (HRD) department invited written feedback from senior managers at the end of the second module of the programme. The feedback is almost euphorically positive about the importance of Indian values in transforming the quality of life in personal behaviour and organisational roles. Minor doubts and questions raised by a few executives were regarding the commitment to human values at the top management level and the perceived gap between practice and precept.

The group leaders who conducted fortnightly meetings between modules were expected to share their experiences with the consultant and seek his guidance by mail. Thirty-three sets of exchange of letters between Chakraborty and the group leaders have been reproduced in a separate chapter. This correspondence reflects what the author calls the process of institutionalisation of the chosen values in GBL management. For the most part, the letters state how happy and enriched the participants in group meetings felt by practice of mind-stilling exercises and discourses on the Indian values as en-

shrined in the author's previous writings. A few executives were sceptical about whether their acceptance of the right values would yield results in the long run in view of the pervasive debasement of human character in the wider environment.

Further feedback was sought by the consultant from the executives when he met them for the second and third modules. The responses obtained from participants indicated high progress in the form of change of behaviour in the right direction. Between the second and third modules, the already high rate of transformation moved up further. The only variable which recorded decline in progress was 'team leader support' which meant that the internal leaders for group meetings could not provide the catalyst role as effectively as they were expected to. Thirty per cent of the participants in the second module withdrew from the third.

ASSESSMENT

The company and the consultant planned a comprehensive assessment of the transformation-by-values programme at the end of third module. An independent researcher was hired for this purpose to avoid the risk of distortions underlying internal assessment. Seventy-three executives were interviewed on their learning experiences in the programme. Typically, those who found the programme less relevant or were more sceptical about its practical use were in the 31-40 age group, had formal education in technology with management, were in the middle-management category and came from families with inclination towards Indian values (as against those who came from westernised families). The westernised group found the programme largely relevant but not very useful, while the value-based group found it more useful but less relevant.

The quantitative analysis of the independent evaluation of the programme is supplemented by a qualitative analysis which consists of extracts from the in-depth interviews with 35 executives and 60 office-bearers of the workers' union and staff association. Once again, these narrations bring out a predominantly positive and euphoric feedback on the various facets of the programme leading to an overall impression of well-rooted institutionalisation of the Indian values in GBL. A few respondents expressed scepticism or cynicism about the practical long-term usefulness of the transformation programme because of its perceived incompatibility with the internal or external environment of GBL.

Finally, in June 1992, the company's

HRD department circulated a questionnaire to over 600 persons who had participated in the programme over a period of more than two years. The purpose of this study was to obtain a picture of the participants' orientation towards the programme. The feedback was overwhelmingly in favour of the programme, suggesting remarkable success of the pilgrim's mission. The vast majority expressed faith in the ideals of the programme, though it stimulated them to transform their own values and wanted it to be an ongoing process. The only modestly discordant note was struck by the fact that a relatively smaller proportion of managers noticed improvement in the quality of interface among peers and subordinates and superiors.

As I mentally travelled with Chakraborty on his sacred mission to transform the values of GBL managers, I understood his mounting sense of pleasure and satisfaction with the involvement and positive feedback from managers at various stages of the transformation effort. With his characteristic wisdom, the author has blended the zeal of the missionary with the spirit of scientific inquiry. Continual feedback on the progress of the mission was sought from the corporate pilgrims. A lot of concern was shown about the need for objectivity of the feedback which was also subjected to a good measure of statistical probing for inter-item and periodical variations. The missionary was also aware of the difficulties in translation of the various values sought to be imparted to the corporate pilgrims. "A very high degree of sincerity and tenacity, supported by a deep aspiration for the higher and nobler, are essential. No one from outside can trigger them—except by offering some glimpses or flashes. One needs to essentially awaken from within, with external inspiration playing only a catalytic role" (p 61).

'SAMSKARA' SYNDROME

This indeed is the crux of the problem of transformation of (or by) values. Any mission for such transformation is predominantly conditioned by the innate tendencies and desires (*samskaras*) of the pilgrims. In the present case, an important factor contributing to the reported success of the mission was the congenial corporate *samskara* represented by the cherished values of the founding family whose members occupied the status and esteem of owner-managers. They provided a well-worshipped *samskara* model to all managers and workers. This model probably provided plenty of fertile

ground to yield a high degree of success to the mission as documented in the book.

The documentation is, however, punctuated by evidence of unwelcome results. There was a continuing concern about the value of transformation in one enterprise in the midst of visible rapid degeneration of human character. Some people also wondered if the transformation process could be sustained all over the organisation over a long period of time. There was some awareness that the hope of achieving high quality of management by transformation of values was utopian. There were signs to suggest that while Chakraborty's image and credentials inspired most participants in the programme to be positively inclined to the transformation effort, their enthusiasm slowed down considerably during follow-up exercises in his absence. Also, fewer people volunteered for the third module in comparison with the second. Not many managers felt enthused to continue the mind-stilling exercises. Not many could recall the main concepts of the Indian value system in a year's time. Of course, such evidence does not disappoint the missionary. He is confident that the inculcation of the new values received by the pilgrims would act upon their behavioural and attitudinal structure and produce good results in time. A missionary's march to his utopia is characteristically ennobled by euphoria. GBL managers need a lot of psychological and social fortitude to sustain the missionary's spirit of pilgrimage within the psychedelic contours of the degenerate world around them.

What can people and organisations which do not possess the *samskara* syndrome of GBL learn from its pilgrimage? Obviously, if they were inclined to try the GBL pattern of transformation by values, they would face an uphill task of greater magnitude than GBL. Perhaps the irony of managerial transformation by value is that it is relatively more intractable during the process of implementation and more dubious in its outcome in those organisations which are relatively more muddled by degeneration of values and hence more in need of transformation. We need many Chakrabortys to face this challenge in the spirit of *nishkama karma*. Their missions should be both guided by high idealism and fully grounded in its execution. They should take disappointments and failures in their stride and march on. For degeneration of values and attempts to transform them have been an integral part of human society since its infancy. They will continue in the same fashion as long as you and I can foresee.

Islam and Women's Rights

Shabana Makani

Women and Islam: A Historical and Theological Enquiry by Fatima Mernissi translated by Mary Jo Lakeland; Kali Publications, New Delhi, 1993; pp 228, Rs 225.

FATIMA MERNISSI, a professor of sociology at the University of Rabat, Morocco is a strong campaigner for a reinterpretation of the Islamic texts vis-à-vis the status of women. In this book she examines and reassesses literary sources like the *Koran*, the *Tafsir* of Tabari (a commentary of the Koran), the *Hadith* of al-Bukhari and al-Nasai, biographies of the Prophet and of the Companions, treatises on the causes of revelations, namely, *Asbab al nuzul* by al-Nisaburi and *Lubab al nuqul fi asbab al-nuzul* by al-Suyuti, treatises on the Koranic verses like the *nasikh* and the *mansukh* by scholars like Qatada Ibn Di'ama al-Sadusi, Ibn Hazm, Ibn al Jawzi, Ibn al-Barizi. The treatises are concise summaries of dozens of volumes of commentary and are usually in just one volume. The value of the sources used here cannot be underestimated and Muslim intelligentsia will not question the validity and urgency of the principal step urged by Fatima Mernissi, namely, the re-opening of the door of free interpretation. Indeed, this door should never have been deemed closed. Human society is dynamic; the need of guidance both by formulation of principles and by regulation of conduct, is constant. To declare the door of interpretation sealed is to force a rift between the ever-growing need for change and the state guidance which must, in time, widen into a gulf too broad to be bridged. The result would be frustration.

In the first half of the book entitled 'Sacred Text as Political Weapon' the need for such reinterpretation comes across strongly. In the four chapters 'The Muslim and Time', 'The Prophet and Hadith', 'A Tradition of Misogyny' (in two parts) the author defines a Muslim as belonging to a theocratic state. "What the individual thinks is secondary for this definition... Being Muslim is a civil matter, a national identity, a passport, a family code of laws, a code of public rights" (pp 20-21). The author highlights the almost indissoluble entwinement of religious ideas and political considerations in the examples of al-Bukhari and al-Afghani. The hadith "those who entrust their affairs to a woman will never know prosperity" is stated in al-Asqalani's 13th volume and is based on al-Bukhari's Sahih. This hadith is a sledgehammer in the hands of those who want to exclude women from politics.

She wonders how the three concepts normally considered independent of each other, the relationship to time, the relationship to power and the relationship to femaleness, become connected as a discourse on identity. And above all how the identity crisis present in both men and women becomes transformed by authors (like al-Afghani) obsessed with the past into a uniquely male problem? Answers to these questions might facilitate the understanding of those feelings which impel al-Afghani and other scholars to take up their pens and write books about the necessity of excluding women from politics (p 21). A fairly recent example of the denial of political rights to women in the name of scriptural injunctions is that of Benazir Bhutto. It may be recalled that a section of the clergy mounted a campaign against her when she led her party, Pakistan People's Party, in the struggle against Zia ul-Haq's military regime.

The author explains in great detail the painstaking manner in which the hadith were collected and compiled (pp 42-45). But of special interest is A'isha's refutation of some hadiths. One can read among al-Bukhari's 'authentic' hadith the following one: "Three things bring bad luck: house, woman, and horse." Al-Bukhari did not include other versions of this hadith, although the rule was to give one or more contradictory versions in order to show the readers conflicting points of view and thus to permit them to decide for themselves about practices that were the subject of dispute. However, there is no trace in al-Bukhari of A'isha's refutation of this hadith: "They told Aisha that Abu Hurayra was asserting that the Messenger of God said: 'Three things bring bad luck! house, woman and horse.' A'isha responded: 'Abu Hurayra learned his lessons very badly. He came into our house when the Prophet was in the middle of a sentence. He only heard the end of it. What the Prophet said was: 'May Allah refute the Jews; they say three things bring bad luck: house, woman and horse.'" (pp 75-76). A number of such examples have been cited in the first part and hence it is axiomatic that free interpretation must keep pace with changes in the pattern of human life and thought.

With the widening intellectual horizon, coinciding with territorial expansion and, at least partially, caused by it, the pro-

blems to be coped with cover an ever-widening range. They touch every aspect of the Islamic way of life that is, the minutiae of its ritual, its religious secular and social practices. In the course of development, hadith assumed a function far beyond the scope of its earlier stage. Instead of being merely the repository of past usages and traditions as a guide to correct behaviour, it became the instrument for introducing or repudiating innovations. Theological, philosophic, religious, legal and social disputes were fought by way of hadith. It thus became a weapon in the hands of proponents and adversaries. But the unbiased study of the history of religion shows that both the Koran and the hadith call upon its followers to move with the times—indeed these who assert that women in Muslim states cannot be granted full enjoyment of human rights are simply betting on our ignorance of the past, for their argument can never convince anyone with an elementary understanding of Islam's history. The author, therefore, surmises "we Muslim women can walk into the modern world with pride, knowing that the quest for dignity, democracy, and human rights, for full participation in the political and social affairs of our country, stems from no imported western values, but is a true part of the Muslim tradition" (preface p viii).

The second part of the book entitled *Medina in Revolution: The Three Fateful Years* consists of six chapters, namely, the Hijab, the Veil, the Prophet and Space, the Prophet and Women, Umar and the Men of Medina, the Prophet as Military Leader, the Hijab Descends on Medina. Chapter V provides an insight as to how the hijab, the veil was introduced. The fuqaha (religious scholars) speak of "the descent of the hijab". This expression covers two simultaneous events that take place in completely different realms: on the one hand, god's revelation to the prophet, which is in the intellectual realm; and on the other hand, the descent of a cloth 'hijab', a material object, a curtain that the prophet draws between himself and the man (Anas Ibn Malik) who was at the entrance of his nuptial chamber. (p 85). Ample historical evidence portrays women in the prophet's Medina raising their heads against slavery and violence to join as equal participants, in the making of their Arab history (instances cited in the chapter VII pp 125-40). The same chapter contains a very interesting resume on the wives of the prophet (pp 115-25). Specially pertinent is the question of Umm Salama. "Why", she asked the prophet one day, "are men mentioned in the Koran and why are we not?" After divine revelation the prophet said:

"O people! Allah has said in his book 'Men who surrender unto Allah, and women who surrender, and men who believe and women who believe... Allah hath prepared for them forgiveness and a vast reward' (p 118). This is a clear proof that Allah speaks of the two sexes in terms of total equality as believers and it is not sex that determines who earns his grace, it is faith and the desire to serve and obey him. Umm Salama's concern was shared by the women of Medina. Sura 4 entitled 'An-Nisa' (Women) contains the new laws regarding their status.

Chapter 10 'The Hijab Descends on Medina' analyses the reasons for purdah. Women, whatever their status, were being harassed and accosted in the streets. Women were, therefore, enjoined by the prophet to behave modestly and not to flaunt their beauty. In particular, Muhammad's wives were reminded of their status as 'Mothers of the Believers' and required to talk to strange men from behind a 'hijab'. In the Koran this term is used for a 'partition' dividing the house. In the course of post-Koranic development, partly as protection in war disturbed areas the hijab was generally accepted and segregation and veiling acquired the character of binding laws; gradually they were interpreted as demanding complete severance of women's activities from those of men.

The author categorically mentions, "When I finished writing this book I had come to understand one thing: if women's rights are a problem for some modern Muslim men it is neither because of the Koran nor the prophet, nor the Islamic tradition, but simply because those rights conflict with the interests of a male elite. This elite faction is trying to convince us that their egotistic, highly subjective and mediocre view of culture and society has a sacred basis...Islam was not sent from heaven to foster egotism and mediocrity. It came to sustain the people of the Arabian desert lands, to encourage them to achieve higher spiritual goals and equality for all..." (Preface p ix).

For a reinterpretation of the Islamic texts *vis-a-vis* the position of women the author analyses the sociological, economic and cultural-anthropological trends. She has painstakingly researched into the primary sources for the necessary clarifications concerning the issue at hand and discusses debatable and polemical problems without bias in favour or against them. She has a penetrating comprehension of the well-springs of Islamic culture and is not writing as an apologist for, but as an impartial student of Islam, nor is she currying favour with any side but only aspires to honesty in her interpretations. She may not always please theologians

and 'fuqaha' but her understanding of the problems of Muslim women compel her to state the truth according to her best judgment and ability. Due credit must also be given to Mary Jo Lakeland for her excellent translation. The language is neither laboured nor pedantic but lucid and

precise. The book is a must for all interested in the position of women in Islam and will serve to clarify several misconceptions. It will be a handy source material for research scholars by virtue of its data, free interpretation and methodical presentation.

LAND REFORMS IN INDIA, Volume 1

Bihar--Institutional Constraints

B N YUGANDHAR and K GOPAL IYER (editors)

This is the first volume in a major series which studies the status of land reforms throughout the country. This volume focuses on Bihar and contains original essays by scholars, activists and administrators.

This volume constitutes a landmark in the field of land reforms studies. With its admirable presentation of the ground realities, it will serve as a sound basis to initiate remedial measures. As such, students of land reforms and agrarian change, state and central government officials dealing with programmes for the rural poor, and others interested in the areas of political economy of agriculture, problems of rural development, labour and social welfare will find this book of tremendous interest.

Communal Representation in Tamil Nadu, 1850-1916

The Pre-Non-Brahmin Movement Phase

P Radhakrishnan

Though communal representation and reservations are often identified with the non-brahmin movement and the Indian Constitution respectively, the evolution of the non-brahmin movement itself was preceded by certain intricate and elaborate processes of over half a century. These processes had a direct bearing on communal representation and reservations at the ideational and pragmatic levels as functional imperatives of the colonial administration.

Central to the discourse on communal representation and reservation of this period, the related administrative process and the non-brahmin response to these were the statistics collected from time to time. These made the non-brahmins and the British officials increasingly aware of the structural cleavages in south Indian society of brahmins versus non-brahmins, Hindus versus Muslims, and so on. Such awareness in turn sharpened these cleavages, pitted the non-brahmins against the brahmins and gradually paved the way for the non-brahmin movement.

DESPITE its pejorative overtones as communal counterpoise, communal appeasement, minorityism, and so on [Krishna 1939; Page 1982], communal representation in India is often identified with the non-brahmin movement, and its reformulation reservations with the Indian Constitution. But, analogous to the growth of the backward classes [Radhakrishnan 1989; 1990], these had begun to evolve from at least the mid-19th century.¹

In fact, communal representation and reservations were integral even to pre-British Indian society in the sense of the numerous social closures operated by the caste system.² However, the context of this paper is not these indigenous incarnations, but the categories introduced by the British.

No doubt, to begin with these categories were a continuation of the pre-British ones. That was only in keeping with the British endeavour to create an overarching administrative machinery reflecting the established structure of the country [cf Page 1982: 7], and its related concern for incorporating into its colonial framework, the traditionally well-entrenched, and from its viewpoint, the strategically placed, social groups, as its compradors [cf Irschick 1986: 6]. That explains the following directive of the Committee of Public Instruction, Madras, to the district officers, soon after its appointment in March 1826:

[T]he Committee wish it invariably to be kept in mind, that no measures can be pursued whatever other advantages they may offer, which are at variance with the customs and prejudices of the people. Such obstacles must be carefully avoided.

Every measure must, as much as possible be divested of the odium of innovation; and be such as to induce the people to go along with the government in the undertaking (Public, Sundries, Vol 145).

That also explains this committee's educational efforts through the 'principal' or 'respectably connected' inhabitants, that is, brahmins and other high castes '*brahminnis proximi*'; and preference for brahmin teachers in the schools established since 1826. The British emphasis of about half a century thence on the education of this 'influential class' should also be seen in this light [see Government of Maharashtra 1982: 403-4].

In fact, the British attempts to go along with this class long preceded its educational efforts. As early as in 1814 the Court of Directors had ordered exclusion of Indian Christians, then mostly of the 'untouchable' castes, from certain offices such as of 'munsiff', 'vakil', and law officer in Bengal presidency, and also of 'sudder ameen' (civil judge), and Cavalry in Madras presidency (see Public Despatches from England to Fort William, No 8, February 2, 1831).

In 1831 the Court of Directors did convey the inexpediency of such exclusion and their belated realisation that the British religious neutrality in India did not require placing by law converts to Christianity in a less advantageous situation than others. In 1846, in response to a request from the sheriff of Madras for sanction to select peons from among the pariahs to be employed in the grand gaol indiscriminately with those of other castes, the BOR reaffirmed this principle:

The sheriff is informed that upon the principle laid down in the Honourable Court's dispatch number eight of 2nd February 1831, the government do not recognise caste, or any religious distinction as a ground of civil disability and all classes or castes are therefore *alike eligible* to offices for which the Head of an office may consider them qualified, and their employment advantageous to the public interests (BRP, April 21, 1845, and April 23, 1846).

But, it was one thing to reaffirm a principle and quite another to redeem it. And therein was the British dilemma. One instance of this dilemma was the inability of the Board for College and Public Instruction, Madras, established in December 1826, to decide on an application it received in 1833 from a pariah boy:

The Board... have not felt it right to decide of themselves whether a person of this class shall be admitted as a scholar, in consequence of the strong repugnance evinced by the native headmasters to give instruction to Pariahs, and the knowledge that Hindoos of caste would consider their prejudices, interfered with, were Pariahs taught in the same classes, with themselves... (Public Consultations, vol 618, January 24, 1834).

The Madras government whom the board approached sought the views of the Bombay and Bengal governments. The result of this correspondence could not be traced.³ But, the fate of the pariah boy could not have been any different from that of a mahar boy who sought admission to a Dharwar school in 1856. Rejecting his petition, despite the May 1854 order of the Court of Directors that "no

boy be refused admission to a government college or school merely on the ground of caste' (GO 329 Home (Education), March 17, 1919), the Bombay government wrote:⁴

There can be no doubt that the mahar petitioner has abstract justice in his side; and government trust that the prejudices which at present prevent him from availing himself of existing means of education in Dharwar may be ere long removed... But government are obliged to keep in mind that to interfere with the prejudices of ages in a summary manner, for the sake of one or few individuals, would probably do a great damage to the cause of education. The disadvantage under which the petitioner labours is not one which has originated with this government, and it is one which government cannot summarily remove by interfering in his favour, as he begs them to do [Government of Maharashtra 1982: 339-40].

Underlying the contradiction thus evident between the professed neutrality principle and its practice were the British perceptions of the caste-based structures of power and privilege, and its related patronage politics. It is with these perceptions and practices in Madras presidency and their effect on south Indian society that this paper is concerned in the context of the British curbs and counterpoises against brahmins, and concessions for and conciliation of Muslims, and the efforts of other non-brahmin groups to take advantage of these manoeuvres.

I

Brahmins and British Administration

It is now a well established fact that as the 'ritualistic supermen' and literati, combining in them both sacral and temporal powers, brahmins had dominated pre-British Indian society. Dubois, a French missionary who spent about 30 years in India mostly in the Tamil regions, since a couple of years before the fuscillades of the French revolution, had remarked in the early 1800s that "the rule of all the Hindu princes, and often that of the Mahomedans, was, properly speaking, brahminical rule, since all posts of confidence were held by brahmins" [Dubois 1982: 4-5, 289-90].

With their scribal background brahmins were the first to realise that under the colonial dispensation English education was the key to government employment and literate professions. Therefore, through their eager acquisition of such education, as Dubois observed, they perpetuated their predominance under the British rule as well.

The brahmins have also been clever enough to work their way into favour with the great European Power that now governs India. They occupy the highest and most lucrative posts in different administrative boards and government offices, as well as in the judicial courts of the various districts. In fact there is no branch of public administration in which they have not made themselves indispensable [Dubois 1982: 290-91].

This predominance is more clearly brought out by Suntharalingam:

As the European collector was often overwhelmed with multifarious duties, it was the 'sheristadar' who attended to the onerous details of revenue collection and accounts, settling the annual assessment and authorising remissions. In the eyes of the rural community, the sheristadar was the 'real administrator' who controlled the sole channel of access to the collector... As the chief executive officer of the taluk containing a few hundred villages, the tahsildar discharged revenue, judicial, and police duties under the supervision of the... collector [Suntharalingam 1980:18].

To begin with, the key positions were held by Mahratta brahmins,⁵ a miniscule group.⁶ By the mid-19th century they along with the other, especially Tamil, brahmins, controlled the entire district administration.⁷ In the whole of Madras presidency brahmins accounted for about 90 per cent of all the 'huzur' (chief) sheristadars, 87 per cent of all the 'naib' (deputy) sheristadars, 75 per cent of all the tahsildars, and 78 per cent of all these positions taken together (Table 1).⁸

However, by this time the government itself realised the danger of its exclusive reliance on brahmins [cf Irschick 1986: 6], and began to check their monopoly in public service and weaken their family connections, a vital link to such monopoly and their established lines of patronage.

CURBS ON EMPLOYMENT

The first attempt in this direction was in the 1850s. The revenue establishment in Nellore district was then controlled by as many as 50 brahmins, all from the same family, and the collector could transfer only two of the 49 relations of naib

sheristadar Gotoor Vencataramanah, even after the BOR's order. On ascertaining this the governor wrote in 1853:

Whatever may be the aptitude of the members of this family for the public service, and whatever may be the family differences, or disputes between themselves, it is evident that the Head of the office—the European officer—must be almost powerless to detect and punish fraud or wrong on the part of the members of this family, and, as a necessary consequence, he will be powerless to protect the people against the extortions or oppressions of the family (BRP, December 1, 1853; March 9, 1854).

The governor felt that people would not bring forward complaints, and seek protection against wrongs done by members of this family while they see them occupying so many important posts and all the younger members introduced into office gradually rising to higher posts. So, he desired the BOR to take immediate steps for effectively abating and remedying the evil by transferring Vencataramanah, and other brahmins, and debarring the collector from advancing, without the BOR's permission, the junior members of the same family beyond their existing grade unless by transfer to other districts. The governor also wanted the BOR to examine the statements of relationship among public servants in other districts, and adopt similar action should one or two families were found engrossing the greater portion of the appointments. The result was a Standing Order of the BOR (BSO):

Collectors should be careful to see that the subordinate appointments in their districts are not monopolised by the members of a few influential families. Endeavour should always be made to divide the principal appointments in each district among the several castes. A proportion of the tahsildars in each district should belong to castes other than the brahman, and it should be a standing rule that the two chief revenue servants in the collector's office should be of different castes.

In the following years the BOR reminded the collectors of this order which they also tried to enforce. Thus, in 1866-67 the Tinnevely collector reported that in that district the 'influences for evil' of the

TABLE 1: COMPOSITION OF DISTRICT ADMINISTRATION, 1855

Caste/Community	Huzur Sheristadar		Naib Sheristadar		Tahsildar		Total	
	No	Per Cent	No	Per Cent	No	Per Cent	No	Per Cent
Mahratta brahmins	17	81.0	20	52.6	117	47.6	154	50.5
Other brahmins	2	9.5	13	34.2	68	27.6	83	27.2

Source: Tabulated from Suntharalingam 1980: 18.

native officials had grown far beyond his power to grapple with. The BOR ordered the surrounding collectors to assist him by arranging for transfers, in this case, of the Pillais, a non-brahmin upper caste, with whom every office in the district was "crowded" (BRP 607, March 12, 1886).

Shortly thence, W R Cornish, census superintendent of Madras, reported that the "brahmanical element" was strong in all higher offices in the civil departments open to Indians, that in every department there were representatives of this "great class" [Government of Madras 1874: 134], and that the brahmins' contempt for the lower classes was in itself a serious bar to their usefulness in official life:

If the brahmins really represented the feelings of their countrymen, and had any sympathy with, or desire for, the moral and material improvement of the people, outside their own small section of the community, no great harm would arise from their employment in the service of the state; but it is sufficiently notorious that, as a class, the brahmins care mostly for their own advancement, and that they have no desire to see the lower classes educated or improved in social position.

Cornish counselled the government that politically it was not to its advantage to view every question connected with the progress of the country through "brahman spectacles", and that its true policy would be to limit their numbers in official positions and encourage a larger proportion of non-brahmin Hindus and Muslims so as to allow no special pre-eminence or great preponderance of any particular caste.

In 1886 the BOR itself described its efforts to enforce the BSO as necessarily fitful, constantly neutralised, at the best but partial, and always subject to the persistent counteracting process of officials struggling to return to their own surroundings. It also mentioned that while there was a "natural combination" amongst all native officials to help each other by mutual accommodation, there was no such understanding among the several collectors (BRP 607, March 12, 1886).

As illustration the BOR mentioned that in Cuddapah as many as 48 posts were monopolised by just one family, and the whole district was in the hands of "cliques of relations, ramifying through all branches of the administration", making it "most difficult, and often impossible to unravel the truth from the network of interested falsehood with which it is entangled and overlaid, while defalcation, etc, is the natural outcrop of such protective influences". As Bellary was suffering from the same causes and its huzur sheristadar D Krishna Rao was found to be surrounded by officially employed connections to

a degree incompatible with public interest, the BOR ordered his transfer to Cuddapah and his similarly circumstanced brother-in-law, deputy tahsildar A Lakshmana Rao, to Kurnool. The BOR noted that Coimbatore was similarly hampered, and so doubtless were the other districts in varying degrees [cf Washbrook 1977: 36-37]. Its account of the state of affairs in Tanjore needs elaboration.

Following loss of crops caused by the 1884 rains and floods, the Tanjore collector proposed in 1885 remissions to the extent of Rs 8 lakh. As this sum was far in excess of the remissions granted till then, the government deputed H S Thomas, a member of the BOR and an ex-collector of Tanjore closely familiar with the area and its subordinate bureaucracy, to ascertain if such heavy remissions were really called for. His investigations revealed that nearly half the amount claimed was fraudulent and the outcome of a well-organised conspiracy by officials interested in obtaining remissions on their and their relations' lands, together accounting in value for more than a hundred lakhs of rupees. Following this scandal the government dismissed 19 officials (13 brahmins, four pillais, and two naidus—another non-brahmin upper caste), awarded lesser punishments to six others (four brahmins and two pillais), and called upon four others (all brahmins) to state how, when scrutinising the 'jummabundy' (annual revenue settlement) accounts they passed them as correct and failed to bring to notice the numerous fraudulent entries (GO 122 Revenue, February 15, 1886; cf Washbrook 1977: 38-39).

As a prelude to these illustrations the BOR had dwelt on the grave consequences for the administration from two causes: First, "the accumulation of many public offices in the hands of relatives of a few influential families, tending naturally to the formation of strong cliques for the benefit of those families necessarily at the expense of others and of the state". Second, the intensification of such personal interests "by the possession of landed property in the district in which the monopolising families hold office, such landed property necessarily implying influence, as well as interests generally inimical to those of the state by which they are employed so that officials are naturally under strong temptation to be at the heart the guardians of their own personal and family interests in preference to those of the public" (BRP 607, March 12, 1886).

The BOR was unequivocal in its conclusion that it was better for the state materially, and such officials morally, to have their sphere of duty outside the circle of such temptations, and that this could be arranged only by employing

them in districts other than those in which they were subject to such influences. Accordingly, it directed the collectors to submit returns of the properties and relationships of all officials on salaries exceeding Rs 50 a month, that is, of posts involving magisterial authority.

While acknowledging the excellence of the BOR's objective the governor held that it had exceeded its powers, and ordered the withdrawal of its proceedings, expressing at the same time his willingness to consider any other proposal. When the BOR insisted that its proposal was the best practical solution, he rejected it *in toto* on the ground that the necessity for wholesome transfers was not made out and the BOR's scheme could not be so modified as to render it both effective and innocuous (GO 77 Revenue, January 30, 1899).

In 1890 while working out the Provincial Civil Service scheme, the Madras government modified free competition for posts of deputy collectors for enabling it to appoint one-third of the vacancies by selection from persons of proved merit and ability. As this had no effect on the brahmins, in 1896 it limited appointment of deputy collectors by open competition to one per year for correcting their communal distribution [Suntharalingam 1980: 125].

By this time instances of the use of family connections by revenue officials had assumed scandalous proportions. One indication of this was a write up in *The Hindu* of August 17, 1892, on the relationship between Krishna Rao, and Lakshmana Rao (both of the Bellary fame), and a number of other officials. Following this, the BOR called for a complete list of the relations of these officials in public service in the district. Finding that a state of things similar to what necessitated their transfer from Bellary existed in Anantapur (then separated from Bellary district) also, the BOR cancelled its earlier proceedings transferring to Anantapur Krishna Rao from Cuddapah and Lakshmana Rao from Kurnool and ordered for the exchange of the former with the huzur sheristadar of Cuddapah and the latter with the tahsildar of Koilkuntla in Kurnool (GO 4519 Revenue, October 17, 1892).

PREPONDERANCE IN HIGHER EDUCATION

No doubt, brahmin preponderance in public service was a reflection of that in higher education. Reviewing the results of the 1870-72 Matriculation and First Arts (FA) examinations, the MPA R for 1871-72 recorded that "[t]he percentage of brahmins, always immense, has increased, while that of other Hindus has greatly fallen off". The situation was much the

same even after a decade. The PIR for 1880-81 recorded the educational statistics as "curious, illustrating the energy with which brahmins are endeavouring to keep the lead in the higher education". The PIR for 1881-82 revealed that for the FA and BA examinations combined there was one candidate for every 125 brahmins in the presidency as against one candidate for as many as 5,888 Other Hindus, 11,984 Muslims, and 447 Indian Christians. The PIR also recorded that the vast preponderance of brahmins in the Arts course was highly creditable to their ability and energy. The DPI's regret then was that they were little prone to adopt callings of a scientific or practical character. However, in the PIR for 1882-83 he wrote:

I rejoice to have to now to record a change in the brahmin students, which promises well for the country and for the future, influence and position of the brahmin community. The Civil Engineering College, the Medical College, and the School of Agriculture... are attracting to themselves brahmin students in rapidly increasing numbers whilst the growing partiality of BA students for the science course is an indication of the same spirit.

By this time, when the government had determined to employ only men of acknowledged educational attainments in higher branches of public service and there was keen competition for appointments, only about one-third of the graduates had gained entry into public service (PIR 1882-83). In view of this, the PIR for 1882-83 recorded that it was hopeless to expect Europeans, Eurasians, or Muslims to contend on equal terms with Hindus (read brahmins) whose progress at school or college was more rapid, and proposed reservation of appointments for the various classes. The government concurred with the DPI, but postponed its decision to further consideration.

Sensing the strong nexus between English education and government employment, by 1888 the education department began to express its concern about the disproportionate distribution of higher education as well. For instance, the PIR for 1888-89 recorded the unequal distribution of higher university education among the different sections of the population as certainly a matter for regret, and an anomaly which demanded the serious attention of all interested in the progress of the country.

However, it was only in the 1900s that any action was initiated, that too in the limited context of the College of Engineering, Madras.⁹ Of the students admitted to this college about 92 per cent in 1899, and 79 to 93 per cent during 1900-03 were brahmins, though their population in the presidency was only about 3 per cent (Table 2).

The college rules already had provisions for admitting four qualified Europeans/Eurasians and three Muslims annually, even if they were not within the first 15 qualified candidates. In view of the brahmin preponderance, the DPI, college principal, and the education department officials favoured reservation for non-brahmin castes as well (see Educational GOs 244-45 of May 25, and 544 of December 9, 1903). But, A G Cardew, education secretary, felt that brahmin preponderance was a case of the survival of the fittest, and that it was not shown that brahmin was less fit for engineer's duties than non-brahmin Hindus, while it was proved that he was more intelligent. He, therefore, wanted to see if there was any sufficient reason for deliberately preferring the "less intelligent class".

Responding to Cardew, the Coimbatore collector credited the brahmins with more brains; the Nellore collector rated them as the best workers, on the average more intelligent than others, and "not a whit more dishonest"; the Bellary acting collector remarked that "the brahmin is as a rule clever and can be made to do good work", and did not "consider it necessary to make admission of men of other castes more easy"; the south Canara acting collector favoured them more eloquently:

If other castes are as good as brahmins then there is no particular object in giving them "most favoured" treatment. If they are not (and I believe they are not), then you are deliberately laying yourself out to get an inferior article... [A]pparently the idea is to convert a sort of free trade into a modified form of protection; as an encouragement to vaisyas and sudras to move out of their hereditary groove it might be useful. Intellectual work always has been more or less the property of the brahmin "guild" and I don't consider the preponderance of brahmins... undesirable except insofar as it indicates a stagnation in the intellectual activity of other castes.

The remaining officials were against brahmin preponderance: The Vizagpatam collector reported that sudras made excellent engineers, and wanted to increase

their numbers. The Cuddapah collector remarked that the "clannish nature" of the brahmins was an obstacle to the "senior local man" exercising proper supervision over them. The Madurai acting collector expatiated that "an engineer has generally a lot of camping and knocking about to do", that "though an Aiyangar will, as a rule, adapt himself to this life, an Aiyar will not and tends sooner or later to get lazy", and that "the non-brahmin, though his brain work is worse, is generally better than either at knocking about and handling coolies". The Ganjam collector recorded that "brahmins are good in an office, but not so useful in the hard out of door life that an engineer should lead" and that "besides, if brahmins get such a monopoly the subordinate posts will be filled with their relations or caste men...". The Tanjore acting collector complained that brahmins constantly neglected their duties for performing religious ceremonies. The Trichinopoly collector conveyed that "in the event of any underhand or dishonest practices obtaining among the subordinates... brahmins form a clique which it is very difficult to break down", and that "non-brahmins and Mussalmans can be more easily found out, because they have fewer friends and more enemies".

Virtually all the officials consulted were Europeans. As most of them were for letting in other castes more freely, in 1903 the government enhanced the admissions to the college from 15 to 20 an year, and ordered induction of not less than 25 per cent of the candidates from non-brahmin castes (GO 544 Education, November 9, 1903).

Though brahmin preponderance in higher education continued even after this order, it was only since the late 1920s that the government made any serious attempt to reduce it.

FURTHER CURBS ON EMPLOYMENT

It was, however, continuing with its efforts to curb brahmin monopoly in public service. Thus, in 1904 the BOR obtained from the collectors a statement of the castes of all employees in superior service,

TABLE 2: ENGINEERING STUDENTS BY CASTE/COMMUNITY

that is, on monthly salaries of Rs 15 and above,¹⁰ in the revenue offices in the districts. As the brahmin-non-brahmin ratio was 70:30, it instructed the collectors to watch the recruitment of non-brahmins for ensuring more fair distribution of appointments. That year, in the uniformly introduced district establishment list of revenue officials, the BOR provided a column to show the caste/sect of each subordinate for enabling the collectors to see how far the BSO was enforced (GOs 792 Revenue, July 25, 1904; 2491 Revenue, August 15, 1911).

In 1909, the BOR informed the Registrar of Co-operative Societies that "not more than one half of the total number of superior appointments in an office should ordinarily be held by brahmins, the other half being at least the due share of non-brahmin Hindus, Indian Christians, Muhammadans, and Eurasians". Finding that the proportion of brahmins did not show any substantial diminution, in the following year the BOR asked the registrar why he had not followed its instructions and why the power of making appointments shall not be withdrawn from him. It also ordered that until the proportion of brahmins was reduced to nearly 50 per cent of the total strength he should appoint fully qualified non-brahmins in preference to brahmins (GO 2357 Revenue, July 16, 1910).

By this time brahmin preponderance had also become a threat in the Bombay presidency. The Bombay government regretted in 1910 that its principle, recorded in 1881 and reaffirmed repeatedly, that in distributing public patronage endeavour should be made to secure a due admixture of the various races/castes, had remained practically a dead letter, and that this was particularly so in the central division and in the Marathi speaking districts of the southern division of the presidency where brahmins continued to secure by far the largest proportion of government posts in all departments and in all grades of service. It also reported that brahmins showed bitter hostility towards the British, that there had been no seditious movement in which they, especially chitpavans and desasthas, had not taken part, and that it had difficulty in depending on their loyalty. It felt that the danger of their disaffection was greater in the "great imperial services" such as of the postal, railways, and the telegraphs, where the harm which the subordinates with little supervision had "special facilities for doing, by spreading the taint of disloyalty", was incalculable.

The Madras government's reaction to Bombay's predicament was lukewarm. In the public department one official recalled the "strange tales" he had heard when on

the west coast, of an adjoining Bombay district where a native collector had filled the district with his relatives, his 'dufedar' (personal peon) even being a first cousin. He concluded that Bombay government evidently had good cause for alarm. As of Madras, he expressed his confidence that the BOR was exercising "constant vigilance".

Another official accused the Bombay government of clearly convicting itself of "extraordinary supineness" in having omitted, despite the "startling warning" of 1897, including the murder of two British officials by chitpavan brahmins, to take effective measures to prevent the predominance of a single caste. As of the conditions in Madras he reasoned thus:

The real danger against which action should... be concerted... is not against the predominance of brahmins, who [have] not been shown to be specially disaffected towards the government and who after all [are] unquestionably, on the average, the most efficient portion of the community, but against the tendency towards the practical exclusion from the higher offices of the state of those portions of the community, especially the Muhammadans and the Eurasians, who are least able to compete with the rest of the population in the severe struggle imposed by our examination system.

Accordingly, he wanted the government to make some allowance for the "inferior efficiency" of Muslims and Eurasians, take up seriously the question of promoting a fair proportion of them to the rank of deputy tahsildars, tahsildars and district munsiffs.

A third official expressed his view against the monopoly of any single caste: [W]hen an office consists largely of one caste... faults and even serious offences are concealed and members of other castes are shut out of employment. The first is bad for efficient administration and leads to corruption and the transfer of power from the hands in which it should lie to the hands of inferior public servants. The second... is unfair to the excluded com-

munities and must create discontent among them.

Stating that "there is always an ill-defined apprehension about what the future may have in store in the way of sedition", he stressed that like the class regiments to prevent collusion and detect seditious or mutinous conspiracies, there was need for quasi-class establishments. He also noted that while in the higher ranks of public service there must "always be a high preponderance of brahmins, since they are by far the most intellectual class, yet it is important to prevent that caste, or any other caste gaining a monopoly".

The BOR's scrutiny of the state of affairs prompted by the Bombay missive again revealed the predominance of brahmins: They held 57 to 76 per cent jobs in different departments, and about 69 per cent of all the jobs, though they were only about 3 per cent of the population (Table 3).

In the light of this preponderance the BOR again asked all the departments to adhere to the BSO. In view of the difficulty in getting qualified candidates, the chief presidency magistrate even proposed the creation of a recruitment bureau for different grades and classes of appointments, though the government dropped it as unfeasible (GO 1561 Public, December 19, 1912).

Following the 1909-10 Morley-Minto reforms, the first major step towards Indianisation of the administration, in 1911 the government of India desired the provincial governments to secure in their services adequate representation of the various classes. On its part, the Madras government called for statistics from all heads of departments on the distribution of the various classes in public service. In that connection the BOR reported that it was scrutinising the annual lists of persons recommended by the collectors for posts of tahsildars and deputy tahsildars to check the preponderance of brahmins by securing suitable non-brahmins from

other districts if the district did not have a sufficient number of them. It also mentioned that having found in 1910 that brahmin preponderance was marked in some districts, it informed the district authorities that it would decline to place any more brahmins on the list of such districts, unless the collectors had taken every possible means to find suitable non-brahmins for inclusion in the lists.

However, the government's scrutiny of the revenue establishment list corrected up to January 1, 1911 revealed that in no less than 10 out of the 24 districts the BSO was on that date apparently disregarded. Expressing its lack of confidence in the care taken by the BOR to avoid the dangers arising from the concentration of an undue number of posts in a district in the hands of a single caste or a single family, it advised the BOR to institute an enquiry in all districts (GO 1763 Revenue (Confidential), June 9, 1911). In a related GO it also declined to concur with the BOR that "different sects of brahmins may safely be regarded... as constituting different castes", and held that "[i]n spite of the existence of rivalries... there is reason to believe that they will unite in their opposition to the preferment of men of other, and in [the BOR's] view, lower castes". Therefore, it insisted on maintaining as strictly as possible the rule that the men doing duty in the appointments of sheristadar and head clerk shall not be of the same caste (GO 2491 Revenue, August 15, 1911).

In a note on provincial services prepared for the Royal Commission on Public Services, appointed in pursuance of the Morley-Minto reforms, the Madras government reported in 1913 that all the officers appointed after the competitive examinations of 1893-95 were, with one exception, brahmins, that of the total deputy collectors in the presidency they accounted for 53 per cent in 1896 and 55 per cent in 1912, and that in the judicial branch in 1912, 15 (83.3 per cent) of the 18 permanent sub-judges, and 93 (73.8 per cent) of the 126 permanent district munsiffs were brahmins. Stating that as a consequence of their extraordinary ability in passing examinations, it was practically certain that they would always or at least for many years, obtain all or nearly all the appointments thrown open to competition, it observed that such a monopoly was not advantageous to the administration both because of the preponderance of this one class and because, the large proportion of them recruited will leave it no opportunities for rendering justice to the other classes. Therefore, it recommended that the proportion of brahmins shall not exceed 50 per cent (GO 202 Public, February 12, 1913; also

Arooran 1980: 37).

Parallel to and reinforcing these efforts to reduce the representation of brahmins were those to increase that of Muslims.

II Muslims and British Administration

The resentment of Muslims against their political dispossession by the British, their lack of social integration with non-Muslims, and failure to participate in English education and its material benefits, the belated British efforts to draw them into its patronage network, and other related issues have all been concerns of several works (Ahmed 1981; Coupland 1942; Hasan 1985; Hunter 1872). Suffice to say that though in Madras presidency, where Muslims were not too large a group and their sense of hurt, loss of pride, and discord with the Hindus were not too deep [cf McPherson 1969: 401], as a follow up to viceroy Mayo's resolution of August 7, 1871 on Muslim education, in a memorandum of July 29, 1872, governor Hobart laid down what turned out to be a major policy on Muslim education and employment for over the next four decades.

Restating Mayo's views, Hobart regretted that Muslims should have passed, from intimate association with the British in the governance of territories they once ruled, into almost absolute political insignificance, and should have been superseded in that association by "races" whom they had subjugated and considered very inferior to themselves. He saw this as injurious to the most vital interests of the empire, and reasoned thus:

The exclusion of any class, by any other fault than its own, from political power to which other classes are admitted, and for which it is not disqualified, is opposed to the general principles of political science. When the class excluded has a character and history such as of the Muslims, the temptation to disaffection and conspiracy against the state is exceedingly strong. The state, in losing the services of Muslims, loses the services of men possessing some peculiar qualifications for the business of government, which are probably more valuable than those possessed by the "races" which have supplanted them. One of the principal objects of according Indians a participation in the governance of India is that they may be interested in its stability. This object is all the more important in the case of a class whose power for good or evil is greater than that of any other in the country.

Hobart attributed the Muslim alienation to the long absence of the demand

for Muslim functionaries in the departments of the administration requiring legal knowledge, because of the replacement of Muslim law and the languages in which it was conveyed by English law and the English language throughout India; and to very few Muslims qualifying themselves for public service. He felt that the first cause was beyond the government's control, while the second could be modified or removed. Accordingly, he considered the reasons which prevented Muslims from qualifying for public service, namely, their impression that the government was disinclined to admit them to public employment and their objection on religious or other grounds to its education, and how these could be eliminated. He explained that the impression of the Muslims about the government did not arise from any prejudice on its part, that qualified Hindus were more eager and ambitious aspirants to public employment than qualified Muslims, and that the former usually presented themselves in the "van of the crowd of candidates", while the latter were relegated to the background (GO 288 Education, October 7, 1872; Suntharalingam 1980: 254-56; also cf Ahmed 1981: 133-140).

PREFERENTIAL EMPLOYMENT

Hobart's memorandum was followed up by a circular on his anxiety to see that Muslims participated in public service more proportionate to their numbers and intelligence, and that the claims of those Muslims who satisfied the prescribed tests should be specially considered when filling up vacancies. The circular also called for statements of Muslims employed in various offices on salaries exceeding Rs 10 a month, with the name of the person, his salary, and designation, vernacular languages with which he was acquainted, nature of the tests passed, and any other desirable information (Saraswathi 1974: 107-8).

In the years since 1872 the government called for periodic reports from its officials on the special efforts required for giving qualified Muslims a fair share of public employment. In keeping with the government of India's directive following the recommendations of the 1882 Education Commission, in 1885 it also directed the accountant general to furnish on September 15 every year details on the extent of Muslim employment in government for inclusion in the annual MPARs (EP 507, August 14, 1885). The PIRs also devoted a section to such details.

The information obtained from these sources revealed the continuing underrepresentation of Muslims, and overrepresentation of brahmins: For a population of 6.4 per cent, Muslims were only

2.7 per cent of the officials in 1881, despite an increase of 12.5 per cent over the preceding decade. For a population of 3.7 per cent, brahmins were 60.2 per cent and almost the same proportion as in 1872. Though by 1886 the representation of Muslims had increased it was mostly in posts on salaries not exceeding Rs 10 a month: In 1886 Muslim officials on salaries not exceeding and exceeding Rs 10 were 24.6 per cent and 4.2 per cent respectively, whereas the corresponding figures for brahmins were 5.2 and 55.1 (Table 4).¹¹

Though the 1886 statistics dividing officials into two salary categories of not exceeding and exceeding Rs 10 were insufficient for ascertaining the distribution of appointments and the future returns were to show the number of each class employed in the various upper grades separately, the BOR again directed the collectors to introduce as many Muslims into public service, consistently with the efficiency of their offices and the claims of the other classes (GO 1296 Revenue, March 1, 1887).

EDUCATIONAL ADVANCEMENT

Meanwhile, the government was also monitoring its policy since 1872 on Muslim education. The MPAR observed in 1871-72 as of "deserving note" that a Muslim obtained the BA degree for the first time in the history of Madras University, in 1877-78 that in matriculation the advance was most marked among Muslims, and in 1887-88 again as of "deserving note" that another Muslim obtained the BA degree; while the PIR observed in 1887-88 that few things were more encouraging in the history of education in the presidency than the appreciable advance Muslim education was making year after year.

These observations were not without exaggeration: For a population of 6.4 per cent, Muslims were only 1.8 per cent of the total matriculates from 1858 to 1890, 0.9 per cent of the total Arts and professional graduates from 1861 to 1890, and 1.5 per cent and 3.8 per cent of the total students in 1891 under higher and secondary education respectively. In contrast, for a population of 3.7 per cent, the corresponding figures for brahmins were 60.2, 66.6, 66.5 and 42.5. Though nowhere near brahmins, it was only in primary education that Muslim representation was close to their population percentage.

In a numerical sense, however, the observations were not without significance, especially since the 1890s: While Muslims had only 503 matriculates and 21 Arts and professional graduates over the preceding three decades, the corresponding additions were by 248/56, 462/76, and 978/59 during the years 1891-1900, 1901-10, and 1911-16 respectively. This in-

crease was mainly a reflection of that in the number of students under higher and secondary education, from 67/1275 in 1891, to 87/2353 in 1901, to 103/5519 in 1911, to 200/7114 in 1916 (Tables 5-7), that is, just on the eve of the launching of the non-brahmin movement.

This numerical increase led to the emergence of an incipient class of English educated Muslims in south India, who, as Suntharalingam has observed, were either absorbed into the administration or became lawyers, doctors, journalists, or teachers [Suntharalingam 1980: 256]. This class had linkages with similar classes in the rest of India, through migration of wealthy and well-educated professionals, as for instance, from Calcutta to Madras; organisations like the National Muhammadan Association founded in Calcutta in 1878 for drawing government's attention to the socio-educational needs of the privileged Muslims [Ahmed 1981: 36-37]; all-India Muslim educational conferences, themselves a part of educated Muslims' efforts to mobilise public opinion for their action programmes [Ahmed 1981: 152]; and the British perception of Indian Muslims as an all-India ensemble as reflected in its educational and employment policies since the 1870s. Such linkages gave this new class a semblance of pan-Indian identity, especially in the face of an emergent Hindu nationalism through all-India and provincial organisations like the Indian National Congress and the Madras Mahajana Sabha which heightened the consciousness of educated Muslims

of their own political effectiveness and minority status [Suntharalingam 1980: 253-256].

Though not very effective in leadership and mobilisation, this class tried to articulate the aspirations of the Muslim community. Numerous associations were formed for this purpose, often with overlapping objectives and the same personalities. Of these at least five deserve mention here:

First, the Anjuman-i-Islamiah of Madras founded in 1876 for remitting money through the Turkish Relief Fund launched for helping the Muslim brethren in Turkey, embattled by the 1877 Russian aggression. After its dormancy for a while following the termination of the war in 1878, its activities since 1881 centred on regional issues like ventilating the grievances of Muslims, reforming the customs and usages detrimental to their progress, and establishing good fellowship among them and with other communities. According to Suntharalingam, by July 1884 the Anjuman had about 500 members on its rolls, two schools to educate Muslim youth up to the middle level, and an Urdu paper, *Ittifaq*. Second, the Madras branch of the Central National Muhammadan Association formed in 1883 as a "proper channel" for Muslims to communicate with the government and for the socio-political and intellectual improvement of the community. Third, the Board of Muhammadan Education in the same year for maintaining a boarding house attached to the Madrasa-i-Azam for the secular and religious education of at least

200 resident Muslims at a time. Fourth, the Anjuman-i-Mufidi-Ahla-i-Islam established in 1884 for furthering the interests of the Muslims by approaching the government on matters affecting their rights and privileges, and promoting their loyalty and attachment to the government and the throne. It was managing a technical school and a workshop, and since 1903 was in receipt of an yearly grant of Rs 5,000 from the government. Fifth, the Central Mahomedan Association launched in 1886 at the instance of C D Maclean, collector of sea customs and chairman of the Mahomedan educational endowment fund for unifying other Muslim associations.

Humayun Jah Bahadur¹⁴ was president, and Mahomed Abdulla Badsha, a wealthy merchant, was treasurer of the first and second; Mir Ansaruddin, presidency magistrate, and Mohamed Ishak, assistant government agent at Chepauk (Madras), were vice-presidents of the second; Ahmad Mohidin, a member of the prince of Arcot's staff, Syed Abdur Rahman, a Bengal Muslim qualified as barrister in England and practising in the Madras High Court, and Mohidin Sheriff, a doctor at a Triplicane (Madras) hospital were secretaries of the first, second, and third; governor Wenlock was patron, and prince of Arcot was vice-patron of the fourth; and Lt Col TO Underwood, Paymaster, Carnatic Stipends, was president, and Syed Mahomed Nizamuddin, a lawyer of the Madras High Court, was secretary of the fifth [Radhakrishnan 1990: 512, 519; Saraswathi 1974: 126; Suntharalingam 1980: 250-53; Educational GOs 480 of July 7, 1893, and 977 of October 25, 1913].

The articulation by these and other associations, often limited to government patronage, was through the provincial councils, Muslim press, petitions and memorials.

PROVINCIAL COUNCILS

Of these, the provincial council started in 1862 under the 1861 Indian Councils Act, was probably the least effective. In the transactions of the council the nominated members, far outweighed by officials, had hardly any say, and the nominations were innocuous "honours" flaunted by some of the local notables on whom the governor fancied to confer them. The meetings were also few and far between, not exceeding a dozen times a year, arbitrarily convened by the governor [Krishnaswamy 1989: 2-7; Markandan 1964: 12-13]. The observation of the Madras Almanac that during Humayun Jah Bahadur's long tenure in the council from 1867 till his death in 1893 it could

hardly remember a single occasion when he took an active part in its proceedings [Markandan 1964: 12], echoes the hollowness of such nominations.

Though the 1892 Act was an improvement over the 1861 Act, the provincial council under it was still a far cry from a representative institution, and interpellations by Muslim nominees were few and far between. Some exceptions were those by Vellore Mohamed Sheriff in 1896-97, and Gulam Mohamed Sahib Bahadur in 1898-99 [Markandan 1964: 88-90]. Depending on its expediency the government explained its action in response to certain interpellations such as on Muslim education and employment; and declined to comply with certain others such as for reservation in public service for qualified Muslims, for inquiring into individual claims of Muslim graduates for advancement in higher ranks, and for appointment of a committee of members of leading Muslim associations in Madras to report upon Muslim employment. Interpellations which embarrassed the government were invariably disallowed.¹⁵

MUSLIM PRESS

The Muslim press was relatively more effective. In 1887 the Central Muham-

madan Association, Madras presidency, made two suggestions for securing larger employment of qualified Muslims in public service. One was the preparation of a list of Muslims seeking employment in government service. The government advised the Association that it would further its cause by preparing the list itself and forwarding directly to the heads of departments. The other was for furnishing information of vacancies to the editor of *Muslim Herald* for free publication. The government commended this to the heads of departments (GO 677 Education, December 7, 1887).

A decade later the editor of *Muhammadan* brought to the government's notice that though the *Muslim Herald* had agreed to publish free all advertisements for Muslim candidates, the matter was dropped after a while. He felt that though heads of departments might have been inclined to comply with government orders, want of information about qualified hands was coming in the way. In view of this, he also offered to publish free all advertisements requiring Muslim candidates. The government commended this also to the heads of departments (GO 100 Public, February 4, 1897).

Shortly thence, the *Muhammadan* of March 11 and 14, 1901 made a furore over

a suggestion to withdraw all concessions to the Muslims. The suggestion was by Rev E Sell, chairman of the executive committee of the council of aided education, Madras presidency, made at the anniversary of Harris High School, Mangalore. Speaking generally, Sell averred, he could not see any improvement in Muslim education, that too despite very special and peculiar privileges, and called for the most earnest attention of the leaders of the Muslim community. In that context he observed that "[a] favoured class is apt to become a lethargic one" and as such "the quickest method of rousing their interest and energy would be to abolish all special concessions and privileges".

Condemning Sell's suggestion, in a memorial to the governor the Muslims of Mangalore town pleaded that the time to accept it had not come, that their younger generation deserved some more concessions as a "backward class", and that those already granted were inadequate and unequal to what their Hindu brethren were enjoying since the organisation of public service. Their specific requests were for some suitable Anglo-Hindustani schools with superior management and low fee for the education of the Muslims of Mangalore district, and to confer on them some responsible posts such as of deputy collector and *tahsildar*. In view of what it felt as too many concessions already offered, the government declined to do anything more (GOs 37 Education, January 27, 1900; 552 Education, September 30, 1901).

PETITIONS AND MEMORIALS

Of all the means of Muslim articulation petitions and memorials were the most effective. Of these only a few are discussed here.

At the all-India level, in an 1882 memorial to viceroy Ripon, which the Education Commission of that year reported as by far the most important of all the memorials from Muslims [GOI 1883: 496-97], the National (redesignated as "Central National" since 1883) Muhammadan Association, one of the most effective Muslim political pressure groups of the late 19th century [Ahmed 1981: 163-64], deplored the "decayed" position of Indian Muslims and the circumstances which prolonged it. These, according to the memorial, were the substitution of Persian with English or the vernacular as the official language; resumption during 1828-46 of the revenue free grants which under the Muslim rule were generally made to men of learning for charitable and pious purposes, and the 1864 order that English alone should be the language

of examination for the more coveted appointments in the subordinate civil service. Of the poor representation of Muslims in public service it observed:

It has been to no purpose, ... that for the last twenty years the Musalmans have made strenuous efforts to qualify themselves to enter the lists successfully with the Hindus, for, with every avenue to public employment already jealously blocked by members of a different race, it is almost impossible for a Muhammadan candidate to obtain a footing in any government office. The various orders, issued from time to time, that a proper regard should be paid to the claims of Musalmans had practically become inoperative [GOI 1883: 497].

This memorial was fully reported upon by the provincial governments and discussed by the Education Commission (GO 507 Education, August 14, 1885). As Ripon left India before he could deal with it, his successor, Dufferin, after considering it and other related material, reaffirmed his "lively interest" in the advancement and well-being of the Muslim community in India, and laid down the following policy:

It is the earnest desire of the supreme government to treat all classes of her majesty's subjects in India with absolute impartiality, and see all alike benefiting by the protection, the patronage and the assistance of the state (GO 507 Education, August 14, 1885).

In an 1888 memorial, recalling the one of 1882, the association again drew the attention of the viceroy to the difficulties under which Muslims generally laboured in obtaining a just recognition of their claims to a proper share of government patronage, despite government's repeated expression of goodwill. Forwarding a copy of this memorial to the Madras government, the government of India reaffirmed its policy laid down in 1885 (GO 577 Education, September 27, 1888; 57 Education, February 1, 1889).¹⁶

At the regional level, an 1886 petition by the Anjuman-i-Islam of Salem called for conferring on Muslims the newly sanctioned appointments of income tax clerks in the collectorates, their divisional offices, etc. The government replied that it had decided to employ only men from the permanent establishment for income tax work, and that in filling up the temporary vacancies thus created due consideration will be given to the orders already issued regarding Muslim employment. At the same time, it ordered the preparation in all departments of statements of the entire number of officials from the highest to the lowest grades employed in public service under the classes brahmins, other Hindus, Muhammadans, native Christians, and Europeans/Eurasians. Officials whose salary did not exceed Rs 10 a month were to be shown separately, while

menial and inferior servants like 'punkah' (fan) pullers, scavengers, and members of the police and village establishments were to be excluded (see GOs 43 Education, January 30, 1883; 3433 Revenue, June 10, 1886; and 415 Education, July 1, 1886). The statistics available from these and related returns have already been discussed in the context of Table 4.

The December 1901 Muhammadan Educational Conference of Southern India passed a resolution for recognition of Hindustani as an official language in departmental examinations on the ground that its exclusion from the list of recognised languages was operating against the Muslims who wished to enter government service. The resolution was forwarded to the government by the president of the Muhammadan Educational Association of Southern India (GO 645 Education, October 17, 1902).

A 1907 address to the viceroy by the Anjuman-i-Mufid-i-Ahla-i-Islam, the Muhammadan Educational Association of Southern India, and the Madras presidency Muslim League started in 1908 as the provincial branch of the All-India Muslim League founded in 1906 [McPherson 1969: 387; also GO 977 Education, October 25, 1913], represented that one of the questions in which Muslims like other Indian communities felt keenly interested concerned their position in government service. Stating that the status of the Muslims was by no means such as to satisfy their legitimate expectations, it pointed out that there were several properly qualified young men who could not find suitable openings (GO 263 Public, April 3, 1907).

Prompted by this address the Madras government considered from various angles the measures taken since 1872 for Muslim advancement. Finding that Muslims held 14.1 per cent of all the posts in superior service in 1907-08, it observed that they could not complain of not having a fair share of such posts. However, since superior service included a large number of ill-paid posts, the statistics also showed that they had considerably less than their proportionate share of higher appointments: The percentages of appointments held by them on yearly salaries of Rs 250-500, Rs 500-1,000, Rs 1,000-2,500, Rs 2,500-5,000, and Rs 5,000 and above were 4.7, 4.3, 5.4, 4.1, and 1.2 respectively. To bring out this inadequacy more clearly the government argued that out of a 100 posts arithmetically due to them they held only 73 on salaries of Rs 250-500, 67 on Rs 500-1,000, 84 on Rs 1,000-2,500, 63 on Rs 2,500-5,000, and 18 on Rs 5,000 and above. However, it also noted that this arithmetical inadequacy was not for want

of official favour, and showed that the figures available of those qualified and those holding appointments as deputy collectors, tahsildars and deputy tahsildars pointed to the conclusion that Muslims were specially favoured (GO 263 Public, April 3, 1907).

In petitions and representations in the context of the Morley-Minto reforms, the Madras presidency Muslim League insisted on conferring on Muslims the right to choose their own representatives in the provincial council through election instead of nomination, and for Muslim representation on the imperial council. The government conceded to these demands (see Public GOs 379 of June 2, and 565 of August 6, 1909; 1-2 of January 3, and 78-79 of January 26, 1910).

The December 1910 All-India Muhammadan Anglo-Oriental Educational Conference held at Nagpur forwarded a copy to the Madras government of its resolution for fixing a suitable number of Muslim students in all classes of schools and colleges. As there were then no cases of rejection of Muslim students, the government did not find it necessary to fix their number. However, when the Muhammadan Educational Association of Southern India forwarded a similar resolution in September 1916, the government considered it impracticable. Its reasoning was that even if the colleges were induced to set apart a few seats for Muslims, Muslim students may not always avail themselves of such seats, in which case students of other communities who would have otherwise been admitted would be inconvenienced (see Educational GOs 397 of June 21, 1911, and 329 of March 10, 1917). Butressing the British policies towards brahmins and Muslims were the pressures from non-brahmin Hindus.

III

Non-Brahmin Pressures and British Response

In fact, from almost the beginning of British rule non-brahmin Hindus were protesting against brahmin dominance. An 1840 petition by 32 Panchalar¹⁷ from Salem blamed the East India Company for succumbing to the wiliness of brahmins by, among other things, conferring on them all the responsible public offices, and prayed for employment of all classes of men alike without distinction [Bower 1851: 91-95]. Similar petitions of the subsequent years, though sporadic to begin with, gathered momentum towards the close of the 19th century.

One group persistent in its demands prior to the non-brahmin movement was the Oriyas (also Uriyas). An 1891 memo-

rial by K Adinarayan, K Ramamurti, and 127 other "principal members" of the Vizagpatam district Oriya Samaj stated that the absence of their "class" in the several offices even to give information of any vacancies, and the presence of all the head ministerial officers from a different sect having no "patriotism" towards them, made it difficult for them to get government employment. It also stated that government orders on distribution of appointments equally among all classes were not adhered to; and that due to the "unemployed... and beggarly condition" of the few matriculates among the Oriyas with no hope of finding employment, parents were persuading their children to discontinue their education. Citing the patronage offered to Muslims they sought preference in government employment particularly in the Ganjam-Vizagpatam districts and the agency tracts.

Responding to the memorial, the government furnished a list of qualified Oriyas (14 names submitted by the DPI) to the collectors, district judges and some other officials, for consideration when filling up vacancies; and informed the memorialists accordingly (GO 521 Education, July 9, 1891).

Referring to a GO of October 1906 for preferring better candidates to certain qualified Oriyas, in a letter of the same month the Ganjam district Oriya Samaj pleaded that though the British policy was to distribute its patronage among the different "races" of India, as a result of this GO "the advanced races may always carry the day and a backward race like the Uriyas must go to the wall", and that the required qualifications for public service being equal, such a system is "calculated to unduly handicap the progress of the backward races and give an undue advantage to the advanced races". It suggested nomination of Oriyas for fair representation in the administration of the district. The government expressed its inability to do so on the ground that it would disregard the prescribed qualifications for appointments in superior service (GO 217 Judicial, January 31, 1907).

Persisting with its claim, in May 1907 the Samaj pointed out that government orders for giving preference to Oriyas in the Oriya speaking tracts were always overlooked, and requested for reservation of a certain proportion of the magisterial and other high appointments in the district "as a means of preventing monopoly of loaves and fishes of the state by the advanced races". While rejecting the request, the government stated that steps will be taken to employ educated Oriyas as far as possible, and conveyed the same to the agent to the governor in the Ganjam district (GO 1161 Judicial, June 27, 1907).

In a similar address in 1913 the Samaj pointed out that Oriyas were not being appointed to higher posts in the provincial civil service and special services such as of deputy collector, munsiff, and deputy superintendent/circle inspector of police, and reiterated its demand for nomination of some qualified Oriyas to these posts. Stating that of the nine new names for deputy collectors eight were brahmins, in a note on the address A G Cardew, revenue secretary, asked the BOR to submit some additional names, all of non-brahmins, and advised it to have one-third of its fresh recommendations each year from non-brahmins. The government's reply to the Samaj was that it was ready to do all in its power to encourage Oriyas in public service when possible to do so (GO 22 Public, January 5, 1914).

A brief look at some of the other petitions and memorials of this period should give a better idea of the non-brahmin perception of themselves, of brahmins, brahmin dominance, and the British administration:

An 1896 petition by T Tiruvengata Mudaliar and 14 others, on their own behalf and purportedly also on behalf of the "dumb masses" of Anantapur district, deplored that the composition of the personnel of the district was against the letter and spirit of the "wholesome" BSO which was often violated with impunity. It also stated that the pernicious control of virtually all the public offices in the district by a "family coach" under the guidance of huzur sheristadar Seshagiri Rao was a crying evil, disastrous to public interest and dispiriting to the people, and that collectors as a class did not trouble themselves to look below the surface and appointed officials on the advice and information given by the sheristadar. It urged the governor to remedy the evil by, as a first step, transferring the sheristadar to some other district. Acting on this petition, the BOR asked the collector to furnish a list of the relations of the sheristadar (GO 4282 Revenue (Confidential), October 30, 1896).

While on this petition it may be relevant to note the following statement of the education commission drawing upon its Madras report:

[T]he children of peasants (read non-brahmin Hindus) have no special provision made for their education in middle schools, and take no advantage of these institutions. The only public service examination in Madras is the middle school examination, and therefore the door to the public service is closed against the peasant proprietary (GO 1883: 144).

This educational backwardness is clearly evident from Tables 5-7: For a population of 86.6 per cent, non-brahmin Hin-

dus (including paraiyas and kindred classes alias panchamas or the present scheduled castes who had not then emerged as a separate category) accounted for only 23.5 per cent of the total matriculates, and 19.8 per cent of the total arts and professional graduates from 1858-61 to 1916, and 20.4 per cent and 40.2 per cent of the total students in 1916 under higher and secondary education respectively. Even in primary education their representation (74.9 per cent) was below their population percentage.

The education commission had observed in the context of this backwardness that "[t]he most efficacious of all encouragements to the spread of education is that supplied by the bestowal of public appointments upon educated candidates", and that "[u]nfortunately no lever for raising education is less systematically applied". This observation is also borne out by the statistics collected by the government in 1872, 1881, and 1886, in the context of Muslim employment. The representation of non-brahmin Hindus was only about 32 per cent in 1881, and had increased only by 4 per cent since the preceding decade. Though by 1886 it had increased considerably, it was mostly in posts on salaries of Rs 10 or less: In 1886 non-brahmin Hindus were 68.2 per cent of the total officials on salaries of Rs 10 or less, and 33 per cent on salaries exceeding Rs 10 (Table 4). Reviewing the statistics in 1887 the BOR noted that in the disproportionate distribution of employment non-brahmin Hindus were the worst sufferers:

These have suffered from no scholastic disadvantages in having to learn through the medium of a foreign language, and their disparity to brahmins must be attributed in part to their not having yet overtaken the great lead which centuries of past education has naturally given to the brahmin, and in part to their largely embracing the agricultural classes, which will never enter the competition to any great extent.

Accordingly, it drew the attention of the collectors to the proportion of offices which on a representative basis should be held by each class, mentioning at the same time that representative proportion cannot be rigidly imposed at once without injury to offices, and can only be approached to in the course of years (GO 1296 Revenue, March 1, 1887).

An 1897 memorial by the Viswakulatharana Association, Madras,¹⁸ submitting to the governor its "Kammala Condition Amelioration Bill" made the following observations:

Kammalas constitute not less than one-tenth of the total presidency population, but have no seat in the legislative coun-

cil. "[T]o accord to them one is to secure them an agency to watch their interests; develop them in different directions, and establish a good loyal power out of the forces within the race". The exclusion of the country's vernaculars from the work of administration has affected the progress of all classes of the people. As even the commonest nail is imported, the Kammalas who were the suppliers of all the local wants are placed in acute poverty. They are most deplorably backward in education, and require stipends as a necessary incentive for education until they receive a due share of public appointments; and special schools like the ones for Muslims and pariahs. High educational qualifications though not needed for ordinary office routine are yet demanded universally; examination rules prescribing such qualifications, the age bar, and prohibitive school and college fees deter the disabled classes from competing with the predominant class, and are a patent obstruction to the free growth of all the interests concerned. Inability of the few qualified Kammalas to obtain decent situations in public service has nipped in the bud the hope of the community's future in a matter of vital consequence to its rise. Each class has its "sacred right" to a share in public service. In the Accountant General's office out of every 14 candidates selected ten are brahmins, and nepotism and intrigue are in full play.

Its most eloquent expression was its resentment against brahmin preponderance:

One class, by undue preponderance in the public service absorbs the vast resources coming from the sweat of all classes and set apart for that service; this places it in a position to educate itself, and it again absorbs such other resources of the country, set apart for public instruction. Public monies are thus doubly locked up and, for want of legitimate use, fail to exert their regenerating influences on all the contributing classes (GOs 970-71 Public, July 20, 1897).

In 1902 the Acharis (Kammalar) of Tinnevely district pointed out that public service was fully and skilfully shut out to them through the particular and peculiar revenging spite of the brahmins, and that surrounded by them the British officials were being entirely misled (GO 112 Education, March 11, 1903).

A 1910 memorial of the "leading representatives" of the Lingayat community and of the all-India fifth Lingayat conference held at Bellary in December 1909, submitted to the government by M Basava Iya, High Court wakil, Bellary, observed with "extreme regret" the specially backward condition of the lingayats in English education and

representation in public service. The memorial requested the government to encourage and improve their education, offer concessions, and appoint them in responsible positions in the revenue, judicial, and other branches of public service. As a climb-down, against its earlier request for three seats in the Madras legislative council which the government had turned down, the memorial requested for one seat.

The public department termed as misnomer the lingayats' claim as a "depressed class", inasmuch as in the pamphlet attached to the memorial they had claimed themselves as superior to brahmins, and their religion as an improvement on the Vedas. Its reply to the memorialists was that government was not prepared to show special favour to members of any particular sect in public service disregarding their fitness, and to reconsider its earlier decision against lingayats' separate representation in the legislative council (GO 660 Public, July 28, 1910).

One group which has not figured in the discussion of non-brahmin Hindus is the "depressed classes", comprising mostly the panchamas and partly the "hill tribes". Even as late as 1916, for a population of about 16.4 per cent their representation was virtually nil in higher education, only less than 1 per cent in secondary education, and about 8.8 per cent in primary education (Table 7). With such educational backwardness they could not have had any significant representation in public service either. Nor could they have made any serious claim for such representation as they were ill-equipped to fill important government posts. That probably explains the absence of any mention of them in the statistics on government employment.

Meanwhile, most of the petitions for inclusion in the backward classes list for educational concessions, especially after the introduction of half-fee concession in 1892 had also urged for representation in public service. More often than not, the education department considered them favourably for inclusion in the list (Radhakrishnan 1990: 512-13). Their claims for representation in public service were, however, overlooked. This could have been because either the petitions were not directly for such representation, or the petitioners were not articulate enough as pressure groups. However, this situation began to change since 1917 when a vocal and well organised pressure group appeared on the scene. An understanding of this change anticipates a close look at the non-brahmin movement which is beyond the scope of this paper.

IV Conclusion

Though communal representation and reservations are often identified with the non-brahmin movement and the Indian Constitution respectively, the evolution of the non-brahmin movement itself was preceded by certain intricate and elaborate processes of over half a century. These processes had direct bearing on communal representation and reservations at the ideational and pragmatic levels as functional imperatives of the colonial administration.

The imperatives were both tactical and moral. On the tactical side were considerations of the stability and legitimacy of the British administration, as evident from its attempts to draw on its side first the "influential class", and later the "alienated class"; its apprehension of corruption, nepotism, favouritism, administrative inefficiency, and the undermining of British authority by the administrative dominance of the "influential class", and belated attempts to prevent such dominance; and its fear of the poor representation of the "alienated class" as injurious to the most vital interests of the empire. On the moral side was a seemingly abiding concern for rendering justice to the disprivileged sections of the society through attempts at communal representation and reservations on the ground that they could not compete on equal terms with the "influential class", and the related dilemma to strike a balance between equity and efficiency.

As the imperatives were often incompatible with each other, they resulted in contradictions. Examples are the failures of the administration to ensure its professed neutrality principle because of its exclusion of the lower castes for fear of alienating the "influential class"; to honour its policy of absolute impartiality because of its special treatment of "the alienated class" for fear of its disaffection; and to stick to its repeated assertions against communal representation and reservations because of their *ad hoc* introduction as part of its patronage politics.

The long interface of this period between the colonial administration and the local society created in the non-brahmin segments an increasing awareness of the close nexus between English education and government employment, their own disprivileged position in both compared to the brahmins, and the role of British administration as a great dispenser of patronage. The recurrent themes in such interface were inferior versus superior races, backward versus forward races, ad-

ministrative stability, and distribution of government patronage. Each group was concerned with its own claims and reference to others was not for any concern for overall social justice or equality, but for only justifying its own claims. There was also no composite category of non-brahmins as used in the context of the subsequent non-brahmin movement.

While all groups were eager to have a share of the government patronage, only one group was equipped itself for doing so through competition by mastering English though this language was as alien to it as to all others. Other groups merely sought protection. This was especially so in the case of Kammalar, who for several centuries maintained a struggle for a higher place in the social scale than allotted to them by the brahminical authority [Maclean 1989: 229], though unlike the brahmins they hardly made any effort for competition for the material and socio-cultural benefits under successive rulers.

To conclude, central to the discourse on communal representation and reservation of this period, the related administrative processes, and the non-brahmin response to them were the statistics collected from time to time. These made the non-brahmins and the British officials increasingly aware of the structural cleavages in south Indian society of brahmin versus non-brahmins, Hindus versus Muslims, and so on. Such awareness in turn sharpened these cleavages, pitted the non-brahmins against the brahmins, and gradually paved the way for the non-brahmin movement.

Notes

[Unless specified otherwise the GOs and other proceedings cited are of the GOM, consulted at the Tamil Nadu archives. This paper is part of a larger study of backward classes and reservations. The author is grateful to Malcolm S Adiseshiah and S Neelakantan for their comments on its draft.]

1 Krishna's contention that the origins of communal representation 'are to be sought

in the growth and strength of the Indian National Congress and the need for a policy of counterpoise by the government against the Congress" [Krishna 1939:37] is true only for representation in politics and not in public service, the main concern of this paper.

- 2 The oft-quoted episodes of such closures are from *Ramayana* about Rama beheading Shambuk for his 'tapasya' (penance), an austerity prohibited to shudras; and from *Mahabharata* about Drona mutilating Ekalavya's thumb for learning archery even after he declined to teach him owing to his 'low birth'.
- 3 In this connection it is relevant to note that admission of 'untouchable' students in 1851 to the Madras High School (of the Madras University) established in 1841 was strongly condemned by the caste-Hindus, with some withdrawing their wards, and one Hindu member resigning from the University Board [see Suntharalingam 1980: 58-61].
- 4 O'hannon has observed that in 1851 "when the Board of Education, after much heart-searching, had decided that it could not admit mahar boys to government schools", *Dnyanodaya*, then the most important missionary periodical of western India, "protested bitterly against this deference to a set of social rules that took no account of individual qualities", and that this case was the subject of a long correspondence of the Bombay government [O'hannon 1985: 72, also 66, 70].
- 5 Suntharalingam has explained this monopoly by their recruitment into the revenue administration since the 16th century when the deccani incursions into the Tamil and Telugu regions gathered momentum; and the eagerness of early British officials to use their expertise in creating the district administrative framework [Suntharalingam 1980: 19-20].
- 6 Going by the 1901 Census, of the 11,98,914 brahmins in Madras presidency maharatta brahmins along with konkani and tulu brahmins (all classified under 'Others') were 8.8 per cent of the brahmins, whereas the percentages of Tamil, Telugu, Oriya, Canarese, and Malayalam brahmins were 34.7, 36.4, 10.7, 7.8 and 1.6 respectively [Government of Madras 1902, XVA(2): 156].
- 7 Exceptions were nambutiri brahmins of Malabar, and Vydiki brahmins of northern circars, who for a long time spurned English education [see Suntharalingam 1980: 113].
- 8 Dash in the tables throughout the paper indicates nil.
- 9 This college was then only a feeder to public service, with admissions to it regulated by government's need for engineers.
- 10 In theory, the requirement for this service was a pass in matriculation or upper secondary examination in first class, and in a test in hand-writing and dictation. In practice, some of the higher appointments were restricted to persons of higher educational attainments. Thus, only those who had passed the first arts were admitted to the criminal judicial tests prescribed for the appointments of tahsildars or inspectors of police; and non-graduates could not ordinarily become deputy collectors, as only graduates could appear for the higher grades revenue test (see PIR 1886-87; MPAR 1901-02).
- 11 Figures for 1872-81 were mostly for posts on salaries of Rs 11 and more, whereas those for 1886 covered virtually all the posts on

salaries of Rs 10 and less. The formation of Anantapur district and the large additions since 1881 to the establishments of the Salt Commissioner, the Forest Conservator, etc, also added to the 1886 figures (see GO 1296 Revenue, March 1, 1887).

- 12 Figures are for Bachelor of Arts, Law, Medicine/Surgery, and Civil Engineering; Master of Arts, and Law; Doctor of Medicine, and Law; and Licentiate in Medicine/Surgery, Sanitary Service, and Teaching.
- 13 Table excludes education department's 'special schools' and institutions not recognised by it.
- 14 Humayun Jah Bahadur, a descendant of Tipu Sultan, born and educated in Calcutta, was settled in Madras as a wealthy notable with large landed and business interests [see Suntharalingam 1980: 251].
- 15 For some of these interpellations, see Public GOs 323 of March 14, 1899, 396 of April 5, 1899, 629-30 of June 9, 1899, 1401 of December 22, 1899, 1407 and 1409 of December 23, 1899.
- 16 Following this reaffirmation, for encouraging their entry into medical service the Madras government reserved for Muslims a certain number of stipendiary appointments in the medical apprentice grade (see GO 507 Education, August 14, 1885).
- 17 Panchalar or visva brahmins are ironsmiths, carpenters, brasiers, masons, and goldsmiths, commonly called kammalar in Tamil Nadu and Kerala, kamsalas in Andhra Pradesh, and panchalas in South Kanara. [see Bower 1851: 91-95; Maclean 1989: 229; Washbrook 1975: 162-64].
- 18 The commissioner of police reported in August 1897 that this association held only one meeting since its inauguration in December 1894, attended by about 80 kammalas who resolved to forward to parliament a memorial signed by every goldsmith and carpenter in Madras, and to start a Tamil paper *Virvaguru* as soon as sufficient funds were forthcoming (see GO 528-29 Public, May 9, 1899).

12. **Caste and the Agrarian Structure** by T. K. Sundari, 1991, pp. 175; Price Rs. 125, Paperback.

Titles 1-8 are available directly from the Centre and 9-12 are available from M/s Oxford and IBH Publishing Co., 66, Janapath, New Delhi 110 001.

For obtaining copies of the publication available with the Centre, please send D/D in favour of Centre for Development Studies, payable at Trivandrum. (Please add Rs. 14 towards postage for each title. Postage will be paid by the Centre for purchase of minimum 4 titles.)

DIRECTOR

Future Trade and Exchange Rate Policy for India

Vijay Joshi
I M D Little

The authors propose a trade policy for India which would be much less protective than the spectrum of customs duties envisaged for 1997-98 by the Chelliah Committee. The Committee's proposals, they argue, are not only too protective (and hence biased against exports) but also much too complex.

I

Trade Policy in the Long Run

BY the long run we mean that enough time has elapsed for a restructuring of production to have occurred without serious hardship. If any protection or other subsidisation of particular activities remains, it is because there are good social reasons for special encouragement of such activities.

We assume that there are no balance of payments reasons for trade taxes. Sound macro-economic fiscal and monetary policies, together with a flexible exchange rate, ensure the maintenance of a viable overall balance with foreigners. This is further discussed in Section IV below.

We take it also to be agreed that the continued use of quantity controls over imports or exports for either balance of payments or protective reasons is ruled out. Their use in an emergency or a trade dispute is not ruled out. Nor, of course, is the prohibition or regulation of trade in certain services or commodities for reasons of defence, health, or morality, excluded.

It is useful to think of trade policy as part of public finance.¹ Indeed, given the provisos made above, trade policy boils down to the question of how trade should be taxed or subsidised. Obviously trade taxes and subsidies cannot be considered apart from other taxes and subsidies, and from the social utility of public expenditure in general. At present, Indian trade taxes amount to about 4.0 per cent of GDP, and about 50 per cent of the cif value of imports (the latter figure is easily a world record). Total consolidated government revenue is about 20 per cent of GDP. Suppose for the sake of argument concerning orders of magnitude that in the long run there will be a comprehensive VAT of 15 per cent which is also charged on all imports. Suppose also that the abolition of quotas and customs duties results in a rise in imports from the present 10 per cent of GDP to 13.3 per cent. Then the VAT on imports yields 2 per cent of GDP (13.3 per cent \times 15/100), implying a switch of tax on imports to other taxes of about 2 per cent of GDP. There

is no doubt that such a switch is feasible. There is plenty of room in India for broadening the base of indirect domestic taxation (preferably by a VAT which could be and should be extended to services); and also for raising direct tax revenue. Admittedly the division of responsibility for the design and collection of taxes between the centre and the states, and the division of the revenue, raises serious political problems. Nevertheless, it can be concluded that *in the long run*, there is no general revenue reason for trade intervention, that is for higher taxes on imports or exports of a commodity than on domestic production.²

This brings one to the ancient subject of protection. Protection normally involves favouring domestic sales over export sales.³ The standard reason for this is improving the terms of trade (since we have already ruled out any revenue reason). It is assumed that there is nothing to be gained on the *import* side (India is too small a part of the world market for any commodity, for one to presume otherwise). There could be a reason for a few specific export taxes (but probably only if this was co-ordinated with other countries). The only further terms of trade reason for any protective tariff would be to allow for some generalised inelasticity of foreign demand: note that if this is the reason agriculture should be as much protected as industry, and that all sectors of industry should be equally protected.⁴

But what about the various asserted reasons for protection of manufacturing on grounds of external economies, or factor price distortions? No one in the past 30 years has seriously undermined the finding of J Bhagwati and V K Ramaswami that domestic taxes and subsidies, not trade taxes, are the optimal way of correcting domestic distortions.⁵ Yet many may feel that there is still a fiscal problem in implementing an optimum system of subsidies and taxes. However, if a subsidy to an industry is justified by some distortion, then it surely cannot be optimal that domestic consumers of the product should pay the whole cost of the subsidy (the tariff method) rather than general taxation including taxes on other polluting

industries; or a reduction in other expenditure. But a low tariff combined with both production and export subsidies might perhaps be justified. The tariff revenue would pay a small part of the subsidisation, with general taxation and a reduction in other government expenditure paying for the rest.

In Little (*ibid*) the extreme case was analysed in which, apart from imports, manufacturing was the *only* source of taxation, while its product also gave rise to positive externalities. Ignoring the externalities there should be an optimal and equal rate of taxation of both production and imports (e.g., a VAT with exports exempt). Introducing the externalities would result in both a tariff and a reduction in the VAT⁶ ('relative' subsidisation) and a subsidy on exports. Revenue and other government expenditure would fall. It was concluded that "this seems to be the atom of truth left in the protection argument". It was thought to be an atom because the general beneficial externalities of industry were doubted, because taxes on manufacturing are not the only source of revenue, and because other expenditures should not be sacrosanct.

At this point in the argument it should be noticed that some protection is accorded by a VAT: that is, all industrial and service enterprises too small to be economically VATable are protected both from imports and from larger enterprises. If, supposing that *all* imports would pay VAT, as suggested, unprocessed domestic agricultural products (except maybe the output of large plantations and timber estates) were VAT exempt, that would result in some effective protection for them too.

We leave it as an open question whether there should be a low protective customs duty on top of VAT. If it was at all significant, it would be desirable to retain the apparatus of designating certain units as exporters that could import free of customs duty. Otherwise a major and desirable industry such as diamond processing might go under to competition from some other developing country. If the customs duty was as low as say 5 per cent, this tiresome administrative com-

plication of exemptions might, however, be dispensed with.

We still have not addressed the question of the desirability of an active governmental industrial policy, and whether protection of the domestic market is a necessary part of such a policy. There is a running debate on this issue, especially in relation to the amazing industrial revolution that has occurred in the past 30 years in South Korea and Taiwan.⁷ We do not have the space or time to comment in depth on this issue, which is currently being examined by the World Bank. (But one of us has visited a good many firms and talked with planners in both South Korea and Taiwan.) We believe that government was very important in creating the 'export oriented' economy in which exporters operated under virtual free trade conditions, and had the assurance that government would see to it that there were many profitable export opportunities by maintaining a competitive exchange rate (or, when it threatened to become over-valued, providing compensating incentives), and in general both bullying industrial leaders to export and honouring them for it.

But we do not believe that the 'heavy' industries that government (in particular President Park) especially promoted from around 1973 played a leading role in Korea's success. Korea had already experienced a decade of astonishing growth, manifestly based on exports of clothing and other textile products, footwear and hats, cutlery and tools, and light electrical equipment and instruments.

The believers in active industrial policies most often mention Hyundai's shipbuilding and cars, petrochemicals, and steel and they talk of *creating* comparative advantage. Steel is now internationally competitive in Korea, but the main steel company (Posco, the only important state enterprise in the industries mentioned) has had low financial returns throughout its 20-year life despite heavy subsidisation of its non-traded inputs, including the real interest rate which has been negative throughout most of its life. It has also received protection (the import tariff on steel was 25 per cent until recently). But subsidisation has been more important than protection, since some three quarters of its output has been either exported or sold at world prices to downstream users, principally shipbuilders and motor car producers.⁸ Shipbuilding likewise has achieved international competitiveness, though at least until very recently it enjoyed a subsidised interest rate, and probably still does. One of us visited Hyundai's shipbuilding and heavy machinery works at Ulsan three years ago, and was amazed at their technological progress. However, huge investment errors had been

made, and a top manager disclaimed economic success.⁹ Nor has any Korean economist that we know of claimed that Hyundai's cars, the Pony and the Excel, whose export sales have been subsidised, have contributed much to Korea's economic success. As for the petrochemical industry, it remains very high cost, and exists only as a result of heavy protection.

Of course, Korea was well advised to 'trade up' in terms of skill and capital intensity as she reached full employment and as savings rapidly rose as a proportion of GDP. It could be and was argued that without government targeting, she would not have made this transition.¹⁰ Counterfactuals are irrefutable. But it should be noticed that Taiwan has progressed from early success with labour-intensive manufactures with much less industrial targeting than Korean, while Hong Kong has none. However, it is certainly true that the investment inspired by Korean government in the 1970s, even if not socially very profitable, was not the disaster that it was in many developing countries in Africa and Latin America.¹¹

India's situation is very different from Korea's in the early 1970s. Korea then had very little heavy industry. India now has long experience in all branches of heavy industry. Korea was governed by a powerful single-minded autocrat who had no difficulty in imposing his policies. India is a federal democracy, with a bureaucracy that has shown no aptitude for masterminding an efficient industrialisation.

If nevertheless the Indian government decides that it should try to promote particular industries, we would finally plead with it to do this by subsidisation which does not discriminate against exports rather than protection. Although Korea certainly protected the home market, subsidisation was often more important than protection; certainly, for example, in the case of steel and shipbuilding. Subsidies, however, need to be continuously reviewed and justified to ensure that they do not get out of hand, like the fertiliser subsidies. They should, as far as possible, relate to specific externalities, for example training and the acquisition of technical and scientific skills in the case of relatively high technology industries.

A form of protection of the home market not so far mentioned is the use of export prohibitions or taxes, to drive down the domestic price of inputs below the world price for the benefit of manufacturers using those inputs. Hides and skins may be the prime example. In a muddled way such restrictions are sometimes supported as increasing domestic value added. All such restrictions should go. If manufacturers do not pay the full value

to the economy of their inputs, their value added is a mirage from a social point of view.

We are now in a position to sum up our proposed design for long run trade policy. As already emphasised this can only be stated in the context of indirect taxation in general:

- (1) There should be no permanent trade restrictions, except for reasons of safety, health or morality.
- (2) A uniform VAT should apply to everything including all imports, excluding only the following:
 - (i) all unprocessed agricultural products, except those of plantations and estates; and
 - (ii) all productive enterprises with a turnover less than some limit to be determined; these exceptions would be VAT exempt (rather than zero rated).
- (3) There should also be high excise taxation of the normal 'demerit' items—alcohol, tobacco, gasoline, and such others as may be easily enough taxable while also claiming attention on grounds of health, external diseconomies, or that they are consumed only by the wealthy. Such excises would, of course, be matched by countervailing duties on imports.
- (4) The above implies some effective protection only for agriculture and small-scale activities of the order of, say, 15 per cent. The question remains of whether there should be some further protection either of manufacturing or agriculture, or both. Since the logic of such further indiscriminate protection is to allow for some general slight negative elasticity of world prices with respect to Indian trade, it should apply to neither or both. We suggest a general duty of no more than 10 per cent on all imports. If it was as low as 5 per cent, it might be all right to dispense with all import tax exemption for exporters, which would be a considerable administrative advantage.
- (5) Any special promotion of particular industries should be by subsidy. Protection of the domestic market by tariff should not be necessary for this purpose.

II

A Comparison of Our Suggestions with Those of the Chelliah Committee¹²

The Chelliah Committee presents a tariff profile to be achieved by 1997-98. This is not necessarily a final target. In the Final Report, Part II (para 12.8) it is recognised that some of the suggested

rates are high relative to other developing and developed countries, but it is argued that lower rates in the medium term would be inadvisable. "The situation can be revised during the next decade." We feel, however, that a final design should be suggested and welcomed by the government. Industrialists need to plan for many years ahead, far longer than the 3-4 year horizon of the Chelliah Committee.

The committee suggests customs duty rates of 5, 10, 15, 20, 25 and 30 per cent, with 50 per cent to be applied to consumer goods as and when they are delicensed. We assume that countervailing duties equal to the rate of excise or VAT imposed on domestic production would be on top of such customs duties so that the above rates compare with our suggested simple rate of say 5 per cent on all imports.

Our long run design and that of the medium term Chelliah plan differ greatly. First consider the average height. In advising high protection (and the implicit rates of effective protection proposed are very high, not only in relation to those suggested by general reasoning, but also in relation to most developing countries now, and in relation to the historical levels that once prevailed in the now 'industrialised' countries), the Chelliah Committee refers to such 'inherent disadvantages' suffered by Indian industry as "general inefficiencies in the economy such as higher interest costs, power cuts, lack of efficient infrastructure and cascading types of State and local taxes".

These are strange reasons for advocating protection, especially in the long run. Apart from higher interest costs which may be no distortion (even if true!), these inefficiencies are domestic distortion that should be dealt with by domestic reform.¹³ But even in the interval during which they persist, there is no reason for favouring domestic sales over export sales which the Chelliah tariff certainly does, despite the advocated retention of 'advance licensing'.

Despite its stated belief in moderation and simplicity the Chelliah Committee still advocates seven rates of nominal customs duty. This is surely too complex for the long run and invites wasteful rent-seeking activities. Industry cannot be reliably divided into seven groups distinguished by their varying net external benefits, thus meriting seven different degrees of encouragement. Externalities are not in fact mentioned by the Chelliah Committee as reasons for protection. The disadvantages that are mentioned as reasons certainly do not impinge upon different industries so differently as to justify a range of effective protection from 5 per cent to 100 per cent or more. (The

50 per cent nominal protection for consumer goods might well amount to effective protection of 100 per cent, or more in some cases.)

Part of the reason for suggesting so many rates seems to have been acceptance of the principle that higher stages of manufacturing should have higher rates of nominal protection than lower stages. But this is a totally unprincipled principle, for it has no foundation in economic principles. It is, of course, a fallacy that a higher stage of production must have higher nominal protection than a lower stage in order to achieve the same level of effective protection. Identical nominal protection yields identical effective protection at all stages.

It is, however, almost universal that higher stages of production get higher protection. It is easy to see how this comes about. The belief in industrialisation as the road to riches, and in protection as the obvious stimulus to industrialisation, implies that manufactures should be protected, but not the hewers of wood and drawers of water who supply materials (and anyway materials were often mainly imported). It follows quite naturally that the more processed is a good, the better it is to make it (and the 'higher' the technology the better!). Now only that, but the makers of intermediates face the countervailing power of the makers of final goods, while the consumers of the latter are mostly unorganised and impotent. The fact that almost every country has institutionalised the fallacy in all this, is not a good reason for following the herd. The main argument given by the Chelliah Committee for not endorsing a single low rate of customs duty is that only Chile has done so (with much success in recent years).

There are certainly good reasons for having several rates of duty in an interim period of adjustment. It is clear that the Chelliah Committee to some extent calculated in the manner of old-fashioned tariff commissions which enquired into domestic and cif costs, and tried to find a rate of duty which would bridge the gap to the extent of permitting at least the more efficient domestic units, or a 'representative firm', to make a normal profit. These tariff commissions did not dream of any need for radical adjustment or restructuring. This approach is indeed necessary for the adjustment period: industries must be effectively protected to the degree required to avoid any drastic loss of output or employment, but not over protected. Multiple rates and changes in the assignment of industries to particular bands in the tariff spectrum may also be necessary in the reform period to see that desired rates of effective protec-

tion for one industry can be maintained when changes (reductions) are made in supplying industries. But it is an approach which in the long run denies the validity of all the work of the past 30 years on optimising the benefits to be derived from trade.

The Chelliah Committee recognised in principle the advantages of simplicity. Seven rates of duty with a large reduction in exemptions is a great simplification compared with the present amazing complexity. But it still leaves plenty of room for lobbying and corruption to determine which rate should be applied to particular industries and products—to no purpose except perhaps to benefit the customs administration itself. Much further simplification is appropriate for the final design.

Before leaving the long run or final objective pattern of customs duties, we should say something more about consumer goods. First, it should be recognised that there will be no balance of payments reason for excluding them (and allowing their production in India often at high cost and with little saving in foreign exchange). Given the exchange rate regime that we are assuming there can be no enduring or chronic shortage of foreign exchange (for that implies an over-valued real exchange rate). What other reasons can there be? In general none. Why should India be self-sufficient in consumer goods, rather than anything else? Or, indeed, self-sufficient in anything? The reason why consumer goods should *not* be banned are strong (quite apart from the ethical argument that consumers' choice should not be restricted except for some very good reason). The guarantee of a home market, often with very limited internal competition, has proved to be a recipe for high cost production and lack of innovation. Permitting import competition encourages that absorption of international standards of design and quality, which is essential for thriving exports. It is a tragedy that India was by-passed in the massive supply of consumer goods from developing countries to world markets.

III

The Transition

Some progress has been made. In the 1980s there was some liberalisation of quota restrictions on intermediate and capital goods. This was combined with tariff increases to increase revenue. Serious reform began in July 1991. The crisis was such that the emergency import controls already in force had to be continued, but notice was given that they would be removed as soon as possible. The max-

imum import duty was reduced from 300 per cent to 150 per cent, and duties on capital goods were slightly reduced. The rupee was devalued by 22 per cent and export subsidies were removed.

The reforms were deepened in February and April 1992. The emergency import controls had already been abolished. Import licensing and quotas were now eliminated for most capital goods and raw materials. A single negative list remained consisting mainly of consumer goods. There was some reduction in the list of canalised imports. The maximum tariff came down from 150 per cent to 110 per cent, and tariffs on most capital goods were reduced from 80 per cent to 55 per cent, and to 25 per cent for capital goods used by exporters. Some export restrictions were removed. In the budget of February 1993, tariffs on project imports and capital goods were reduced from 55 per cent to 35 per cent, and there were various other reductions for materials and components. There was some further pruning of export restrictions (but the main ones still remain). The Chelliah Committee Report received the imprimatur of the government.

The Chelliah Committee envisaged that their proposed reforms could be completed by 1996-97 or 1997-98 at the latest. The average tariff rate (excluding countervailing duties) would be reduced to about 25 per cent from about 50 per cent, probably leaving it still higher than any other country, except may be Myanmar. It seems that the committee considered that in view of the fall in the real exchange rate, these falls in protection could occur without pain. No extensive restructuring of organised industry would be required; although there might be some pressure towards cost reduction it could be handled without many shut-downs or major lay-offs of workers. Furthermore, no very serious fiscal problem was apparently envisaged. The halving of the average rate of duty would result in a much lesser fall in customs revenue, as the value of imports rose and the composition changed. There might even be no fall though this was not expected. It seems that these tariff changes were not considered to be dependent on the institution of the fairly comprehensive VAT which the committee favoured. Desirable changes in excise taxes (and perhaps state sales taxes) and direct taxes would easily redress the balance. Similarly any disturbance of the share of the centre and states in the total tax-take would not be large. The committee did not mention any possible balance of payments problem.

We agree that trade reform on the scale and with the speed envisaged by the

Chelliah Committee is unlikely to present any grave economic problems. Certainly to date, the committee's own evidence shows that even after the 1993-94 import duty reduction, the tariff rate of protection will still be much higher than in 1986-87, when allowance is made for the change in the exchange rate (though, of course, import quotas were often the cutting edge of protection in the earlier period). But since we envisage a much more radical trade reform extending beyond 1997-98, with the Chelliah rates of trade taxation no more than a milestone on the way, we need to focus on the transition process more explicitly.

We take it as accepted that the reform should be gradual, allowing time for adjustment so as to avoid any serious short-term loss of production or employment. The main arguments for sudden reform

are political—gradualness invites the opposition to muster its forces, and the circumstances that make reform acceptable, for example a crisis, will not last. Although we think that 'big-bang' reform must be rejected in India's circumstances, the political economy of reform must still be respected. All producers, and those who influence them, must be convinced that the reforms will succeed, and they must also be aware of what the end-product will be. Without this, bureaucrats and others will give inappropriate guidance, and producers will take inappropriate production and investment decisions, which themselves will hinder and hamper the reform and its political and economic benefits. This requires both a well defined objective and steady progress towards it. A certain momentum has to be maintained, or faith in the achievement

Centre for Research in Rural & Industrial Development

2-A, Sector 19-A, Madhya Marg, Chandigarh-160 019 (India)

For the past some years this Centre has been engaged in studies on Ethnic Conflicts and Violence, population dynamics, development of border areas and technological perspectives for the industrialisation of the Northern Region. These studies are multi-disciplinary and inter-disciplinary in approach and involve extensive fieldwork as well as collection and analysis of the necessary secondary data. Also included in the studies is a programme of providing training to junior research staff in research methodology and for award of M.Phil and Ph.D Degree by arrangement with the Punjab and Punjabi Universities.

In its present programme of expansion, the Centre is looking for Research Investigators, Research Fellows, Senior Research Fellows and Associate Research Coordinators (Corresponding to the position of Lecturers, Senior Lecturers and Readers) in the revised UGC Scales.

The Centre shall be happy to receive applications, recommendations and response for these posts. Candidates with specialisation in *Statistics, Economics, Population Studies, Demography, Sociology* and related social science disciplines with experience of inter-disciplinary research will be preferred.

Please apply within a fortnight from the publication of this advertisement to the Chief Research Advisor, on the above address.

of the objective will be lost. So although gradualness is the order of the day, it must not be too gradual. On economic grounds also, investment will not be appropriate unless the final regime is clear and progress is both perceptible and correctly anticipated. For example, there should be no uncertainty as to how long imports of consumer goods are to continue to be banned, or about the rate of effective protection they will be given when no longer restricted.

After the above generalities let us look a little more closely at what should govern the rate of progress. It will depend on (1) the extent of the restructuring of production—both in manufacturing and agriculture—that the full exploitation of India's comparative advantage will require, and the speed with which such restructuring can be accomplished without undue loss of output or employment; (2) on the fiscal situation; and possibly (3) on the balance of payments. Let us discuss these three potential limiting factors in turn.

RESTRUCTURING

To date, the changes in tariff protection can have required very little restructuring. As we have seen, the reduction in tariffs has mostly been less than the real devaluation of the rupee.¹⁴ Some manufacturers for the domestic market may have felt increased competition as a result of the elimination of quotas, but not from tariff reductions. Although exports have become more profitable, which should attract resources, there thus seems to have been as yet no positive push out of the import substituting sectors. This requires tariff cuts greater than the real devaluation, 'an adjustment that will have to come, and would be significant if our suggestion of very low uniform protection were adopted.

Agriculture has some special features. Under our proposed system of taxes, the landed price of agricultural products would be 20 per cent above the cif price (15 per cent VAT and 5 per cent tariff), while domestic raw agricultural products would be VAT exempt. Assuming away input subsidies, agriculture would thus also have 20 per cent effective protection. In recent years the effective subsidisation (or 'taxation') of cereals has been close to zero, input subsidies roughly offsetting the fact that output prices were less than cif prices. The move to an effective import tax of 20 per cent would permit the price of cereals to rise in the same proportion. This would roughly compensate cereal farmers for the removal of input subsidies, and it therefore seems quite likely that cereal prices would indeed rise by nearly that amount. In some years cereals might

be exported, and the price rise would then be still greater (some varieties, for example Basmati rice, may be a regular export).

A higher price for cereals would hurt the poor. Although partly offset by falls in the prices of edible oil and sugar, this would constitute the most serious distributional outcome of liberalisation. It would make a reform of the public distribution system, desirable in any case, essential. It is well known that a large part of the subsidisation inherent in this scheme is wasted in that it does not benefit the really poor. It would become a high priority on social and humanitarian grounds to devise a better targeted system of poverty relief (it should be noted that the expenditure saved by eliminating fertiliser subsidies could be directed to this end).

India also has a comparative advantage in cotton, whose domestic price is held down by restricting exports. Exports could be increased, and cotton farmers would multiply and benefit with a rise in both prices and quantities grown. India has a comparative disadvantage in edible oils and sugar, whose production the government has in the past greatly promoted. It is surely perverse that India should grow groundnuts and import wheat. Protection of edible oils and sugar should be reduced from around 100 per cent to our standard 20 per cent over the course of the transition period. There should be time enough to solve (or at least greatly soften) the regional and area problems that may arise.¹⁵

It is very difficult to generalise concerning the speed with which manufacturing and agriculture should be required to adjust. The extent of adjustment will vary greatly, as some parts of Indian industry will prove to be much more competitive than others, when the 'final' real exchange rate comes to be realised. A very high cost import competing sector may be given more time than others, if it produces final consumption goods that does not present a serious problem. Licensing may first be abandoned in favour of a relatively high tariff which is gradually reduced to our standard low rate. A slow pace of adjustment is more problematic if the sector produces capital goods or intermediates, since its relatively high tariff protection would require the retention of some tariff protection for industries using its output. This suggests that pressure should be put on such industries which would otherwise hinder the speed of adjustment elsewhere.

The general process of tariff reduction towards a uniform low rate should be to reduce all rates proportionately, until near the final rate. This is the so-called 'radial' method (adopted by Mexico, for example)

as opposed to the 'concertina' method (adopted by Costa Rica, for example) by which each highest rate is reduced to the next highest, by stages. The latter puts no pressure on the relatively lowly protected until very late in the process.¹⁶ While we have mentioned the probable need for making some exceptions to a well defined process of reduction by stages, these exceptions should be genuinely exceptional—one can imagine the political manoeuvres and administrative complications which could otherwise seriously block the whole process.

Can one sum up by specifying the desirable length of the transition period? Solely on the grounds of industrial and agricultural adjustment to, say, a uniform 5 per cent protective duty (on top of all countervailing duties), it surely has to be longer than the four years allowed by the Chelliah Committee for its milder programme. Shall we say, for the sake of argument, seven years—bringing one to the next century? But, perhaps, it is too naive to suppose that the momentum of reform can be kept up for so long.

THE FISCAL SITUATION

Although considerable progress has been made in the past two years towards a viable fiscal deficit (the central government fiscal deficit fell from 8.4 per cent of GDP in 1990-91 to 5.3 per cent (revised estimate) in 1992-93), there is still some way to go—the central government fiscal deficit should probably be reduced to around 3 per cent of GDP which implies a small primary surplus.

The reductions in customs duty rates and the revision of other indirect taxes and subsidies, and direct taxation, should march hand in hand. Since the effects are very difficult to predict with any accuracy, the fiscal situation will have to be monitored from year to year (and possibly more frequently). But provided that the centre and the states can come to new agreements concerning the collection of revenues and their division, the fiscal problems surely need not delay the large reduction in customs duties that we envisage. No other country relies on customs duties to the extent that India has done in recent years.

THE BALANCE OF PAYMENTS

There is a danger that the current account deficit, running at about \$ 7 billion or 2.5 per cent of GDP could frighten the authorities into going slow on reducing barriers to imports or even raising them again—this has been the fate of many reform movements.

But provided the fiscal deficit is further reduced, the current account deficit will

certainly improve. There may, however, still be a lag in the sufficient growth of exports, while imports boom with the recovery of the economy. There should be no letting up on the encouragement of exports (the exchange rate is considered in the next section). Special measures such as duty free imports for registered exporters should be retained until near the end of the transition period. There may be a case for further borrowing from the IMF if it is devoted directly, or indirectly via infrastructural investment, to boosting exports. Industrial reform is also very relevant. The easier it is to switch production, especially production for the domestic market to exports, the smaller will be the cost of the adjustment, and the less the reliance on foreign borrowing.

A much greater inflow of private foreign investment would be very helpful, both in the short and medium run when it would reduce reliance on borrowing, and in the longer run when it should help both to raise the level of productive investment and to facilitate the transfer of technology. Provided prices reflect social costs and benefits there is no need to fear that foreign investment may actually be harmful.

Foreign investors are no different from domestic investors in their need to have confidence in the validity and sustainability of the reform process. Prudent macro-economic policies, and steady progress on the liberalisation front, are both needed. In addition, of course, foreign investors need to be assured that they can convert their profits or asset sales when they want to.

We believe that India is now creditworthy enough to survive a short-term worsening of the current account (which may not occur), and that the balance of payments will not be an impediment to trade reforms the pace of which is governed by the need for industrial and agricultural restructuring.

IV

The Exchange Rate and Convertibility

THE EXCHANGE RATE

Little needs to be said about the exchange rate since India has already arrived at a sensible regime. The rate has been unified, and the regime is now effectively a managed float. The rupee is now freely convertible at the market rate for current account purposes.

In view especially of the need for a rapid growth in export receipts the RBI must avoid the temptation of supporting the rupee. There will always be some who argue that this must be done to counter

inflation. Except in the very short run, in cases where there is a need to break inflationary expectations, a policy of trying to stop inflation by freezing the exchange rate has invariably been disastrous. Furthermore, the theory that a fixed exchange rate ensures a non-inflationary economy in the long run has little or no historical support. The world is replete with examples of inflation under a fixed rate, ending eventually with a maxi-devaluation or a new currency; and there are also examples of countries with flexible rates and low inflation.¹⁷

There is no need to fear that the exchange rate may fail as an instrument to maintain a viable balance of payments—provided, of course, that macro-economic policy gives it room to operate, that is, that there is no large general excess demand for domestic output. There is no doubt that foreign demand for Indian manufactures and many agricultural products is very elastic.¹⁸ The removal of import controls will also have introduced some elasticity into the demand for imports, and the elasticity will increase when the import of consumption goods is liberalised. Remittances also are exchange rate elastic.

CONVERTIBILITY

The question remains as to whether the rupee should be made fully convertible.

Capital movements contributed to disaster in several developing countries in the late 1970s and early 1980s. It is arguable that they never would have occurred if there had not also been foolish macro-economic policies. Thus, for example, capital poured into Chile when interest rates were high and the government guaranteed the exchange rate while inflation continued. When people naturally stopped believing the government, it poured out.

But even with sound macro-economic policies, a serious risk can arise as a result of a weak financial system and inexperienced managers. If (as also happened in Chile) the banking system has a portfolio of dubious non-performing assets, it may be tempted to borrow abroad and pour good money after bad. (Foreign lenders can also be very foolish, as the late 1970s and early 1980s showed.) To prevent a financial collapse, the government may then have to nationalise the debt, as also happened. Until the banking system in India has been strengthened, we think that control should be retained over the acquisition of foreign assets and liabilities by residents. This is consistent with giving non-resident Indians and foreigners guarantees of convertibility at the market rate when they buy assets in India.

V

Summary

We first consider long-run trade policy, by which we mean the policy that should prevail when enough time has elapsed for the required restructuring of production to have taken place without intolerable economic or political disturbance.

There should be no quantitative import or export barriers except on grounds of safety, health, or morality. There will be no good reason for trade taxes on revenue grounds. It is proposed that there should be a low uniform (5-10 per cent) protective tariff on all imports. Excise taxation of domestic production would be extended to imports via countervailing duties: if a VAT were used, it would apply to all imports, even raw agricultural products although their domestic production would be exempt (all very small-scale production would necessarily be VAT exempt).

We do not advocate industrial targeting;

Notes

- 1 Twenty-two years ago it was stated at the end of a lecture that "much of what used to be thought of as trade theory has been shown to be simply public finance: and indeed to boil down to such mundane matters as administrative costs". See I M D Little, 'Trade and Public Finance' (a memorial lecture for V K Ramaswami), *Indian Economic Review*, Vol VI (New Series), October 1971, No 2.
- 2 A particular reason might possibly arise in the case of a commodity where a marginal fall in the rate of taxation of production in units large enough to be taxed (factories) would result in such a transfer of production from very small untaxable units that revenue would rise. Although, in that case, it would be likely that lower taxation of both imports and domestic production would increase revenue, it is possible that the elasticities of substitution would be such as to make unequal taxation of imports and domestic production revenue maximising (note that it could be that a lower rate of tax on imports than domestic factory production would be revenue maximising). Our guess is that this is a rather esoteric and far-fetched reason for 'revenue protection'.
- 3 An exception is a tariff offset by an export subsidy. The domestic consumer then pays the cost of subsidising home sales, and the government the cost of subsidising export sales.
- 4 A uniform protective tariff of 10 per cent was suggested on these grounds in I M D Little, Tibor Scitovsky and Maurice Scott, *Industry and Trade in Some Developing Countries: A Comparative Study*, London: Oxford University Press, 1970.
- 5 J Bhagwati and V K Ramaswami, 'Domestic Distortions, Tariffs and the Theory of Optimum Subsidy', *Journal of Political Economy*, February 1963. The so-called new trade theory, propounded by P Krugman and others, calls particular attention to the case of internationally oligopolistic increasing return industries (the prime example being large passenger aircraft), where government intervention may help to capture supernormal profits for one country rather than another. We do not think this theory is very relevant for India.
- 6 Alternatively an employment or training subsidy depending on what was the heart of the externality.
- 7 Prominent recent books expressing the view that government should play a leading role in industrial development include A Amsden, *Asia's Next Giant: South Korea and Late Industrialisation*, New York, Oxford University Press, 1989 and Robert Wade, *Governing the Market*, Princeton University Press, 1990.
- 8 See R M Auty, 'Creating Competitive Advantage: South Korean Steel and Petrochemicals', *Tijdschrift voor Econ en Soc Geografie* 82 (1991), No 1.
- 9 This is supported by R M Auty who has written (ibid), "Shipbuilding presents the paradox of an industry established as a downstream consumer of cheaply priced steel which recorded an even more disap-

pointing financial return than that of the basic trigger industry, but its low return was not due to uncompetitiveness. Rather it reflected heavy reliance on export markets which underwent an unexpectedly protracted decline." We would add that the initial investment seems to have been rather euphoric. It catered for the construction of million ton tankers.

- 10 It is now being argued that "the bureaucracy's taste for micro-management is hindering a necessary restructuring of industry", and it is reported that the government will cease targeting industrial sectors for support and protection. See *Financial Times Survey*, Korea, June 3, 1993.
- 11 For example, Argentina, Brazil, Costa Rica, Cote d'Ivoire, Mexico, Morocco and Nigeria among the 18 countries studied in Ian M D Little, Richard N Cooper, W Max Corden and Sarath Rajapatirana, *Boom, Crisis and Adjustment: The Macro-economic Experience of Developing Countries*, Oxford University Press for the World Bank, 1993. It might be added that government intervention in the UK, to promote aircraft and atomic energy, has contributed much to her relative stagnation.
- 12 Government of India, Ministry of Finance, *Tax Reforms Committee, Interim Report*, December 1991; *Final Report*, Part I, August 1992; *Final Report*, Part II, January 1993.
- 13 High real rates of interest are an important incentive for promoting a reasonably labour-intensive industrial development. Government interventions are usually in favour of highly capital-intensive industries, believed to be infant industries which will eventually achieve such economies of scale as to satisfy their early subsidisation. If the government still wishes to pick such supposed winners it had best do it by subsidising interest rates, as in Korean shipbuilding.
- 14 See Chelliah, *Final Report*, Part II, Tables 2.1 and 2.2.
- 15 The above paragraphs on agriculture owe much to Ashok Gulati and Pradeep K Sharma, 'Government Intervention in Agricultural Markets: Nature, Impact, and Implications', *Journal of Indian School of Political Economy*, April-June 1991; and to Ashok Gulati, 'Reforms in Agriculture: Need and Strategy', NCAER March 1993 processed.
- 16 These points are made by Vinod Thomas and John Nash, *Trade Policy Reform*, Oxford University Press for the World Bank, 1991. This work draws lessons concerning the process of reform from the experience of the many countries that have instituted reforms in the last decade. However, it has to be said that countries vary so much in many relevant respects that it is hard to draw any general lessons.
- 17 On all this see Little, Cooper, Corden and Rajapatirana, op cit, especially chapters 6 and 7. The evidence in India's case for viewing inflation as highly independent of the exchange rate is presented in Vijay Joshi and I M D Little, *India-Macroeconomics and Political Economy 1964-91*, The World Bank, and Oxford University Press, India, 1993.
- 18 See Joshi and Little, ibid.

but if done it should be by subsidy and not by protection of the domestic market.

The proposed trade policy would be much less protectionist than the spectrum of customs duties envisaged for 1997-98 by the Chelliah Committee. We argue that the committee's proposals are, for the long run, not only too protective (and hence biased against exports) but also much too complex. We see no good reason for seven rates of duty, and advocate a single rate. We believe that the Chelliah set-up should be regarded as no more than a staging post on the way to more neutral taxation of production and imports.

We suggest that seven years would be long enough for the extensive restructuring implied by our proposed changes to occur without hardship. The severest distributional effect might come from a relative rise in cereal prices. The effect of this on the poor should be offset, or more than offset, by a reform of the public distribution system (or its replacement by a better targeted system).

Neither the fiscal situation nor the balance of payments need inhibit the proposed process of reform. The fiscal deficit needs to be further reduced. Indeed, it is essential for the credibility of the reform process that it should be reduced. Falls in customs duty revenue must be more than compensated by increases in other tax revenue or reductions in subsidies: but this is perfectly feasible, the main problem being centre/state relations.

We are confident that a viable current account will result from sound fiscal policies and a flexible exchange rate. But the possibility of a worsening in the next year or two has to be contemplated. For this reason it is important to retain at least all the existing export incentives. Although we think that India is now creditworthy enough for the momentum of trade reform to be maintained, a surge in foreign direct investment would be helpful in reducing the need to borrow (apart from longer-run benefits). In this connection further institutional reforms may be in order. But most important for all investors, domestic and foreign, is the credibility of the movement to a liberal system: which in turn requires the momentum to be sustained.

Little needs to be said about convertibility and the exchange rate regime. The rupee is now convertible for current transactions, and the exchange rate regime is a managed float. We advise only that the Reserve Bank should not support the rupee in the name of reducing inflation. As for further convertibility, we think that controls over outward capital movements and foreign borrowing should be retained until at least the domestic financial system has been strengthened.

Schedule 17—Notes forming part of the accounts for the year ended 31 March, 1993

I. Principal Accounting Policies:

i) General:

The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country.

ii) Transactions involving foreign exchange:

- Monetary assets and liabilities have been translated at the exchange rates prevailing at the close of the year.
- Income and expenditure items have been translated at the exchange rate ruling on the date of the transactions.
- Profit or loss on forward contracts have been accounted for on an accrual basis.

iii) Investments:

In accordance with the Guidelines issued by the Reserve Bank of India the investments of the Bank have been bifurcated into 'Permanent Investments'—which are normally held upto the date of maturity and 'Current Investments'—which need not be held upto the date of maturity.

In respect of Permanent Investments the difference between the redemption value and cost of acquisition of the Investment is accrued as profit/loss over the period upto the date of redemption. In respect of Current Investments other than Treasury Bills the same are valued at cost or market value whichever is lower. The profit/loss on revaluation is charged to revenue. To conform with the aforesaid Reserve Bank of India guidelines issued during the year, the Bank has adopted the above practice with effect from the current year. Treasury Bills are valued at cost.

The Market value of other Quoted Investments is Rs. 8.92 crores (Cost Rs. 8.77 crores). The Market value of Investments has been worked out by means of an appropriate capitalisation of yield method.

iv) Advances:

- Provision for doubtful advances is based on their classification into 'performing' and 'non-performing' assets in accordance with Reserve Bank of India guidelines. Provision for non-performing assets is made as under:

Sub-standard assets — 10% of net advance.

Doubtful assets — 100% of the unsecured portion and 20% to 50% of the net secured portion depending on the period for which the asset has remained non-performing.

Loss assets — 100%

The Bank has, while making the provisions in the manner referred to above, considered the guidelines issued by the Reserve Bank of India with respect to phasing of the aggregate Provisions required over a period of two years ending March 1994. The provisions so required by the Bank have been made after considering the provisions existing in the books of the Bank as at the end of the Previous Year.

- Provisions in respect of doubtful advances have been deducted from advances.
- Provisions have been made on a gross basis. Tax relief which will be available when the advance is written off will be accounted for in the year of write-off.
- Interest on advances, classified as non-performing, has been credited to Interest Suspense account as specified under the guidelines issued by the Reserve Bank of India. Advances are reflected at net of interest suspended.

v) Fixed Assets:

- Fixed Assets other than Premises have been accounted for at their historical cost. Premises have been considered at their revalued cost.
- Leasehold Premises have not been capitalised. Lease rentals paid during the year have been charged to revenue account.
- Depreciation has been calculated on a straight line basis to write off the cost of fixed assets over the expected useful lives of the assets duly certified by the management. The principal periods used are:

Premises	25 years
Furniture and Fixtures	5 years
Equipment	5 years
Motor Vehicles	5 years
Computers	5 years

The depreciation on additions to Fixed Assets made during the year has been charged on a *pro rata* basis. The depreciation provided on the above basis is higher than the depreciation computed in accordance with Schedule XIV of the Companies Act, 1956.

- Depreciation on the increase in the value of the owned premises arising out of the revaluation has been charged against the Revaluation Reserve over the balance useful life of the Asset.

بنك عُمان الدولي ش.م.ع.
Oman International Bank S.A.O.G.

vi) Staff Benefits:

Contributions to Gratuity Fund have been made on an accrual basis on the computation of the management of the Bank. A separate Fund for Gratuity has been created which has been recognised by the Commissioner of Income-Tax.

2. Net Profits:

The net profit disclosed in the Profit and Loss account is after considering:

- a) Provisions for taxes on income in accordance with statutory requirements.
- b) Provision for doubtful advances.
- c) Head Office Administrative Expenses to the extent estimated to be allowable under Section 44C of the Income Tax Act, 1961.

3. General:

- a. Based on the Valuation Report by an approved valuer appointed for the purposes specified, Office Premises in a Commercial Co-operative Society, in Bombay, have been revalued during the year. The increase in value of the premises arising out of the Revaluation has been transferred to Capital Reserves under the head 'Revaluation Reserve'.
- b. Figures of the previous year have been regrouped/rearranged wherever necessary.

Chief Manager—India

Auditors' Report on the Indian Branch of the Oman International Bank S.A.O.G. under Section 30 of the Banking Regulation Act, 1949..

We have audited the attached Balance Sheet of the Indian Branch of the Oman International Bank S.A.O.G. as at 31 March, 1993 and the relative Profit and Loss Account of the Indian Branch of the Bank for the year ended on that date signed by us under reference to this report.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of Sub-Sections (1), (2) and (5) of Section 211 and Sub-Section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account together with the notes thereon are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are, therefore, drawn up in conformity with Forms "A" and "B" of the Third Schedule to the Banking Regulation Act, 1949.

- (1) We have obtained all the information and explanation which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory.
- (2) The transactions which have come to our notice have been, in our opinion, within the powers of the Indian Branch of the Bank.
- (3) In our opinion, proper books of account as required by law have been kept by the Indian Branch of the Bank so far as appears from our examination of these books.
- (4) The above mentioned Balance Sheet and Profit and Loss Account of the Indian Branch of the Bank dealt with by this report are in agreement with the books of accounts.
- (5) In our opinion and to the best of our information and according to the explanations given to us the Balance Sheet and Profit and Loss Account together with the notes thereon give the information required by the Companies Act, 1956 as amended, in the manner so required for Banking Companies and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Indian Branch of the Bank as at 31 March 1993 and the Profit and Loss Account gives a true and fair view of the profit of the Indian Branch of the Bank for the year ended 31 March 1993.

Liberalisation Debate: Some Careless Mistakes

Amitava Bose

This brief note discusses some instances of careless economic reasoning which have marked the otherwise very welcome debate among economists on economic liberalisation.

WHAT is pleasing about the liberalisation debate is that so many serious economists are participating in a public debate. But in spite of this, the debate is marked by many instances of careless economic reasoning. Some of these are taken up here. They deal with various trade liberalising policy shifts. Quite often liberalisation is held responsible for effects that result from actions that have nothing to do with liberalisation. It is very common to mix up the consequences of greater external borrowing with those of liberalisation. In what follows, the first two exercises deal with this kind of confusion. My concern in these as well as the other examples taken up subsequently is only with *what* is expected to happen and *why*; whether the consequences are good or bad is quite another matter.

LIBERALISATION AND VOLUME OF IMPORTS

Consider first the anxiety that import liberalisation will lead to a flood of imports and worsen the trade deficit. But this is misplacing the blame. Import liberalisation has nothing to do with the volume of imports; it addresses a wholly different problem: by what device should a given amount of foreign exchange be allocated across competing claims. Liberalisation involves switching from discretionary allocations to market-determined allocations.

On the other hand, the total volume of imports will be determined simply by the total quantum of foreign exchange that is available, given world prices. It is certainly possible that liberalisation leads to more of a certain type of import. But then this must be matched by a reduction in at least one other import.¹ The country as a whole can import only as much as its foreign exchange availability will permit. This is true regardless of whether the allocation of foreign exchange is through interventionist instruments such as quotas or through market-determined prices and exchange rates.

Notice that in the above, the availability of foreign exchange is regarded as a constraint independent of import demands. This was not always so. One could think of the opposite case of an overdraft regime,² a situation that is not so inconsistent with India's past. In the overdraft regime, the amount of foreign exchange borrowed is residually determined by the

country's net imports; the causation therefore runs from net imports to foreign exchange availability. What makes for this comfortable but dangerously fragile 'soft budget constraint' is the assurance of external finance on demand.³ This is something that has ceased to be valid for India since 1990-91, and yet the implications that flow from this regime change are sometimes lost sight of.

It is useful to formulate all this as a proposition. Consider a 'small' country for which the world prices of the different importable goods are given. Suppose that export earnings, foreign capital inflows, remittances are all exogenously given in the short run. Add to this any desired adjustments in the level of foreign exchange reserves—to make them less precarious or less flabby⁴—and make allowances for committed outflows such as loan repayments and interest on outstanding debt. What we thereby obtain is the availability of foreign exchange for the financing of imports in the short period and clearly the amount is given. Take this figure and deflate it by an index of the world price level of importables. What results is the real volume of imports for the given period.⁵ Therefore

Proposition 1: In the short run, the real volume of imports for a small country facing a foreign exchange constraint is fixed and is independent of specific policy changes associated with liberalisation.

I can anticipate one rejoinder to this. It may be pointed out that the availability of IMF loans is conditional on liberalisation taking place. Hence both the volume of imports as well as our indebtedness will go up as a direct consequence of liberalisation. However, the original point stands since one can liberalise without taking an IMF loan. Or one can liberalise, take an IMF loan, and use it only to effect repayments.

IMPORT DUTIES AND DOMESTIC PRICES

In the context of a flexible exchange rate, it is a fallacy to believe that domestic firms can be protected by raising tariffs or, equivalently, that a reduction in tariff rates will lead to a displacement of domestic goods by imports. We can already see why by appealing to Proposition 1—reducing tariff rates cannot increase the availability of foreign exchange for imports⁶—but we can go a step further. Let us examine the following question:

Will slashing tariffs make imports less costly for the domestic user?⁷

The answer is that it will not. In a flexible exchange rate system, there is a presumption that a proportionate change in tariff rates will itself induce an offsetting depreciation of the rupee so as to leave domestic prices exactly unchanged.

Consider an economy which imports only one good. The world price in dollars is P^* , the rupee price of a dollar is e , and the world price in rupees is P_f :

$$P_f = eP^* \quad (1)$$

The domestic price of imports is P_d and the tariff rate is t :

$$P_d = (1+t)P_f \quad (2)$$

The demand for imports is given by a demand function the main argument of which is the price paid by the consumer:

$$Q = D(P_d) \quad (3)$$

We have already done the spade work for the supply side. From Proposition 1 the supply of imports is given:

$$Q = \bar{Q} \quad (4)$$

where $\bar{Q} = A^*/P^*$, and A^* denotes the availability of foreign exchange in dollars. A^* and P^* are constants.

Now, the intention of liberalisation is to let the domestic price of imports be determined by demand-supply equilibrium:

$$D(P_d) = \bar{Q} \quad (5)$$

Equation (5) is self-sufficient. It determines P_d independently of anything else. In particular, P_d is independent of t . Thus changes in tariff rates cannot make imports cheaper or dearer in a flexrate regime. How then are these changes accommodated? Combining (1) and (2) we find the answer: Since both P_d and P^* are unaffected, e moves up in proportion to the fall in $(1+t)$.

It is not hard to see that this neutrality result will hold regardless of the number of importables provided that the tariff factors, i.e. $(1+t_i)$ where t_i is the tariff rate on the i th import, are changed in the same proportion.⁸

Proposition 2: With a flexible exchange rate, a proportionate change in the tariff factors will not have any short period effect on the domestic prices of importables for a small country facing a foreign exchange constraint. Only the exchange rate will depreciate in the same proportion.

Notice that the proposition would not be true in the context of a fixed exchange rate. We would then have to drop equation (5) above and also do away with one

FIGURE 1: RELATIVE EXPORT PROFITABILITY

of the variables, viz, e , the exchange rate. Consequently P_d would vary in proportion to $(1+t)$.

A number of corollaries to these two propositions can be derived. Let me give just two very simple examples. Consider first the allegation that liberalisation will reduce employment in a demand-constrained set up. The claim is that liberalisation will expand imports which will crowd out an equal amount of domestic output. But the first step is wrong. It is not liberalisation that can be blamed for a bulge in imports; that must be the result of an inclination to live beyond our means in a foreign exchange sense.⁹

Another very clear implication is the following. In a fully liberalised regime, the domestic price of imports is essentially determined by export earnings. A rise in export earnings makes imports cheaper, a fall in export earnings makes them costlier.

DEVALUATION AND INFLATION

The government has introduced many changes over the past couple of years. However, interventions and controls continue to exist in several areas. Think of oil imports for India. This is under government control and the government also fixes the domestic prices of petroleum products. A major objection to letting the rupee float freely in the international market is that this will cause a devaluation, oil will thereby become costlier and that will lead to inflation at home.

But must this happen? Suppose the

government decides that it will not change the issue price of petroleum products and it will continue to import the same amount of oil and spend the same amount of foreign exchange. What then? Will inflation have been avoided?

Surely the government will end up with a larger rupee deficit which it will owe the Reserve Bank. However, the inference that this shows that a cost-push inflation has simply been replaced by a demand-pull inflation is not correct. This is because the larger deficit is merely an accounting deficit that has absolutely no impact on money supply. The point is obvious since the larger government borrowing is not for the sake of making a domestic payment. The larger rupee deficit will be cancelled out by the increase in the rupee value of the fall in foreign exchange reserves on account of oil imports so the stock of high powered money will be unchanged.

Of course the increase in the rupee earnings of the exporter will tend to inflate money supply. But that will happen irrespective of whether the government decides to raise oil prices or not. On the other hand, if the domestic price of petroleum products needs to be raised in order to generate more budgetary resources and reduce money creation, then this can be done—and in the past has often been done—without waiting for the exchange rate to first change. Finally, how do we know that if more revenues must be raised the best way to do so is by raising the price of petroleum products or that this is the optimal way for the government to intervene?¹⁰

LIBERALISATION AND EXPORTS

There appears to be considerable academic scepticism regarding the ability of liberalisation to induce a significant increase in Indian exports. However, the evidence cited in support of this scepticism is inconclusive. I will take up only one argument here. What I wish to examine is the manner in which a certain kind of evidence regarding costs and prices is used to conclude that liberalisation will not help.

The argument runs roughly as follows: There are a number of domestically produced goods that, even without liberalisation, were internationally cost effective or more so, yet exports of these did not pick up. In some cases, the figures indicate that the Indian exporter should be able to undercut and take away market share, but this is not happening. Thus the evidence suggests it is not profitability that is holding us back but the existence of powerful non-economic barriers to Indian entering the global market place. In such a situation, how can liberalisation or export subsidies help?

There may well be entry barriers economic or non-economic, strategic or natural. But it is difficult to imagine that these are universal. In any case, it is not my intention to settle an empirical point here. What I feel worth emphasising is the fact that there is certainly no contradiction between profit maximisation and the evidence regarding domestic costs and international prices. The point is an especially simple one to communicate. Though the profit margin on exports is

positive, that on domestic sales may be more so. So the domestic firm may choose not to export. Indeed, one of the chief arguments in favour of liberalisation is that an import-substituting regime artificially bolsters profitability of home sales and provides a built-in bias against exports. This argument suggests that it is lack of competition that makes the home market stronger for incumbent firms. It is easy to illustrate this by using the theory of price discrimination.

Consider a firm that enjoys a monopoly in the domestic market. The international market for the product is perfectly competitive—so there are no entry barriers. The world price is P_f and this is given to the firm. Let Q denote domestic sales and X denote exports. Domestic marginal revenue is given by the function $M(Q)$, and domestic marginal cost of production by $C(Q + X)$. If there are "interior solutions", the profit maximising point is where $P_f = M(Q) = C(Q + X)$. We assume that imports of this good are prohibited, so X must be non-negative and this may preclude an interior solution. Let \hat{Q} solve $P_f = \hat{M}(Q)$. Now if $P_f < C(\hat{Q})$ and $C(\cdot)$ is increasing, then clearly $X = 0$ is optimal. In this case the domestic monopolist chooses not to export because of the protected domestic market and the high marginal costs of expanding production. However, note that unit costs could be lower than world prices, i.e. $P_f > AC(Q')$ is quite possible. All this is illustrated in Fig 1(a), where the thick, broken line RST is the horizontal sum of the marginal revenues in the two markets. For $P_f > C(\hat{Q})$, it is optimal to sell \hat{Q} in the home market and export an amount X^* , where $C(\hat{Q} + X^*) = P_f$.

The analysis can be made sharper. Assume that marginal costs are constant and equal to c as long as production is strictly below a capacity ceiling, K , but are infinite otherwise. Also let $c < P_f$, to load the dice in favour of exports. It is, nonetheless, clear that for $K < \hat{Q}$, the monopolist will choose not to export. Of course for the case of large K , the monopolist must export since it would always be profitable to do so after having exhausted the domestic market, given that production is internationally "cost effective", i.e. $c < P_f$. Fig 1(b) illustrates both possibilities, taking alternative capacities, K_1 and K_2 .

Liberalisation would affect the picture in three ways. First, by allowing a depreciation of the exchange rate, it will cause P_f to be raised and this will increase the opportunity cost of domestic sales. Second, it may enable a relaxation of the capacity constraint through delicensing. But a deeper reason is that by removing artificial barriers to entering the domestic market,

it will tend to weaken domestic monopolies and narrow the gap between the marginal revenues.¹¹

LIBERALISATION AND COMPETITION

This leads me to my last point. Many pro-liberalisers implicitly assume that removal of policy-imposed restrictions necessarily enhances competition. This is patently false. Why should we assume that left to itself the market would always be perfectly competitive? It may well result in a monopoly and for a variety of reasons. One pertinent reason could be increasing returns. I shall deal with this very briefly.

Suppose that the world market for one of our imports is monopolised by a gigantic corporation. Production is characterised by increasing returns that set in after a point; there is an initial stretch of constant costs. The same technology is available to home producers. However, the domestic country is a closed one, so the home producers service only domestic demand. The level of domestic demand is not high enough to take production beyond the constant cost stretch. But world demand is sufficiently high to enable operation in the decreasing cost region if all production is carried out by one firm.

In such a situation, consider what happens when the home country opens up. We have a unified world market dominated by a single giant producer exploiting increasing returns and bringing prices down in the home market. Here liberalisation has in fact eliminated competition. The proposition that is at issue here is whether, left to itself, the market tends to select the efficient outcome, not whether the market invariably decides to be competitive. With increasing returns, efficiency calls for large-scale production.

We have selected this example to also highlight one other point. It is sometimes argued that the answer to India's problems with costs and inefficiencies lies not in trade liberalisation but in domestic liberalisation. This will enhance efficiency by engendering competition without the threat of multinationals and other foreign firms taking over the market. But internal liberalisation will be quite inadequate if there are increasing returns that require a scale much larger than can be achieved through domestic demand of a poor country.

Notes

[I should like to thank Alok Ray and Abhirup Sarkar for very helpful discussions.]

1 For reasons of relevance, I am not dealing with tied loans whereby more foreign ex-

change is made available provided it is spent on selected items.

- 2 The term has been borrowed from Hicks, who used it in connection with the domestic credit market; see Chapter II of John Hicks, *The Crisis in Keynesian Economics*, Basil Blackwell, Oxford, 1974.
- 3 The best example of the use of a soft budget constraint is the investment demand function of Keynesian macro-economics. Here there is assured credit for the investor who is not subjected to the rigours of a budget constraint. This led to a host of problems for those who tried to derive Walras' Law in the usual manner by summing up individual budget constraints.
- 4 This is a slippery idea in the context of a flex-price regime; if they are really flexible, prices should move so as to always convert existing stocks into desired stocks. Concern with the level of reserves thus reflects an apprehension regarding price volatility. For a nice introduction, see Hicks, op cit, Chapter I.
- 5 Essentially, this amounts to measuring the available stock of foreign exchange at constant prices.
- 6 Unless we succumb to the temptation of borrowing more from a country which promises a good loan on condition that we reduce tariff rates on their exportables. In such cases the fault lies not in liberalising but in taking a loan and using it to augment imports.
- 7 The question is pertinent in the wake of this year's budget. The majority opinion appears to favour an affirmative answer. There are of course sceptics who point out that this might not be true this time since there have been two simultaneous policy shifts, the other one being the termination of the dual exchange rate scheme. Unification of the exchange rate, they argue, will inevitably result in a depreciation of the rupee that will work in the opposite direction, so the net effect is unpredictable. But our question here is different. What will happen after the exchange rate has been unified and given time to settle at its equilibrium level if tariffs are slashed once more?
- 8 We are dealing only with the immediate or impact effects. The most important thing left out is the income redistribution effect of a transfer of erstwhile tariff revenues to the exporters.
- 9 It is possible that the allocative effects of liberalisation may include a change in the level of employment, for instance if the market reallocates in favour of industries with a lower labour intensity per unit of foreign exchange used.
- 10 Of course the analysis needs to be made more complete by bringing in second round effects. In particular one would have to consider the fact that if oil prices are kept unchanged but those of other goods are allowed to rise, then there would tend to be some change in the demand for oil resulting from the standard substitution and income effects for buyers as well as sellers.
- 11 In the fully liberalised case, of course, there is no such thing as a separate domestic market; it is part of an integrated world market.

Assessing Economic Reform

Rajesh Kumar Jha

MANU SHROFF's rejoinder (May 8) to Deepak Nayyar's article 'Indian Economy at the Crossroads: Illusions and Realities' (April 10) attempts to cover up the essence of the economic reform currently under way in India at the behest of the multilateral funding agencies. The basic inspiration for the policy reform comes from the orthodox neo-classical school of economics whose mouthpieces these agencies—e.g. IMF and World Bank—are. This orthodoxy is characterised by a much greater degree of dogmatism than is the Marxist one against which Shroff speaks in a subtle yet quite audible tone. An important issue in this context is that of 'analytical absolutism' raised by Nayyar, but it is completely evaded by Shroff. We will come to this point later.

Shroff contends that Nayyar's conclusions do not follow either from the evidence cited by him or the "experience of other countries which had embarked on similar reforms". This is a strange assertion because there is enough evidence from other countries which have undertaken these reforms. This evidence has generated a lively debate in academic circles. To cite one example, one may mention Rehman Sobhan's paper 'Structural Maladjustment: Bangladesh's Experience with Market Reforms' published in the same issue of this journal as Shroff's rejoinder. Sobhan shows that the GDP growth rate of Bangladesh declined sharply from 7.1 per cent for the period 1972-73 to 1974-75 to 5.1 per cent for 1975-76 to 1980-81 and to 3.1 per cent for 1991-92. Bangladesh was on the same reform package dictated by WB-IMF which India is following today. The policy package has not led to any improvement in the performance of Bangladesh's economy over the period of reform. It is worth noting that Bangladesh was in a better position to implement the reforms as it was under military or semi-military rule for the larger part of the period of reform and was thus less encumbered by non-economic considerations like public acceptance of the reforms which become vital for a democratic country like India. The growth rate of agriculture in Bangladesh averaged 4.2 per cent in the 1970s and 1.6 per cent in the 1980s. Though in 1989-90 it picked up at 7.6 per cent, it fell to 2 per cent in 1990-91 and 1991-92. The manufacturing sector too grew at 2.5 per cent in the 1980s, well below the rates in the 1970s. Overall investment as a percentage of GDP declined from 15.9 per cent in 1980-81 to a low of 10.3 per cent in 1991-92. The decline was reflected in falling private as well as public investments. On the export front, however, the performance has been good and the growth rate in the 1980s

has been double than that in the 1970s. A major part of this boom in export is accounted for by increased garment exports with very little backward linkage effects. Inflation has been kept under control mainly through stabilising foodgrain prices. Sobhan concludes, "Bangladesh's reform programme remains in deep crisis because it has over a decade failed to accelerate growth, diversify the economy, stimulate investment and domestic savings and create the basis for a sustained growth process which can lead to greater self-reliance and substantial reductions in mass poverty".

This is the experience of one country from our neighbourhood indicating the failure of the policy package recommended by the multilateral financing agencies. Other examples, specially from Latin America and Africa, can be cited to show the inadequacy of these policies. There have been pioneering works in this sphere showing that simple monetarist prescriptions for correcting current account deficits or controlling inflation, etc, have been unsuccessful in most countries. Against this background, the assertion that the experience of other countries does not warrant the conclusions drawn by Nayyar is not tenable.

It is also not correct to say that Nayyar's article does not assign any probability to the risks of the reforms not working and that he bases his conclusions on the implicit assumptions about their failure. In fact, while talking about the stabilisation of the balance of payments situation and reduction in the rate of inflation, Nayyar categorically states that the chances of success of the reforms depend on the probability of achieving these two objectives which, in his view, have been low and are even lower now. This conclusion follows from the worldwide experience with stabilisation and structural adjustment programmes as also from the Indian experience of the last couple of years.

Even if things 'do not go wrong'—which is most unlikely, given the simplistic theoretical model behind these policies and the historical experience—the problems of transition and adjustment are considerable which can upset the applecart any moment. The reason why policy-makers cannot give 'careful consideration' or 'adopt substantial correctives' is because doing so will undermine the very basis of the reforms. Thus we are faced with a dilemma—without correctives the reforms are bound to go the wrong way and with them the very basis of the reforms will be subverted. There is no plausible answer to this dilemma available within the parameters set by the policy reforms. Implicit in the article

by Nayyar is a clear perception of this problem which Shroff fails to appreciate.

While summarising the main points raised by Nayyar, Shroff misrepresents him regarding the deregulation of the financial sector. Rather than viewing the financial sector deregulation as 'inadequate', Nayyar calls for a careful and cautious approach. To quote him, "deregulation in the financial sector, unless it is paced with care, can be perilous not just in terms of scams or scandals, but also if it diverts scarce resources to unproductive uses". Thus it is a wrong reading of Nayyar's article to say that he is pleading for greater deregulation of the financial sector.

Coming to the diagnosis of the malaise of the Indian economy, Shroff agrees that the crisis of 1991 was mainly a result of the macro-economic imbalances of the 1980s, but he criticises those economists who supported deficit financing to spur investment although it led to macro-economic imbalances. It should not be forgotten, however, that the larger proportion of the deficit in the 1980s went to finance the luxury consumption of the middle classes benefiting from transfer payments, specially on account of public debt interest payments. Gross capital formation out of the budgetary resources of the central government as a percentage of GDP remained stagnant or fell during this period. In 1980-81 it was 6.6 per cent and remained at the same level in 1990-91, with some fluctuation in the intervening period. According to the budget estimates for 1992-93, the rate fell to 5.6 per cent as a consequence of adherence to the Fund-Bank policy package. Total developmental outlay did increase in absolute terms from Rs 36,845 crore in 1980-81 to Rs 1,76,548 crore in 1990-91, but as a proportion of GDP its share remained constant at about 18 per cent after reaching a peak of 21.7 per cent in 1989-90. On the other hand, non-developmental outlay was Rs 12,419 crore in 1980-81 which shot up to Rs 70,626 crore in 1990-91. As a proportion of GDP it marked an increase from 9.1 per cent in 1980-81 to 13.3 per cent in 1990-91. The highest increase among the items of the government's current expenditure has been in interest payments which rose as a proportion of GDP from 1.9 per cent in 1980-81 to 4 per cent in 1990-91. Contrary to the picture being painted, subsidy as a percentage of GDP has not increased very much over this period. It was 1.2 per cent of GDP in 1980-81 and increased to 2 per cent in 1990-91.

As a proportion of the government's total expenditure, gross capital formation out of budgetary resources fell from 40.1 per cent in 1980-81 to 34.7 per cent in 1990-91. The government's consumption expenditure fell from 23 per cent in 1980-81 to 21.5 per cent in 1990-91. The major increase was in

transfer payments which include interest payments, subsidies, grants to states and other items. From 30.7 per cent of total expenditure in 1980-81, they reached a level of 43 per cent in 1990-91. Interest payments which constituted 10 per cent of total expenditure in 1980-81 rose to 19 per cent in 1990-91. Subsidies were 8.5 per cent of the total expenditure in 1980-81 and increased to 10.5 per cent in 1990-91.

All this clearly brings out that the profligacy of the 1980s was not directed towards raising productive investment. Much of it went into larger transfer payments as interest, which accrued mostly to the richer sections of society. This was reflected in increased demand for imported luxury goods. With the international financing institutions and private creditors flush with money and ready to lend, the inherent check on government profligacy was gone and there was resort to heavy short-run and long-run borrowing from private lending institutions. External debt rose sharply from 9.9 per cent of GDP in 1980-81 to 12.5 per cent in 1990-91. The conclusions following from this are simple: (i) fiscal profligacy was not caused by increased investment in the public sector undertakings, etc; and (ii) fiscal profligacy might have been encouraged by the easy availability of foreign credits rather than the other way round. Therefore, the profligacy of the 1980s was neither caused by a realisation of the virtues of deficit financing in raising productive investment nor was it associated with the strategy of development adopted in the 1950s. It was simply a reflection of the distorted priorities of the government and its short-sightedness.

Shroff agrees with Nayar that "it is the nature and the form of state intervention that matters". He, however, highlights the 'gathering conviction' that the nature of the state itself has changed a great deal and hence there was need for greater reliance on market forces. He does not spell out what has been the change in the nature of the state which forces greater reliance on the market. The nature of the state has changed inasmuch as it sees the market as the panacea of all the ills facing the economy. In this sense, however, talk about the changing nature of the state as a reason explaining the total dependence on markets is tautological. Nevertheless, in one sense the nature of the state has certainly changed as from being the 'plaything of criminalised politics' it has now become a remote-controlled robot fed on neo-classical monetarist principles far removed from ground realities. In both the cases, however, it is the common people who suffer.

It is also not correct to say that Nayar's major criticism of the structural adjustment policies is that they have not gone far enough. Apart from pointing out the serious drawbacks of the structural adjustment policies and the inherent contradictions in the policy package, he has talked about the direction in which the reforms should move. It is basically a question of the direction and

not the speed of the reform process. Talking about the speed and the sequencing of the reform process, Nayar points out that the problems noticed elsewhere have already appeared in India. Industrial deregulation poses the problem of retrenchment and creation of monopolies preventing the entry of other firms (a recent case in point is the merger of TOMCO with Hindustan Lever). Public sector reform would grind to a halt the moment all the major PSUs are sold, since no attention is being paid to raising the efficiency and the productivity of the PSUs. The so-called full convertibility of the rupee has not solved any of the balance of payments problems and the principal instrument to achieve BOP equilibrium remains the depreciation of the rupee. Liberalisation of imports without any concerted effort to shore up exports has led to a widening trade gap. All this points not only to the problems associated with the speed of the reforms but more importantly to those related to the direction of the reforms which Shroff ignores.

Coming to inflation, it is true that inflation has decelerated over this period. But good monsoons and the expectation of another good monsoon this year have contributed significantly to the fall in the inflation rate. For the rest, the demand compression has been achieved by plunging the economy into a recession—a classic case of the remedy being worse than the disease. It is true that on annual average basis the rate of inflation fell from 13.7 per cent to 11.1 per cent between 1991-92 and end-December 1992. However, the consumer price index for agricultural labour still showed a high rate of inflation, suggesting a drastic erosion of the living standards of the poor.

The exchange reserves have improved from a precarious \$ 2.2 billion in March 1991 to \$ 7.07 billion in April 1993. Most of this has, however, come from exceptional financing sources like the transactions with the IMF and the India development bonds. The balance of trade for 1992-93 was negative to the extent of Rs 10,151 crore. In the absence of increase in export earnings, India will have no option but to rely on further borrowing.

The problem of inflation associated with the differential speeds of adjustment of demand and supply is supposed to be met through larger imports on the basis of additional capital inflows through foreign equity and borrowing. The flow of foreign capital through equity investment has not shown any substantial rise over this period. Dependence on the flows of such funds is dangerous since international capital movement is infamous for its capricious behaviour, moving out rapidly at the slightest possibility of earning a better return elsewhere. With the doing away of lock-in period for equity investment, dependence on such capital inflows could prove disastrous in times of crisis, real or perceived.

Criticising Nayar for implicitly considering public investment as an engine of growth,

Shroff denies that the public investment has any crowding-in effect today though this may have been so in the past. No reason is provided for why public investment has no crowding-in effect now. What has been the critical change in the economy due to which public investment now has a crowding-out rather than a crowding-in effect? It is true that emphasis is needed to be put on improving the productivity and efficiency of the public sector, but that does not mean that investment in the public sector would cause harm to the economic health of the country in general. It is simplistic to criticise Nayar for engaging in a stereotype of the 'growth vs equity' debate. The main concern of Nayar is the direction in which economy is moving where we will have deceleration in growth with worsening equity.

So far as the fertiliser subsidy is concerned, it is true that proportionately greater benefits are cornered by the rich farmers which is bound to be the case for any generalised subsidy scheme, given the institutional-political set-up of the economy. In a situation where the elasticity of fertiliser use with respect to price is high, an increase in prices would adversely affect foodgrain output unless foodgrain prices are allowed to rise. When foodgrain prices rise, an overall cost-push inflation will be generated which will affect the stabilisation programme. Cut in priority sector lending also has serious repercussions for the agricultural sector. It is not clear how Shroff asserts that these implications for agriculture have been taken into account.

Shroff is right in criticising Nayar for not paying attention to the sequencing problem. However, the remedy suggested by Shroff does not work as has been proved by the experience of countries which opted for simultaneous implementation of stabilisation and structural adjustment programmes. More often than not such shock therapy has resulted in stagflation and wide-ranging social unrest.

Lastly, it is curious that Shroff keeps a total silence on the problem of the asymmetric distribution of the burden of adjustment. At the global level this asymmetry can be clearly seen in the tensions over the GATT negotiations and the Dunkel draft. It is implicitly assumed in all such policy packages that the poorer sections will have to bear the cost of adjustment whereas those responsible for bringing the economy to such a pass continue enjoying the fruits of reform even as they had earlier benefited from the process causing the economic malaise.

Last, but not the least, is the question of social acceptability of the reform as also the externalisation of our policy initiatives which make us insensitive to changing realities on the ground. Unless we are prepared for a dictatorial set-up, ready to bulldoze its way through to reform, we must remain sensitive to the changing socio-political and economic situation and, for this, to retain the policy initiative is very important.

Can you look to
India as a source of
new technology?

Technology transfer took a new direction when ABB India exported an indigenous circuit breaker innovation back to Europe. 8000 employees in 16 marketing offices and 10 manufacturing units, with extensive R&D

facilities, place ABB at the leading edge of achievement.

And look at ABB India's exports. Sophisticated powerline carrier communications to Australia. Low cost erection and engineering services to Sri Lanka. Software exports to Sweden. Breaker Drives to Sweden, Switzerland and USA. As a leader in electrical engineering for the generation, transmission and distribution of power, and industry and transportation. ABB is committed to industrial ecological efficiency worldwide. ABB transfers its know-how across borders with ease. Yet in each country, the ABB local operation is decentralized and flexible. Which means that we are close at hand to help

Yes, you can. our customers reply swiftly and surely to technological challenges which stretch the limits of the possible. Like creating a new technology source within one of the world's most ancient cultures, India.
